The more than $7 billion worth of farm surpluses already piled up in warehouses and old ships are the direct result of the 90 percent of “parity” price-support program. This piling up of surpluses, with its drain on the Treasury, continues even under the “flexible” price-support program. Yet the Democrats are pressing for a return to 90 percent support, and the Administration feels driven to suggest still greater farm expenditures. On top of present price supports, it now proposes to recommend a “soil bank” plan. Under this, in the first year, the taxpayers would be called upon to hand out some $450 million more to induce farmers to put part of their acreage in soil-building grasses rather than in price-supported crops.

As the need for farm relief has grown less, farm relief itself has grown greater. In 1934, realized gross farm income was only $8.5 billion; in 1944, it had jumped to $24.4 billion; in 1955, it was about $32 billion. Yet over the same period government farm subsidies have steadily mounted.

A similar growth may be traced in unemployment insurance, old-age assistance, and other social-security programs. In 1949 Edna Lonigan wrote a study for the American Enterprise Association of Washington, D.C., in which she showed not only how welfare programs had been steadily expanded but how the concept of what constitutes “need” had been steadily raised. Such a study, brought down to date, would show the same expansion going on in the last six years. A similar secular trend can be traced in the various veterans’ programs.

Another dramatic illustration is the expansion of Federal grants-in-aid to the states and localities. More than 50 different grants-in-aid have been enacted so far. Roger A. Freeman, in his study of Federal aid to education that I referred to last week, tells us that these grants-in-aid have soared from $3 million at the turn of the twentieth century to more than $3 billion in 1955.

Another outstanding example is aid to housing. The various mortgage-guarantee programs and subsidies for public housing were originally enacted on the argument that they were needed to compensate for an abnormally low volume of private building. But these programs continue even during the greatest housing boom and the greatest general boom in our history.

In some respects the strangest of all examples is the foreign-aid program. Our government has now poured out more than $50 billion in foreign aid since the end of the second world war. All the arguments for the institution of the Marshall Plan in 1947 have now evaporated. The aid was to last only four years. But under constant changes of name and reasons in continues in heavy volume.

What causes this constant rise in expenditures for the benefit of special groups? Why are the forces acting in the opposite direction so weak? The general principle at work was once summed up by Elihu Root, a senator and onetime Secretary of State. “Minorities punish,” he said, “and majorities will not protect.”

That this should be so in the realm of public expenditure is not mysterious. To the beneficiaries of Federal aid (which include the bureaucracy hired to direct it) it makes a direct and substantial difference whether or not they get it. The tax burden, on the other hand, is spread over the whole nation, and no taxpayer can be sure precisely how much a given spending program costs him personally. Therefore the steady flow of organized propaganda is all on the side of continuing that spending program, while the arguments put forward against it are scattered, and much more abstract and disinterested. They seldom carry a threat to the political life of any congressman.

A cure for this ominous trend would not be simple. But one part of it would surely be to adopt a really responsible budget system.

---

**Hazards of Forecasting**

January 9, 1956

“Cromwell was about to ravage all Christendom; the royal family was undone, and his own forever established, save for a little grain of sand which formed in his ureter. Rome herself was trembling under him; but this small piece of gravel having formed there, he is dead, his family cast down, all is peaceful, and the king is restored.”

Perhaps nothing in literature more concisely and effectively illustrates the way in which apparently tiny causes can have tremendous effects than these two sentences from the great seventeenth-century mathematician and philosopher, Pascal. The world had another telling illustration of the hazards of forecasting in the year just passed. When President Eisenhower’s heart faltered on Sept. 24, the whole economic outlook seemed to change overnight. On the Monday after that week end, the stock market opened with the most
violent drop since the panicky days of 1929, later to recover with the President’s own recovery. Not one of those who had forecast business and market conditions at the beginning of 1955 had thought to condition his forecast upon the health of a single man.

Yet as the year turned out, the forecasters for 1955 went wrong for the strange reason that they were not optimistic enough. An article in the National Industrial Conference Board’s December Business Record, with the witty title “What Went Right?” points out that “the consensus of forecasts for 1955 was certainly far wide of the mark.” The forecasts were only moderately optimistic. In general they guessed that 1955 might be the “second best” year in our business history—better than 1954, but not as good as 1953.

When the forecasts were made, nothing in the statistical sky seemed to hint anything better than this. “While consumer demand had held up very well indeed during 1954, there was no very good evidence that it was about to advance into a wholly new range of spending.” The assignment of cause and effect can be questioned, but the Conference Board article thinks it is “reasonably clear that, in 1955, personal consumption and related magnitudes of personal saving and personal debt were the dynamic and driving forces behind business. . . . Of all the records set during the year, the most impressive are the 7.5 million level of new car sales, and the $5 billion–$6 billion increase in installment debt outstanding. No other figures so clearly distinguish the year from all others. If the forecasters had known them a year ago, they would have needed little else to get on target.” In other words, if the forecasters had known what was going to happen, they would have known what was going to happen.

If the consensus of the forecasts could go wrong for 1955, it can just as easily go wrong for 1956—and not necessarily in the same direction. It is the weakness of most forecasters to assume that conditions are going to continue as they already are—or, rather, to assume that they are going to change in the same direction and at the same rate as in the immediate past. In more technical language, the unconscious tendency of most forecasters is to “extrapolate” the recent business curve.

Let us study the present forecasts therefore, with appropriate caution. All of us must base our decisions on some guess regarding the probable future. But we should do well to keep in mind that business forecasting can never be a science. The future does not depend on any set of past or present statistics, or any extrapolation of them, but on a million future developments which no one can foresee. The best forecast can be based only upon apparent probabilities; but “probabilities” can be falsified by events.

As the Conference Board’s article concludes. “It is not easy to say what the lesson of 1955 should be. Should the performance of consumption in 1955, which was extraordinary by the standard of all preceding years, be counted on for 1956? . . . Or does the boom in personal spending in 1955 presage a steep return toward an historical ‘normal’? . . . The answers to these questions are very much the answers to 1956.”

### Foreign Aid Forever?

**January 16, 1956**

The request of the Administration for an appropriation of almost $5 billion for foreign aid, as compared with $2.7 billion for the current fiscal year, is so ill-advised and unjustified that all I can do here is to list some major objections to it, and leave further elaboration to a later time.

1—Secretary Dulles’s defense of this request is that the actual rate of foreign-aid spending will increase from $4.2 billion in the current fiscal year to “only” $4.4 billion in the fiscal year beginning next July 1. His defense of an 80 percent increase in the appropriation is that it is necessary to keep foreign aid flowing, to keep the “pipeline” filled up. Yet even without this addition to its foreign-aid reserves, the Administration will have a $7 billion carry-over of foreign aid appropriations at the end of this fiscal year.

Moreover, the Administration’s present line is a complete reversal of its previous attitude on budgetary carryovers. At a press conference on April 30, 1953, President Eisenhower said: “No more glaring illustration of the lack of balance between the military logic and the economic logic could possibly be found than the situation that existed when we took office. On the one hand, we found our Allies deploring our unfulfilled defense promises. On the other hand, we found that there was a total carry-over of $81 billion in appropriated funds, largely committed, for which cash must be provided from revenues in future fiscal years, over and above the normal cost of government. It’s just as if the late Administration had gone to the store and ordered $81 billion of goods, which we’ve got to pay for as they’re delivered.”

If Mr. Eisenhower was right in 1953, he is wrong now. A larger appropriation now means that the taxpayers must spend that much more, whether in the next fiscal year or later. Only by rejecting the present demand can Congress hope to control even future foreign aid,
not to speak of bringing it to a long-overdue termination. The suggestion of a pledge to continue foreign spending for ten more years is an unwarranted attempt to tie the hands of future Congresses.

2—We have already spent $50 billion of the taxpayers’ money in foreign aid since the end of the second world war. Propagandists for this aid boldly give it entire credit for the postwar European recovery that has taken place. But it could just as plausibly be argued that this recovery would have been faster without it. Certainly it has subsidized and prolonged foreign exchange controls and socialism.

3—As the old excuses for foreign aid run out, our bureaucrats invent new ones. The present somewhat hysterical clamor for it rests on the tacit assumption that allies can be bought if we only raise our price. We are told we must outbid Russian offers of foreign aid. Yet even Secretary Dulles admitted that we ought not “to put ourselves in a position where the Soviets, by just making paper offers, can require us to make real offers to top them. That would mean that the Soviets would be spending nothing except a piece of paper but would require us to spend a great deal of money.” Yet this is precisely what we are doing, for example, in offering American taxpayers’ money to help Egypt build a grandiose dam.

4—The tacit assumption behind nearly all our so-called foreign “economic aid” has been statist or socialistic. It assumes that a nation prospers by handouts, rather than by attracting private investments through encouragement of free enterprise.

5—Even our so-called “military aid” rests on the dubious economic assumption that other countries can not afford to pay for their own defense, and that American taxpayers must assume that burden.

6—The foreign-aid program is merely one more symptom of budget irresponsibility. The Administration is not only asking more for foreign aid, but more for agriculture, more for highways, Federal aid for local schools, and so on. It wants to give other nations more than $4 billion a year, though we groan under onerous taxes, we haven’t yet balanced our own budget and are already $280 billion in debt.

The Presidential Burden
January 23, 1956

President Eisenhower’s State of the Union message calls in substance for the continuance and expansion of the measures and principles of the New Deal-Fair Deal. It asks for increased spending on foreign aid, farm aid, and on a vast highway system; for more housing subsidies, bigger social security, new Federal spending on local schools, “distressed areas,” flood insurance, and health reinsurance. Everybody is remembered but the taxpayer who is to pay the bill.

Most of the estimated 46 or more legislative measures for which the President calls are not only unnecessary, but would do more harm than good. Yet one of the most urgent steps that the new session of Congress ought to take was not even mentioned in the President’s message. This is a measure or set of measures: (1) To relieve the present tremendous burden of work and responsibility on the Presidential office; (2) to allow a President, in case of disability, to delegate whatever powers he thinks necessary to the Vice President, and to terminate this voluntary delegation of power at will; and (3) to provide for the delegation or transfer of Presidential power whenever a President can no longer “discharge the powers and duties” of his office, but is either unable (as was Garfield) or unwilling (as was Wilson) to acknowledge his own inability.

1—The need of reducing the tremendous burdens on the Presidency is acknowledged on all sides. Former President Herbert Hoover, in a recent television interview, made the interesting suggestion that “what we need is a new Administrative Vice President to be selected by the President and assigned such duties as he may wish.” The essence of this suggestion is sound, but there may be wide differences of opinion about details. It would certainly be confusing to have two men with the title of Vice President, one elected as such, and the other an appointed official. It would be perhaps more practicable to permit the President (by written authorization) to distribute much of his present detail work among his existing Cabinet officials, and in addition to permit the appointment (with Senate approval) of a new member of the Cabinet, a Secretary General to whom the President could delegate such other enumerated duties or powers as he thought wise.

Mr. Hoover pointed out that there are now 64 agencies of government that report directly to the President. He thinks that something like 35 or 40 of them could be placed, with the authority of law, under the “Administrative Vice President” he suggests. It would seem even more practical, to the present writer, to abolish some of these 64 agencies of government. The tremendous burdens and responsibilities put upon the President are caused primarily by the fact that our government itself has grown too big. It attempts to meddle in too much. It attempts to formulate and enforce more policies than can be encompassed by the mind of any
A Farm-Vote Program
January 30, 1956

The President’s farm message is a strange document, full of contradictions. It opens with an unsparing criticism of the farm price-support program. “Mountainous surpluses overshadow everything else,” because “wartime production incentives were too long continued. . . . Were it not for the government’s bulging stocks, farmers would be getting far more for their product today. . . . Both at home and abroad markets have been lost. Foreign farm production has been increased. American exports have declined. Foreign products have been attracted to our shores. . . . Our farmers have had to submit to drastic acreage controls. . . . Even these controls have been self-defeating.”

The logical conclusion from all this would be to stop government farm price support as soon as feasible. Instead, the President attributes all these evils to the Democratic price-support program at 90 percent of “parity.” He assumes the evils will end under Republican “flexible” price support at 75 to 90 percent of parity. No doubt, at slightly lower artificial price props surpluses may pile up at a less appalling rate than otherwise; but they will pile up. “We must stop encouraging the production of surpluses,” says Mr. Eisenhower; and then endorses a plan which must continue to encourage them.

He realizes this; for he immediately proposes another plan to offset this encouragement. This is a “soil bank,” designed to take at least 40 million of the country’s 350 million acres of crop land out of production. These would be planted to trees or grass. Participating farmers would be forbidden even to graze cattle on any land put in the “acreage reserve.”

In other words, under the price-support program, the farmer is given a subsidy to encourage him to produce surpluses, while under the soil-bank program he would get another subsidy to discourage production of surpluses. He would be offered one handout to increase production and then another handout if he agreed not to take advantage of the first one.

This “solution” is full of question marks. The sheer administrative problem of enforcement of this soil-bank program would be enormous. In one part of the message the President admits that acreage controls are almost worthless. “In 1955, on an acreage allotment calculated to yield 10 million bales of cotton, nearly 15 million were harvested.” In short, production per acre can be increased amazingly — given an artificial price incentive. Therefore, beginning with the crop of 1957, the President suggests quantity allotments for cotton instead of acreage control. But acreage control would also be worthless for other crops as long as their prices are government-supported. The whole plan would lead toward complete regimentation of farming, with each farmer told exactly how many pounds or bushels of every crop he could sell, based on his “historic” production.

The President’s message piles up so many subsidies, handouts, and administrative headaches that it is impossible even to list them here. But he does suggest that Congress “consider placing a dollar limit on the size of price-support loans to any one individual or farming unit. . . . Price-support loans of tremendous size have occasionally occurred.” He doesn’t mention figures, but the records show that payments of more than a million dollars have been made to individual farms for growing cotton that nobody wanted to buy. This is surely carrying “relief” to the “needy farmer” pretty far.

Yet while putting a limit on the size of the price-support check to any one farm may mitigate this scandal, it only underlines the absurdity of the whole price-support program. Something like 85 percent of our total farm output comes from the big, efficient farms that are the main beneficiaries of the program. To continue price support mainly to the small producers would be to subsidize and encourage much costly and inefficient at the expense of efficient production.
But hoped—for political advantage is likely to play a much greater role in any new farm program than probable economic consequences.

**But Is It Balanced?**
February 6, 1956

President Eisenhower has abandoned a philosophy of economy to embrace a philosophy of spending.

The evidence of this reversal lies in his budget message for fiscal 1957—in the overall spending estimates, the detailed spending programs, and in pronouncements in the message itself. In the fiscal year 1953 the government spent $74.3 billion. In fiscal 1954 it spent $67.8 billion; and in fiscal 1955, $64.5. The budget which the President submitted a year ago, for the current fiscal year to end on June 30, estimated spending at $62.4 billion. Now the trend has been reversed. Mr. Eisenhower estimates that in the current fiscal year the government will actually spend $64.3 billion, an increase of nearly $2 billion above his estimate a year ago. In the new fiscal year, to begin on July 1, expenditures are estimated at $65.9 billion.

Less than $1 billion of this increase for fiscal 1957 can be blamed on the increase in military expenditures. Practically every other major category of spending is higher—foreign aid, veterans’ benefits, labor and welfare, farm subsidies, housing subsidies, general governmental expenses. And the new spending programs suggested are too numerous to list here. In order to obtain a substantial surplus in the 1957 budget, or to permit of a substantial tax reduction, it would not have been necessary to find new economies, but merely to refrain from any new spending above that originally contemplated for fiscal 1956.

The reversal in the President’s spending philosophy is apparent in the message itself. “A significant increase in revenues is currently anticipated,” the President declares, “as the result of our present unprecedented prosperity. In the achievement of this prosperity, the historic $7.4 billion tax reduction and reform program of 1954...and the confidence born of prudent fiscal and credit management have been strong energizing factors.” But later on in the message he declares: “Budget revenues now permit us to undertake some new and expanded programs for enhancing opportunities for human well-being and economic growth.” This second passage seems to justify more spending mainly on the ground that the government will have more money to spend. It assumes that the way to prosperity and well-being is not to economize and cut taxes, as assumed in the first passage, but to keep up taxes and add new spending programs. It deserts the philosophy of providing incentives for the philosophy of the handout.

The President’s estimate of a balanced budget for 1957, moreover, is not convincing. I have printed tables several times in this column to show the persistent discrepancy between estimates and realities in the budgets of the Roosevelt and Truman Administrations. Mr. Eisenhower’s record is no better. He originally estimated a deficit for fiscal 1955 of $2.9 billion; it turned out to be $4.2 billion. For fiscal 1956 he estimated that budget receipts would be $60 billion and expenditures $62.4 billion. He now estimates expenditures in fiscal 1956 at $64.3 billion, or nearly $2 billion higher; but the situation is saved because estimated receipts are miraculously $4.5 billion higher.

Now these receipts have come because 1955 turned out to be the year of the greatest prosperity and greatest national income on record. Yet instead of considering this perhaps an abnormally high income, continuance of which it might be imprudent to count on, the President actually assumes that 1956 will be an even more prosperous year than 1955, and that revenues will be $1.8 billion higher. He gets this result in part through the dubious assumption that Congress will approve a $350 million postal-rate increase at this session, although it refused to do so last year. And he makes his fiscal 1957 budget “balance,” also, by providing no funds whatever for the new Federal highway program he is recommending. If his slim and precarious surplus for the fiscal year 1957 is actually to be realized, this whole series of doubtful assumptions must turn out to be right. The country desperately needs a responsible budget system.

**Facing Both Ways**
February 13, 1956

Like his Budget Message, President Eisenhower’s Economic Report seems to preach two mutually contradictory philosophies at the same time. It pays lip-service to government economy and free enterprise, and ends with scores of recommendations for increased spending and more governmental controls.

It is perhaps forgivable, especially in an election year, that the Administration should congratulate itself on the astonishing economic record of 1955, and imply that the result came about because, as Franklin Roosevelt once boasted, “we planned it that way.” “Full employment, rising incomes, and a stable dollar have been cherished goals of our society. The practical
Resources to encourage other Americans to buy houses for 7, 5, 2, or 0 percent of the purchase price. The Federal Reserve authorities, bluntly, have not had the courage to exercise a sufficiently firm control over the total volume of bank credit. They have kept down interest rates below the levels to which they would otherwise have gone. It is this that has encouraged and made possible the huge growth in consumer credit. It is futile economically, and dangerous politically, to give governmental authorities the right to increase the total supply of credit to make it cheaper and easier, and then to ration the oversupply by stepping in to say who shall and shall not have credit and on what terms. This substitutes bureaucratic judgment and favoritism for the judgment of the market place.

Mencken: A Retrospect

February 20, 1956

H.L. Mencken, who died on Jan. 29, was the outstanding American literary critic of his generation, its most influential stylist, its most prominent iconoclast, the chief scourge of the genteel tradition, and a great liberating force.

I devote this column to him in the hope of correcting a persistent misunderstanding about his economic and political ideas. The typical view, reflected in most of the obituaries, is that Mencken began as an archrebel and idol smasher; but that when the New Deal came along, he could not keep abreast of its “progressivism” and its “new ideas”; so the procession passed him by, exposing him as a mere “conservative.”

Those who hold this view have never understood either the real nature of the New Deal, or the real philosophy of Mencken. That philosophy never changed. Mencken was first and foremost a libertarian. That explains his unceasing warfare against censorship and prohibition, and most of his assaults on “democracy”—insofar as that word was used to imply the right of a majority to suppress or persecute a nonconformist minority.

I can speak about his views with a certain confidence, not only because I devoured all his work as it came out, but because of close personal experience. When Mencken nominated me in 1933 to succeed him as editor of The American Mercury, he thought I understood his philosophy and he mine well enough to assure his readers that in the magazine’s “basic aims and principles there will be little change.”
In his political and economic opinions Mencken was from the beginning, to repeat, neither “radical” nor “conservative,” but libertarian. He championed the freedom and dignity of the individual. Therefore he always considered Socialism preposterous. He had never known a Socialist, he was fond of saying, who wasn’t crazy on other subjects as well. One of his very earliest books, *Men vs. the Man*, published in 1910, was a debate against a Socialist. His famous blast against “this Prof. Dr. Thorstein B. Veblen, head Great Thinker to the parlor radicals, Socrates of the intellectual Greenwich Village, chief star [at least transiently] of the American Atheneums,” appeared, it is important to recall, in 1919, in the very first series of the *Prejudices*, and at the beginning of the great Mencken vogue.

Veblen remained the darling of the American intellectual left-wingers for at least twenty years longer. When the New Deal was at the height of its power and prestige, it was fashionable to say that Mencken had “missed” Veblen because he could not make him out. Now that the once exorbitant reputation of Veblen has itself rapidly fading, it is perhaps permissible to point out that whatever was sound in his celebrated *The Theory of the Leisure Class* had already been said, in a few brief paragraphs, by Aristotle; and that Veblen’s attacks on “the price system” came from a man who had not the remotest understanding of that system, or of the role it plays in stimulating, directing, allocating, and balancing production.

Mencken was not a technical economist. He did not possess the specialized intellectual implements necessary to dissect all the Veblenian fallacies. His own essay, in fact, was published a couple of years before Veblen’s “The Engineers and the Price System.” But Mencken had an almost unerring sense of smell. He could usually detect pretentiousness and nonsense at the first whiff. True, his essay begins with an attack primarily upon the professor’s “incredibly obscure and malodorous style.” But when he got to his ideas he excoriated them irreparably, and concluded: “From end to end you will find the same tedious torturing of plain facts, the same relentless piling up of thin and overlabored theory, the same flatulent bombast, the same intellectual strabismus.”

In short, Mencken recognized from the start that Veblen’s ideas were “simply Socialism and water.” He prized human liberty too highly to be carried away by the growing academic mania for collectivism. Like Herbert Spencer, he sensed that “all Socialism involves slavery.” He brought in the minority report. ✈️

**The War on Big Business**

February 27, 1956

Recent actions and proposals of the Eisenhower Administration with respect to big business are disturbingly like those of the New and Fair Deals. Once more mere bigness is being treated as a crime in itself.

Stanley N. Barnes, Assistant Attorney General in charge of the Department of Justice Antitrust Division, hinted, in a speech on Feb. 8, at the possibility that antitrust action would be taken against the country’s major automobile manufacturers, because the three biggest producers now turn out almost 95.5 percent of the cars. Yet the United States has achieved by far the greatest industrial productivity that the world has ever known. And if one industry stands out above all others as the wonder and envy of other nations, it is our automobile industry. Nowhere is there keener competition in price, quality, and output. The intense competition between companies, in fact, forces competition nearly as keen within companies. The Oldsmobile competes for the consumer’s favor and dollars with the Buick, the Chrysler with the Imperial, the Ford with the Mercury.

But, alas, this intense competition does not fit the Justice Department’s preconceived numerical notions of what competition ought to look like. If there were twenty automobile companies, each doing forever just 5 percent of the business, the department would apparently be satisfied. What alarms it is that a few companies should achieve the goal of competition by being more successful than their rivals and attracting a higher percentage of consumer buying.

Even more disturbing evidence that there is something basically wrong with the Administration’s new attitude toward big business was the announcement by Attorney General Brownell on Jan. 24 of a “consent decree” under which the American Telephone & Telegraph Co. was compelled, among other things, to license 8,600 existing patents to all applicants without royalties. But what is the consistency or sense in granting patents by act of Congress, and then forbidding companies, by bureaucratic decree, to take advantage of such patents? Will the big companies continue to spend as much on research when they know they will be forced to give away what they discover? In the long run, will “consent” decrees of this sort advance scientific and technological progress—or retard it?

A final touch of “antitrust” absurdity is found in the consent decree announced on Feb. 6 forcing the Hilton Hotels Corp. to dispose of two of its 27 hotels within “a reasonable time.” It must sell, for example either the New Yorker or the Roosevelt in New York, so that it
will have only four hotels in that city under one management instead of five. Just what will this accomplish? How does the Department of Justice know that in a city containing 400 to 500 hotels, the ownership of just five of them by a single management constitutes a threat of monopoly, but the ownership of four does not? Does the common ownership of five hotels reduce the number of rooms available? Does it make “monopoly pricing” possible? Incidentally, are local hotels in interstate commerce?

Not the least curious thing about this sudden pre-election ardor against “monopoly” is that it utterly ignores the most serious monopoly of all—that of industrywide unions. These unions, in the railroad, automobile, steel, or coal industries, can at any time paralyze the economy of the whole nation until their demands are met. Yet instead of showing concern, the government deliberately builds up their power by making it illegal for an employer not to “bargain” with them.

Our antimonopoly laws need thorough revision. They should be clear, general, and, as far as possible, equal and certain in their application. Such vague formulas as “undue concentration of economic power” can mean anything an individual bureaucrat or judge wants them to mean. In the present nebulous and contradictory state of our antimonopoly laws, we are bound to suffer from government by bureaucratic caprice and discrimination. The legal and political consequences of this can be as serious as the economic consequences.

‘Selective’ Credit Control
March 5, 1956

Secretary Humphrey showed political courage as well as excellent sense when he refused to endorse the suggestion in the President’s Economic Report for restoration of the government’s power to regulate the terms of consumer installment credit.

The Secretary also gave the right reasons why such stand-by powers would be inadvisable. They would put too much discretion in the hands of whoever was to administer them: “You take a great responsibility on yourself when you tell 160 million people what they can afford to buy.” Chairman Martin of the Federal Reserve Board also pointed out that: “Selective controls of this nature are at best supplements and not substitutes for the general overall credit and monetary instruments.”

The most eminent advocate of the imposition of stand-by controls on installment credit is Allan Sproul, president of the Federal Reserve Bank of New York. In a speech on Dec. 29 he declared: “I do believe that there is a temptation to abuse consumer credit in boom times, that it can thus become a serious source of instability in our economy, and that we would not jeopardize our general freedom from direct controls by giving the Federal Reserve System permanent authority to regulate consumer credit.”

But Sproul’s argument indirectly admits that he wishes this power in order to avoid a sufficiently firm control over general interest rates and the total volume of credit: “If there has grown up a form of credit extension which . . . is introducing a dangerous element of instability in our economy, and if it is difficult to reach this credit area by general credit measures without adversely affecting any of the less avid users of credit is there not a case for a selective credit control?” What Sproul is saying in effect is that a handful of government monetary managers should be given the power to discriminate among borrowers; to say which are “legitimate” and which not; to say just who should have credit and on what terms. No government body should have such power. It becomes an implement for political favoritism.

President Eisenhower declared in a press conference on Feb. 8 that if the government were granted stand-by powers over consumer credit they would not be abused. But the record shows that the “selective” powers over credit which already exist have already been abused. Our Federal Reserve authorities complain of “inflationary pressures.” Yet they keep the official discount rate down to only 2½ percent. (Compare this with Great Britain, which has just been forced to raise its discount rate to 5½ percent.) And they have allowed and encouraged a $12 billion increase in the total volume of money and bank credit since the beginning of 1954.

The government authorities discriminate against purchase of corporate securities by compelling a minimum down payment of 70 percent. They discriminate in favor of purchase of houses by pledging the taxpayers’ money to allow such purchases for a down payment of only 7 percent or perhaps only 2 percent. A Congressional subcommittee has recently raised a storm about even these tiny down payments. It has asked for a return to the conditions under which a veteran could buy a $10,000 house without putting up even the $200 cash now required. The belief that government agencies are above the political pressures which lead to such discriminations among borrowers has been disproved everywhere.

In sum, if general interest rates are allowed to rise to their appropriate level, and if there is a sufficiently firm rein on the total quantity of credit, “selective” credit controls are unnecessary. But if there is not a sufficiently firm rein on the total quantity of money and credit,
“selective” controls are largely futile. If a man has $2,500 cash, for example, but can buy a $10,000 house for only $500 down, then he can also buy a $2,000 car with his “own” cash, whereas if he had to pay down his $2,500 for the house he couldn’t buy a car even on pretty loose credit terms. This elementary principle of the shifting or substitution of credit seems to have been overlooked by the champions of “selective” credit controls.

That Gas Bill Veto
March 12, 1956

President Eisenhower’s veto of the natural-gas bill was confused, irrelevant, and a political blunder. It cannot be defended logically, constitutionally, or economically.

Most of this is clear from the text of the veto message itself. The President declares that “legislation conforming to the basic objectives” of the bill “is needed because the type of regulation of producers of natural gas which is required under present law will discourage individual initiative and incentive to explore for and develop new sources of supply. In the long run this will limit supplies of gas, which is contrary not only to the national interest but especially to the interest of consumers.” That accurately sums up the economic need for the bill.

In addition the President might have asked whether the Federal government has any business regulating the price of a commodity before it enters interstate commerce, and whether the Supreme Court, in its 5-to-3 decision of June 7, 1954, did not usurp legislative functions and flout the plain intent of Congress itself. Congress specifically exempted from the provisions of the Natural Gas Act of 1938 “the production or gathering of natural gas.”

But the President deliberately set aside the merits of the case, and the interests of more than 20 million consumers, in order to punish the “highly questionable activities” of a few “private persons, apparently representing only a very small segment of a great and vital industry.”

The only proper procedure was to decide each question—the question of natural-gas regulation, and the question of improper influence on Congress—on its own merits. That is what the Senate majority tried to do. By the President’s own admission, he is punishing some 8,000 natural-gas producers and more than 20 million consumers, continuing a practice that is more dubious constitutionally, and supporting an indefensible Supreme Court decision, all because one gas producer had acted improperly and stupidly in trying (unsuccessfully) to influence one or two votes in Congress.

The President’s veto message, unfortunately, did more than this. His veto was based on “efforts I deem to be so arrogant and so much in defiance of acceptable standards of propriety as to risk creating doubt among the American people concerning the integrity of governmental processes.” But it was the President’s veto message itself that did most to cast doubt on “the integrity of governmental processes.” For the Senate voted after the facts in the Case affair had been publicly aired—by the Senate itself. The vote was not along party lines. Thirty-one Republicans voted for the bill and fourteen against it. Twenty-two Democrats voted for it and 24 against it. By implication the veto message threw doubt on the motives of the majority that voted for the bill—though there was also a powerful lobby against the bill.

The economic and constitutional case in favor of the bill is overwhelming. There is no argument against the Federal regulation of some 110 interstate pipeline companies, and local regulation of some 1,200 public-utility gas companies; but under the present Supreme Court decision the Federal government is regulating some 8,000 intensely competitive producers who take a great risk every time they dig an exploratory well. (Over a period of years producers are estimated to have drilled an average of eight exploratory “dry holes” for each successful one.)

It is estimated, moreover, that 90 percent of the gas bill paid by the ultimate consumer goes to the pipeline company and the local public utility to cover the cost of transmission and distribution. In other words, even if the producer gave his gas away, absolutely free, the average household consumer could cut his gas bill only about 10 percent.

Finally, if gas prices can be regulated by the Federal government at the individual well, it is certainly as logical for it to regulate petroleum prices locally—not to speak of coal, farm products, automobiles, or anything that eventually finds its way into interstate commerce.

Ike and the Economic Outlook
March 19, 1956

It is still too early to say precisely what effect the willingness of Mr. Eisenhower to run for a second term will have on the future of business.

We cannot judge too much from recent mercu- rial reactions of the stock market. At the moment
the most probable outlook is for a race between Mr. Eisenhower and Stevenson. But it is far from certain that the outcome will be the same as four years ago. Mr. Eisenhower’s personality and policies are better known to the voters now than they were then. The impression left by his personal earnestness, candor, dignity, sense of duty, and absence of malice is perhaps even more favorable now than in 1952. But his reputation as an efficient administrator, or as a statesman with a firm grasp of political and economic principles, has considerably diminished. And any turn for the worse before November in either the domestic or the foreign situation will hurt his chances.

He started off well. He promised a drastic reduction of governmental expenditures, and a balanced budget. He ended a stalemated war in Korea. He removed price controls. But in the last year—and especially since his heart attack—his program has turned more and more into a mere extension of the political and economic policies of the New Deal. Details of the drift toward “ever-expanding Federal power and paternalism” were summarized in this column of Aug. 22 last. Recent developments have emphasized present New Deal tendencies in foreign aid, farm aid, housing aid, loose fiscal policy, big spending, and money and credit expansion to sustain an inflationary boom.

The net result of these recent policies and tendencies has been to alienate the conservative Republican vote, which constituted a large and perhaps determining factor in the election of 1952. In recent months, moreover, Mr. Eisenhower and his aides have made several grave political blunders. The two most important were Secretary Dulles’s inept “brink of war” interview, and Mr. Eisenhower’s illogical veto of the natural-gas bill in a message which cast doubt upon the integrity of the votes of the very senators who thought they were supporting him.

As a result of all this, it is extremely doubtful that the Republicans can win a majority in the forthcoming Congress. It is even far from certain that Mr. Eisenhower can win the election against Adlai Stevenson. For even if neither side were to say another word about it, Mr. Eisenhower’s heart attack is bound to be an important issue in the campaign. The voters are certain to weigh much more heavily than they usually do the possibility that the Vice Presidential candidate may become the President. Stevenson, on his side, is a very articulate, astute, and ruthless campaigner, adroit in making mountains even out of molehills. It would be the height of folly for the Republicans to ignore Senator Knowland’s warning that in the forthcoming election “not a thing can be taken for granted.”

Mr. Eisenhower, again, is repeating and magnifying the very blunder that defeated Governor Dewey in 1948. This is the blunder of presenting to the electorate a halfhearted copy of the New Deal, on the theory that this will capture the “middle of the road” voters, and that the regular orthodox Republicans have “no place else to go.” These voters, however, did and do have one place not to go—and that is to the polls. They refrained from doing so in the millions in 1948. That is what defeated Dewey.

In sum, in a race today between Eisenhower and Stevenson, the voters would be presented, so far as policy is concerned, only with a choice between the original New Dealer and their Johnny-come-lately imitators. Those voters who look with concern upon the steady growth of centralized government, of paternalism, of big spending, of subsidies for every pressure group, of continued inflation, and the steady erosion of states’ rights, will have no candidate who reflects their views—except in the improbable event of the formation of a third party of conservatives drawn from both the Republican and Democratic ranks.

---

Extending the Farm Folly
March 26, 1956

Any farm legislation likely to emerge from the present Congress gives no promise of solving the farm problem. Its most probable result will be to make the problem much worse.

The Administration won a victory when the Senate voted to retain flexible price supports of 75 to 90 percent on most “basic” commodities, and defeated the effort to restore rigid 90 percent supports. But the Administration paid an excessive price for this “flexibility” by offering all sorts of concessions and new subsidies in order to win it. And it suffered a stunning setback in the discriminatory “two-price” vote for wheat.

In his farm message of Jan. 9 President Eisenhower correctly pointed out that “mountainous surpluses overshadow everything else. . . . Were it not for the government’s bulging stocks, farmers would be getting far more for their product today. . . . Even [acreage] controls have been self-defeating.” He therefore proposed that, in addition to continuing to offer a subsidy to the farmer to overproduce, the government should try to offset this by offering him still another (“soil bank”) subsidy for not producing. “I do not propose this program,” he said, “as a device to empty government warehouses so that they may be filled again. There is,
therefore, a basic corollary to the acreage reserve program: In future years we must avoid, as a plague, farm programs that would encourage the building up of new price-depressing surpluses."

There is every reason to suppose, however, that the new price-support legislation would continue to encourage the building up of price-depressing surpluses and would keep the government warehouses filled. It seems likely to prolong the burden on the country’s food consumers and taxpayers, lead toward increased regimentation of farming, and create further ill will by threatening the price stability of foreign-grown farm products. In brief, this country would be better off without these proposed changes in farm legislation.

There is only one certain way to stop the building up of demoralizing surpluses. This is to halt the price supports that encourage the production of such surpluses. If even “moderate” price supports are continued, they should in no case apply to any new crop as long as the government still holds a surplus of any past year's crop. If the government were to support wheat (or any other crop) even at 76 percent of “parity,” for example, it should be free to resell its holdings in the open market at, say, 77 percent of parity (plus storage and handling costs). Whenever the 76 percent “floor” was reached, farmers would be automatically put on notice that no price supports would apply to any new plantings of wheat until the government had got rid of accumulated surpluses. The farmer would have to plant and dispose of any new crop entirely at his own price risk. This is the only type of price-support program that would not risk foreign resentment or the accumulation of mounting surpluses from year to year.

It is probable that only a drastic program could extricate farmers and the government from their present predicament. The surpluses of each crop could either be given away to the individual farm unit in proportion to its “historic” annual production, or sold to it at a price substantially below the world price. Each farmer could then make his own decision whether to resell his allotted share of the surplus immediately, or hold it for a rise at his own cost and risk. Any new market price so established would doubtless discourage new production for a year or so; but the farmer would be compensated financially by the share of the crop surplus either given to him, or sold to him, below world prices.

The farm problem has become so grave as a result of the high government price supports of the last seven years that nothing short of some such bold slashing of the Gordian knot could restore orderly, balanced production and free markets. But instead of arranging to terminate government price supports and surpluses, both parties have been competing with each other to pile up new subsidies. 

That Egyptian Dam
April 2, 1956

The proposal that the U.S. Government and its agencies pour hundreds of millions of our taxpayers’ dollars into a grandiose dam in Egypt has at least one merit. It illustrates almost every bad principle involved in our foreign-aid program.

1—The High Dam at Aswan is to be more than 3 miles long, to cost $1.3 billion (at least half of Egypt's estimated national income), and to take some fifteen years to build. Our proposed aid is called “economic”; but indirectly it is military aid. The less the Egyptian Government needs to lay out for its own dam, the more funds it will have left over for buying armaments. When the dam is completed it will no doubt supply power to create still more armaments.

2—This is one more plan for our government to subsidize foreign state socialism. The Aswan High Dam is doubtless inspired by the Dneprostoil dam and hydroelectric plant, the prewar pride of Soviet Russia, which also inspired our own TVA. The Dneprostoil dam was not justified by economic results. (See Boris Brutskus, Economic Planning in Soviet Russia, 1935.) State-directed “industrialization” programs are usually disguised militarization programs.

3—One of the originally declared objectives of the Marshall and other foreign-aid programs was to “combat Communism.” Yet this money and aid are to be given to a country that is buying arms from Communist countries and pursuing foreign policies that coincide with the purposes of those countries. One of the favorite arguments for our foreign aid is that it tends to halt Communism by providing foreign countries with higher living standards. This is a naive belief. In the decade since the second world war there is no evidence that higher living standards, when achieved, have been accompanied by marked decline in Communist sentiment.

4—Our foreign-aid program, both directly and indirectly, tends to discourage and delay a return to the principles of free enterprise in foreign countries. We do not encourage free enterprise by subsidizing socialist ventures. Moreover, when we so freely offer government-to-government loans or gifts we make it unnecessary for “underdeveloped” countries to undertake the reforms or give the assurances calculated to attract private capital, either native or foreign.
Experience daily shows however, that our foreign aid often has precisely the opposite effect. The countries that are gracious enough to accept our handouts insist that there must be “no strings attached.” In plainer words, our money must be given to them unconditionally. In consequence, we have abandoned even the most essential conditions. Only a few days ago Secretary Dulles announced that “there is no connection whatever” between giving U.S. economic aid and securing U.S. allies. He went on to point out that Pakistan had security arrangements with the U.S. but not India or Ceylon; yet all three are receiving U.S. aid. Our foreign aid advocates begin to remind us of Santayana’s definition of a fanatic—one who redoubles his efforts when he has forgotten his aim.

The Administration cites the Aswan-dam project as an illustration of why Congress must give at least moral if not legal assurances that our aid will be continued over a period up to ten years. But that project seems to illustrate precisely the opposite. If we commit ourselves to continued aid regardless of what policy the Egyptian Government follows, we lose whatever chance we might otherwise have of exercising any control for peace. Our one hope of retaining control would be to leave the Egyptian Government in constant doubt regarding the next year’s handout.

Not that even this policy is here recommended. We have already thrown away the tremendous sum of $50 billion in foreign aid since the end of the second world war. Judged by its originally declared objects, never has so much accomplished so little. It is sad to speculate on how much more we could have got for that $50 billion if we had been permitted to spend most of it at home! It “has today placed a dangerous strain both on the Afghan economy and on the nation’s morale.”

The previous history of our foreign-aid programs all over the world, in fact, raises the most serious questions about President Eisenhower’s message asking for a total of $4.9 billion new foreign-aid appropriations for the new fiscal year:

1—“We cannot now falter in our quest for peace.” We cannot. But this begs the real question at issue, which is whether our foreign-aid programs actually contribute to security and peace. We should not confuse obvious goals with dubious means. The most dangerous aspect of the foreign-aid program is that it creates the illusion we are “doing something,” and diverts attention from the real measures that need to be taken. Do we solve every problem by giving away more of the American taxpayers’ money?

2—“We must continue to stimulate expansion of trade and investment of the free world.” Is a foreign give-away program the sound way to do it?

3—“We have . . . no purpose to change their [other people’s] chosen political, economic, or cultural patterns.” Yet unless most of the governments to which we are giving handouts change from socialistic to free-enterprise policies, our help is worse than useless in bringing permanent improvements in living standards.

4—Asiatic and other nations “are striving to create the standards of living under which their economies can develop.” A worthy goal. Any American who wishes to make a voluntary contribution to it is free to do so. But what is the ethical basis for the notion that our government bureaucrats must force our taxpayers to turn over their hard-earned money to relieve foreign taxpayers and to raise foreign living standards? Why must we have a guilty conscience because we produce more than foreign nations?

5—“Military grant assistance is still necessary in most countries to assist them in maintaining equipment and replacing materiel lost by attrition. . . . Military assistance in Latin America should be continued where needed in order to provide standardized equipment,” etc. Some nations are no doubt unable to manufacture

**More about Foreign Aid**
April 9, 1956

Last week I cited here the proposed Aswan High Dam in Egypt as an embodiment of the most dubious principles involved in our foreign-aid program. A foretaste of the probable consequences of financing this program by American fiscal agencies is supplied by what has already happened to the Helmand Valley Irrigation Project in Afghanistan. The consequences of this were described by Peggy and Pierre Streit in *The New York Times Sunday Magazine* of March 18. This is the largest American-financed and constructed development in Asia. Conceived as a boon to the people of Afghanistan,
their own arms. But why must U.S. taxpayers pay for the armament of other countries? Some areas, such as Korea and Formosa, undoubtedly need our help. But most countries honestly determined to resist Communist aggression can afford to pay for their own armament. If they can’t make it themselves, they can buy it from our government, at cost.

6—The President’s message mentioned that in the last two fiscal years there has been a “reduction in unexpended balances” for foreign aid of $2.5 to $3 billion. Yet as of Jan. 1 last there was still an unexpended foreign aid balance of $9 billion. Why didn’t the President’s message mention this amount also?

7—Is it either wise, or in accordance with the spirit of our Constitution, to ask one Congress to commit its successors to any long-term foreign aid program?

Foreign Arms Aid Again
April 16, 1956

Many members of Congress are becoming increasingly skeptical about either the need or wisdom of further foreign “economic” aid. But most of them continue unhesitatingly to endorse further “military” aid. Is the difference very real?

The truth is that one kind of aid can easily act as a substitute for the other. When we relieve another nation of the need to pay for its own defense, we in effect give it just that much more funds to spend, say, on economic “welfare” schemes. Failure to recognize this substitutability of foreign aid has led to much mental confusion. “Military” aid is not in fact solely a military question. It is primarily an economic question. The chief question is not, How much defense does Ruritania need? but, Why can’t Ruritania afford to pay for its own defense? Why must that burden fall on the American taxpayer?

I present below a table showing the latest fiscal year’s armament expenditures of fifteen of our aid beneficiaries stated as a percentage of (1) their total central governmental expenditures and (2) of their gross national product. The record of these countries is compared with our own.

While such international comparisons cannot be precise, they are accurate enough to furnish much instruction. Comparing the overall dollar figures, for example, the United States alone is spending on national defense three times as much absolutely as these fifteen nations combined! (Some $39.7 billion against a total of $13.4 billion.) We are also spending much more relatively—10.2 percent of our gross national product against an average of 6.6 percent for these fifteen beneficiaries.

The United States, which is giving the defense aid, is spending some 62 percent of its total budget on defense, whereas these thirteen countries receiving aid (if we omit for the moment Formosa and Yugoslavia) are spending on the average only some 26 percent of their total central government budget on defense. This is another way of saying that while we in the United States can afford to spend only some 38 percent of our total budget on nondefense items, these thirteen beneficiaries of arms aid are spending some 74 percent of their total budgets on nondefense items.

This relationship can hardly be excused on the plea of poverty. Among the countries that are spending relatively most on defense are Greece, Turkey, and Formosa. (It is only fair to add that they are doing this partly because of our defense aid.) The outstanding exception of Yugoslavia is not reassuring. It is frankly a Communist country. We are unlikely to find it on our side when the chips are down.

Is it a good idea for us to rob our own defense, in order to pay for part of the defense of countries that are comparatively indifferent about their defense or do
not take the Communist military threat very seriously? Instead of our contributing nearly $3 billion to these countries for their defense, why wouldn’t it be a good idea simply to suggest to most of them that they transfer part of the total of $36.1 billion they now spend on non-defense items to their present modest $13.4 billion for defense?

Ruining Peter to ‘Aid’ Paul
April 23, 1956

The new farm bill is a shameless monstrosity. During debate on it the “farm bloc” itself was torn into a dozen haggling special commodity blocs. Wheat-belt congressmen voted for a two-price system for their commodity, but not for corn or cotton. Southern congressmen voted for “parity” supports that discriminated in favor of cotton. And so on around the circle, in a sordid scramble for local votes. Neither party did anything to be proud of. But one thing at least was accomplished by this spectacle. It should stand as a classic illustration to the American people of what inevitably happens when class legislation is either asked for or tolerated; of what inevitably happens whenever the principle of the free market is abandoned for government “economic planning.”

The whole notion of government-enforced “parity” prices or income for “agriculture” is a pious fraud. No doubt when it was first proposed it had a certain superficial plausibility. If “agriculture” were not kept prosperous by government subsidy, how could “industry” prosper?

The weaknesses in this idea became evident the moment a serious effort was made to apply it. Why should one section of the population alone (about one eighth of it) get guaranteed prices not granted to every other section? If farmers perform an “essential” service, so do doctors and nurses and teachers, scientists, reporters, and plumbers. Where can one draw the line?

As a matter of fact, as soon as Congress got down to cases, the costliness and impracticability of granting “parity” even to “the farmers” were seen to be so great that discrimination immediately began even as between farmers themselves. Congress decided to guarantee “parity” only for half-a-dozen “basic” commodities. How peculiar the definition of “basic” was, can be seen when we list the so-called basic commodities and the percentage of the total cash receipts from agriculture that each of these commodities represented in 1954: Cotton, 8 percent; wheat, 6.6 percent; corn, 4.6 percent; tobacco, 3.8 percent; rice, 0.8 percent; peanuts, 0.4 percent; total, 24.2 percent.

Altogether, the so-called “basic” commodities account for less than a quarter of the total direct cash receipts of the nation’s farmers. On the other hand, cash receipts from livestock and their products constituted in 1954, 55.3 percent of the total. Cattle and calves alone accounted for 16.9 percent of the total, dairy products for 13.7 percent, poultry and poultry products for 10.6 percent, and hogs for 12.1 percent. But the producers of these latter products got no advantage from the price support of the “basic” commodities. On the contrary, this price support for the “basic” commodities increased the feed costs and the price-cost squeeze on the producers of livestock and livestock products.

The biggest joke in the “basic” commodity list is peanuts. They account for only four tenths of 1 percent of total farm cash receipts, as compared with twice as much from oats or barley or potatoes, or with six times as much from soybeans. Politics are fearful and wonderful.

All price-supported commodities together, in fact, account for only 45 percent of gross farm receipts. Support for one commodity producer, as we have just seen, increases the production costs of other farm-commodity producers. The government is forced to order acreage reductions on price-supported commodities to mitigate the surpluses that supports would otherwise create. In 1955, 28 million fewer acres were planted to wheat and cotton than in 1953. But as a result 23 million more acres were planted to oats, barley, soybeans, sorghum grain, and other sorghums. So the previous producers of all these latter crops were just as much injured by this diversion as the producers of the so-called basic crops were “helped.”

These are only a few random examples of the distortions of prices, production, and income that are inevitably brought about by government controls. Farmer Peter victimized to “aid” farmer Paul.

Why Farm Aid Runs Amuck
April 30, 1956

President Eisenhower showed political courage in vetoing the hodgepodge farm bill. He made an excellent analysis of its worst provisions and contradictions. And then, by administrative action, he canceled out half of his own courage and argument.

Mr. Eisenhower correctly pointed out the four main provisions that made the bill unacceptable: “(1) The return to a wartime rigid 90 percent of parity supports for the basic commodities; (2) dual parity...
for wheat, corn, cotton, and peanuts; (3) mandatory price supports for feed grains; (4) multiple-price plans for wheat and rice.” The effect of these provisions, he pointed out, would be to “increase the amount of government control and further add to our price-depressing surpluses.”

The provision for dual parity, for example, would result in a permanent double standard of parity for determining price supports. Four crops would receive preferential treatment out of 160 products for which parity prices are figured. And the bill “would hurt livestock farmers more than it would help them—although well over half of farm income is from livestock.”

The President rightly trained his main battery on the effort to go back to rigid wartime price supports at 90 percent of parity. The bill, he pointed out, would not help solve “the real problem—the surpluses which hang over the market and push down farm prices.” On the contrary, it would “set in motion forces designed to produce more of certain crops at a time when we need less of them.” It “would encourage even more surpluses; more surpluses which we cannot use...more surpluses which build up faster than we can dispose of them...more surpluses which would further depress farm prices in the market.”

But after having made this eloquent analysis, the President himself then announced that in 1956 “we” would set price supports on five of the basic crops—wheat, corn, cotton, rice, and peanuts—at a level of at least 82½ percent of parity.” He named minimum support levels that would result in a national average of $2 a bushel for wheat and $1.50 a bushel for corn. He promised high price supports on cotton and peanuts, and increased price supports on manufacturing milk and butterfat. He has well over $400 million for that purpose, he declared.

Then he went on to ask for his soil-bank program, nevertheless, with payments that “could add up to as much as an additional $500 million” to farmers this crop year. The government is already holding the tremendous amount of $8.9 billion of unsalable farm commodities. This is in itself conclusive evidence that even the present “flexible” scales of 75 to 90 percent of “parity” is far too high. The prices announced by the President would in all probability force the surpluses still higher. Just how low price supports would have to be set now to make it possible to work off surpluses is hard to say. It is instructive to recall at this time that the Agricultural Adjustment Act of 1938 adopted price supports ranging from only 52 to 75 percent of “parity.” No one would have the courage to propose such moderate supports today. Yet even these price supports led to the accumulation of burdensome surpluses.

The proposed addition of a huge soil-bank subsidy even to prevent government price-support subsidies looks more like an election-year scheme than an economic solution. It would simply add a subsidy not to produce to the existing subsidies that encourage overproduction. Once we adopted such a soil-bank program we would probably never be able to get rid of it.

Nothing less seems likely to get us out of a hopeless farm mess today than the complete termination of the whole “parity” fraud. One step in doing this would probably have to be to give back the present farm surpluses in storage to the farmers who produced them, or to sell them back at less than it would cost farmers to produce more. The farm program today is a classic illustration of what inevitably happens when the principle of the free market is abandoned for government “economic planning.”

Keynesism Crippled by Facts
May 7, 1956

Keynesism—the philosophy of big government spending, deficit financing, and continuous inflation—today dominates the policy of nearly every government in the world. Yet developments in the last few years have destroyed its central prop.

The disciples of Keynes disagree among themselves about what the chief contribution of the master really was. Yet most of them would probably agree with his leading American disciple, Prof. Alvin H. Hansen, that “Keynes's most notable contribution...was his consumption function.” In 1936 in his famous General Theory of Employment, Interest, and Money, Keynes declared that there is a “fundamental psychological law, upon which we are entitled to depend with great confidence...that men are disposed, as a rule and on the average, to increase their consumption as their income increases, but not by as much as the increase in their income.” He went on to call this “law,” rather pretentiously, the consumption “function.” Keynes's great “discovery,” in short, was that if we knew what national income was going to be we could tell from a curve or a mathematical formula what consumption was going to be.

Of course, from time immemorial it has been a truism that most families spend most of their income. Official statistics for the last eight years, for example, show that on the average in that period Americans spent about 93 percent of their annual income on...
personal consumption and save only about 7 percent of it. So if you knew what personal disposable income were going to be next year, it would be hard to make too great a percentage error in predicting what consumption expenditures were going to be. It would be much easier, however, to make a substantial percentage error in predicting what saving was going to be, because saving is comparatively such a small figure.

I append at the bottom of this article a table showing (in billions of dollars) the nation’s disposable personal income for the last twelve years, the amount of personal savings, and saving as a percentage of disposable income. Now Keynes’s great “law” is that consumption does not increase in proportion to income, and therefore savings increase proportionately more than income increases. The events of 1955 were in themselves a crushing contradiction of this “law”. Disposable income increased by $14.6 billion, but savings fell by $1.2 billion. The total percentage of saving to disposable income fell from 7.2 to 6.3. The same thing happened between 1953 and 1954. Disposable income went up, $4.4 billion, savings down, $1.5 billion. Out of the last eleven years, in sum, Keynes’s “law” worked in four and was reversed in seven.

I may be accused of unfairness for including the enormous savings in 1944 and showing their decline in 1945, 1946, and 1947 in spite of substantial rises in disposable income in each year. It will be said that savings were heavy in 1944 and 1945 because they were war years and consumer goods were not available. Precisely. But this only underlines the fact that Keynes’s “law” is no law, and that the relationship of spending and saving does not depend solely on total income changes but on innumerable factors. Savings may depend less on what people earn today than on what they expect to earn tomorrow. Their spending this year may depend to a large extent on whether they expect the prices of the things they want to buy to be higher or lower next year. People may buy on impulse, or refrain from loss of confidence. In short, experience and statistics fail to support the main Keynesian tenet; and the Keynesian logic is a rope of sand.

You, Too, Can Forecast
May 14, 1956

In the issue of Jan. 30, Newsweek carried an amusing and instructive article on how far wrong the economic forecasters went at the end of 1954 in predicting what was going to happen in 1955. The moral was that forecasting is not a science.

This is completely true. This column, in fact, has gone farther, and has contended (see Newsweek, Jan. 9, 1956; Jan. 3, 1955; Nov. 22, 1948) that not only is economic forecasting not an exact science yet, but from the very nature of its subject can never be. Ludwig von Mises, in an excellent article in National Review of April 4 last, concisely explained why this is so. Economics, because it deals primarily with human choices, decisions, and actions, cannot be a “quantitative” science. Statistics have a limited value because they necessarily refer to the past only. Knowledge of the future can never be firmly assured by charts or curves “extrapolating” some recent trend. And it is merely of negative help to the speculator or businessman even to guess the future correctly unless his correct guess is shared only by a few. For in the economic field expectations concerning the future themselves help to determine that future.

Yet when all this has been said, all of us must forecast. For we are daily forced to act on some expectation regarding the future. Therefore, a recent carefully compiled and sensibly reasoned study of 76 pages, “Forecasting in Industry,” published by the National Industrial Conference Board, can be read with profit, as much for the negative as for the positive lessons that it has to teach.

As the study declares in a foreword: “Forecasting is a rudimentary and essential element of business. An appraisal of future prospects, whether based on study, judgment or hunch, is inherent to financial planning, appropriating capital, timing purchases, setting production and inventory levels, directing sales . . .”
in some companies the process amounts to little more measurable” and “objective,” and of “quantifying” their
tics may often be helpful, but may also be treacherous.

Take correlation. As the Conference Board’s study admits: “Good correlations occasionally result from coincidence rather than from logical cause and effect or from any direct relation between the two factors. . . . The great disadvantage of correlation analysis is the danger of relying too heavily upon the statistical method and a tendency when using it to neglect independent appraisal of future events.” But isn’t this a way of admitting that it isn’t so much statistics or mathematical formulas. These have the advantage of being “measurable” and “objective,” and of “quantifying” their conclusions. But they are full of traps for the unskilled and unwar.

An instructive case in point is the American Radiator Co. It discovered years ago that there was “a good correlation between the F.W. Dodge figures on residential building contracts awarded and sales of its plumbing products.” It found that residential contracts led its sales by about four months. But, as homes always need plumbing, it was obviously common sense, and a prior knowledge of cause and effect, that led company officials to look for this correlation. To sum up, statistics may often be helpful, but may also be treacherous. They can never take the place of shrewd judgment, good sense—and a large measure of good luck.

And now that you know all the secrets, you too can forecast. ✽

Cheap Money and Inflation
May 21, 1956

The steady shower of criticism that has beaten upon the Federal Reserve authorities since they increased prevailing discount rates to 2¾ percent in April reveals the strength and extent of the inflationary sentiment that has developed in this country. The criticism has come both from within and outside the Administration. Treasury Secretary Humphrey and Dr. Arthur Burns, the President’s chief economic adviser, were reported to be opposed to the increase. Commerce Secretary Weeks and Labor Secretary Mitchell have publicly questioned its wisdom or necessity at this time. State and city officials complain that it will raise the cost of their borrowing. Builders and other businessmen are grumbling. And of course inflationists are raising cries of alarm.

President Eisenhower, however, in two press conferences, has stoutly maintained the political independence of the Federal Reserve authorities. It is good to have this independence reaffirmed. But it is perhaps even more important to point out that the decision in favor of monetary restraint is the right one, and the only safe one at the present time.

William McChesney Martin, Jr., the chairman of the Federal Reserve Board, has made an excellent defense of this decision. “We fight inflation,” he declares, “partly because it is the forerunner of deflation. . . . If I thought inflation would create jobs and prosperity, I might be for it. But I am convinced that, apart from transitory effects, the result of inflation is destruction of jobs and prosperity.”

It is also heartening to report that two of the largest banks in New York, the Guaranty Trust Co. and the First National City Bank, have made admirable defenses of the Reserve banks’ increase in interest rates in their May letters. The Guaranty Trust points out that much has been made of the fact that the latest advance carried the prevailing discount rate to the highest level in 23 years. But what most commentators do not mention, the Guaranty Survey goes on to point out, is that the present rates, viewed in a longer perspective, “are not high but low. Not until 1930 did any Federal Reserve discount rate go below 3 percent. . . . Only by comparison with conditions during and since the depression are current rates high. . . . A rise in money rates usually indicates an increasing utilization of available credit resources and a corresponding need for restraint. Under such conditions, a refusal to follow the market would amount to positive intervention on the side of easy money, overexpansion of credit, and inflation.”

Both the Guaranty and National City letters then go on to point out the numerous indices of present-day inflation. “Excessive borrowing, pressure at bottlenecks, rising wages and prices,” declares the National City, “are all evidence that people are trying to get more out of the economic organization than it can presently produce. This is the general situation, despite the soft spots, and it is the essence of the inflationary trend.”
In fact, the Keynesian game of “cheap money forever” shows signs of playing itself out. Cheap money and inflation can work their apparent miracles only as long as creditors do not expect further inflation. As soon as they do expect it, they demand much higher interest rates to compensate for real capital losses. Higher interest rates are now worldwide. The Bank of England’s discount rate is now 5½ percent. The chief remedy required here at home is to restore confidence in the dollar.

The case for monetary restraint was summed up impressively in the President’s latest annual economic report: “Success in preventing depression depends in large part upon a willingness to avoid the excesses that can so easily develop during prosperity. . . . If credit on easy terms were available to everyone at a time when the economy is already working close to capacity, the consequence would be a scramble for limited resources and a cumulative bidding up of prices. . . . A government that sought to prolong prosperity by such devices would be taking a road that all too often has ended in disaster.”

**Built-In Inflation**
May 28, 1956

In its last annual report the U.S. Steel Corp. described what has been going on in the United States in recent years (and for that matter in nearly every country in the world) under the illuminating phrase, “institutionalized inflation.”

The U.S. Steel report began by citing what appears to be a “permanent and alarming peacetime trend of cost and price inflation.” Its employee cost per employee hour, for example, between 1940 and 1955, showed an increase averaging 8 percent a year compounded. This, and an even greater percentage rise in other costs, has forced the steel industry to raise steel prices and “thereby pass on to buyers of steel part of the underlying cost of inflation.” Prices of steel-mill products, as a result, increased 119 percent between 1940 and 1955.

**THE TWO BASIC ROOTS**

The company then went on to describe the “two basic roots” of this “inflationary tendency”: “The first one is the institution of industrywide labor unions, headed by leaders who, with power to bring about industrywide strikes, seek always to outdo each other in elevating employment costs in their respective industries. The legislative and social framework within which they function compels them to compete in elevating this basic cost.

“The other root is the government’s ‘full employment’ policy under which the money supply must be inflated fast enough to accommodate the inflating employment cost, lest that mounting cost bring about its natural result of pricing some people out of their jobs, even though only temporarily. It takes ever more dollars to cover ever-rising costs and prices if industry’s full output is to be purchased. The money supply—people’s bank deposits subject to check plus their pocket currency—was in 1955, on a per capita basis, 2.7 times what it was in 1940. This is equivalent to 6.8 percent per annum compounded.

“The abuse of labor monopoly privilege and the monetary policy that transfers to the public in higher prices the penalty of that abuse appear to be the main elements of institutionalized inflation. It would be helpful in this regard if those responsible for determining wage costs and fiscal policies were constantly aware of the inflationary potentials of their decisions.”

This is an excellent compact description of what has been happening. But it is important to be clear concerning the precise chain of cause and effect, and not to confound the two. The direct cause of inflation is always an increase in the quantity (as well as a depreciation in the quality) of money and bank credit. This is almost wholly controllable by governmental policy. At the end of 1939 our total supply of bank deposits and currency outside of banks was $64.7 billion. At the end of 1952 it was $200.4 billion; at the end of 1953, $205.7 billion; at the end of 1954, $214.8 billion; and at the end of 1955, $220.2 billion.

This is the result of governmental inflation—a combination of continuous deficit spending with artificial low-interest rates which overstimulate private as well as public borrowing. If an individual labor union, or labor generally, were to force up its wage rate level beyond the equilibrium point, the result would not be further inflation, but unemployment. Yet the government does not dare to let this natural consequence of excessive wage rates take place. It constantly finances this wage increase by deficit spending and cheap money policies. Under the Taft-Hartley and other laws it builds up industrywide unions, legally forces employers to “bargain” with these monopolies, and makes resistance to continuous wage increases practically impossible.

**POLITICAL PRESSURES**

Thus we have wage inflation financed and made possible by monetary inflation. True, our Federal Reserve authorities are now trying to effect some measure of restraint. But practically all the bipartisan political pressures in Washington—wage boosting laws, huge new spending schemes for foreign aid, roads, schools,
farm subsidies, social-security expansion, government-guaranteed mortgages, and government pressures for further strengthening of industrywide unions—are on the side of still more institutionalized inflation.

Foreign-Aid Mania
June 4, 1956

One of the most baffling developments of the last decade has been the persistence and growth in Washington of the mania for giving away billions of the American taxpayers’ money to foreign governments. The pressure for ever-greater farm aid, old-age assistance, grandiose road-building programs, home-mortgage guarantees, and a score of other such projects is not difficult to understand politically. The pressure groups who want and get this aid have votes. But foreigners don’t vote here. Why is the pressure for foreign aid in Washington so persistent?

Part of the answer, no doubt, lies in an established bureaucracy. Once a bureaucracy of hundreds or thousands of people is built up to exercise any function whatever, its tendency is to keep pushing for the continuance or expansion of that function, regardless of whether changed conditions may have made the original reasons for it no longer valid.

AID MEANS HIGH TAXES

This bureaucratic pressure is not in itself a complete answer to the puzzle. And certainly the answer is not that the amounts involved are negligible. We have already turned over to foreign governments since the end of the second world war the enormous sum of more than $50 billion. The government now wishes to spend $4.4 billion on foreign aid in the next fiscal year alone. It wishes Congress to appropriate $4.9 billion. At any time prior to the last fifteen years, this would have been thought a staggering sum. It represents four times the entire amount spent for our own national defense in the fiscal year 1939.

But perhaps it is more meaningful to make a comparison in terms of present taxes. It has been estimated that if the top progressive income-tax rate stopped at 50 percent (instead of going on to 91 percent as at present) the revenue loss would be only $1.2 billion. On various estimates, in fact, if progression above the basic rate of 20 percent were totally abolished, the annual revenue yield would be only $4.7 to $5.8 billion less than now.

But this approximates what the government is asking for foreign aid alone in the next fiscal year. In any case, anyone who is now paying a top income-tax rate of more than 22 percent can consider that the excess all goes for foreign aid. It need hardly be pointed out that if the top rate stopped at 22 percent, the result would be to give an enormous impetus at home to incentive, saving and investment, production, and jobs.

As former hopes of the benefits from foreign aid have been successively disappointed, the rationalizations for its continuance keep constantly changing. They become increasingly rhetorical and vague. We are now being told by “experts” that we are placing too much emphasis on military instead of “economic” aid; that our foreign giveaway should be given away without conditions; and that we should not try to foster free enterprise abroad or even to win friends with our aid. If such arguments are accepted, it becomes difficult to see what excuse for foreign aid remains. As National Review has put it: “A government has no right to dispose of the property of its citizens, except as their prudent, responsible steward and in their palpable interest. A government has no obligation, moral or political, to give aid to other governments.” In fact, the only foreign aid Congress is justified in giving at the expense of the American taxpayers is military aid or aid with a definite quid pro quo.

FOR PRIVATE LOANS

The blunt truth is that the only “economic” foreign aid that is likely to be beneficial either to the receiver or the giver is in the form of private trade or private loans and investments. If foreign governments could no longer get these easy handouts from our government, they would be forced to turn for capital to private sources, either at home or abroad. In that case they would be obliged to move toward free enterprise. They would have to give real assurances against socialization or expropriation. Such reforms are necessary in any case for any permanent or rapid economic development. The “underdeveloped” countries have remained underdeveloped chiefly because of their own hostility to the profit-seeking system.

Transitory Magic
June 11, 1956

The storm of criticism that has beaten upon the Federal Reserve authorities since they made a small increase in prevailing discount rates to 2¾ percent in April, and the indications that as a result those authorities are now planning to make money “easier,” raise some fundamental questions. One of them is whether constant new doses of easy money and inflation can really keep a “full employment” boom going indefinitely.
It is the present prevailing belief that they can. The most direct challenge to this popular belief from any official source has come from the chairman of the Federal Reserve Board himself, William McChesney Martin, Jr., in a statement quoted in this column of May 21: “We fight inflation partly because it is the forerunner of deflation. . . . If I thought inflation would create jobs and prosperity, I might be for it. But I am convinced that, apart from transitory effects, the result of inflation is the destruction of jobs and prosperity.”

**PRICE-WAGE RACE**

It is hard to get people to realize this today. Money and credit inflation has seemed to work its “full-employment” magic in the United States for the last fifteen years. Nevertheless, inflation can bring “full employment” only under special conditions, which are unlikely to prevail for more than a limited time.

The first of these special conditions is that prices must rise faster than wage costs in order to restore or increase profit margins. A second condition is that businessmen must be convinced that prices will continue to keep ahead of wage rates and other costs, otherwise business will not embark upon ambitious expansion plans. A third condition is that lenders, on their side, must be convinced that the inflation has come to an end. If they also believe that inflation will continue into the future, they will refuse to lend except at high rates that compensate for the expected depreciation of their money.

Whenever any one of these three major conditions ceases to exist, monetary inflation will cease to create “full employment.” Yet for these three conditions to exist, both workers and lenders must be the victims of what the economist Irving Fisher called the “money illusion.” The workers must fail to recognize that their real wage rates are going down (because prices are going up faster), and creditors must fail to recognize that they will lose real purchasing power as a result of their loans.

**THE MONEY ILLUSION**

An instructive table published in the May letter of the First National City Bank of New York showed that those who bought U.S. Savings Bonds at any time between 1935 and 1946, and held them for a ten-year period, suffered an actual loss from their investment. The interest received has not been enough to compensate for income-tax payable and the “inflation tax” levied in the form of a shrinkage in the buying power of the dollar. This condition continues. In the week ended, May 22 last, for example, wholesale commodity prices showed an average increase of more than 4 percent for the twelve-month period. This means that a businessman who lent out his money at 4 percent or less twelve months before got practically no real interest at all. When lenders come to expect any such annual rate of price increase in the future, they will insist on adding it as a “price premium” to what the rate of interest would otherwise be. That is why money rates tend to soar in the late stage of an inflation.

An inflation brings “full employment,” in short, only as long as prices are rising faster than wage or interest rates, or keeping ahead of them. As soon as wage costs start to race ahead of prices, as they now show signs of doing, then, whether or not there is more inflation, the result will inevitably be unemployment.

Inflation always brings about great strains and distortions in the economy. This is why Chairman Martin of the Federal Reserve Board is correct when he declares that the ultimate result of inflation is “destruction of jobs and prosperity.” The longer inflation is continued, the greater the correction that must ultimately be made. It is much better to permit a relatively mild adjustment now, than to force a more violent correction later.

---

**Political Farm Law**

June 18, 1956

The new farm law is primarily a political document. It will not solve our self-created farm problem. It will entangle the government more hopelessly than ever in farm controls. It will greatly increase the already heavy burden upon the taxpayer. True, the new law is better than the bill the President vetoed; but it threatens in the long run to do even more harm than the law it displaced.

Mr. Eisenhower’s own objections to the new measure when he signed it were enough to condemn it. He rightly deplored the “inflexible” requirement that the government must dispose of 5 million bales of its cotton surplus abroad at a price no higher than 25 or 26 cents a pound. This is not only much below the original government acquisition cost of 32 cents a pound or more; it is below the present domestic level of about 35 cents a pound, and below the 1956 support rate of 31 cents a pound.

**TWO-PRICE SYSTEM**

This disposal requirement threatens not only to get us into serious difficulties with other cotton-raising countries, but it means that foreign textile firms will be able to get their raw American cotton at much lower prices than our own textile firms will have to pay. This will place the American textile industry at a disadvantage both in the home and in the foreign market. If,
as is being suggested, the government subsidizes the American textile exporter, it will mean that the taxpayers must subsidize the cotton manufacturer to offset their subsidy to the cotton grower! The new bill in effect sets up a two-price system for cotton without explicitly calling it that. It does explicitly call for a two-price plan for rice.

But Mr. Eisenhower thinks that the “advantages” of the new law “outweigh its harmful provisions” because “the heart of the bill is the soil bank.” This “will check current additions to our price-depressing, market-destroying surplus stocks of farm products.” It remains to be seen whether the soil bank will in fact do this.

If the soil bank had been made a complete substitute for a price-support program something might have been said in favor of it. But it is an addition to the price-support program. Price supports, in fact, are even being raised. This means that the government will first pay the farmer a subsidy to encourage him to increase his crop production, and then pay him still another subsidy to encourage him to decrease his crop production. In addition to getting price supports for what he raises, the farmer will be paid 90 cents a bushel for the corn he doesn’t raise, 15 cents a pound for the cotton he doesn’t raise, and $1.20 a bushel for the wheat he doesn’t raise.

**CONTRADICTIONS**

The soil bank, it is estimated, will pay farmers $1,250,000,000 a year above present subsidies for taking crop acreage out of production and putting it into cover crops or trees. An additional $500 million of funds will be authorized to remove perishable farm items from the market to prevent price declines. Once more, in sum, everything is to be solved at the expense of the general taxpayer.

The soil bank does have one advantage over the previous system. Up to now, when his acreage was restricted on one crop, the farmer usually planted this acreage to other crops on which there were no restrictions. As these substitute crops were usually feed grains, the result was a stimulus to livestock production, which helped to depress the prices of cattle and hogs. But this evil could have been cured simply by removing existing price supports and acreage restrictions. The government’s accumulated surpluses could have been got rid of, with greater advantage all-around, by offering them below world market prices to the American farmer himself in proportion to his previous production, leaving it to him to dispose of them at whatever profit he could obtain.

Now that we have the so-called soil bank, it is impossible to see politically how we will ever get rid of it. The present farm-control fiasco should stand as a classic illustration of how government economic “planning” leads to ever-wider and contradictory interventions in the vain hope of correcting the evil consequences of previous intervention. ☞

---

**The Great Swindle**

June 25, 1956

We live in the Age of Inflation. It has become a fixed idea among governments that their paramount economic aim must be to maintain “full employment,” and that full employment can be maintained only by deficit financing, artificially cheap money, or direct recourse to the printing press.

Once under way, inflation sets in motion powerful special interests which demand its continuance. For it benefits some groups of the population at the expense of all the rest. Inflation is a tax—the cruelest and most wanton of all taxes. Under it, all creditors are systematically swindled.

**CYNICAL DEFENSE**

“He that would hang his dog,” says an old proverb, “gives out first that he is mad.” He that would swindle a creditor must first give him a bad name. The late Lord Keynes did this by calling him the “rentier.” He implied that the rentier was simply an idle plutocrat who lived on unearned interest at the expense of the struggling workers. In his *General Theory* (page 376) Keynes spoke of “the euthanasia of the rentier, and, consequently, the euthanasia of the cumulative oppressive power of the capitalist to exploit the scarcity-value of capital. Interest today rewards no genuine sacrifice.”

But who in the modern world are the creditors, the “rentiers”? They include, in addition to the holders of mortgages and corporate bonds, the thrifty, the small people who put their money in savings deposits or life-insurance policies, and all the owners of government bonds, who were induced to take these bonds for patriotic reasons. And who are the debtors who are being relieved of the allegedly dreadful burden of having to pay interest and repay capital in currency units of the same value as those they borrowed? They include the big corporations, the big holders of common stocks, and the speculators who have learned how and when to jump in and out and exploit the value of a depreciating currency.

I append a table compiled by Franz Pick for his forthcoming 1956 edition of *Pick’s Currency Yearbook*. This shows the depreciation of 53 currencies in the ten years from 1946 to 1955, as measured by each
government’s own cost-of-living index. This table, it will be noted, shows that the U.S. dollar, the world’s monetary pivot, shrunk 17 percent* in buying power over the past decade. The British pound sterling lost 35 percent; the French franc 66 percent. The currency units of Chile, Paraguay, Bolivia, and Korea had their purchasing power practically wiped out.

Some of the countries whose currencies suffered worst, such as Formosa and Korea, were struggling with special war or defense problems. But this was obviously not true in Chile, Paraguay, or Bolivia. The truth is that this shocking swindle by governments of their own citizens was brought about in most cases by deliberate monetary or credit inflation. And it was all done under the pious pretense that inflation is a sort of calamity visited on a country by malevolent outside forces, which the politicians and monetary managers profess to be incessantly combating.

Cut-Rate Currencies

July 2, 1956

This year more than a million Americans will travel abroad, and probably spend about $2 billion doing so. Most of them will take only dollars with them, in the form of travelers’ checks, and buy their foreign currencies in each country as they need them. In this way they will needlessly waste hundreds of millions of dollars. Most foreign currencies can be bought right here
before leaving, and at substantial reductions below the “official” parity rate.

The average American traveler either does not know that these bargains can be obtained here, or mistakenly believes that they represent a black-market transaction. He still does not realize the extent to which foreign-currency controls have been relaxed in recent years.

There are limits, of course, to what can legitimately be done. Great Britain, for example, still makes it illegal to bring more than £10 into that country. But France, Germany, Austria, Belgium, Ireland, India, and Italy impose no limit on the amount of their own currency that may be taken in by the traveler. Spain imposes the high limit of 10,000 pesetas.

POSSIBLE SAVINGS
To give an idea of some of the savings that might be effected at recent quotations, French francs at the official rate are 350 to the dollar; they can be bought here (legally) at 390 to the dollar. The official rate for Turkish lire is 2.80 to the dollar; they can be bought here ten for a dollar. At the moment of writing there is a terrific “bargain” in Bolivia’s boliviano. The official parity is 190 to the dollar; it can be bought here for 5,500 to the dollar. The foreign-exchange dealers in New York who specialize in these sales wonder why an American tourist will figure how to save a few dollars on his airplane tickets or luggage, or travel tourist-class rather than better, and then throw away $100 or $1,000 by failing to buy his foreign currencies here before he leaves.

Some banks sell foreign currencies, but such business is done in the main by foreign-currency dealers. Among the larger dealers are Perera Co., Deak & Co., William Holzman & Co., and Lionel Perera, Manfra & Brookes.

The huge discrepancy that has developed between “official” and market rates of foreign currencies is the result of foreign-exchange controls built up during and since the second world war. Foreign-exchange control is a totalitarian device. A government seizes from its own exporters part of the dollars (or other “hard” currencies) they would otherwise have earned, thus discouraging exports from that country. The government then encourages excessive imports into its own country by selling these seized foreign currencies at bargain prices. It thus creates an “unfavorable balance of trade”—and blames its own exporters and its own citizens for this result. Exchange control also enables a government to conceal from its own people the real extent of the depreciation of their currency.

THE REAL SOLUTION
A few weeks ago Dr. Ludwig Erhard, West Germany’s Minister of Economics, once more spoke out against the consequences of this system. He declared that only three currencies in Western Europe—the West German mark, the Belgian franc, and the Swiss franc—are valued correctly in terms of the U.S. dollar. The rest are priced too high and ought to be “readjusted.” As a result of false official valuations the world no longer has a true international price system or free convertibility of currencies.

Although Dr. Erhard did not go this far, the real remedy is not another official “readjustment” of currency values; it is to follow the example of Canada, and let each currency be bought and sold at its daily market value. It would thus become fully convertible. It would then be up to each government to stabilize its currency, not by imposing coercions on its own citizens, but by taking the measures necessary to maintain confidence in its currency both at home and abroad. This would mean an end to deficit financing, to cheap-money policies, and to any further resort to the printing press. This is the first necessary transitional step. Ultimately, of course, there will be no lasting stability of domestic or international currency values until the world returns to the international gold standard.

Money and Goods
July 9, 1956

Among the popular ideas which make the inflation of our era so hard to combat is the belief that the supply of money ought to be constantly increased “in order to keep pace with the increase in the supply of goods.”

This idea, on analysis, turns out to be extremely foggy. How does one equate the supply of money with the supply of goods? How can we measure, for instance, the increase in the total supply of goods and services? By tonnages? Do we add a ton of gold watches to a ton of sand?

We can measure the total supply of goods and services, it is commonly assumed, by values. But all values are expressed in terms of money. If we assume that in any period the supply of goods and services remains unchanged, while the supply of money doubles, then the money value of these goods and services may approximately double. But if we find that the total monetary value of goods and services has doubled during a given period, how can we tell (except by a priori assumption) how much of this is due to an increase of production, and how much to an increase in the money supply? And as the money price (i.e., the “value”) of
Business Tides

of goods and services has led to absence of concern in the face of a constant increase in the money supply in the last six years. From the end of 1949 to the end of 1955 the supply of bank deposits and currency increased $47 billion, or 27 percent. And since the end of 1949 average wholesale prices have increased more than 15 percent, in spite of an increase in the industrial production index of 46 percent.

Steel Strike Lessons
July 16, 1956

Once more an industrywide union has demonstrated that it can halt a great industry and cripple the nation’s economic life unless its demands are met. Once more union leaders have shown that they will not hesitate to abuse this enormous private economic power.

Was the position of the steelworkers so intolerable that their leaders had no choice? On the contrary, the steelworkers were receiving the highest pay they ever received in history. Speaking for the steel industry, Adm. Ben Moreell pointed out that the steelworker’s wages alone averaged more than $5,200 a year, and that his average hourly earnings were already 52 cents above those in all manufacturing industries.

On top of this, the steel industry offered its workers wage increases and other benefits which, it estimates, would have increased the companies’ employment costs by an average of more than 17 cents an hour in the first year and by a total of 65 cents an hour in the fifth year. According to Admiral Moreell, “the total offer was the largest single package ever advanced by the companies in the history of the steel industry.”

This offer was not only turned down cold by David J. McDonald, the $40,000-a-year president of the industrywide steel union, but treated with derision and contempt. It was “picayune.” “The titans of industry have labored,” as he so elegantly put it, “and brought forth a louse.”

EXCESSIVE POWER

Upon what meat do such union leaders feed that they have grown so arrogant and powerful? Up to the moment of writing, the Eisenhower Administration has kept “hands off” the present dispute. That is to say, it has neither threatened to seize the steel companies unless they capitulate, in emulation of Truman, nor has it sought an 80-day no-strike injunction under the Taft-Hartley Act. Yet the union leaders’ power has been in large part brought about by Federal interference under the routine operation of the Wagner-Taft-Hartley Act.
That act forces the employer to “bargain in good faith” with the representatives of a specified union no matter how unreasonable their demands. It is this law that has built up industrywide unions. Through interpretations by the National Labor Relations Board and by the courts, it even permits the strikers to use physical intimidation to prevent others from working. As the president of the steel union’s Local 1843 candidly put it: “The picket lines [around Jones & Laughlin] are being established to prevent anyone from going into the plant.”

It has been years, in fact, since the steel companies have dared make any attempt to operate in the face of a strike.

STRIKES VS. WAGES

Labor law is now what it is because of the deep-seated popular fallacy that strikes and other coercive actions by nationwide unions can raise the general level of real wages. But a successful strike by the steelworkers will further raise the price to consumers of all products made with steel. It will thus reduce the real buying power of the wages of all other workers. Further gains by the unions already most powerful and best paid can only be at the expense of the great body of workers that are paid less. A higher price for steel may cause unemployment among steel and other workers. If an attempt is made by Federal officials to counter this by further expansion of money and credit, the result will be another round of inflation. The money-wage gains will be wiped out by further rotting of the dollar.

And what of the steelworkers themselves? Suppose they do gain a further increase, but only after a prolonged strike? The Westinghouse Electric strike, which lasted 156 days and was settled in March, may serve as an illustration. At the end the workers got increases ranging from 5 to 17 cents an hour. But The Wall Street Journal calculated at the time that even if the benefits claimed add up to as much as 20 cents an hour increase, it will take Westinghouse workers 250 full-time weeks, or nearly five years, to earn back the $100 million they lost in wages. They will be then just where they would have been if there had been no increase at all and no strike.

Profits Mean Payrolls

July 23, 1956

At the time they went on strike the steelworkers were already receiving the highest wages in history. They were averaging $103.25 a week in January compared with an average of $78.55 for workers in all manufacturing industries. As compared with 1940, whereas living costs had increased 91 percent, the steelworkers’ weekly earnings had increased 230 percent. On top of this the industry offered the union the “largest single package” of wage increases and fringe benefits it had ever proposed.

Yet the union leaders disdainfully turned the offer down, preferring, instead, the disruption and risks of a strike. One of the major reasons they gave for this course was that the steel industry was making large profits.

MOVING TOGETHER

Now it is true that the bookkeeping profits of the steel industry in 1955 were comparatively high. But it by no means follows that these profits were at the expense of wages. The historical record, both in the steel industry and in industry in general, shows: (1) Total wages paid are nearly always several times total net profits. (This means that the workers collectively have an even greater material stake in the security and prosperity of the corporations than the stockholders have.) (2) Overall profits and wages do not vary inversely, but rise and fall together. In the six years from 1950 through 1955, for example, total wages paid by the steel industry were almost exactly three times as great as its profits after taxes. In 1950, when the industry’s profits were only $767,000,000, it paid total wages of $1,786,000,000. In 1955, when its profits had risen to $1,098,000,000, it paid wages of $2,665,000,000.

Even more impressive evidence of the normal correspondence of wages and profits emerges when we select a longer range of years and compare total wage payments in the U.S. with total corporate profits (both before and after taxes). This does not, of course, show the comparison of total profits with total wages, because wages are paid by partnerships and individual employers as well as by corporations. But a comparison of corporate profits with total wages nonetheless does show clearly that when profits are high wages are high, and that when profits are lowest wages are lowest. The following figures are all in billions of dollars:

<table>
<thead>
<tr>
<th>Year</th>
<th>Before taxes</th>
<th>After taxes</th>
<th>Labor income</th>
</tr>
</thead>
<tbody>
<tr>
<td>1929</td>
<td>$ 9.6</td>
<td>$ 8.3</td>
<td>$ 51.0</td>
</tr>
<tr>
<td>1931</td>
<td>- .29</td>
<td>- 1.3</td>
<td>39.6</td>
</tr>
<tr>
<td>1932</td>
<td>- 3.0</td>
<td>- 3.4</td>
<td>30.9</td>

<td>18.7</td>
<td>175.6</td>
</tr>
</tbody>
</table>
It will be noticed that in the years when industry did worst (as in 1931 and 1932, when net profits were less than zero) labor did worst. When profits were at record high levels, so were wages.

There is nothing accidental about this. Employers take on most workers and pay highest wages when the outlook for profits is most promising. And it is out of past profits that they chiefly derive the capital to make those investments in new equipment and plant that increase the total national productivity out of which wages must be paid.

**POSTWAR INFLATION**

My article in the June 25 issue, “The Great Swindle,” presented a table compiled by Franz Pick showing the depreciation of 53 currencies in the ten-year period 1946–55. As the result of a typographical error occurring in Dr. Pick’s office, unfortunately, the depreciation of the U.S. dollar was shown as only 17 percent, instead of the real figure of 27 percent. This correction only emphasizes the extent to which all American creditors, and nearly all Americans whose annual income has gone up less than 37 percent (the extent of the official cost-of-living rise in the ten-year period) have been cheated by the postwar inflation. And this inflation has not been brought about by malign outside forces, but by Federal fiscal and monetary policies.

**Communist Production**

July 30, 1956

Two articles by Harry Schwartz (in The New York Times of June 25 and 26) are disturbing both in themselves and as a symptom of a recent trend of thought in this country. The burden of the articles is this: “An economic race whose outcome could decide the fate of the world is in progress. The leaders of international Communism expect to win the contest by beating capitalism at its own game—production.” Particularly because Schwartz is usually a careful and judicious writer on Russian affairs, these articles call for critical analysis.

On close examination most of Schwartz’s statements are seen to be qualified and guarded. (The italics in the following quotations are my own.) “The Communists expect to overtake and surpass the West industrially,” etc. “It does not seem easy to raise industrial labor productivity 50 percent and collective farm productivity 100 percent in a mere five years, as the Soviet regime plans.”

Yet the articles as a whole take the Communist plans and boasts very seriously. They are illustrated with solemn charts which compare U.S. actual production last year, not merely with the U.S.S.R. 1960 goal, but even with the “possible U.S.S.R. 1965 goal.” And Schwartz’s qualifying words are faint: “That this [Communist overall production] program will make progress seem difficult to challenge. But that it will succeed in all its aspects seems open to question.” Perhaps the understatement of the year.

**PROPAGANDA FIGURES**

The net effect of the Schwartz articles, in short, is to scare the unwary Western reader into thinking that the Communists will soon surpass the free-enterprise U.S. and the whole West in overall productivity by Communist “planned” production methods.

It should be made clear that what Schwartz is discussing is not purely military production. In this respect everyone must agree that the Communists present a real menace. Conquest and war, and heavy industry expansion and similar preparations for conquest and war, have from the first been their primary and almost their sole objective. With us, military production has been only one among a very wide number of objectives.

Schwartz relies chiefly on studies of the official Soviet statistics of production. But there is no reason for supposing any of these statistics to be correct. They are published primarily for propaganda purposes. Until very recently, they consisted mainly of boasted percentages of increase, with no absolute figures that anyone could check against. When two Soviet statistics cannot be reconciled with each other, it does not in the least follow that both or all of them must be right. They may be merely a set of matching fictions.

Then there is something which never gets into these statistics—the quality of the product. Millions of shoddy or ill-fitting shoes can look just as good in the statistics as the same number of first-rate shoes that fit. Square-footage of housing constructed can mean anything from shabby and jerry-built tenements to luxury apartments.

**SOVIET REALITIES**

If we start talking not of “plans” and daydreams but of actualities, then one of the things to talk about, as compared with the marvelous actual record of American free
enterprise, would be the dismal failure of Khrushchev’s virgin lands program last year. “Excluding the Ukraine” (I quote Schwartz himself in The Times of Dec. 18 last), “...the Soviet Government apparently got at least 4 million tons less grain from Soviet farms this year than in 1954.” Next, one might consider the recent Poznan riots, desperate acts precipitated by a shortage of food. We might then examine the appalling condition of Russian housing. Finally, we might consider an article in a Polish weekly (probably printed at the risk of life) complaining, according to a New York Times report of July 15, of “mass unemployment, huge land waste, and food and housing shortage throughout Poland.”

It is a strange procedure to compare American actualities with Communist “plans,” boasts, or daydreams for the future.

Communism as Producer
August 6, 1956

Last week I commented here upon two articles by Harry Schwartz in The New York Times of June 25 and 26 which, in spite of many qualifications, left the impression that Communism had a good chance of winning the “economic race...by beating capitalism at its own game—production.” I pointed out that the articles mainly relied upon Soviet official statistics, and that there was no reason for supposing these propaganda figures to be true.

A conviction in the West that Communist “planning” and production methods can beat free enterprise in overall production would have such disastrous consequences that it calls for further scrutiny. I must again make clear that I am not talking (nor was Schwartz) of production purely for war purposes, upon which the Communist world concentrates, but of total production, including production for consumer welfare.

FOOD AND HOUSING
That the recent riots in Poland were precipitated by an actual food shortage is now admitted even by Communist officials. Thus Edward Ochab, “regarded as Moscow’s principal representative in the Polish Communist Party,” confessed on July 20 last that Poland’s Six-Year Plan not only had failed to produce enough coal and food but also had fallen short by 50 percent of its goal to raise wages. He conceded that while the Polish Bureau of Statistics reported to the Central Committee that real wages had increased 27.6 percent during the Six-Year Plan, the committee’s own investigation showed that the increase was only 13 percent. There is no good reason for trusting even this “correction.”

Yet American officialdom today seems to regard Russian statistics with respect and even awe. On Oct. 10 last, Secretary Dulles declared that U.S. production, at about $400 billion, was “three times that of the Soviet Union.” A writer in the National Review estimated that Russian production was only about half that claim. After thumbing through some old clippings, I incline to think this lower estimate much nearer the truth.

A study released by the U.S. Labor Department on July 12, 1947, estimated that the standard of living of the average American, in terms of what his weekly wages would buy, was almost 1,000 percent higher than that of the average Russian worker. A detailed comparison of food costs by the department in 1951 showed that it took the average Russian worker 769 minutes to earn enough to buy the same “food basket” as the American worker could buy with 100 minutes’ work. In The Times of Oct. 24, 1950, an article by Harry Schwartz himself pointed out that “available data suggest that the typical Soviet housing pattern is still that of one family to a room”; that “the present crowding of housing in Moscow is appreciably worse than it was in 1939”; and that in Leningrad there was “an average of about twelve persons for each apartment.”

Alfred Kohlberg recently presented strong reasons for doubting Russian statistics even on steel production. If the figures on steel production should prove to be fictitious or inflated, the whole set of Russian claims of expansion even in the heavy industries would be thrown in doubt.

COSTLY ERRORS
And yet, rushing in on the basis of unestablished and highly improbable Russian boasts, a letter writer to The Times of July 8 last (a professor of economics!) triumphantly contended that the example of Soviet Russia disproved the Mises-Hayek thesis that a centralized tyranny cannot maximize or balance production because it can neither calculate comparative costs nor know consumers’ wants. In a country like Soviet Russia, “still short of everything it needs,” the letter writer argued blandly, “errors in planning are not fatal” because a wrong investment “is at worst premature and will soon be utilized.” Yet it is, of course, precisely a country “short of everything it needs” that can least afford errors. If it builds giant power dams and steel plants by diverting labor and capital from food production, a few million citizens may starve before the “wrong investment” is “utilized.” This is precisely the
If the workers directly involved in the strike did not gain, who did? Certainly not the companies. Their earnings will be cut by six weeks’ idleness and by future increased labor costs. The idea that the companies can pass the increased labor costs—or more—along to the public, simply by raising prices, overlooks the fact that higher prices tend to reduce sales and production. In the long run higher costs of production will slow up steel industry expansion and mean less employment of steelworkers.

The buying public, and workers outside the steel industry, will lose by the strike in more than one way. Projects were held up during and shortly after the strike through lack of steel. Workers were laid off. When steel is in full supply again, the buying public will have to pay higher prices for everything using steel. The real wages of other workers will be reduced because they must pay higher prices for what they buy. But as the steelworkers’ weekly earnings of more than $100 even before the strike were already more than $20 a week higher than the average weekly earnings of all manufacturing workers, the settlement will not make for less distortion, more balance, or more overall real purchasing power in the economy. It seems likely, on the contrary, to increase strain and imbalance, and to set off a new round of wage demands.

**INFLATION RATCHET**

In fact, the outcome of the steel wage settlement must either be less employment or more inflation than otherwise. The latter is more probable than the former, at least between now and Election Day. Inflation now works on a built-in ratchet principle. Existing Federal legislation creates industrywide unions and makes it all but impossible for employers to resist demands for higher wages. Then the government follows inflationary money and credit policies to make the higher wage-costs payable. This further increases prices, leads to further wage demands, and so on.
Röpke’s thesis has so many facets and corollaries that it is difficult to summarize in any short space. He begins by pointing out that a central element in the Socialist movement of the last hundred years has been the idea of the international mission of Socialism. Yet Socialism in practice (or any other brand of collectivism-interventionism, “planning,” the Welfare State) has led to nationalism, economic isolationism, autarky—in brief, to international disintegration.

**AN AS-IF WORLD MONEY**

Röpke contrasts this international disintegration, brought about by the interventionist, collectivist, and inflationary policies followed by most governments today, with the “universalist-liberal” solution approached in the nineteenth century—and largely retained, for that matter, up to about twenty years ago. Nations did not surrender their sovereignty to some international super-state. They did not set up endless intergovernmental bodies like the United Nations, with its maze of sub-agencies, or the International Monetary Fund, or the European Payments Union, or the Schuman Plan. But they did adhere to a far more real international order, a sort of As-If World State, with an As-If World State, with an As-If World Money.

International law respected private property. The natural resources of the world were owned and developed by private persons, or by corporations in which anybody, whatever his nationality, could buy shares in the world’s stock exchanges. International trade was obstructed only by tariffs. It was not ripped into shreds by exchange control, blocked currencies, devaluations, bilateralism, import quotas, export subsidies, balance of payments deficits, and “dollar shortages.”

But the great achievement of traditional liberalism in the nineteenth century was the creation of a de facto world currency, the international gold standard. The gold standard meant that governments and central banks, in their money and credit policies, were subjected to a severe common discipline which prevented anyone from stepping out of line and upsetting international equilibrium.

**DISCIPLINE OF GOLD**

This discipline was economic rather than political. Any disobedience to the rules was promptly followed by consequences which every government found it to its own interest to avoid. Governments were continuously compelled to coordinate their money, credit, and fiscal policies in such a way that the resulting monetary unity of the world was not very different from a genuine de jure international currency system.

The politicians destroyed this system, and now treat it as utopian. But it is their proposed substitutes that are really impracticable and utopian. Professor Röpke analyzes the fallacies behind the notion of European economic “integration” through a collectivist super-state. He shows how advocacy of this utopian ideal has drawn attention away from the first real step in any reform, which is a return to free convertibility of currencies. This presupposes the abolition of exchange control. He dissects the failure of the International Monetary Fund, and particularly of the European Payments Union, which compels its creditor members (and ultimately the American taxpayer) to subsidize the monetary and fiscal follies of the debtor countries, and which sets up, at best, a closed currency block discriminating particularly against the dollar area. He points to the arbitrariness and tensions inherent in the Schuman plan.

Röpke proves, in short, that collectivist planning on the national scale must find its counterpart in national autarky, and that real international economic cooperation is possible only with free markets, free competition, and a freely working price mechanism.

---

**Invitation to Seizure**

**August 27, 1956**

How did the West manage to get itself into the position where it can be blackmailed or robbed by any petty pirate, and hardly dares defend its own property or treaty rights?

It was not always so. Compared with our own era of war and constant dread of war, the nineteenth century (or from 1815 to 1914) was an era of international peace, disturbed, apart from our Civil War, only by a few short conflicts. There was no United Nations, but there was real respect for international law. And one of the cornerstones of international law was the acknowledged right of each country to protect the lives, liberties, and property of its citizens, wherever they were. If any little despot or robber chief defied the treaty rights of, say, Great Britain or the United States, an ultimatum went out, or the Marines landed. Such action is now in disrepute, but no effective substitute has been found. It protected citizens in the peaceful possession of their property abroad as well as at home.

**MEXICO AND IRAN**

This state of affairs began to disintegrate during the first world war. Even in the interwar period the great powers rashly set precedents which undermined the foreign property rights of their own citizens. When on March 18, 1938, President Cardenas of Mexico seized the British and American oil properties there, Mexican
If investors in foreign countries have no assurance against expropriation, then private investment abroad will cease. The worst sufferers, in the long run, must be the very “underdeveloped” countries that insist on the right of arbitrary seizure.

Democratic Claptrap
September 3, 1956

Is the Democratic platform really meant to be taken seriously? It is shrill, intemperate, long-winded, repetitious; a compound of abuse, half-truths, untruths, and glaring self-contradictions. It is a bid to buy the votes of every conceivable pressure group. It promises utter recklessness in spending the taxpayers’ money. If its framers had deliberately tried to write a parody of a political platform they could hardly have done better.

The greatest danger of a Stevenson victory is not that he might repudiate his platform’s pledges, but that he might try to keep them.

Nothing is too bad for the platform framers to say about the Republican Administration. It seems that practically every measure it took has already proved “disastrous.” The Democrats alone, one gathers, know how to conduct foreign affairs. They alone “wrote humanity upon the statute books.” Republicans represent only “special privilege”—“government by the few, and for the few.” It is startling to discover in fact, that the American people “are now ruled by a government which they did not elect and to which they have not given their consent.” Who cast the 34 million votes for President Eisenhower becomes a baffling mystery.

Prosperity ‘MYTH’

It appears, also, that our present prosperity is no prosperity at all, but just another Republican myth. Our national income is at the highest figure on record. But one learns from the Democratic platform that the Republican Administration has “crippled and stunted” our economic growth. Wages are not only at the highest average level on record, but have raced far ahead of living costs. Yet we are informed by the Democratic platform that “wages lag.” And for some inscrutable reason (a will to political suicide?) there is a “Republican crusade against full prosperity.”

At any rate, present prosperity can’t compete with Democratic promises. Instead of the present picayune but record annual rate of $408 billion of gross national product, the Democratic platform promises “a $500 billion national economy in real terms”; an “increase of 20 percent or better in the average standard of living,” and
an even bigger increase, through “special emphasis,” to families now making less than $2,000 a year. The platform promises. But space forbids even the barest list of its promises.

The platform is riddled with self-contradictions. It pledges “a truly balanced Federal budget.” How? By promising increased expenditures in a hundred directions to benefit every imaginable group. The platform repeatedly denounces the Republicans for “false economy” on national defense and for “political considerations of budget balancing.” All this would imply a huge increase in taxes to pay the higher expenditures. Instead, the platform promises “tax relief”—in particular by increasing the personal tax exemption of $600 “to a minimum of at least $800.” This alone would mean a loss of $4.5 billion in tax revenues.

MORE CONTRADICTIONS
But balancing the budget by simultaneously boosting expenditures and slashing taxes is no trick at all for the Democratic platform makers. They pledge themselves to “expand world trade” and “to support vigorously the Hull reciprocal-trade program.” And they propose to do this by preventing “serious economic injury” to anybody by any tariff cut and by continuing quotas on agricultural imports. They endorse the Marshall Plan and more economic assistance both to Israel and the Arab States. But they also tell us that “the time has come for a realistic reappraisal of the American foreign-aid program.” So every man must decide for himself whether the platform is for more foreign aid or for less.

The platform endorses states’ rights. But it insists that the Taft-Hartley Act must be repealed because it permits state “right to work” laws. The platform denounces corporate monopolies but is completely silent about industrywide labor monopolies. It deplores the fact that “American farmers have gone deeper and deeper into debt.” It proposes to cure this by providing “an increased reservoir of farm credit”—in other words, by encouraging them to get deeper into debt. And so on and on.

As for the Republican platform—but that is another column.

GOP Double-Think
September 10, 1956

Last week I remarked in this place that the Democratic platform was intemperate, repetitious, full of half-truths, untruths, and self-contradictions. By comparison, at least, the Republican platform has several merits. It is just as repetitious; it is also full of half-truths and misleading implications; but its tone is much more temperate, its program is less fantastic, and it pays at least lip service to the ideal of limited Federal intervention and limited governmental power:

“We hold that the major world issue today is whether government shall be the servant or the master of men. . . . We hold that the strict division of powers and the primary responsibility of state and local governments must be maintained, and that the centralization of powers in the national government leads to expansion of the mastery of our lives. . . . We are unalterably opposed to unwarranted growth of centralized Federal power.”

But when the platform gets down to details, these words are as if they had never been written. The main record of the Eisenhower Administration, and even most of the present Republican boasts and promises, run directly counter to them.

SELF-CONTRADICTIONS
“We pledge . . . further reductions in government spending. . . .” This is followed by promises of continued or increased spending in uncountable directions. The foreign giveaway program is to be continued. “Small business” is to get loans too unsound for private lenders or investors to make with their own money. More Federal funds are to be spent on more local schools, more subsidized local housing, expanded social security, health reinsurance, flood insurance, more aid to veterans, a grandiose public-roads system. Farmers, in addition to their previous price supports, are to get “soil bank” subsidies, crop insurance, drought and flood insurance, “supplemental credit.” Whenever “producers of perishable farm products” produce “temporary market surpluses,” the government is to buy up the surplus with the taxpayers’ money and give it away. This promise, for some strange reason, is not extended to dealers stuck with a surplus of last year’s automobiles or television sets or perishable novels. For further farm relief, the Republicans promise to “expand” the school-milk and school-lunch program. All of this is obviously inconsistent with protestations of unalterable opposition to “unwarranted growth of centralized Federal power.”

It is obviously also incompatible with the announced fiscal aims of the Eisenhower Administration. You cannot reduce government spending while you increase it. You cannot at the same time have more spending, “further reductions in taxes,” and “continued balancing of the budget.” The Republican platform even pledges, in the face of this program, “gradual reduction of the national debt.” Under President Eisenhower, in fact, the national debt has risen by $7.7 billion—not to mention.
what has happened to the government’s contingent liabilities.

CONTINUED INFLATION

Nor is the fiscal record or program consistent with the platform’s announced aim “to maintain the purchasing power of a sound dollar.” The Eisenhower Administration, until recently, has been favored with good luck in this respect. But wholesale prices are now 3 percent higher than a year ago, while the consumer price index has hit its highest level on record. Behind this lies a steady expansion in the supply of money. The nation’s bank deposits and currency increased an average of $6.9 billion a year in the last four Truman years—and an average of $6.9 billion a year in the first three Eisenhower years!

Mr. Eisenhower has come sincerely to believe that the maintenance of “full employment” is primarily a Federal responsibility, that the way to achieve this goal has been discovered, and that it consists mainly in imitating and expanding most of the inflationary welfare-state policies of the New and Fair Deals. But this presents a grave dilemma to those voters who are convinced that the real future of America lies in the preservation of individual initiative, self-reliance, and freedom, and who watch with growing concern what Mr. Eisenhower himself has called “the growth of a swollen, bureaucratic, monster government in Washington.”

‘People’s Capitalism’

September 17, 1956

The Voice of America has recently been pointing out that capitalism in the United States today is a “people’s capitalism.” Even in the special sense that millions of Americans now share in the direct ownership of industry, and many more millions in its indirect ownership, the phrase is amply justified.

The major facts were summarized in Newsweek, July 30. This country now has some 10 million direct share owners in business. Nearly 70 million Americans hold savings accounts and 115 million, life-insurance policies.

The new campaign of the U.S. Information Agency, judging from the angry reaction it has provoked from Soviet sources, must be effective. A “people’s capitalism” takes over their own favorite adjective (without falling into the childish tautology of a “people’s democracy”), and boldly defends what the Communists have always vilified as their real archenemy, capitalism.

VARGA’S ARGUMENTS

The Soviet leaders have now called on their top economist, Eugene Varga, to step in and lead the fight against American capitalism. This year he has written two articles in a weekly journal called the New Times, published in ten different languages. As these articles total more than 5,000 words, it is impossible here to deal in detail with his tortured statistics and arguments. Insofar as his arguments are capable of any summary, they reduce themselves to two: (1) It isn’t true that ownership of American industry is widely spread. (2) But if it is true, what of it?

In the first part of this argument he collides hopelessly with solid facts. In the second part he trips over his own contradictions. It is particularly unwise of him to argue that: “[Private American stock] ownership is of course illusory; the workers have absolutely no influence on the operation of the corporation as a whole or of its individual plants, including those at which they themselves are employed.” Such an argument is dangerously likely to call the Russian workers’ attention to the completely illusory character of their own supposed “people’s” ownership of the factories in which they work, and to the lack of influence they exercise, as workers or individuals, on the overall Soviet production plan or on the conditions of their own employment.

“But even if a worker does own some shares,” continues Varga, “can he be considered a capitalist? Of course not. Dividends are a negligible quantity in the budget of any worker, however highly paid.” In fact, he might have continued, dividends are not only a small percentage of the workers’ income, but of the whole nation’s income—precisely because wages bulk so large. Out of total U.S. personal income of $306 billion in 1955, only $11 billion was in the form of dividends, while $217 billion came in the form of wages and salaries.

It is at this point especially that Varga gets snarled in his own Marxian dialectics. He considers it outrageous that the salaries of half a dozen U.S. corporation executives should range from $213,000 to $686,000 a year. But as an undeviating Marxist he would have to argue that even so these executives must be underpaid, because they are after all hired hands, and the corporation owners must be withholding for their own profit the “surplus value” that the salaried officials produce. And as Varga does in fact insist on the long-discredited Marxist fallacy of “surplus value,” he should never forget that his logic compels him to regard a television star getting $500,000 a year as being “exploited,” and the owner of a barbershop with one hired assistant as being an “exploiter.”
MAXIMIZING INCENTIVE
But wholly apart from the preposterousness of Marxist theory, I hope the Voice of America will extend its argument to show not merely that present-day American capitalism is a “people’s capitalism,” but that all capitalism (in the sense of a really free, competitive private enterprise society) has always been a “people’s capitalism.” It tends to give to labor what labor creates, to capitalists what capital creates, and to entrepreneurs what their coordinating function creates. And by doing so it maximizes the incentives to production and increases individual freedom as it multiplies the total wealth to be shared. ⚫

How High Is 3 Percent?
September 24, 1956

The extent of the national pressure for continued inflation was demonstrated by the reaction in political, business, labor, academic, and journalistic circles to the general rise of the discount rate of the Federal Reserve Banks to 3 percent. The most vociferous reaction was that of Democratic orators, already expressed in the Democratic platform, that this “hard-money policy” was just part of “the Republican crusade against full prosperity for all.”

But this time there were new objections. (1) The higher money rates were not only denounced, as on previous occasions, as “deflationary”; they were also criticized (often by the same people) as (2) ineffective, and (3) actually inflationary.

While even the first and second objections are of course incompatible with each other, either could be justified in principle, depending on the real state of the facts. If a 3 percent discount should prove in itself high enough to lead to an actual contraction of the total volume of bank credit outstanding, it would be deflationary. If such a rate were at least high enough to halt any further expansion in bank credit, it would halt inflation. This, in fact, is precisely the usual purpose in raising the discount rate. If a 3 percent discount rate does not prove high enough to discourage further expansion of bank borrowing, it will of course be ineffective.

HIGH ENOUGH?
At the moment it does not seem probable that a 3 percent discount rate will in itself prove sufficient to halt the present inflation. True, it is the highest rate since 1933; but prior to 1930, 3 percent was the lowest discount rate. The rate went as high as 7 percent in the boom of 1920 and to 6 percent in 1929.

Two current fallacies, however, must be rejected. One is the idea, put forward by a prominent Wall Street house, that: “High taxes make interest rates relatively unimportant to businessmen. The government pays a little more than half the interest charge, so that a 6 percent rate really costs the businessman only 3 percent,” etc. It is not true that the government “pays” half the interest charge, as any businessman whose project does not yield a net profit soon discovers. The government merely permits a corporation to deduct full interest payments before seizing 52 percent of what the company has left as net profit. Higher money rates will still discourage marginal borrowers.

A much more dangerous fallacy is the belief that higher money rates are actually inflationary. One of the country’s leading newspapers, in its news story on the Aug. 24 discount rise, “reported” matter-of-factly: “It will take time for today’s action to be reflected in retail prices. . . . However, the high cost of working capital . . . is bound to be reflected, even if slightly, in the ultimate prices paid by the consumer.”

A DANGEROUS FALLACY
This contention that a rise in short-term interest rates is actually inflationary is disquietingly familiar. I remember encountering it three years ago in an interview with the head of the central bank of a leading European country that had already been, and has since been, ravaged by inflation. The fallacy (1) greatly overestimates the percentage that interest payments on bank loans constitute of the average business firm’s total production costs; (2) falsely assumes that a rise in such costs can be passed along to consumers in higher prices, regardless of what happens to consumers’ monetary purchasing power or willingness to buy; and (3) most importantly, overlooks the fact that higher interest rates themselves reduce the volume of business borrowing compared with what it would otherwise be. They therefore tend to halt the expansion of money-and-credit supply, and consequently to halt the rise of commodity prices.

The present rationalizations of cheap money are another symptom of how deep-seated inflationary sentiment has become. They also illustrate the theme, so well developed in the August Survey of the Guaranty Trust Co. of New York, of how the growth of the doctrine that government must assume “social responsibility” for maintaining continuous “full employment” has in fact led to the growth of fiscal and monetary irresponsibility. ⚫
A Free Man’s Library
October 1, 1956

In The Road to Serfdom, published in 1944, Friedrich A. Hayek made an analysis, profound and prophetic, of the drift toward a statist or totalitarian ideology even in the Western world. “Although,” he wrote, “we had been warned by some of the greatest political thinkers of the nineteenth century, by de Tocqueville and Lord Acton, that socialism means slavery, we have steadily moved in the direction of socialism. . . . We are rapidly abandoning not the views merely of Cobden and Bright, of Adam Smith and Hume, or even of Locke and Milton, but one of the salient characteristics of Western civilization as it has grown from the foundations laid by Christianity and the Greeks and Romans. Not merely nineteenth- and eighteenth-century liberalism, but the basic individualism inherited by us from Erasmus and Montaigne, from Cicero and Tacitus, Pericles and Thucydides, is progressively relinquished.”

SPREAD OF SOCIALISM
Since that book appeared the totalitarian regimes in Germany and Italy, and even in the Argentine, have been overthrown. But the totalitarian regime in Russia has enormously increased its dominion and power. The newly “liberated” countries of China, India (and generally in the Near East, Far East, and Africa) are ruled either by socialists or outright Communists. In Europe and in America the socialist ideology has on net balance gained. It is true that the Labour Party is out of power in Britain and that a Republican regime now rules in Washington. But the Conservatives in Britain have not dared to repeal most of Labour’s socialist and welfare-state planning, while here the Eisenhower Administration has not only retained but expanded most of the New Deal measures.

Now this drift of mass opinion is not the result, as it is the fashion to think, of new knowledge or great new discoveries in the realm of economics or politics. It is a revival of immemorial fallacies, a turning back of the clock to the mercantilistic theories refuted by Adam Smith, to the inflation and price-fixing of the France of 1789, or toward the totalitarian socialism of the Incas. This drift of opinion has come, in brief, because most of the so-called leaders of thought in the world today have not the remotest idea of the richness and range of the literature of freedom.

In an effort to bring this literature together, and to guide readers through this great treasury of thought and knowledge, I recently published a bibliography called The Free Man’s Library (Van Nostrand). I ended up with a collection of more than 550 books, devoting to each from half a dozen lines to a page of description, synopsis, or comment. But because the prospect of reading or even choosing among 550 books may be discouraging or bewildering, I gave in an introduction, and present in a modified form here, a list of the “ten best” classics on freedom, another list of the “ten best” contemporary works, and a suggested “introductory reading course.”

THE ANTIDOTE
In chronological order the list of “classics” is: Milton’s Areopagitica; Locke’s Second Treatise on Government; Hume’s Essays Moral, Political, and Literary; Adam Smith’s Wealth of Nations; selections from Edmund Burke; Bastiat’s Economic Sophisms; de Tocqueville’s Democracy in America; Mill’s essay “On Liberty”; Herbert Spencer’s The Man vs. the State; and Lord Acton’s Essays on Freedom and Power.

The “ten best” contemporary works in alphabetical order, are: B.M Anderson’s Economics and the Public Welfare; Max Eastman’s Reflections on the Failure of Socialism; Hayek’s The Road to Serfdom, and, in addition, a book edited by him, Capitalism and the Historians; John Jewkes’s Ordeal by Planning; Ludwig von Mises’s Socialism: An Analysis and his Human Action; George Orwell’s Nineteen Eighty-Four; Lionel Robbins’s The Great Depression; and Wilhelm Röpke’s The Social Crisis of Our Time.

A good “introductory reading course” would be: Hayek’s Road to Serfdom; Mill’s essay “On Liberty”; Max Eastman’s Reflections on the Failure of Socialism, and, to cap it Mises’s Socialism: An Analysis.

Policies and Votes
October 8, 1956

In 1954, the Maine elections forecast the Democratic Congressional victory that followed. This year the Maine elections seem to forecast an even greater Democratic Congressional victory. They even throw doubt on the previous complacent assumption that “Ike is a shoo-in.”

Republican excuses are not convincing. President Eisenhower declared at a press conference that he did not regard the Maine results as marking a trend: “Maine had a very popular governor . . . and his majority was such that he helped every other person on the ticket.” But by the same reasoning the popularity of the President did not help the Republicans running for Congress.
1956

Mr. Eisenhower's chosen advisers, in fact, give no sign that they understand the real lesson of the Maine elections, any more than they seem to have understood the real lesson of the Congressional defeat of 1954 or the Dewey defeat of 1948. Writing in Newsweek of Nov. 1, 1954, just prior to the Congressional elections of that year, I offered an interpretation of the probable result that may apply with even greater force today:

“It is this so-called middle-of-the-roadism, this semi-New Dealism, which will probably be the main cause of a Republican Congressional defeat if it occurs. It is amazing that President Eisenhower should exactly duplicate the incredible error that caused Governor Dewey to snatch defeat out of the very jaws of victory in 1948. Like Dewey, he has ignored the traditional Republican philosophy in order to go after the votes of the supposed moderate New Dealers—the so-called middle-of-the-roaders of both parties. Like Dewey, he has taken for granted the votes of the orthodox Republicans on the assumption that they cannot vote for New Deal Democrats and therefore ‘have nowhere else to go.’ But Republican conservatives proved in 1948—as they seem only too likely to prove again in 1954—that they do have a place to go. That place is anywhere but to the polls. They can stay home, play golf, or take a walk.

“This is precisely and demonstrably what they did in 1948. Only 49 million voters bothered to vote for a President in that year compared with 61 million in 1952. Mr. Truman won by default. He got the votes of only about 25 percent of the total eligible electorate. Mr. Eisenhower’s real problem today, like Dewey’s unrecognized problem in 1948, is not that the American public is hot for a return to Trumanism and New Dealism; the real problem is the indifference and apathy of conservative Republicans.”

In the two years since the 1954 elections the Administration’s policies have swung more and more to the left. Even Adlai Stevenson, in accepting the Democratic nomination, admitted that: “After twenty years of incessant damnation of the New Deal [the Republicans] not only haven’t repealed it, but they have swallowed it, or at least most of it. . . . They have caught up with the New Deal at last.”

Mr. Eisenhower, in fact, seems to have been following the theory attributed to Sherman Adams—that if Republicans take over the New Deal they will take over former Democratic voters with it. The record to date suggests that such tactics tend only to alienate traditional Republicans without winning over New Deal Democrats, who put more trust in the originators of the program than in its imitators. Mr. Eisenhower’s popularity is personal, and in large part unrelated to his policies. For some it exists in spite of his policies. The slogan of his promoters has always been, significantly, “I like Ike,” not “I like Ike’s policies.”

NO COATTAILS

Other Republican candidates, it has been shown, cannot ride in on Ike’s coattails. There are no coattails on the Eisenhower jacket. It is not more energetic political campaigning that can save the Republicans from a Congressional defeat, but a highly improbable return before election to their traditional Republican philosophy.

The President’s advisers may think that Administration New Dealism is depriving the Democrats of issues, but its more important effect is to deprive the Republicans of zeal: Some of Stevenson’s recent demagogic and irresponsible proposals, however, may yet frighten enough voters back into the Eisenhower camp. #

Why Anti-Capitalism?

October 15, 1956

The supreme paradox of the present age is this. Capitalism—particularly in America, where it has reached its highest development—has brought to mankind the greatest liberty, the greatest security against violence, despotism, and expropriation, the greatest abundance, that it has ever known. To the common man it has brought the benefits of mass production and mass consumption, and amenities that, a century ago, were not even within the reach of kings. Yet this very capitalism is in our age daily denounced by the ruling clique in at least half the nations of the globe. More than half the world’s population has been taught to regard capitalism as the worst of all social evils. And within the “capitalistic” countries themselves, most of the “intellectuals” look upon a genuinely free capitalism with distrust. They never tire of satirizing and ridiculing either the system itself or the businessmen who are most successful under it. They advocate “reforms” ranging from more government intervention or “planning” at one end to outright Socialism or Communism at the other.

THE PARADOX

Why? Why, at the very moment when capitalism has brought the greatest material and scientific progress known to history should it be meeting with its greatest disparagement and opposition? This is the question Prof. Ludwig von Mises has set himself to answer in
those men prosper who have succeeded in filling the 

wants of the people in the best possible and cheapest 

way.”

Lesson from England

October 22, 1956

It would profit us as a nation (including especially the 

Republican leaders) to study recent economic poli-

cies and political results in Britain. When the British 

Labor Party came into power in 1945, it launched upon 

a policy of Socialism, “planning,” inflation, and “full 

employment.” England stumbled from crisis to crisis. 
The Conservatives were voted back in 1951. They held 
on in the new elections of May 1955. But those vot-
ers who thought the Conservatives would dismantle 
the Socialism and halt the inflation of the Laborites 
were disappointed. The Conservatives did arrest the 

further progress of Socialism, dropped some price-fix-
ing, freed a few markets, and allowed interest rates to 
go up enough to slow down the inflation. And then 
the new regime lost its nerve. It lacked the conviction 
and the courage even to attempt to denationalize the 
coal mines, the railroads, gas and electricity, telephone 
and telegraph service, or the Bank of England. It kept 
all the welfare state schemes. It still keeps rent control. 
And it hangs on like grim death to exchange control.

FULL EMPLOYMENT

An illustration of the controllist ideology that now 
governs even the Conservative Party was given by the 
speech of Harold Macmillan, Britain’s Chancellor 
of the Exchequer, at a meeting of the International 
Monetary Fund on Sept. 26. The Chancellor pays lip 
service to the need of each member country “to follow 
sound internal policies.” But, he continues: “We must 
remember that governments today are pledged, and 
rightly pledged, to policies of full employment and a 
high level of economic activity. They cannot, there-
fore, push their fiscal and monetary policies to the point of 
outright deflation.” Translated into more candid terms, 
this means that governments today dare not halt their 
inflationary policies if such a halt threatens to bring 
even some temporary unemployment.

In the last twenty years, governments have 
demanded more and more direct controls over their 
national economies to try to suppress the undesirable 
results of their own inflationary “full employment” 
policies.

Chancellor Macmillan admits that he has already 
been driven “to supplement general monetary and fiscal
Democrats will control Congress by an even more decisive margin than they do today.

This outlook could of course be changed between now and Election Day by some major blunder on either side or some other unexpected event. I present it not as my own, but as a composite forecast. My chief purpose here is to discuss the consequences of such an outcome.

These consequences would depend heavily not only on the election result itself, but on the dominant interpretation of that result. If it is the same interpretation as the one that has prevailed among New Dealers and among those advisers who seem until now to have most influenced Mr. Eisenhower, then it will be concluded that the Republicans were denied the control of Congress because they refused sufficiently to divest themselves of their traditional “ultraconservative,” “right wing,” or “reactionary” opinions, and that Mr. Eisenhower had been re-elected because he had moved sufficiently to the left to get into the middle of the road.

UNLEARNED LESSON
It is as likely as not that this will in fact be the prevailing interpretation. The Republicans have so far failed to learn the lesson of the Dewey defeat of 1948 or their Congressional defeat in 1954. The first part of this lesson is that you cannot win with a me-too policy. You cannot defeat the original New Dealers with Johnny-come-lately New Dealers. New Deal addicts prefer the stuff straight, not diluted with soda water. Mr. Eisenhower seems likely to survive by his sheer personal popularity. But his charm and amiability are personal and nontransferable, and most Republicans will probably find themselves under a heavy handicap.

The second part of the lesson is that wherever a Republican Administration does have the courage to substitute a more conservative policy for a New Deal policy, it must explain and defend its course at least as vigorously and tirelessly as its opponents attack it. And it must do this as it goes along. It cannot afford to leave the defense to a few speeches just before election.

It is possible, of course, that the Republicans who survive this time will see at last that their only hope is to rebuild a coherent conservative philosophy and record to stand on in the next election.

ECONOMIC OUTLOOK
But if the election result is the one that seems at the moment most probable—Mr. Eisenhower with a Democratic Congress—the immediate outlook for a conservative or responsible economic and monetary policy is not bright. It should hardly be necessary to point out again at this late date that the bulk of Mr. Eisenhower’s foreign and domestic policies are essentially continuations and extensions of New Deal policies.
We need merely take, as typical examples, farm subsi-
dies, the compulsory minimum wage law, social secu-
rity, and inflation. The Republican Administration, like
the Democrats, believes in farm price supports—only
not quite as high. It believes, like the Democrats, in a
Federal minimum wage—only not quite as high. It
believes, like the Democrats, in expanding social-secu-
rity benefits—only not quite as recklessly. It believes,
like the Democrats, in inflation—only not quite as
much. Almost nowhere is there any difference in prin-
ciple, only in degree.

It is this situation that now causes so much soul-
searching among conservative Republicans, and so
much apathy on the part of the great body of voters.
Whichever of the two major party candidates they vote
for, the subsequent policy will probably be more govern-
mental control over our lives, more intervention, spend-
ing, and inflation. But even differences of degree are
important, and in the matter of inflation, very impor-
tant. That is why most conservatives will end by voting
for Mr. Eisenhower, but with less enthusiasm than four
years ago.

Party of Inflation

November 5, 1956

“Americans are on a luxury-craving and luxury-buying
binge unsurpassed perhaps by any other period in U.S.
history.” So concludes The Wall Street Journal, in a story
supported by some startling examples. Sales are soar-
ing of more expensive clothing, furniture, foods, liquor,
foreign tours, jewelry, furs, Cadillacs.

Some of the reasons are obvious: The highest
employment, weekly wages, and national income on
record. Personal income has been running at an annual
rate of $325 billion, compared with $306 billion in 1955
and only $227 billion as recently as 1950. But this is not
the whole story. Americans in nearly all income brack-
ets are on a huge spending binge, not merely because
of their present prosperity, but because they assume
that their current high incomes will continue or even
increase. People do not mind paying high prices for
luxuries this year, if they believe prices may be even
higher next year. Now the Democratic candidate for
President has been telling his audiences that they are
“deeper in debt” than ever before. As a statement of fact
this is correct. Installment debt outstanding in July of
this year was $29.1 billion, compared with $18.7 bil-
lion at the end of 1952, and $6.7 billion at the end of
1947. Total consumer debt shows similar comparisons.
And mortgage debt outstanding on one- to four-family
nonfarm houses at the end of last June totaled $94.2
billion compared with $58.5 billion at the end of 1952,
and with only $18.6 billion at the end of 1945.

WHY ‘DEEPER IN DEBT’?

But the implication of Stevenson’s “You’re deeper in
debt” is the exact opposite of what he supposes it to be.
People are borrowing more (and getting more credit)
precisely because they are so prosperous and so confi-
dent about the future.

In Newsweek of May 7, I called attention to the late
Lord Keynes’s belief that there is a “fundamental psy-
chological law, upon which we are entitled to depend
with great confidence . . . that men are disposed, as a
rule and on the average, to increase their consump-
tion as their income increases, but not by as much as
the increase in their income.” Leading disciples regard
this “consumption function” doctrine as “Keynes’s most
notable contribution” to economics. I pointed out, by a
comparison of official statistics of national income and
savings over the preceding eleven years, that American
consumers acted in accordance with Keynes’s “funda-
mental psychological law” in only four of those years,
and actually reversed the law in seven of them.

KEYNES’S ‘LAW’

Keynes went on to contend that his “law” applied
“especially . . . where we have short periods in view,
as in the case of the so-called cyclical fluctuations
of employment.” Yet it should now be obvious that this is
especially where any such law does not meaningfully
apply, and where the very reverse is apt to apply. In a
deression, people still employed tend to contract their
consumption-spending even more than their income
has fallen, precisely because they become unsure of the
continuance of their jobs and income and suspect that
the prices of what they buy will be even lower next
month or next year. During “full employment,” on
the other hand, many people, as now, tend to increase
their spending by an even greater percentage than the
increase in their incomes, and even go heavily into debt
to buy consumption goods, because they are confident
(rightly or wrongly) of the continuance and further
rise of their incomes. They assume that the inflation-
ary boom will continue and that consumer-goods prices
will be even higher next year. They are borrowing dol-
lars that they expect to pay off in cheaper dollars.

Yet Stevenson deplores this borrowing on precisely
the wrong grounds, regards it as a symptom of depres-
sion, and recommends still more inflation (more gov-
ernment spending and tax cutting) to combat it. The
Democratic platform itself condemns Republican efforts
to curb inflation by raising the cost of borrowing as “the
first time bomb of the Republican crusade against full prosperity for all."

If the American people vote for the Democratic candidate for President they will vote for a racing inflation leading to a crackup.

The Economic Meaning
November 12, 1956

What is the meaning of the Eisenhower victory, and what, specifically, will be its consequences for American business?

It is not yet possible to answer these questions in simple or precise terms. In large part Mr. Eisenhower's reelection is an endorsement of a personality. It is significant that the chief campaign slogan this year, as in 1952, was "I like Ike," not "I like Ike's policies." In the four years since his first election, the President may have lost standing in the public mind as an administrator, but he has not lost stature as a man.

He has, indeed, even more deeply impressed the American people with his earnestness and integrity, his devotion to the national welfare, the national security, and world peace, and with his personal modesty and amiability. He has revealed in remarkable degree the Lincoln-esque quality of "malice toward none, charity for all." And this absence of malice has been especially felt by millions of voters who doubted that absence in Franklin D. Roosevelt or in Harry Truman. Mr. Eisenhower will go down in history as a magnanimous man, above personal spite or vindictiveness.

What Mandate?
Has the President been given a "mandate" by the American people? And if so, what is that mandate? This question is difficult to answer because the issues in the last campaign were so many and so mixed. We will be nearer to an answer when there has been time to analyze the make-up of the new Congress, not only as regards the exact number of Republicans and Democrats elected, but the exact division between conservatives and radicals, between advocates of centralized power and advocates of states rights, between economizers and super-spenders.

But what is at least indisputable with regard to the Presidential vote is that, insofar as the American people had a choice, they voted for conservatism as against an extension of radicalism, and for a stable dollar as against still more inflation. Stevenson and Kefauver, as the campaign wore on, made it increasingly clear that they favored more government spending and interference, more centralization of power and more socialistic measures in nearly every direction. The Democratic platform came out for income-tax cuts that alone would have reduced revenues by $4.5 billion. Such a combination of increased spending and huge tax cuts would in itself have meant more inflation. In addition, the Democratic platform had denounced the so-called "hard-money policy" as "a time bomb . . . against full prosperity." This meant that a Democratic Administration would have reinstated a cheap-money policy which could only have led at this time to a very dangerous inflation.

Against Inflation
It is true that Mr. Eisenhower in the last four years has continued and even expanded many New Deal policies. But he has also refused to continue some important New Deal policies—notably further Federal socialization of electric power. The reckless proposals of Stevenson and Kefauver forced the President in the latter part of his campaign more and more to emphasize his own comparative conservatism.

It is quite possible, therefore, that Mr. Eisenhower's policies in his new term will become more conservative. He will doubtless continue to respect the independence of the Federal Reserve Board, and will continue to view with concern any development that threatens further erosion of the value of the dollar.

This is the interpretation most likely to be put on the election results by most businessmen. If that assumption is correct, they will go ahead with their current plans. Business confidence, insofar as the election results play a part in it, should continue high in the immediate future.

But even if Mr. Eisenhower does not become more conservative than he has been in the last two years, the Republicans in the new Congress, if they wish their party and their record to be meaningful, will resist the pressures for further expansion of Federal powers, big spending, inflation, and increasing governmental control over our lives.

They've Had It
November 19, 1956

In Newsweek of July 30 and Aug. 6, I wrote two columns questioning the main assumptions of two articles by Harry Schwartz in The New York Times of June 25 and 26. The theme of these articles was that: "An economic race whose outcome could decide the fate of the world is in progress. The leaders of international
Communism expect to win the contest by beating capitalism at its own game—production."

It is of course important not to underestimate Soviet military power. But there is an equal danger of paralyzing resistance to Russian Communism by gross exaggeration of that power. Admiral Radford, chairman of the Joint Chiefs of Staff, has testified that "defense hysteria" has led to precisely such gross exaggerations.

Even Russian steel output, which gets first priority because of its military need, has not been too impressive. In a study for the National Bureau of Economic Research, published last May, G. Warren Nutter pointed out: 

"[Russian] output of steel ingots in 1913 . . . was the same as that which had been reached in the United States in 1890, 23 years earlier. In 1928, Soviet output lagged 36 years; in 1940, 35 years; and in 1954, 38 years. The recently announced Sixth Five-Year Plan would, if realized [my italics], reduce the lag behind United States steel production to nineteen years . . . [or only] four years smaller than in 1913."

‘BREAD AND LIBERTY’
When we come to overall production, including civilian, the Communist claims of "beating capitalism" become ludicrous. I pointed out in my earlier articles that there was no good reason for supposing most Soviet statistics to be trustworthy. Reasons for doubting the Communist production boasts have now become overwhelming. For a time the Soviet leaders were able to cover their failures by plundering occupied countries. We can only guess how desperate the plight of the Hungarians must have become to drive them to their heroic revolt, and to their poignant twin demands for "Bread and Liberty."

Meanwhile specific light has been thrown on production in Poland. On Oct. 16, the Warsaw newspaper Trybuna Ludu acknowledged that Communist Poland's claims to industrial improvement in the Stalin era were mostly myths. "In industrial development," this Communist Party organ admitted, "we are about ten years behind the chief European capitalist countries and about 30 to 40 years behind the United States."

GOMULKA'S PROPOSAL
Then on Oct. 20, Gomulka, Poland's Communist leader, made some jolting confessions before the Central Committee of the Polish Communist Party. The country, he said, faced a serious inflation. Collectivization of agriculture had been an expensive failure. Individual peasant farms yielded 16.7 percent more produce to the acre than collective farms, and 37.2 percent more to the acre than government-owned state farms. The failures of the collective farms, he continued, had been concealed. "The imbecility of agricultural policy . . . brought ruin to many an individual farmer."

The situation in industry was certainly no better. Productivity in the coal industry in 1955 was 12.4 percent under that of 1949, though Polish coal miners had been forced to work 93 million hours overtime. Some of the machines and installations Poland was forced to produce, he said, "[had] so far found no application in production and will not find any such application for years to come." Two million persons were working at unneeded tasks, and still there was large-scale unemployment.

When Gomulka came to housing, he pointed out that in the six-year plan since 1950 Poland had built only about 40 percent of housing needed for mere replacement. And then the bombshell "The insufficient amount of building materials could be overcome by resorting to private enterprise." (My italics.)

For the last decade Americans have been bombarded with the cliché that if they do not continue to pour their money into the "underdeveloped" countries those countries "will turn in desperation to Communism." Now we see nations that were forced into Communism trying to turn in desperation to private enterprise.

Mathematical Economics
November 26, 1956

In his fascinating four-volume anthology, *The World of Mathematics* (reviewed in *Newsweek* of Oct. 15), James R. Newman has chosen, as his two outstanding examples of the use of mathematics in economics, excerpts from the works of Cournot and Jevons. He has chosen wisely. These are the two outstanding pioneer works upon whose fundamental postulates practically all current mathematical economics is based. If these postulates are unsound, the whole towering structure of mathematical economics is built on sand.

Mathematical economics today enjoys immense academic prestige. Open at random almost any issue of, say, *The American Economic Review*, and your eye will probably fall on an unintelligible maze of algebraic symbols, differential equations, and diagrams and graphs full of crisscrossing curves. Open almost any "advanced" or even "elementary" college textbook on economics today and you will find the same thing, interspersed with contemptuous references to mere "literary" economists—i.e., economists who manage to get along without an ostentatious arsenal of x's and y's, ordinates and abscissa, big Deltas and little d's.
Two Kinds of Inflation?

December 3, 1956

It is reassuring that the President has expressed concern about inflation. Unfortunately his remarks reveal the same misunderstandings that have led to the worldwide continuance of inflation.

He falsely distinguished between “two types” of inflation. “One is just cheapened money, deficit spending . . . and printing money . . . that naturally brings rising prices because the money itself is cheaper.” This increase in money supply is the real cause of inflation.

But the President went on to describe what he thought was another type of inflation: “There are also the rising prices brought about by the efforts of all people to gain a bigger portion of the results of our great productivity. Finally you get to the point . . . where you cannot attract money, capital investment money, that will build the factories that give . . . 67 million people their jobs, because lying behind every job in America is an investment of . . . $15,000 to $17,000. That money has got to be accumulated . . . If you raise prices . . . too rapidly in one area, say the labor area, then prices go up, and finally you get to a point where you simply can’t keep things in order.” He ended by expressing confidence that there would develop “business and labor leadership that is sufficiently wise and farseeing to help solve this problem and keep it within bounds.”

Too Many Dollars

It is, of course, highly encouraging that the President recognizes the need for industry to earn enough profits to make possible more capital investment. This constantly increases productivity and hence real wages. It is equally encouraging to find him urging unions to refrain from excessive wage demands.

The truth, however, is that there is only one real type of inflation and only one direct economic cause. That cause is an increase in the supply of money and credit. It is the oversupply and the cheapening of the monetary unit that raises prices.
This is the importance not only to the interests of the United States, but to world trade, world investment, and world peace, of maintaining respect for international law, particularly as it affects the security of private property.

The situation in this respect has become richly ironic. It was Nasser himself who on Nov. 21 pledged himself “to the strict observance of all the international law which now exists,” and even called for “the expansion of international law to meet the needs of the complex modern world.” Yet the clearest possible case of breach of international law is one nation’s unilateral violation of a treaty to which that nation has itself been a signatory.

The Egyptian Government was not only a party to the Convention of 1888, it renewed its determination to uphold that convention as recently as October 1954. And that convention provided “for the benefit of all the world that the international character of the canal would be perpetuated for all time, irrespective of the expiration [in 1968] of the concession of the Universal Suez Canal Co.” Nasser couldn’t even wait for 1968. He seized the canal on July 26, only six weeks after the last British troops (partly because of American pressure) left Egyptian soil.

**CONCLUDING SEIZURES**

What was even more remarkable in all this, however, was the failure of the United States and even England clearly to denounce the arbitrary seizure of an international agency and the private property of foreigners as a violation of international law.

As pointed out in this column of Aug. 27, the American Government in the last twenty years has piled up an amazing record of condoning other governments’ expropriations of foreign-owned private property (including that held by Americans). We in effect acquiesced in the seizure of the British and American oil properties by Mexico, and of the Anglo-Iranian oil properties by Iran. But the British were also prevented from taking any firm stand against the so-called “principle of nationalization” because of their government’s own home record in nationalizing coal mines, railroads, and communications.

It has remained for a few German writers to take the clearest stand on this issue. I have already (Newsweek, Aug. 20) referred to Wilhelm Röpke’s pamphlet on Economic Order and International Law. One German writer who has been particularly active in this field has been Hermann J. Abs, at Frankfurt-am-Main, financial adviser to Chancellor Adenauer, and head of...
a new organization called the Society to Promote the Protection of Foreign Investment. Abs recognizes how vitally important it is for world peace and world recovery to restore the protection that international law, until the last quarter century, afforded to private property. He declared in Cologne on March 27:

**TO PROTECT INVESTMENT**

“Without the guaranty that invested capital will remain the investor’s property, bear interest, and be repaid in due time, it will be impossible to mobilize sufficient private capital for foreign projects. It must not be forgotten that private capital both in Europe and the United States has sufficient opportunities to work profitably at home without having to assume the additional risks regularly connected with foreign investment. . . . What is the use of international rules of law, of property-protecting clauses in Western constitutions, national laws and numerous commercial treaties . . . if they are not unreservedly observed in practice?”

Abs went on to recommend “the conclusion of an international Magna Charta, by which if possible all countries in the free world engage to respect and protect rightfully acquired foreign property and other foreigners’ rights. By this Charta, the contracting parties should submit to sanctions determined by an international arbitration court in the case of proven violations of this fundamental government. Perhaps it might be suitable for the Magna Charta to embody general basic rules concerning the fair treatment of foreign investments.”

---

**Foreign-Policy Myths**
December 17, 1956

The possible consequences of the Middle East crisis now overshadow all other economic factors. Any discussion of the American business outlook that ignored this crisis would be fatuous. As long as the crisis lasts or grows, a world oil shortage, raw-material shortage, and shipping shortage will last or grow. And so will inflationary pressures.

We got into this crisis largely because our foreign “policy” since the second world war has been a mishmash of specious slogans, fallacious economic ideas, and pseudo-idealistic assumptions with no counterpart in reality. Among the pillars of this policy have been (1) the reiteration that every step we take must be “short of war”; (2) the program of giving away money and goods to foreign governments all over the globe almost regardless of their internal or external policies; and (3) an announced determination to “act” only through the United Nations.

The consequences of these policies are becoming appallingly clear. The gratuitous announcement by the President that he could not “conceive of military force being a good solution” to the Suez problem, and of Secretary Dulles that the U.S. did “not intend to shoot our way through” the Suez Canal, assured Nasser and the Russian leaders that they could commit any aggression or barbarity without fear of reprisal.

**BLACKMAIL TO NASSER?**

The foreign-aid program has violated every sound economic principle. It has drained America of more than $50 billion of resources. Abroad it has encouraged, subsidized, and prolonged every form of socialism, neutralism, and even anti-Americanism. The huge blackmail we offered to Nasser to help him build the grandiose Aswan Dam (which Egypt needed “as much as another pyramid”) is only one example of the fantastic lengths to which our foreign giveaway program has gone.

Finally, we come to the fetish we have made of the U.N. Here we have been like children bewitched by Tennyson’s vision of “the Parliament of Man, the Federation of the world.” We have acted as if such a dream could be realized merely by setting up machinery, erecting a plate-glass building, and calling the result the “United Nations.” The adjective has become a mockery.

What is no less ironic is that British and French statesmen (who spoke of our “saber rattling” and dangerous belligerency whenever Secretary Dulles used such phrases as “massive retaliation” or “brink of war”) are, now that they are faced with realities, appalled at their success in talking us into timorous appeasement and “action only through the United Nations.” British and French statesmen at last see with crystal clearness that to refer crucial problems to the U.N. is to evade responsibility and invite paralysis. As Anthony Eden has put it: “If we renounce the use of force when law cannot command order, then we are in fact undermining the rule of law. We are leaving the world open to the lawbreakers.”

‘EVERYONE OR NO ONE’

Supplementing this, Christian Pineau, the French Minister of Foreign Affairs, in a speech before the U.N. on Nov. 22, presented a devastating history of the paralysis of the U.N. “each time there has been opposition between the Soviet Union and the West.” Contrasting the U.N.’s intervention in Egypt with its military and
moral impotence in Hungary, Pineau declared that if “the democracies alone must bow before the recommendations or the decisions” of the U.N., “the time would soon come when public opinion in those countries, would no longer agree to participation under such conditions. The U.N. must decide to impose its decisions on everyone, or resign itself to impose them on no one.” Its “very existence,” he warned, may be at stake.

Before irreparable harm has been done, let us hope that we in America will stop putting our conscience and decisions in the hands of other nations, and stop throwing away American principles and Western civilization by turning every critical problem over to the hazards of a vote by African, Asian, and Communist blocs.

Until we have steered our way out of the present world crisis, our economic outlook will remain obscure.

When Do We Stop?
December 24, 1956

Suppose a friend stood by while a thug snatched your bankroll; then urged you to negotiate a compromise with the thief, next called a policeman only to restrain you after you had seized the thief to get your money back, and finally offered to share your losses himself if you would promise to stop threatening the thief. What would you think of your friend’s friendship—or of his mental balance? Yet this is pretty close to the policy we have followed with the French and British. A devastating analysis of our foreign political blunders by Hans J. Morgenthau, director of the University of Chicago Center for Study of American Foreign Policy, recently appeared in, oddly enough, The New Republic. “When we heard spokesmen for the government,” wrote Professor Morgenthau, “propound the legal and moral platitudes which passed for foreign policy in the interwar period, we thought this was the way in which the government tried to make the stark fact of foreign policy palatable to the people . . . We were mistaken. These platitudes are the foreign policy of the United States.” He went on to point out how our “renunciation of force . . . actually increases the risk of atomic war”, and how the subordination of our national policies to the U.N. “makes it well-nigh certain that the enemies of the U.S. will make the terms of the [Middle East] settlement.”

FOREIGN AID FOREVER
Let us turn now to some of the economic consequences of this policy, particularly to the new foreign-aid offers that our government has been so freely making. Whether it was wise or necessary for the British Government to ask the U.S. to cancel $81.6 million and Canada to cancel $22.2 million of interest payments may be doubted. But as the request has been made, it would be unwise of us to refuse it. The enormously larger aid being proposed, however, raises graver problems. If we are to pay for Britain’s losses from Suez, why not those of France? Of all Western Europe? Of Israel? Even of Egypt? How and where and when do we stop?

It is reported that the Eisenhower Administration will ask for more than $4 billion additional foreign aid in the next fiscal year, and thinks “the key to future foreign-aid operations is a grant by Congress of authority to use funds flexibly and without too many strings.” It is reassuring, at least, to learn that Secretary Humphrey is skeptical about the value of another big foreign-aid program and that Senator Byrd is “opposed to any further continuation of foreign economic aid.” The more than $50 billion of aid we have granted since the end of the second world war was not only a gross waste, it actually went to subsidize and prolong harmful collectivist economic policies. There is no good reason why Congress should grant still further discretion to the executive branch in this direction. The discretion the executive branch already has on foreign aid has been used without wisdom. It is dangerous for Congress to keep delegating and abdicating more and more of its constitutional responsibilities and its control over the purse.

TO FREE THE POUND
The International Monetary Fund and the Export-Import Bank are both ill-advised institutions. Both give undue discretion to the executive branch. Both are political institutions which necessarily politicize foreign trade and investment. Now the fund has authorized Britain to draw up to $1.3 billion against it. Britain may perhaps get, in addition, a $500 million to $600 million loan from the U.S. Export-Import Bank.

And these funds are to be used to subsidize the continuance of the thoroughly unsound policies of exchange control and artificial price support for the pound sterling. The so-called “dollar shortage” is caused by exchange control (i.e., by coercive overpricing of the pound and other currencies). The alternative is not another “devaluation” of the pound. It is to let the pound go free, like the Canadian dollar, and to support it, not by the police power, but by restoring confidence in the currency through sound policies. The only sound policies, as Canada has shown, are those calculated to attract both domestic and foreign private investment. The cure for the world’s economic ills is not more statism, but a return to free enterprise.
Forecasts for 1957
December 31, 1956

The economic future depends not only on the vagaries of nature, but on what two and a half billion people are going to think and do, individually and compositely. That future can therefore never be foreseen with certainty. But every businessman and worker is forced to base his producing and spending plans on some assumption regarding the future. Among the people best qualified to assess the business outlook are those who make a business of it. I have asked a group of prominent business forecasters to give me their estimates of the probabilities for 1957 or for the next six months. Here are the results:

Martin R. Gainsbrugh, National Industrial Conference Board: Business activity is still gaining momentum as the year ends. Four types of demand have pushed gross national product into higher ground each quarter: (1) consumer upgrading as well as rebudgeting, so that modest percentage increases in outlays for soft goods and services kept total consumption expenditures rising, in the face of a 10 percent decline in what was spent for the big-tag, durable goods, (2) a sharply accelerated rate of spending for plant and equipment by private industry, (3) further growth in the outlays of state and local units of government in response to ever-mounting population pressures, and (4) expanded markets for goods and services abroad. These should again contribute to expansion in 1957, excepting possibly private business investment. Our estimates of new capital appropriations prepared for Newsweek now show signs of decline. This may mean less capital spending six or nine months hence.

‘ANOTHER BEST YEAR’
The Conference Board Economic Forum’s collective view: Gross national product for 1957 may rise about 4 percent above the 1956 figure equally divided between price and volume. Rate of growth may decline in the second half, but a new offset may be emerging: Greater Federal spending directly for defense or economic aid or indirectly through resuming rapid tax amortization of new defense facilities, particularly steel.

Leo Cherne, Research Institute of America, New York: 1957 will be another best year ever—and yet, very different from those which have gone before. The momentum of current high spending assures continued gains during the early months of the new year. But the zip of the sharp pickup, evident especially during the last quarter of the current year, will be missing. By spring and summer the boom will begin to look somewhat wobbly, hesitation more prevalent than bubbling optimism. The long succession of tight-money moves will make itself felt. Their cumulative effect will be particularly noticeable in construction, inventory policy, and consumer purchases of new cars and other durables. The one unpredictable element which may color all expectations is the developing crisis in Soviet satellite nations and any repercussions which may flow from spreading unrest or Soviet military actions.

PRICES AND BUILDING
Charles F. Roos, Econometric Institute, New York: During the past year, industrial commodity prices have generally reflected an average 5 percent increase in hourly earnings, an average 3 percent increase in productivity or output per man-hour, and ½ of 1 percent decrease in average profit on sales before income taxes. Average hourly earnings will move up about 2 percent during the first half of 1957 and productivity about 2 percent. Because of increases in excess capacity, profits on sales are likely to decrease by about ½ of 1 percent. Hence prices are apt to be about ½ of 1 percent lower.

Roy Wenzlick & Co., St. Louis: Residential building in 1957 will be slightly under 1956, both in dollars and in number of units. In many communities the housing shortage has disappeared, and in all communities money is tighter and interest rates are higher. This will probably result in more than 900,000 new dwelling units for the year, but less than 1 million. The dollar value of new residential building will not be down by so large a percentage, as the buildings that go forward will average larger in size and better in quality. Total construction of all types will probably equal the dollar total in 1956. *}
Overrule the ‘Fed’?
January 7, 1957

On Oct. 22, Elliott V. Bell, editor of *Business Week*, made a speech before the American Bankers Association which deserved and has received much attention, not because it contained anything new, but because it supported, in an unusually lucid and plausible form, increasingly popular Keynesian theories concerning who should manage our managed money, and how. These theories lead in practice to a philosophy of perpetual inflation.

Bell’s plan, in brief, is to subordinate the Federal Reserve Board to a “National Economic Council,” which would “coordinate” all monetary and “basic economic policies” of the government under the President, “who would have final responsibility for its decisions, and for resolving conflicts on basic matters.” As Prof. Walter E. Spahr has already pointed out, this proposal is substantially the same as that made by a research staff of the Committee for Economic Development in 1946. The CED group recommended that a central monetary authority under the President be created and “charged with developing and directing a unified program of fiscal, monetary, and price control action to maintain price stability and high employment.”

Spahr has also pointed out that if the proposed Economic Council is to have “the responsibility of determining the basic economic policies of the government,” even “Congress would be compelled to abstain from exercising the powers and responsibilities reposed in it under the Constitution. It would have to do what the council directed it to do. The President would become a dictator.”

**INDEPENDENCE?**

Bell declares that his plan “would preserve the independence of the Federal Reserve System.” In contradiction to this, however, he questions “whether under present-day conditions the Federal Reserve ought to be able to . . . go counter to the economic policies of the national Administration.” It is clear that the Bell plan would make the “Fed” impotent. If the Fed chairman, as member of the proposed council, wanted to raise discount rates, for example, and other members of the board (which would include the President, Secretary of the Treasury, chairman of the Council of Economic Advisers, “and other top-ranking economic policymakers”) wanted to lower discount rates, they could simply *outvote* the Fed chairman, who would have to go along with their decision. The Fed’s “independence” would become a bad joke, consisting in the freedom to be overruled.

“In no major country of the world today, except in the United States,” Bell declared, “is there a central bank that can legally, if it wishes, tell the head of its own government to go fly a kite.” Let us put aside the question whether the President is “head” of our government or merely its Chief Executive, subject to the laws of Congress and the decisions of the courts. The situation Bell describes, when you come to think of it, is precisely what the situation ought to be. His comparison is unfortunate. It reminds us of the atmosphere of perpetual monetary crisis, or of racing postwar inflation, in nearly every country today where the central bank *can’t* tell the government to go fly a kite.

**ETERNAL BOOM**

The experience of history is that, wherever the central bank is *not* independent of the government, the government is unable to resist the fatally easy course of financing its needs by borrowing from the bank. It is unable to resist the demands of pressure groups for higher wages, subsidies, price supports, and inflation. The government tries to “stabilize” the boom at its peak, and to prolong it to eternity. It turns the central bank into the central inflation factory. What keeps our own Fed relatively independent today is that its governors serve overlapping terms of fourteen years, and cannot be removed for refusing to inflate.

All proposals of the Bell type begin by asserting that “the state is responsible for maintaining the economic health of the community.” But the irony of such pious assertions of “social responsibility,” as the Guaranty Trust Co. has pointed out, is that they nearly always end by proposals for financial irresponsibility.

Still More Foreign Aid?
January 14, 1957

In asking for advance authority to commit American troops to “protect the territorial integrity and political independence” of any Middle Eastern nation against Communist “armed aggression” the President has taken an immense step forward in foreign policy. Yet Congress is still faced with an awkward problem. It is being asked to give much wider discretionary powers to a President and a Secretary of State who have ineptly used the discretionary powers they already possess.

Nasser’s seizure of the Suez Canal was a breach of a treaty and an arbitrary seizure of an international agency. We failed to denounce it as such. Instead, we restrained Britain and France and called a futile “users’” conference, whose conciliatory proposals Egypt...
We come at last to the question of foreign aid. The President wishes to continue such aid “for economic and defensive military purposes,” and will ask authorization of a special discretionary fund of $400 million for the Middle East. But how and to what effect will these funds be employed? Are we once more to urge money upon Nasser, to prop up the Egyptian economy that his own actions have done so much to disrupt? Are we to reimburse Syria for its action in blowing up the pipeline that runs across it? Or are we to recognize, at last, that the whole economic foreign-aid program is a colossal failure? Egypt will recover through restoring the Suez Canal traffic and tolls, and the Middle East generally through restoring the movement of oil, far more quickly than with U.S. Government grants.

Ike's New Program

January 21, 1957

Mr. Eisenhower's State of the Union message is a curious document, praising free enterprise and government economy in general terms while recommending more government controls and special spending. His discussion of inflation was typical. He admitted the government’s duty not to become “profligate in its expenditures.” But then he called upon business to “avoid unnecessary price increases” and upon labor to refrain from “wage increases that outrun productivity.” He implied that, if these two groups do not exercise “self-discipline,” the Federal government might be forced to return to price and wage controls.

The truth is that government policy, particularly fiscal and monetary policy, must bear nine-tenths of the responsibility for inflation. Businessmen could not get higher prices for their goods unless government policy provided consumers with more money to buy the goods. Labor could not get excessive wage rates without bringing about unemployment unless government policy pumped out enough new money and credit to pay higher wages and raise prices. And it is inconsistent for the government to ask unions to refrain from higher wage demands while it retains a network of Federal statutes which make it almost impossible for employers to refuse to yield to higher wage demands.

INVESTIGATING THE FED

The President went on to recommend creation of a commission to inquire into the “nature, performance, and adequacy of our financial system.” Any assumption that such a group would consist of disinterested...
“experts” without already-formed conclusions, and that they would discover hitherto unknown truths, is unrealistic. Once membership of the commission is known, it should not be too difficult to make a shrewd guess concerning its “findings.” We will be fortunate indeed if the proposed commission does not advocate “reforms” that would only make inflation easier.

But the most important immediate decision before Congress, even from the economic point of view, is still the President’s proposal for discretionary power to commit American troops to “protect the territorial integrity and political independence” of any Middle Eastern nation requesting aid against Communist “armed aggression.” This proposal seems to be a belated effort to correct the disastrous blunder the Administration made when it voted with Egypt and Soviet Russia in the U.N. to demand that Britain, France and Israel, as “aggressors,” withdraw from Egypt, and do so without any assurance whatever of a settlement of the Suez Canal problem or the problem of Egyptian-Israeli relations.

**WHAT WE DID AT SUZ**

Had we kept out of the situation altogether (or had we at least insisted on a two-sided resolution for the withdrawal of British, French, and Israeli troops from Egypt at the same rate as Russian troops withdrew from Hungary), it is probable that the canal would now be under the control of the British and French, and that Nasser, instead of Eden, would be “discredited.” As it is, Nasser has become impossible; the canal is still blocked, huge oil reserves are cut off and in grave peril of falling under Russian control. The President seems to be proposing to try to do with American money and at the risk of their own soldiers’ lives.

There is grave doubt, even so, that the lone-hand policy now proposed by the President is the best alternative left to us. A much better course might be our simple adherence to the Baghdad pact. In any case there is no need whatever to authorize a bigger and special foreign-aid program. Resumption of Suez Canal traffic and the enormously profitable oil production and oil flow will give the Middle East all the economic aid it needs. If Congress does feel obliged to give the President discretionary power to commit foreign troops abroad, that power should be as restricted and temporary as it can be made. There is no good reason why every foreign crisis should lead to more powers for the executive branch at the expense of Congress particularly when it is the executive branch’s blunders that have helped produce the crisis. ✪

**Where It Can Be Cut**

January 28, 1957

A few comparisons for perspective: Average annual expenditures of the Hoover Administration (fiscal years 1930–33 inclusive), $4.1 billion. Of the first Roosevelt Administration (1934–37), $7.4 billion. Of the second Truman Administration (1950–53), $55.8 billion. Of the first Eisenhower Administration, $66.6 billion. In the coming fiscal year, $71.8 billion.

The Korean war, let us remember, lasted three years and one month. All but that last month was fought under Truman budgets. The entire $9.7 billion reduction that Mr. Eisenhower effected in total expenditures between the fiscal years 1953, and 1955 ($74.3 down to $64.6 billion) came out of the military budget ($50.4 down to $40.6 billion). Of the $7.3 billion rise in annual expenditures since 1955, the major part is accounted for by increases in domestic “welfare” spending. No wonder Secretary Humphrey rebelled. “I don’t think,” as he put it, “that you can spend yourself rich.”

Disregarding other huge categories of spending, let us consider the proposal to spend $4.4 billion more on foreign aid in the next fiscal year, on top of the $55 billion or so we have already paid out for this purpose since the end of the second world war.

**FUTILE ECONOMIC AID**

Our so-called foreign “economic” aid program has from the beginning been based on a mishmash of political confusions and economic fallacies. Politically, it has not promoted good will or gratitude or stopped the growth of Communism. On the contrary, it has engendered suspicion of our motives precisely in the countries to which we have given most. Its effect has been actually to breed anti-American policies on the part of foreign governments eager to prove to their own people that their receipt of aid from us has not made them subservient.

We on our side no longer dare to ask for any political *quid pro quo* for our aid, or even to insist that the recipient governments follow sound internal economic policies. We are afraid of being accused of attaching “strings” or conditions—although without such conditions our aid must fail to achieve the only results that could justify it. In fact, by freeing foreign governments from making the internal economic reforms that would be necessary to assure and attract foreign private investment, our foreign aid has merely subsidized and prolonged inflation, Socialism, and repressive controls in the countries receiving it. Our “economic” aid has probably on net balance actually retarded recovery in the countries to which it has gone.
Our government used “selective” credit controls at various times between 1941 and 1952. They are widely imposed today in Europe. But the results hardly warrant emulation. Selective credit control is merely one more step along the road toward a command economy. It leads logically back to the road toward investment control and to price control.

Selective credit controls are, in fact, government control of short-term investments. The pressure for them comes from special groups of borrowers who want to be favored at the expense of the rest. It comes from monetary managers who lack the courage to refuse such demands; who lack the courage to let general interest rates rise to the point where they will halt inflation. When the price of any commodity is held down by government control, the demand soon exceeds the supply, and the commodity is then rationed. Selective credit controls are merely government rationing of credit.

**Discrimination**

To ration credit is, of course, to discriminate among would-be borrowers. The decision is thrown into politics and determined by political pressures. This has already happened. Buying a house, even if you can’t afford it, is considered so laudable that the taxpayers are forced to guarantee 95 percent of the purchase price for you. Buying a refrigerator to put into the house, or a car to get to work from it, is considered much less laudable, so that the terms on which the seller was allowed to extend credit even at his own risk were tightened or “liberalized” by bureaucratic decree. Buying shares in Wall Street (i.e., investing in large-scale industries that increase production and create jobs) is considered so antisocial that the government forbids the seller or the lender to accept less than a down payment of 70 percent of the full price.

Government “selective” credit decisions are made, in short, on the basis of popular pressures and prejudices. Even if the record were better than this, what are we to say of a system which gives a group of government bureaucrats power to encourage borrowing for one purpose and to discourage it for another; to decide that there should be a boom in industry X but that industry Y should be choked to death? The only reason why “selective” credit controls, here and abroad, have not proved intolerably disruptive is that (for reasons explained in this column of March 5, 1956) such controls seldom achieve their aims.

**Precise Instrument**

It is possible to deal here with only one or two of the many arguments that have recently been put forward in favor of selective credit schemes. It is contended, for example, that “overall quantitative credit control” is
“a pretty crude weapon.” The truth is that it would be hard to conceive of a more precise and truly selective instrument for allocating the supply of real savings among creditworthy borrowers than overall market interest rates that are allowed to reflect the real conditions of supply and demand. It is nonsense to say that a general rise in interest rates hits only “the little fellow” and favors “the big corporations.” One might just as well argue that a general rise in wage rates hits only the little project and helps the big project. Any general rise in costs merely shuts off the marginal projects, regardless of size, that do not seem likely to earn the higher costs.

This is the meaning and function of free markets, in the price of loanable funds as in the price of raw materials and in wages.

**Economic Doublethink**

February 11, 1957

The late George Orwell coined the word *doublethink* to mean “the power of holding two contradictory beliefs in one’s mind simultaneously, and accepting both of them.” Has this power been acquired by the Eisenhower Administration? It might explain the budget, the Middle East policy, and the Economic Report.

Let’s begin with the budget. We are told by Administration officials that it is the tightest budget that could be presented to Congress, but that it should be cut. The President even told his press conference that “there are literally thousands and thousands” of individual items in the budget, and “anybody that is examining that seriously ought to find some place where they might save another dollar.” It did not seem to occur to him that it was the prior and primary duty of himself, the Budget Bureau, and others who actually put those thousands of items together to search out the possible savings that “anybody” ought to find.

**Spend and Spend**

When some congressmen did suggest that it might be unnecessary just now to tie an authorization for a special discretionary foreign-aid fund of $200 million for the Middle East on to the proposal for unrestricted military authority, Mr. Eisenhower quickly intervened to say that separation or postponement of the foreign-aid authorization “would destroy what we are really trying to do.” But when he was asked at a press conference how the proposed $200 million would be spent, he replied that he didn’t know, “because the only way I can find out exactly how to spend the $200 million would be through the medium of the Richards mission . . . which cannot leave until the resolution has been passed.” He insists on the $200 million, in short, before the need for it has even been determined.

His new philosophy of spending is also puzzling. Though he is presenting the largest peacetime budget on record, with unparalleled nondefense spending, Mr. Eisenhower is not troubled, because the country is enjoying the greatest prosperity on record, and a growing country can afford to and must spend more to meet its growing needs. But suppose the growth were suddenly to stop? Suppose signs of a depression set in? Then the government must spend more. Asked about deficit spending as a cure for recession, the President replied: “You begin then to apply moderate means, and then more, and if it kept going, finally you would go into every single thing, and very quickly . . . . And there would be no limit, I think, to what should be attempted as long as it was constitutional.” There is, alas, no constitutional limit on deficit spending.

**THE ECONOMIC REPORT**

The Economic Report is another example of doublethink. It repeatedly praises “our free economy”—and then goes on to advocate the extension of government controls in a score of new directions. It insists on “strengthening competition”—and then proposes a score of measures to protect small business, labor, and agriculture against the effects of competition. It insists that government “must exercise a strict discipline over its expenditures”—then advocates an expansion of most existing categories of spending, and adds entirely new ones for local-school and highway building.

“As long as the American people demand and, in my opinion, deserve the kind of services that this budget provides,” the President declares, “we have got to spend this kind of money.” This implies the existence of a sort of economic Fourth Dimension. Mr. Eisenhower forgets that the government has nothing to give the American people that it does not take from the American people. It has nothing to give the states and cities that it does not take from the residents of the states and cities. It has nothing to give Paul that it does not take from Peter.

Five years ago (Jan. 28, 1952) with Mr. Truman in office, I remarked here that the Economic Report was an unnecessary document, whose chief recommendations are or ought to be found in the State of the Union message or in the budget. “The rest consists mainly of giving ‘scientific’ and ‘economic’ reasons for what the President has done or wants to do for political reasons.”

Has the situation changed?
Cut to $60 Billion Now
February 18, 1957

Sen. Margaret Chase Smith has called the Federal budget for 1958 “fantastic.” To appreciate just how fantastic it is, we may begin by comparing once more its proposed record-breaking peacetime “visible” spending of $71.8 billion with the $4.1 billion annual average in the Hoover Administration, the $7.4 billion annual average in the first Roosevelt Administration, the $55.8 billion annual average in the second Truman Administration, and the $66.6 billion annual average in the first Eisenhower Administration.

But this is just a beginning. As Raymond Moley pointed out in Newsweek of Feb. 4, the government is spending huge sums which do not appear in the regular budget. In 1958, for example, it will be paying out $14.4 billion from various trust funds, compared with $9.4 billion in 1956 and only $5.3 billion four years ago. And there are other “hidden” expenditures of billions.

NONDEFENSE SPENDING
One favorite excuse for all this is that defense costs money. Let’s disregard defense expenditures for the last ten years entirely, therefore, and compare nondefense expenditures alone (in billions).

The President proposes nondefense spending for the fiscal year 1958 of $28.5 billion. This is $7.6 billion, or 36 percent, more than in 1954. It is, in short, the biggest paternalistic “welfare” spending in any country in the history of the world.

Administration officials have an uneasy conscience about all this. So at the same time as they recommend this immensely overgrown spending program they also recommend that it should be cut. But even under pressure from Congressional committees they decline to name any specific place where a cut can be made. Until they are ready not merely to generalize but to specify, their commendation of economy must be set down as merely lip service.

There will be no real economy until the government is ready to slash drastically or to halt entirely whole categories of spending. And it is not hard to point out what some of these categories are. We may begin with expenditures that the Federal government should avoid on principle—e.g., the proposal of Federal aid for local school construction. (The economic fallacies and political dangers of this program were discussed in this column of Dec. 26, 1955.)

WHERE TO CUT
Next we come to expenditures which, even if we admit that there is a case for the Federal government getting into them at all, are completely contraindicated in the midst of an inflationary boom like the present one. They can only increase inflationary pressures. These would include Federal aid for the grandiose interstate highway system, and mounting subsidies and other artificial stimulants for “low-cost” housing.

Next, we come to the proposal to spend a total of $4.4 billion on foreign aid in 1958. Probably three-quarters of this amount could with advantage be stopped at once. Most of the net proposed expenditures of nearly $5 billion for agricultural subsidies (mainly for supporting food prices above the market or rewarding farmers for not producing) represents huge and inexcusable waste. Veterans’ benefits for 1958 are scheduled at more than $5 billion—$570 million higher even than in 1955.

Clearly it is not a problem of knowing where cuts in the budget can be made, but of daring to say. It has been customary for years to treat our mounting military budget as sacrosanct; yet Congressional investigations, and the Hoover report, have exposed profligate waste.

When Mr. Eisenhower announced his $72 billion budget for 1958, a few newspapers wistfully recalled his 1952 campaign promise to reduce spending to $60 billion a year by 1955. But this $60 billion goal, far from having become chimerical, could be achieved in the new fiscal year, to the great economic benefit of the nation. All that is needed is the political courage and will to achieve it.

Blaming the Public
February 25, 1957

To all those who are so justifiably concerned about the dangers of further inflation, the most dismaying development of recent weeks was an announcement by Mr. Eisenhower (in his press conference of Feb. 6) that unless business and labor imposed on themselves certain unspecified self-restraints, the government would have “to move in more firmly with so-called controls of some kind, and when we begin to control prices and
allocations and wages, and all the rest, then it is not the America we know."

This statement, unfortunately, cannot be dismissed as a mere slip of the tongue. It was preceded by a distinct hint in the President’s State of the Union message that unless business and labor exercised "self-discipline" the government might be forced to return to price and wage controls.

FALSE REMEDY
It should not be necessary to point out at this late date that price and wage controls are a completely spurious "cure" for inflation. We need merely recall the words of Mr. Eisenhower himself, in his first State of the Union message on Feb. 2, 1953: "Direct controls, except those on credit, deal not with the real causes of inflation but only with its symptoms. . . . They have proved largely unsatisfactory or unworkable. They have not prevented inflation; they have not kept down the cost of living. . . . I am convinced that now—as well as in the long run—free and competitive prices will best serve the interests of all the people."

The truth is that government policy alone—particularly fiscal and monetary policy—must bear practically the full responsibility for inflation. For the actions of private bankers, businessmen, and labor leaders that increase inflation are themselves encouraged by monetary policy.

The Eisenhower Administration is spending more "welfare" funds in more directions than any of its predecessors. It supports laws that continue to undermine the ability of private employers to resist union demands for excessive wage rates. It is artificially supporting farm prices. It is artificially stimulating an unprecedented housing boom. It has encouraged or permitted the country’s money and credit supply to increase by $23 billions since it came into office. For an Administration with this record to turn around and blame private business and labor for the inflationary result, and to start disrupting production with price and wage controls, would be the height of irony.

The remedy for inflation lies wholly in a change of governmental policy. And it lies not in giving still more discretionary, arbitrary, or dictatorial powers to government bureaucrats, or still more discretionary powers (more "techniques," "tools," or "weapons") to our monetary managers but, on the contrary, in taking away some of their present discretionary powers and obliging them to abide by fixed and predictable rules.

It must be pointed out once more that a free competitive enterprise system cannot function effectively in the face of constant uncertainty concerning what the monetary managers are going to do—particularly when those managers may not even know themselves. The country is especially fortunate today to have at the head of the Federal Reserve Board a man who combines the rare understanding, integrity, and courage of Chairman William McC. Martin, Jr. But the political pressures put upon him are excessive. They could be substantially lessened, and the dangers of inflation similarly lessened, by changes in our monetary rules or laws.

RULES VS. DISCRETION
I suggest two: (1) Congress or the Federal Reserve Board could adopt a rule similar to that put into effect by the Bank of Canada last November, under which the discount rate is changed weekly so as to maintain a fixed margin of ¼ percent above the latest average tender rate for treasury bills. (2) The legally required gold certificate reserves of the Federal Reserve Banks could be restored approximately to the former requirement of 35 to 40 percent instead of the present "war emergency" requirement of only 25 percent adopted in 1945. Our controllers will not control inflation until they accept controls on themselves. Meanwhile they should stop scolding the American people.

No Boom Lasts Forever
March 4, 1957

The English-language edition has just appeared here of an important and illuminating book—Common Sense Economics by L. Albert Hahn (Abelard-Schuman, $4.50). In addition to being a brilliant refutation of some of the chief fallacies of Keynesian economics, it includes one of the most persuasive discussions of the business cycle, as well as the shrewdest theoretical analysis of price formation on the stock markets, that I have ever read.

But the reader should be warned that the book is not, as its author seems to imagine, a simple introductory text—"a sort of minimum economics for the businessman." For an introductory work Hahn’s exposition is much too technical, condensed, and abstract. And though Hahn’s style is studded with incisive epigrams, his book is not on the whole easy to read, because his sentences are often involved and "Germanic."

Yet readers who come to the book with an adequate theoretical background will value it highly. Its correctives are particularly needed at the present time, when nearly every government in the world, most notably including our own, is looking at events through Keynes-colored glasses, and assuming that the present inflationary boom can be continued forever, provided
only that the government will continue to spend and spend, inflate and inflate.

**PROPENSITY TO WORK**

Hahn shows what is wrong with this theory and policy. “The propensity to work,” he insists, “and not the propensity to spend, is the foundation of national income and wealth.” No inflation, he points out, can be continued forever. The stimulus of any dose of inflation, no matter how large, must ultimately exhaust itself.

The government is then faced with a dilemma—or rather a trilemma. If it tries to deflate the money and credit supply back to where it was, it will bring on price collapse, unemployment, bankruptcies, and perhaps prolonged depression. Even if it decides merely to prevent the inflation from going farther, it may find itself in trouble. For during any prolonged inflation more and more people begin to act on the assumption that the inflation will continue. Many security prices and commodity prices, many wage rates, many ambitious building and other capital-investment projects, are based not merely on the existing inflation but on the belief in a still further inflation. When it is clear that an inflation has been stopped, these anticipatory prices fall. Overambitious investment plans are scaled down or abandoned. This creates what European economists call “the stabilization crisis.”

**INFLATION A SWINDLE**

If, unwilling to take the risk even of a stabilization crisis, the government continues to inflate (by cheap-money policies, housing subsidies, mortgage guarantees, farm subsidies, and even bigger spending), the boom may indeed be kept going longer. But it can be kept going only at an ever-increasing risk, not merely of a greater economic crisis at the end, but of a collapse of the nation’s currency and credit.

And there is no assurance, even so, that continued inflation can keep a boom going up to this point, much less that it can guarantee continued “full employment.” It can keep prices rising, but it cannot assure continuance of volume prosperity. The supposed magic of inflation, in fact, consists entirely in the maintenance of “the money illusion.” Once that is seen through by all major groups, the boom collapses. Inflation is essentially a swindle and cannot be openly planned. Creditors increase the interest rates they demand to compensate for the expected further depreciation of the currency. Labor unions demand wage increases that outrun both price and productivity increases. Inflation can “work” only as long as prices keep ahead of costs and maintain profit margins. The moment costs run ahead of prices, the joys of the spree are over, and only the headache remains.

And the sad part is that the whole binge is seen to have been unnecessary. Reasonably full employment could have been maintained all along without inflation, by a sufficiently free and fluid adjustment of wage rates to prices and of prices to each other. ✿

**A ‘Common Market’?**

March 11, 1957

With a great flourish of trumpets, the leaders of six European nations—France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg—announced on Feb. 20 that they had agreed on the creation of a European “common market” which would also include their overseas territories. The plan is to introduce gradually a single or common market among the six nations, without tariffs or other barriers.

Is this step really, as one newspaper called it, perhaps “the greatest step so far toward the economic and, eventually, the political union of Europe?” There are strong reasons to doubt it.

1—The proposed lowering of tariffs among the participating nations will take place only over a period estimated at from twelve to seventeen years. The caution is understandable; but it recalls previous planned “transitional periods” (such as that envisaged by the International Monetary Fund) which somehow never seem to come to an end.

2—If the proposed common market were ever to become a reality, it would of course have the internal advantages of a customs union (like the German Zollverein of 1833). But it must remain meaningless until the six nations either adopt a gold standard, or abolish exchange controls and import quotas and make their currencies freely convertible into each other in any amount. This cannot happen as long as the currencies of the six countries remain on a paper basis, and have only a limited and controlled convertibility into each other at purely arbitrary valuations. As long as the currency of any one of the six nations is undervalued or overvalued at its “official” price, and as long as exchange controls and import quotas are continued, the so-called “common market” will be a sham, a hollow rhetorical phrase. The same criticism will apply, of course, as long as agricultural commodities are excluded from the “common market.”

3—This European “integration” is something that the dispensers of American foreign aid, most notably Paul G. Hoffman, have been urging for several years. But it is a little hard to understand just what advantage
it will be to the Italian and French motor industries, for example, to continue to be able to keep out American competition but to be forced to accept full German competition—to be able to keep out the Ford say, but not the Volkswagen.

4—One of the mysteries of the whole episode is the paternalistic pressure which our government has applied to bring about the proposed European “common market.” If the United States were urging an all-round reduction of tariffs, or were itself planning to become a member of a free Western world common market, our government’s attitude could be understood as an acceptance of the general advantages of free trade—of cheaper imports for our consumers and wider foreign markets for our exporters. But we advocate this as a medicine good for Europeans but not for ourselves. We intend to maintain our own tariffs against the products of the six nations. We give our blessing to a “common market” from which we are to be deliberately excluded. And we will probably be called upon to finance the scheme, directly or indirectly, just as we put up the $350 million kitty for the misconceived European Payments Union.

5—If such a common market would be good for the six nations involved, why wouldn’t it be good for all nations—or at least for all nations under free governments?

A PROSAIC SUGGESTION
The idea of universalizing the common market helps to bring out the main flaw in the plan as it stands. If each nation, simply acting individually, were to put its currency on a sound basis, abolish exchange control and quotas, and start reducing its own tariffs, all the real benefits of the proposed common market, without its drawbacks, could be universally achieved—and without the necessity of elaborate intergovernmental agreements or supranational statist controls.

But the suggestion that each nation put its own house in order is doubtless too prosaic. It would merely enable the world to catch up with the currency stability and the relative freedom of international trade which was accepted as a matter of course, say, back in 1913.

Are Unions Necessary?
March 18, 1957

The testimony before a Senate committee that high union officials used union funds to engage in organized gambling, bootlegging, and vice has produced some moral indignation—but not enough to lead to any serious move in Congress for legal changes adequate to curb the immense irresponsible private power of unions, and of union officials over their own rank-and-file members.

Fortunately there is increasing evidence of a tendency in academic circles to challenge the century-old premises on which most present one-sided pro-union legislation is based. In a later article I hope to discuss at length two important new books—The Labor Policy of a Free Society, by Sylvester Petro, and Why Wages Rise, by F.A. Harper. But I should like to take up first a remarkable article which appeared in the September issue of Encounter, a monthly magazine published in London.

The title of this article is “Are Trade Unions Necessary?” Its author is Peter Wiles, a fellow of New College, Oxford. “In strict economics,” Wiles begins, “there is scarcely any case for the continued existence of trade unions in a fully employed welfare state.” He then runs through a whole series of traditional pro-union arguments, and starts knocking them down right and left. There is space to quote only a few excerpts.

SPIN OUT THE JOB
“Even in previous conditions of our society, trade unions may well have done more harm than good; modern social history is very sentimental, and handles them quite uncritically. . . .

“Shortening of the hours of work did little economic harm when the working week was 60 hours, and may even sometimes have increased actual production; it is certainly not harmless in the twentieth century when 44 hours is the standard working week.” (Forty hours here.)

“Full employment? But trade unions can only establish fixed employment, by making it more difficult for employers to sack labor—and even then they usually also make it more difficult for them to hire labor. . . .

“Again, trade unions can maintain what we may call unproductive employment, i.e., they can spread the work by resisting the introduction of labor-saving machinery or by making their members spin out the job in hand. These two measures are obviously worse than fixed employment; indeed from the economic point of view they are simply crimes. . . .

“Even if it be admitted that collective bargaining keeps down profits, or increases the general share of wages in the national income, this is not a good thing at all. For it hits investment, since a firm only desires to install machinery if it is profitable, and most of the finance for such things comes either from its own or someone else’s profits. And without investment
economic growth is slowed down. . . . A really severe cut in profits would stop progress altogether. . . .

**CLOSED-SHOP RESULTS**

“Of course, collective bargaining is a potent source of injustice in the distribution of income. It is truly amazing that anyone should suppose this crude, selfish, violent, and piecemeal process to contribute to social justice. . . . All that collective bargaining can ensure is that some workers do better than others. . . .

“The closed shop is about the worst threat to liberty in modern Britain. . . . It is a terrifying example of the moral blindness of this post-Christian, post-Liberal age that men have been driven to suicide because a union sent them to Coventry. . . . What grosser tyranny is there than that? . . .

“It is not only a question of persuading the trade unions to be reasonable over this or that. Economic reasonableness contradicts their very nature, their history, and their deepest inclinations. . . . The question is trade-union abolition.”

The final sentence does more honor to Wiles’s courage than to his judgment. It is an infringement of individual freedom for government to abridge the right of voluntary association. But it is surely the government’s duty to protect the individual worker against compulsory association, and it should certainly stop forcing employers exclusively to “recognize” and “bargain with” any particular union, no matter how unreasonable its demands or conduct may be.

**How to Cut Spending**  
March 25, 1957

Nearly everyone, including the President, who proposed it, seems to agree that the $72 billion budget for the fiscal year 1958 should be drastically slashed. But when it comes to any specific spending program, some special interest is sure to cry out that it cannot be touched. The President himself gave an amusing illustration of this in his press conference of March 7. A friend out West had written to say he “was very much upset about the size of the budget,” but in his last paragraph expressed the hope that there would be no cut in drought relief. Yet in this very conference Mr. Eisenhower, while he told how he was asking every government agency and department to suggest cuts in its own spending, expressed grave concern about proposals to make any substantial cut in foreign aid.

The situation suggests that there is only one feasible political device to get substantial cuts in the 1958 budget. This is for Congress to tie every cut it makes in expenditures to a specific tax cut. Only in this way can Congress dramatize the connection between expenditures and taxes, and offset the special political interest in favor of an expenditure by the interest of taxpayers in favor of tax relief.

**CUT FOREIGN AID**

Let us take, as an example, the foreign-aid program. The public and Congress now express mounting doubts about the need or wisdom of that program. The recent Fairless report, certainly, does nothing to dispel these doubts. It merely reiterates all the question-begging generalities that have passed for argument in the last ten years. It mentions once in passing that about 2,000 separate foreign-aid projects are annually authorized in Washington, but makes no “detailed program examination” whatever. It does not even list the countries that are still receiving aid from us. (There are 54 of them, not including our dependencies.) Yet the program involves not merely appalling waste, but positive mischief.

Sen. Mike Mansfield has estimated that a $3 billion annual cut could be safely made in the sums that our government has been spending abroad. It would seem advantageous to cut at least $3 billion out of the $4.4 billion that the President proposes to spend in the fiscal year 1958 for foreign military and economic aid. Out of appropriations left over from past years, the government will have at least $3 billion to spend for foreign aid in 1958 even if Congress does not appropriate an extra penny. Congress, therefore, need make no appropriation at all for foreign aid for 1958. It can simply recommend that spending for this purpose be limited to $1.2 billion in 1958, and tie this recommendation up with a tax cut of $3.2 billion.

**50 PERCENT TAX CEILING**

There are any number of places, of course, where such a tax cut could advantageously be made. I suggest, by way of illustration, a cut in the normal personal income tax from 20 to 18 percent, and a cut of all personal income tax rates above 50 percent down to a 50 percent ceiling.

Roswell Magill, president of the Tax Foundation and a former Under Secretary of the Treasury, has declared: “If we could afford just one modest tax accomplishment in 1957, this 50 percent rate ceiling is the one which I should choose.” He estimates that the revenue loss would be about $734 million, even without taking into account the probable increases in reported income as a result of the rate reduction itself. (The confiscatory
tax rates up to 91 percent produce little revenue. The basic rate of 20 percent accounts for 85 percent of the total yield of the income tax.) Cutting income-tax rates to a maximum of 50 percent would bring a sharp increase in American production, investment, and the availability of risk capital for new enterprises.

A cut in the normal tax from a 20–percent to an 18–percent would mean an additional loss in revenue of about $2.4 billion; but it would also mean income-tax relief and increased incentives for everyone.

Any attempt to oppose or veto such a tax cut in order to maintain foreign-aid expenditures at their present level would bring home to the American people what foreign aid is really costing them. Other tax cuts could be tied to other spending cuts, with similar educational results.  

Irresponsible Budget
April 1, 1957

The buck-passing between Congress and the President as to which one’s duty it is to slash the $72 billion budget, and how and where, not only darkens the hope that much real reduction will finally be achieved, but emphasizes once more that we will never get real economy until we set up a genuinely responsible budget system. What we have today is mere window-dressing, a make-believe budget system.

Under such a mock budget it is impossible to fix responsibility. The House can plausibly pass a resolution, as it did, requesting the President to “indicate the places and amounts in his budget where he thinks substantial reductions may be best made.” It’s his budget. He and his executive departments and agencies put it together. His Budget Bureau approved it. He recommended it. He himself has admitted that “there are literally thousands and thousands” of individual items in the budget. It does seem grossly unfair to put the burden of passing upon each of them on a body of 531 men, each of whom must pass upon hundreds of other questions.

Yet the President could also plausibly dodge responsibility by replying, as he did, that it was up to Congress to say which program “they don’t want to carry out if they are going to make big savings.” And this retort was supported by Cabinet members who pointed out: “We usually get more than we ask for.”

A WHOLEsome RULE
Responsibility is still further befogged by the Congressional habit of making appropriations for years ahead. It is estimated, for example, that the Administration could spend at least $3 billion more on foreign aid even if Congress failed to appropriate another penny for it. Responsibility is also hopelessly confused within Congress itself by the Senatorial habit of raising the appropriations of the House, and forcing an upward compromise, and by the Congressional practice of assigning appropriations to entirely different committees from those that must raise the money.

All of this would be impossible under a really responsible budget system. In Great Britain the wholesome rule has been established for more than two centuries that Parliament may reduce but not increase any spending recommendation made by the executive government. Under such a system the responsibility for the amount of spending, for a budget balance, and for the kind, rates, and yields of taxes, can be inescapably pinned on the executive.

FOR AN ITEM VETO
Is it utopian to hope that such system could be established here? The practice in many individual states, certainly, gives no reason for despair. In New York State the governor’s annual budget must not only give estimated expenditures and revenues for the next fiscal year, be must be accompanied by bills containing all the proposed appropriation and any proposed new taxes. The legislature (I quote the state constitution) “may not alter an appropriation bill submitted by the governor except to strike out or reduce items therein.” If the legislature wishes to increase or add any appropriation, it must be by separate items or bills “each for a single object or purpose which shall be subject to the governor’s approval.”

In 39 states, in fact, the governor has the power to veto individual items in appropriation bills. Senator Byrd of Virginia two years ago proposed a constitutional amendment to authorize the President to veto any item in an appropriation bill. In 1937 a similar reform was urged by Republican Senator Vandenberg, and supported then by President Roosevelt. It is the very minimum step toward a responsible Federal budget.

It is not, of course, the only step. Hardly less important would be adoption of the recommendation of the Hoover commission that Congress stop appropriating enormous sums that may not be spent for several years, and appropriate money only for actual spending in a given year. A joint House-Senate budget committee, as recently recommended in the Senate, would also help. What is needed, in short, is a thorough reform in our fiscal procedures. Until we get such a reform, the outlook for real economy will not be promising. 

Cotton Fiasco
April 8, 1957

Just how pernicious does a government subsidy or control scheme have to become before there can be any hope of getting rid of it?

The question keeps recurring in connection with the farm program. It is hard to realize quite how grotesque this program is until we examine it crop by crop. Let us look at cotton, for example.

The following quotation is condensed from a book published last year, *Farmers at the Crossroads*, by Secretary of Agriculture Ezra Taft Benson (as told to Carlisle Bargeron):

“The story of cotton is a tragic one. Becoming frightened at the problem of abundance, cotton farmers elected to live by rigid high price supports. What has been the result?”

“Twenty-five years ago, cotton grew on 43 million acres of United States farm land. In 1956 the acreage is 17.4 million.

“Twenty-five years ago, before American cotton growers began to hold the price umbrella for foreign cotton producers, cotton production abroad totaled 12 million bales. This past year foreign production was 25 million bales.

“Twenty-five years ago the United States exported 7 million bales of cotton. During the past year our exports were 2 million bales.

“After 25 years of the utmost government solicitude, cotton has lost markets everywhere. Its producers have lost freedom. Cottonseed-oil supply is limited and soybean oil is increasingly taking its place. The pity is that the road back is a long, long one. Markets once lost are not easily regained.”

CONTINUED FOLLY
This may still stand as a pretty good summary of the present situation, except that, whereas cotton exports were only 2.2 million bales in the crop year ended July 31, it is estimated that they will reach 6.5 million bales in the present crop year. But it is ironic to call these figures “exports.” They are simply the amount of cotton our government is now managing to unload on foreigners at a huge loss to the American taxpayer.

In the summer of 1939, as a result of the price-support program at that time, the government accumulated in storage some 11 million bales of cotton, equal to a full year’s American production. The second world war came along and bailed the government out. So we continued the folly. In the summer of 1950, the government once more accumulated over 6 million bales of cotton. This time the Korean war came to the rescue. We continued the folly. As the president of the New York and New Orleans cotton exchanges summed the present situation in a joint statement a few weeks ago before a Congressional committee: “In effect the program has resulted in subsidies to every foreign competitor of the American cotton farmer and textile manufacturer and in encouraging the development of artificial fibers which have rapidly increased in production to the disadvantage of every farmer.

A WAY OUT?
Last year the government piled a more noxious subsidy on top of existing subsidies. This is the “soil bank,” a subsidy for not producing. It differs only in name, not in substance, from the various acreage reduction and plow-under schemes tried out under Henry Wallace beginning in 1933.

Is there any way out? Some people in the cotton trade have suggested that the government loan level against cotton should be set only to “give protection in case of dire need.” Other have recommended direct “compensatory payments” to cotton growers, but only against the amount of cotton consumed domestically, leaving all sales and prices to the open market. Either of these substitutes, at the start, would at least be less pernicious than the scheme we have. But, like it they would also probably prove self-perpetuating, and follow the same laws of malignant growth.

I should like to repeat a proposal put forward in this column a year ago. Let the government either give back the present cotton surplus to the growers who produced it, or sell it back to them at less than it would cost the growers to produce more. Then leave prices, production, consumption, any exports to the free market, and junk once for all the whole fantastic prices support and crop-restriction program.

The Vice Presidency
April 15, 1957

The decision regarding what should happen if a President is unable “to discharge the powers and duties” of his office can have crucial consequences for business. After studying the problem for three months the President and Attorney General have come up with a solution which seems to satisfy no one. If we break the problem into segments, in fact, it becomes clear that part of what they propose is unnecessary, and the rest inadvisable.

They propose a constitutional amendment to provide, first, that if the President were disabled and realized it, he could delegate his powers to the Vice
President and could resume them when he had recovered. But this could be done by a short and simple law under the Constitution as it stands. The relevant provision (Art. II, Sec. I) is only 83 words long:

“In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.” (My italics.)

A POWER OF CONGRESS
This provision is said to be vague concerning what or who determines Presidential “inability.” But it explicitly gives Congress power to decide all such details by legislation. If Congress, therefore, under this provision, explicitly authorized the President to transfer the powers and duties of his office temporarily, it is inconceivable that the Supreme Court would hold that Congress had acted beyond its constitutional powers.

The constitutional amendment proposed by the Attorney General, however, would go farther, and provide that if the President were disabled but unable to delegate his powers (in the event of a stroke or insanity, say), the Cabinet could decide by majority vote to have the Vice President assume the President’s powers until the President stated in writing that he was resuming them.

Now this proposal would put a crucial decision in the hands of mere Presidential appointees. And as it would require a constitutional amendment to do this in any case, it raises the question whether we should not, while we are at it, go farther and abolish the office of Vice President altogether.

If anyone besides the President himself is to have the power of relieving him of the duties of his office, even temporarily, it should clearly be Congress. Congress, in fact, already has this constitutional power under the impeachment provision. Following that precedent, a new amendment might provide for a President’s removal for disability by a majority vote in the House confirmed by a two-thirds vote in the Senate.

FIFTH WHEEL
One way of solving the problem of who should succeed the President in case of his disability or death would be to abolish the office of Vice President, and give Congress the power to choose the President’s successor; but with the provision, say, that if death or disability occurred before the Congressional mid-term elections, a new Presidential election would be held at the same time as those elections to fill the unexpired term.

There are many possible variations on such a plan, and they would need to be carefully considered. But there is certainly nothing novel in the proposal to get rid of the wholly unnecessary office of the Vice Presidency, and to let the Senate choose its own presiding officer. As long ago as 1803, the Vice Presidency was compared to “a fifth wheel to a coach.” Yet, as John Quincy Adams wrote in 1841, it can place “in the Executive chair a man never thought of for that office by anybody.”

To remove the problem from all personal or partisan considerations, no proposed constitutional amendment on the subject should become effective before the election of 1960. Meanwhile Congress should by simple law authorize the President temporarily to delegate his powers and duties to the Vice President.

No One Is Responsible
April 22, 1957

The efforts of the President and Congress to pass on to each other responsibility for cutting the 1958 budget do not provide an encouraging spectacle, but they do provide an instructive one. They emphasize more than ever that we do not have a responsible budget system. There will be no real economy until we get one.

There are glaring inconsistencies both in the statements of the President and in the actions of Congress. Just before the Republican convention of 1952, Mr. Eisenhower expressed the opinion that the Federal budget could be cut as much as $40 billion in the next few years. In October of 1952 he declared: “My goal, assuming that the cold war gets no worse, is to cut Federal spending to something like $60 billion within four years.” In the same month he said:

“We must find a substitute for the purely temporary business of bolstering the free nations through annual handouts. That gets neither permanent results nor real friends.” Also in the same month (speaking of an annual budget of $70 billion) he said:

“We can’t afford what we’re spending and stay strong enough to lead the world to peace.” But now he declares, deploring even diminutive cuts in his own $72 billion budget: “If we are going to wage peace abroad, and try to provide the leadership and the services at home that our people demand, then we have got to pay for it.”

IGNORING ITS OWN LAWS
Congress, in its Reorganization Act of 1946, provided for joint meetings of the tax and appropriations committees of both houses at the beginning of each session
to draw up a legislative budget for the ensuing fiscal year. Since 1949 it has completely ignored its own legislation on this point.

Buck-passing regarding economy would not be possible if we could once establish a responsible Executive budget system. Under such a system the Executive not only presents an itemized list of all proposed expenditures, but of all proposed changes in taxes necessary to meet those expenditures. This budget is accompanied by bills containing all the proposed appropriations and any proposed new taxes. The Legislature has the power to strike out or reduce expenditure items in such a budget, but not to add or increase any.

This rule against legislative increase has prevailed in Britain for more than two centuries. Under such a system budget responsibility is inescapably fixed upon the Executive. But he gains great advantages in compensation. The President, for example, would know in advance that Congress could not destroy courageous economies by making lavish appropriations of its own to pressure groups. If the President is sincere in his professed desire for economy, he will recommend a constitutional amendment to Congress, now, to create such a responsible budget system.

CONGRESS AS WATCHDOG

And if Congress on its side is sincere in desiring economy and a really responsible budget, it will not hesitate to accept such a self-denying amendment. It will even draft and submit one, whether or not the President asks for it. Congress, too, would find great compensations for giving up the power to increase or add appropriations. Congressmen would no longer be hounded by constituents or lobbyists demanding more appropriations for their districts or their pressure groups. Congressmen could refer all such demands to the Executive branch, and they would surely exercise far more than now their power to reduce proposed expenditures. “There is no propensity of human nature more marked than jealousy of opportunities that one does not share.” Instead of competition between the President and Congress in spending, there would be competition in economy.

Perhaps it is utopian to hope that Congress could be persuaded to deprive itself completely of the power of increasing expenditures beyond those asked for by the President. But it might be willing to go at least as far as the Legislatures of many states, and limit itself to power to add proposed expenditures only in separate bills, individually subject to Presidential veto. Congress should be the watchman of the Treasury. It can be counted on to perform its duty as watchman only if it does not itself have access to the Treasury.

Britain’s Is a Budget

April 29, 1957

Americans, groaning over their April 15 tax payments, must have read with a mixture of envy and incredulity the budget announced by the British Chancellor of the Exchequer on April 9. Here are we, confronting the largest peacetime spending plan in our entire history, and being told by the Administration that it is naïve of us to expect any tax relief this year. And there is Britain, planning to spend in the fiscal year 1958 less than in 1957, and giving appreciable tax relief to its own citizens.

Several important lessons can be drawn from this comparison. Suppose we begin by comparing the American and British budgets over the past eleven years. Let us compare, for example, the official estimate of expenditures, before the beginning of each fiscal year, with the actual expenditures made in that fiscal year. The following table is in billions of dollars for American fiscal years ending June 30, and in billions of pounds for British fiscal years ending March 31.

<table>
<thead>
<tr>
<th>Year</th>
<th>American Expenditures</th>
<th>British Expenditures</th>
</tr>
</thead>
<tbody>
<tr>
<td>1947</td>
<td>$35.1</td>
<td>$39.0</td>
</tr>
<tr>
<td>1948</td>
<td>37.5</td>
<td>33.1</td>
</tr>
<tr>
<td>1949</td>
<td>39.7</td>
<td>39.5</td>
</tr>
<tr>
<td>1950</td>
<td>41.9</td>
<td>39.6</td>
</tr>
<tr>
<td>1951</td>
<td>42.4</td>
<td>44.1</td>
</tr>
<tr>
<td>1952</td>
<td>71.6</td>
<td>65.4</td>
</tr>
<tr>
<td>1953</td>
<td>85.4</td>
<td>74.3</td>
</tr>
<tr>
<td>1954</td>
<td>78.6</td>
<td>67.8</td>
</tr>
<tr>
<td>1955</td>
<td>65.6</td>
<td>64.6</td>
</tr>
<tr>
<td>1956</td>
<td>62.4</td>
<td>66.5</td>
</tr>
<tr>
<td>1957</td>
<td>65.8</td>
<td>68.9</td>
</tr>
</tbody>
</table>

The first thing to be noticed is how close Britain’s estimates of expenditures come to the actuality and how widely our own government misses. In the eleven years 1947 to 1957, inclusive, the furthest the British Treasury came from predicting the result was in 1949; it missed by 7 percent. Its average percentage error for
the eleven years was only 2.3 percent. Compare this with the American record for the ten completed years from 1947 to 1956 inclusive. (The actual 1957 result will not be known until the end of June.) For 1947 and 1948 the estimates missed by more than 11 percent; for 1953 and 1954 they missed by more than 13 percent. The average percentage error for the ten years was 7.62 percent.

It is true, of course, that the President must make his estimate of expenditures for a fiscal year almost six months before that year begins, whereas the British Chancellor of the Exchequer publishes his estimate about a week after the fiscal year has begun (and when it is definitely known what actual expenditures were in the fiscal year just closed). But even if we take the revised estimates of expenditures made by the President a whole year later, more than six months after a fiscal year has begun, his average percentage error turns out to be 5.52 percent.

WORTH DREAMING ABOUT

The basic reason for these differences is not that British Treasury experts can foresee the economic future better than ours can. The basic reason is that Britain has a responsible executive budget system and we have not. When the British Chancellor of the Exchequer presents the budget, he is presenting not a mere set of estimates or a hopeful guess, but a pledge, a program, and an overall bill. Parliament must accept or reject this as a unit; it cannot kick it around or simply disregard it. We could approach such a system here if Congress retained its power to reduce proposed expenditures but relinquished its power to increase them. New York and many other states have such a system. Even to give the President power to veto individual items in appropriation bills—a power for which Mr. Eisenhower has now asked—would help enormously.

The possible rewards of a responsible budget system to the American taxpayer are illustrated by Britain’s latest budget. The British Government plans to spend £4,827,000,000 in the next fiscal year. This is only 23.4 percent more than it spent in the 1947 fiscal year. We are still planning to spend about $71.5 billion in 1958, or 83.3 percent more than in our 1947 fiscal year. Now if we also were planning to spend only 23.4 percent more than in 1947, we would be planning to spend only $48.1 billion in 1958—a saving of $23.4 billion. . . .

Well, a responsible budget is at least worth dreaming about. ✽

If Congress Means It
May 6, 1957

Admittedly the President’s letter to Speaker Rayburn is in large part a political document, designed to pin responsibility on Congress rather than the President for the $72 billion budget. When Mr. Eisenhower declares, for example, that billions of dollars of proposed 1958 spending are “unavoidable” because they are “rigidly prescribed by law,” he forgets that such laws can be changed, and that he himself has already had four years in which to recommend changes.

Nor must some $45 billion of proposed 1958 expenditures be treated as sacrosanct merely because they ostensibly “will support programs related to the protection of our country.” Some of these programs—particularly those relating to foreign aid—may be wholly unjustified; others may conceal great wastes. In its duty to scrutinize and economize, Congress should not be too much intimidated by the President’s sweeping declaration that “a multibillion-dollar reduction in 1958 expenditures can be accomplished only at the expense of the national safety and interest.”

Yet the President’s letter to Speaker Rayburn includes some statesmanlike proposals of the first importance. Congress cannot ignore these without raising serious questions about its own sincerity or judgment.

THE FOURTH DIMENSION

Mr. Eisenhower, for example, begins by acknowledging frankly a fundamental truth that a few of his recent statements have seemed to overlook: “I am sure many members of the Congress are as gratified as I am to note the growing awareness of private citizens that the dollars spent by the Federal government are in fact their own dollars, and that Federal benefits are not free but must be paid for out of taxes collected from the people.” Amen. Federal funds do not come out of any Fourth Dimension. When the Federal government meets more “needs” through Federal spending, the individual taxpayer is able to meet fewer needs of his own out of his own earnings.

At the end of his letter, Mr. Eisenhower names ten “steps” that he strongly urges upon Congress. Although all these recommendations deserve consideration, some raise complicated issues. Limits of space oblige me to concentrate upon recommendations seven and ten. Step seven is of major importance: “Enact bills approved by the Administration to implement Hoover-commission recommendations, such as the authorization of appropriations on the basis of annual accrued expenditures,” etc.
But step ten goes even farther. If adopted, it might enable the President to put into effect most of the other nine. This is the request to “grant the President the power now held by many state governors to veto specific items in appropriations bills.”

**THE ‘ITEM VETO’**

This proposal, so far from being novel, has been raised in one form or another for nearly a century. It is a power already possessed by the governors of more than three-quarters of our states. It is essential to even minimal budgetary responsibility. It would be desirable, in fact, to go much farther, as do many of our states (as well as foreign governments). Congress might voluntarily relinquish the power to increase expenditures recommended by the President while retaining the power to reduce them. Only such a system could eliminate “pork barrel” appropriations. As the late Senator Vandenberg put it: “Congress long since learned that if you put a little something for each of the 435 Congressional districts in one appropriation basket, pretty nearly everybody will help carry the basket.”

There is no danger that the “item veto” would give the President excessive budgetary power. Congress already has an absolute veto, when it chooses to exercise it, on any appropriation proposed by the President. The “item veto” would not even give the President equal power of absolute veto over any expenditure proposed by Congress; Congress could simply overrule his veto by a two-thirds vote.

In place of competition in spending, what is needed is a system in which both the President and Congress have power to restrain the spending of the other. Only such a system can protect the taxpayers.

---

**Unions and the Law**

May 13, 1957

As a result of the revelations concerning Dave Beck and his Teamsters union, the Eisenhower Administration is asking for still further Federal statutory intervention in the field of labor relations—the public disclosure of union receipts and expenditures, especially regarding pension and welfare plans. But Prof. Sylvester Petro of the New York University School of Law, I am confident, would suggest first of all a simpler solution, which is to cease making labor unions and their agents immune from the laws against violence, coercion, extortion and fraud which apply against everyone else.

“No other private association,” writes Petro in his new book *The Labor Policy of the Free Society* (Ronald Press. §5), “has displayed so much corruption and arrogance as some trade unions have. No other private association has so habitually terrorized and exploited both members and nonmembers, or so institutionalized the practice of compelling persons to become members. The combination . . . is no mere coincidence. . . . Internal corruption in some trade unions and the external dangers to society posed by many trade unions can all be traced directly to compulsory, coercive practices.”

**FREE EMPLOYEE CHOICE**

Petro has written what seems to me by far the best analysis of the law of labor relations that has yet appeared. This is because he has tried to think out the basic political and legal philosophy most consonant with a sound free society; because he has given great study and thought to the economic consequences of alternative labor laws and policies; because he is a student of the common law as well as statutory labor law; because he is thoroughly informed on current court and NLRB decisions; and most of all because he has an excellent legal mind.

Petro begins by examining the basic institutions of a free society—personal freedom, freedom of contract, and private property. He dismisses the specious contrast between property and human rights: “Property rights are human rights, and nothing else.”

The right of association is also basic. Trade unions must be protected in the free exercise of that right. But neither employers nor trade unions can be permitted to engage in violent, coercive, or fraudulent conduct. Action otherwise illegal is not made legal by concert. Unions have a full right to strike, peacefully, for higher wages or better working conditions. But they have no right to use violence, intimidation or coercion to prevent other workers from taking the jobs they have voluntarily vacated. Petro would illegalize, for example, all mass picketing as a form of intimidation and a clear violation of the central principle of “free employee choice.”

**WHY WAGES RISE**

There are several important problems in labor law that Petro does not seem to me to have fully solved or clarified. This is not surprising when one considers the inherent difficulties of the subject as well as the intemperate and confused thinking that customarily beclouds it. But his book is full of courageous and magnificent common sense, and throws a brilliant light on a hundred points. His attacks on certain features of the Taft-Hartley Act, on the Norris-LaGuardia Act, on President Truman’s seizure of the steel plants in the 1952 strike, on the
Supreme Court’s argument that picketing is just a form of “free speech,” and on the same Court’s recent doctrine of pre-emption, are beautiful specimens of relentless legal reasoning. He calls in forthright terms for the abolition of the National Labor Relations Board, and the complete repeal of the Norris-LaGuardia Act. His book deserves to be widely quoted and studied for a long time to come.

As a fitting companion to the Petro book, I suggest Why Wages Rise by F.A. Harper (Foundation for Economic Education, Irvington, N.Y., $1.50). Harper supplies the economic basis on which many of Petro’s propositions rest. He proves by reasoning and statistics that wages rise because productivity rises; that productivity rises mainly through increased investment in equipment made possible by profits; and that labor unions do not and cannot, by themselves, raise the general level of real wages for the whole body of the workers.

Bipartisan Economy
May 20, 1957

A spirit of narrow partisanship exists in both major parties in Washington today which does not promise well for economy. The President began by presenting a record-breaking peacetime budget recommending unjustifiable additions and increases. Then he blandly suggested that his own budget should be cut, but that it was up to Congress to find out where to cut it. When Congress thought it had found a few places, the President suggested that such cuts would threaten not only national welfare but world peace. Nearly every department head has protested against the cuts made.

The Democrats, on the other hand, seem to be evenly divided between those who think Federal spending should be cut and those who think it is still niggardly. Adlai Stevenson, for example, holds that a budget of the magnitude of the President’s “is the least we dare have,” which implies that huge spending is necessary for its own sake. It is foolish, he thinks, for the Democrats to try to “out-Republican the Republicans on the issue of budget-cutting.” In short, government economy should be considered exclusively a Republican goal!

CAMPAIGN ORATORY

Then there is the “advisory council” of the Democratic National Committee, a strange group who seem to think that party policy should be set, not by the Democrats in Congress, but by Democrats out of office. Their statement on economic policy blames inflation on “big business,” instead of on the huge spending and cheap money which they themselves advocate. They declare that “small increases in wages are used as the excuse for large increases in prices.” If those who signed this statement had been interested in the truth rather than in campaign oratory they could have easily found that since 1952 hourly factory wages have gone up 22.7 percent while consumer prices have advanced only 4.6 percent.

Fortunately there are in both parties responsible men sincerely interested in economy rather than in trying to pin the blame for its absence on the other party. They include Secretary Humphrey and Under Secretary Burgess, Senator Knowland and many other Republicans; and, among Democrats, Speaker Rayburn, Senator Johnson, and, outstandingly, Senator Byrd. It is true that it is hard to find detailed agreement concerning just where cuts should be made and exactly how much they should total. Individual proposals for total cuts have ranged from $2 billion to more than $6 billion. Even the larger figure may be too modest. If, for example, like the British, we were planning to spend in fiscal 1958 only 41 percent more than in the average of the four years 1947–1950, our new budget would be $18.5 billion less than it actually is.

THE BUDGET PROCESS

But it should not be hard to find agreement concerning just what reforms in budgetary procedure will do most to curb irresponsible spending. Most of these reforms are recommended in reports of the Hoover commission. A few weeks ago President Eisenhower called upon Congress to enact bills approved by the Administration to implement these Hoover-commission recommendations. He particularly emphasized “the authorization of appropriations on the basis of annual accrued expenditures.” In addition, Congress should pass legislation to insure a more thorough and effective Congressional review and check of executive recommendations. And, finally, Congress should grant the President the power for which he recently asked to veto specific items in appropriation bills.

This last step, to be effective, would have to be put in the form of a proposed constitutional amendment. Such an amendment would, of course, have most chance to succeed if offered under bipartisan sponsorship—by, let us say, Senators Byrd and Knowland and perhaps others from both major parties. Procedural reforms that could
be effectively accomplished by simple legislation ought to have similar bipartisan sponsorship.

Only through bipartisan support is real economy likely. Such cooperation will incidentally prove better politics for those who adopt it than transparently partisan efforts to put the other party in a hole.

Communist Crack-Up
May 27, 1957

A little less than a year ago, those who take Soviet boasts seriously were warning us that Communism might be about to beat capitalism “at its own game—production.” Since then the evidence has been unmistakable that, far from there being any “miracle” of Communist production, the lands behind the Iron Curtain are going through an economic crisis.

The most revealing recent study of Soviet production was in a paper presented before the American Economic Association by Prof. G. Warren Nutter of the University of Virginia and the National Bureau of Economic Research. Warning that we must depend on Soviet official statistics, “where a government with flexible standards of candor has exercised rigid control over the trickle of information it has allowed to the outside world,” Nutter presents tables to show that even on the basis of these official statistics production in Russia lags farther behind that of the U.S. in most basic industries than it did in 1913. His tables cover 37 industries in three benchmark years. I select comparisons for nine basic or representative industries:

<table>

<tr>
<td>Median 37 industries</td>
<td>28</td>
<td>36</td>
<td>34</td>
</tr>
</tbody>
</table>

If we take steel ingots as an example, the above table means that the Russian production in 1913 was roughly equal to the production achieved in the United States around 1892, or 21 years earlier; that the lag had risen to 32 years in 1937, and fell somewhat from that point to a level of 29 years in 1955. The comparison is even worse on a per capita than on an overall basis. For the 37 industries in 1955, the median lag in per capita output was 56 years.

A major sign of financial strain in the Soviet Union was the announcement by Khrushchev on April 10 that the Soviet Government had decided to “postpone” for twenty to 25 years the redemption of 260 billion rubles of bonds held by the Russian people. This proved once again not only that the Soviet leaders will repudiate their most solemn pledge, but that they are as contemptuous of their promises to their own people as of their treaties with the “capitalist imperialist” West.

HOW TO DECENTRALIZE
But the most striking evidence of a crisis in Russian production is Khrushchev’s radical plan for decentralizing control. He is planning to abolish most of the giant ministries in Moscow and to shift daily operational control to a separate “economic council” in each of 92 economic regions. This pays capitalism the flat-tery of partial imitation; but it obviously does not go far enough to be effective.

A far more promising step was taken last year in Poland, when Gomulka declared that “joining of collective farms is voluntary.” As a result, it is now announced, 85 percent, or all but 1,958 of the 12,500 collectives forced together in a decade of Communist rule, have been liquidated.

All that Russia now has to do is to allow such a return to relative economic freedom and quasi-private property not only in farming but in industry. Let the government give the workers and managers shares in their respective industries or plants, say, in proportion to their wages or salaries. Let the new shareholders or partners in each plant elect their own managing partner. Allow everyone to buy or sell shares as he chooses; to change his occupation; to buy or sell or produce or consume what he wishes. Free all wages and prices from government control. Let successful managers reap their reward in profit, and let the burden of losses fall on the unsuccessful managers. Allow and encourage competition. Establish security of private property. Stabilize the currency. Respect obligations and enforce contracts. The result will be an enormous increase in production—of the goods consumers want, and in the proportions they want them.

This, of course, will be capitalism. But the Soviet leaders should find no difficulty in accepting it, provided only they are allowed to call it Modern Socialism.
The President’s decision to throw the weight of his great military prestige behind his military budget might have been more effective had he not chosen to defend nearly every other segment of his budget with equal ardor. “No great reductions in it are possible,” he declares, “unless Congress eliminates or curtails existing programs.” If this merely refers to some programs, it is self-evident. But it seems to assume that any program, once started, must continue without re-examination forever.

And this assumption appears to be the chief reason for the continuance of the foreign-aid program. If we had not previously embarked on that program, and got everybody injured to it, and some public figure came along now and suddenly proposed that we give $4 billion away next year to some 60 different countries, he would be thought to have taken leave of his senses. But as we have already handed out some $62 billion on foreign aid since the end of the second world war, the burden of proof is assumed to be on those who would “desert our friends” now.

Let us begin, for example, with the arguments that attempt to belittle the size of the foreign-aid program. Its cost, declares the President, “amounts to only 5 percent of the budget.” But the more extravagant the total budget, the smaller a percentage of it is any given sum. The $3.8 billion proposed for 1958 for foreign aid alone is greater than the entire Federal budget in any fiscal year from 1922 to 1932.

WHAT IT COSTS US
The most realistic way of measuring the present fiscal burden of foreign aid is to ask how much taxes could be reduced if foreign-aid spending did not exist. On the basis of estimates compiled by the Tax Foundation, I find that if no one were taxed at anything higher than a combined normal and surtax rate of 30 percent (which now applies to the income-tax bracket between $6,000 and $8,000 a year), the loss in revenue would be no more than $3.5 billion. Anybody paying any higher personal-income-tax rate than this, therefore, can figure that the addition is what the foreign-aid program costs him personally.

An elementary point constantly forgotten is that it is impossible in practice to tell the difference in net effect between foreign “military” aid and foreign “economic” aid. When we pay for part of a country’s defense, we free that much of its own funds to enable it to buy other things. When we give a country “economic” aid, it has that much more to spend on its military establishment. This means that the constant distinction made between “military” and “economic” aid is of dubious practical importance.

UNPROVED ASSUMPTION
Our military aid (which in 1958 would be some $3 billion, or three-fourths of total foreign aid) rests on the unproved assumption that none of the aided countries can fully pay for its own defense. This assumption is implausible on its face. The President tells us: “Around the world we have provided our allies, over the past seven years, some $17 billion in direct military assistance. Over the same period, the defense budgets of our allies have totaled some $107 billion.” The question naturally arises why these “allies” could not have increased their military budgets an average of 16 percent to pay for the whole of their own defense? A year ago (April 16, 1956) I pointed out in this place that whereas the U.S. was spending some 62 percent of its total budget on defense, thirteen of our principal “allies” spent an average of only 26 percent of their total central government budget on defense.

To claim that we are getting our own defense cheaper by paying also for part of 38 other countries’ defense begs an enormous question. Generally speaking, countries that think they need us for allies continue to want common defense treaties with us whether we help to support them financially or not. Countries that think they do not need us for allies, but only that we need them, may of course consent to take our money. But we merely delude ourselves about what we are buying with it.

The case for foreign “economic” aid is far weaker than the case for “military” aid. But that is another column.

Private Foreign Aid
June 10, 1957

“Military” aid will account for about three-fourths of the total cost of the foreign-aid program. Yet a separate examination of “economic” aid may prove enlightening.

Even the heavy program proposed cannot be described as anything more than a token program. It would be a mere bucket of water in the great sea of poverty into which it was poured. The President tells us that “a billion free people . . . live in lands where the average yearly income of each man is $100 or less.” To the nineteen or so “new nations” in which these people
live he is proposing to give in total economic aid next year about $1 billion. But this means $1 a year per person—which, other things equal, would raise each man's annual income from $100 to $101. Will this 1 percent increase remove the specter of Communism? Will it meet what Secretary Dulles calls their “determination” to raise their pitifully low standards of living?”

CAPITALISM THE ANSWER
It is not by government-to-government token aid that these countries can fight their way out of their age-old poverty. It is not by the socialistic experiments to which they are resorting in their “determination.” It is not by flirting with Communism or adopting it. They can fight their way out of poverty—and at what would seem a magical speed—by adopting the philosophy and methods which built this country up from a few pioneers, struggling with a few crude tools, to the richest and most productive nation that the world has ever seen. The leaders of the “underdeveloped nations” can also do this—by adopting free enterprise, by adopting precisely the philosophy of capitalism to which they are so hostile.

Capitalism is not, as the politicians of the “underdeveloped countries” suppose, mere “technical know-how,” or the “application of mechanical power.” These are among the results of capitalism, not its causes. Capitalism is a set of economic and political principles. It means freedom to produce and consume, freedom to buy and sell, freedom of contract, free prices, and free markets. With these freedoms it combines the institution of private property, under which a man is entitled to keep the fruits of his labor. It is these freedoms and protections that give so tremendous an incentive to production.

If the “underdeveloped areas” were to adopt these principles, they would immediately attract both domestic and foreign private capital for their own development. For then they would willingly give the minimum assurances necessary to attract private investment—guarantees to private property against nationalization, seizure, or excessive taxation; freedom to withdraw earnings or principal; freedom from vexatious regulations and controls generally.

PRIVATE INVESTMENT
Some of us have been pointing this out with perhaps wearisome repetition for years (e.g., Newsweek, July 7, 1952). The case was admirably put a couple of months ago in a report by the American Enterprise Association. The thesis of the report is that, dollar for dollar, private foreign investment stimulates more economic growth than foreign aid; and that primary reliance on private enterprise rather than government-to-government aid is more likely to produce an efficient and sustained rise in the welfare of the underdeveloped countries, as well as good political relations with the United States. Private foreign investment, in contrast to aid, the report pointed out, minimizes suspicion on the part of foreigners that ulterior motives are involved. It creates no sense of charity; it emphasizes mutual benefits; and it averts insoluble disputes concerning the intercountry distribution of aid.

The Administration’s new plan does pay lip service to the potential role of private foreign investment. But it wishes to subordinate it to a government Development Loan Fund which as Secretary Dulles admits, would “take greater financial risks than those acceptable to existing institutions and would, in fact, be primarily an instrumentality of foreign policy.” This apparently means that foreign nations would continue to get loans by threatening to go Communist rather than by creating an attractive climate for private investment. ✫

High Taxes vs. Yield
June 17, 1957

Our steeply “progressive” personal income taxes, as students of the subject have long recognized, undermine incentives and slow down the capital formation upon which our economic progress in the long run depends. But as a new 40-page study by the Tax Foundation proves in detail, these confiscatory rates do not even achieve their ostensible purpose of raising revenue.

If a flat rate of 20 percent (now applying only to the lowest taxable income bracket) were applied, for example, to all taxable income, 85 percent of the revenue at 1955 rates would still be obtained. This rate produced $25.5 billion of the revenue from the personal income tax in 1955. All the “progressive” rates together produced only $4.4 billion more.

Our extravagant Federal expenditures are in large part the result of the belief that “the rich” are paying them. This belief is a delusion. If the present rate structure were cut off at a maximum of 50 percent, 98 percent of the revenue at 1955 rates would still be obtained. (The loss in revenue would be only $734 million.) If the present rate structure were cut off at a maximum of 70 percent, 99.5 percent of the revenue at 1955 rates would still be obtained. (The loss would be only $145 million.)

RATES VS. REVENUES
But even these relatively small losses are calculated on the assumption that income in the higher tax brackets
would not change. Yet the Tax Foundation’s study provides a very heavy presumption that if the top rates were reduced as indicated, the incomes they affected would not only increase relatively to other incomes as a result of the incentives (or reduced deterrents) provided by the tax cut, but would increase enough actually to increase government revenues from these incomes.

Time and again, when the highest rates were reduced, relative revenues from the high-income brackets rose. During the 1920s the greatest reduction in surtax rates was at the top of the income scale (from 65 percent to 20 percent). Despite this reduction, the share of the total income tax paid by the high-income classes more than doubled—from 30 percent in 1920 to 65 percent in 1929.

The contrast is even more striking when we look at the steady long-term fall in the percentage of the total tax revenues collected from the higher incomes as the rate on those incomes was increased. Despite a huge increase in total personal incomes, we find that in the highest incomes (those of more than $100,000) there has been no long-term upward trend in total income reported. In fact, average reported income per tax return above $100,000 is actually less in recent years than in 1916!

THE $100,000 INCOMES
As neither official national income figures nor price indexes are now generally carried back beyond 1929, I take that year as our base of comparison. The national income increased from $87.8 billion in 1929 to $302.1 in 1953—a rise of 244 percent. The top surtax rates on incomes over $100,000 were increased from 20 percent in 1929 to 74 to 89 percent in 1953. And the total income of those who filed income-tax returns over $100,000 fell from $4.4 billion in 1929 to $2.9 billion in 1953, a decline of 33 percent.

Even this does not show the real contrast. For in 1953 wholesale prices had risen to an index of 110.1 as compared with 61.9 in 1929. This means that the incomes of $100,000 and over in 1953 should in strictness be compared (in real purchasing power) with incomes of $56,222 and over in 1929. As the Tax Foundation study does not make full allowance for all these factors, its conclusions actually understates its case.

The effect of high taxes on incentives to work and invest has been obscured, it is true, by nearly three decades of depression, war, and inflation. But it is enormously probable that cutting off the top progressive rates at a maximum of 50 percent (instead of the present merely punitive 91 percent) would lead to an actual increase in governmental revenues. If Congress can set aside all catering to prejudice and envy, and courageously take this step, it will achieve a major tax reform without endangering a balanced budget. *

Tax Reform Now
June 24, 1957

We are being warned from Washington that all hopes for tax cuts that would apply even to part of the fiscal year 1958 are vain and unrealistic. The tacit assumption on which all these warnings rest is that the proposed $72 billion expenditure total for 1958 is sacred and untouchable, and might “have to be” even larger.

Let us, for the sake of argument, grant that the $72 billion budget “can’t” be reduced—or at least won’t be. It is still possible to make, now, major reforms in our tax laws that would not reduce revenues at all.

Other major reforms could be made in the personal income-tax rate structure that would involve only a negligible loss in revenue. One would be to reduce the present discrimination against irregular incomes. An inventor, novelist, or motion-picture actor may earn $100,000 this year and nothing for the next three years. He would pay (if single) a tax of $66,798. A corporation executive, on the other hand, with a $25,000 income for each of four years, would pay a total tax on his $100,000 of only $39,184. Such discrimination could be greatly reduced by allowing a taxpayer to “average down” his tax for a certain number of years on the basis of his average annual income over the whole period.

There are half a dozen different ways in which the great injustices in the present capital-gains tax could be mitigated.

The corporation tax is another area where a major reform could be made without reducing revenues. At present, corporations pay a “normal” tax of 30 percent on the first $25,000 of net income, and a “surtax” of 22 percent (or a total of 52 percent) on all net income above...
It is important to keep this appalling worldwide picture constantly before our minds. For it reminds us that inflation is nothing but a great swindle, and that this swindle is practiced in varying degrees, sometimes ignorantly and sometimes cynically, by nearly every government in the world. This swindle erodes the purchasing power of everybody’s income and the purchasing power of everybody’s savings. It is a concealed tax, and the most vicious of all taxes. It taxes the incomes and savings of the poor by the same percentage as the incomes and savings of the rich. It falls with greatest force precisely on the thrifty, on the aged, on those who cannot protect themselves by speculation or by demanding and getting higher money incomes to compensate for the depreciation of the monetary unit.

WHY INFLATION?

Why does this swindle go on? It goes on because governments wish to spend, partly for armaments and in most cases preponderantly for subsidies and handouts to various pressure groups, but lack the courage to tax as much as they spend. It goes on, in other words, because governments wish to buy the votes of some of us while concealing from the rest of us that those votes are being bought with our own money. It goes on because politicians (partly through the second- or third-hand influence of the theories of the late Lord Keynes) think that this is the way, and the only way, to maintain “full employment,” the present-day fetish of the self-styled progressives. It goes on because the international gold standard has been abandoned, because the world’s currencies are essentially paper currencies, adrift without an anchor, blown about by every political wind, and at the mercy of every bureaucratic caprice. And the very governments that are inflating profess solemnly to be “fighting” inflation. Through cheap-money policies, or the printing press, or both, they increase the supply of money and credit and affect to deplore the inevitable result.

The following table is based on official cost-of-living indexes, many of which underestimate the real extent of currency debasement. Russia and its satellite countries are omitted because disparities between actual and “official” price levels are so wide and the statistics are meaningless. The American dollar, to which so many other currencies are ostensibly tied, itself shows a depreciation of 15 percent in the period. The British pound sterling, the world’s most important trade unit, lost 34 percent, the French franc 52 percent, the currencies of Chile, Paraguay, Bolivia, and Korea, from 93 to 99 percent.

$25,000. This “progression” is quite unjustified. For a corporation earning $25,000 may be wholly owned by one rich man, whereas millions of low-income stockholders in big corporations are paying nearly 52 percent on their share of the net income of these corporations (before paying their personal income tax). Yet nearly all the bills in Congress to change the corporate income tax would carry this grossly misapplied “progressive” principle still further, either by reducing the tax on “small business” or by levying confiscatory rates (up to 75 percent, for example) on big corporations.

CORPORATE TAX CHOICE

There is a simple tax reform which would discriminate neither against sole proprietorships and partnerships nor against small corporations. This would be to make the corporate net income tax a flat 52 percent, but to allow any corporation the option in any year of paying the personal tax rate on net income instead. In practice (assuming present personal income-tax rates), this would mean that any corporation earning less than $46,000 a year would find it advantageous to pay the personal rates (although the personal income-tax bracket between $44,000 and $50,000 pays 72 percent). This plan would mean a smaller tax than at present for all corporations earning less than about $14,000 a year and a higher tax for others.

The net effect of such a change would be to bring in a higher total corporate revenue than the present system. This could be offset by allowing corporations a lower rate on the part of their net income that they paid out in dividends, in place of the present clumsy and confusing system of dividend credits for individuals.

These major tax reforms could be made immediately, to apply to income of the 1958 calendar year. They would not reduce revenues; they would remove inequities; and they would greatly stimulate economic progress.

The Great Swindle

July 1, 1957

A year ago (Newsweek, June 25, 1956) I printed here, under the above title, a table showing the depreciation, in terms of domestic purchasing power, of the currencies of 53 countries in the ten years from 1946 to 1955. This table had been compiled by Franz Pick. He has now carried it forward, for the nine-year period from January 1948 to December 1956, in the 1957 edition of his Currency Yearbook. I present the results below, showing the depreciation of 56 currencies in that period.
The Secretary presented “a record of a prospering America with new high levels of employment, rising income, and increasing purchasing power.” True, he had an easier time praising the early record of the Eisenhower regime than the later one, and under questioning by Senator Byrd made some qualifications not in his original statement. He admitted that the national debt had increased, not decreased, in the four Eisenhower years. When Senator Byrd confronted him with General Eisenhower’s 1952 promise to reduce spending to $60 billion, he made the political blunder of replying: “That was before he was elected.” And he had no convincing answer when Senator Byrd pointed out that a slipping back only to the levels of national income of two years ago would result in a budget deficit of $12 billion, or when the senator went on to express the belief that the “new inflation” that started last year will “in all likelihood continue and may, in fact, be accelerated.”

But to one contention Secretary Humphrey did have a convincing answer. This is the contention of the inflationist that the Administration has been reducing the volume of credit, and causing “inflation” and higher prices by raising interest rates.

Easy Money=Inflation
July 8, 1957

Secretary Humphrey’s defense of the Administration’s economic record was an admirable presentation. It was also (what was not evident in the headlines) a lucid lesson on the causes of inflation, and one of the most impressive answers yet made to the advocates of cheap money.

The Secretary presented “a record of a prospering America with new high levels of employment, rising income, and increasing purchasing power.” True, he had an easier time praising the early record of the Eisenhower regime than the later one, and under questioning by Senator Byrd made some qualifications not in his original statement. He admitted that the national debt had increased, not decreased, in the four Eisenhower years. When Senator Byrd confronted him with General Eisenhower’s 1952 promise to reduce spending to $60 billion, he made the political blunder of replying: “That was before he was elected.” And he had no convincing answer when Senator Byrd pointed out that a slipping back only to the levels of national income of two years ago would result in a budget deficit of $12 billion, or when the senator went on to express the belief that the “new inflation” that started last year will “in all likelihood continue and may, in fact, be accelerated.”

But to one contention Secretary Humphrey did have a convincing answer. This is the contention of the inflationist that the Administration has been reducing the volume of credit, and causing “inflation” and higher prices by raising interest rates.

HOW CREDIT EXPANDED
As to the volume of credit, the Secretary had no difficulty in showing that it has actually “expanded substantially in the last four years.” “There is more credit outstanding today than ever before.” In fact, as the Secretary pointed out, if we count mortgage, consumer, corporate, and other forms of nonbank credit, the total has increased over 1952 by the staggering sum of $146.5 billion ($135.8 billion from “savings” and $10.7 billion “from bank credit expansion, or increased money supply”). The “tight money” complaint, as the Secretary showed, merely reduces itself to this—that the government has put some limits on monetary expansion.

And Humphrey gave the best official answer yet made to the frequent contention that an increase in interest rates raises prices because interest rates are a cost of production. On the basis of the gross sales of all manufacturers, he pointed out that of the cost of an article selling for $100, about 33 cents represents interest During the ten-year period since 1946 “prices of goods that consumers buy rose 27½ percent, or $27.50 on a $100 item [due to labor and other costs], compared with the 20-cent increase due to higher interest.”

INTEREST AS A COST
His comparisons in home-building were no less impressive. A house that cost $10,000 to build in 1946 would cost $19,000 in 1957. If the interest rate on an FHA mortgage increased from 4 percent in 1946 to 5 percent
in 1956, then the monthly mortgage payment (on the basis of 15 percent down and a twenty-year amortization) would increase from $51.51 on the 1946 house to $106.58 on the 1957 house. Only $8.71 of this increase would be due to the higher interest cost; the other $46.36 would be due to other costs raised by inflation.

But to hold down interest rates artificially is to encourage borrowing and thereby to increase the money-and-credit supply. It is this increased money supply that raises prices and constitutes the heart of inflation.

The real criticism to be made of the Federal Reserve is not that it has kept credit too scarce and interest rates too high, but that it has yielded to inflationist pressure. It has made credit too plentiful and kept interest rates too low. It is precisely because interest rates are too low that the demand for credit still exceeds the supply. A discount rate of only 3 percent (when 91-day Treasury bills yield 3.404 percent) is inflationary. The Fed might be well-advised follow the example of Canada, and keep the discount rate always at least ¼ of 1 percent above the bill rate. This would also show that the Fed was merely following the market, and not arbitrarily raising interest rates.

### Why ‘Tight Money’

**July 15, 1957**

The report on June 26 of the subcommittee on Fiscal Policy of the Congressional Joint Economic Committee was obviously a political compromise. Like all such compromises it contained double talk; it said two mutually contradictory things at once.

It began by admitting that “the rapid expansion of Federal government spending . . . has contributed significantly to inflationary pressures.” It had much to say about the need for economy. But: “At the same time, a number of soft spots in the economy emphasize the need for continuing alertness . . . which may require revisions in current public policies”—i.e., deficit spending and “relaxation of present general credit controls.”

Now there are always “soft spots,” even in the midst of the biggest inflationary boom. And if we are to abandon anti-inflationary policy the moment it shows signs of being effective, if the only flexibility we are willing to permit is in the upward direction, then we are in effect committed to a continuance of inflation. Stabilization after an inflationary boom is always painful. It necessarily brings some “soft spots,” recessions in some industries. A stable “full employment” economy, with simultaneous full employment in all lines, and no losses or soft spots anywhere, exists only in a Keynesian dream world. A policy aimed at maintaining constant full employment in every line, and with constantly rising wage rates, is a policy of inflation.

### A Rare Merit

But the Congressional subcommittee report does have an outstanding and (in view of present political pressures and confusions of thought) a rare and unexpected merit. It does support the Federal Reserve’s so-called “tight money” policy. It does declare that “public policies to cope with increases in the price level must take the form of general fiscal and monetary restraints on the expansion of total spending.”

The report shows unusual economic sophistication. It throws proper doubt on the recent fashionable “cost-price push” theory of inflation: “Present inflationary pressures frequently are attributed to the so-called cost-price push, as distinct from the traditional inflation resulting from excessive demand. Whether or not the distinction is valid, it is evident that general price increases can occur without increasing unemployment only if demand is adequate to support the higher price level. The basic problem is an inadequate level of savings out of current income.”

This is correct; but it could have been stated much more clearly and forcibly. The “excessive demand” that causes inflation means excessive monetary demand. Excessive monetary demand comes from excessive money supply. Excessive money supply is the result of increasing the supply of money and credit more than the supply of goods and services.

### Money vs. Wage Rates

And the supply of money and credit is excessively increased whenever interest rates are held down by Federal Reserve policy below the level at which unhampered market forces would have fixed them. When interest rates are artificially held down by governmental policy, borrowing is over-stimulated; excessive money and credit are created through the banking system, and prices (including wage rates) are pushed up. This is the essence of inflation.

Expansion of the money supply is both the necessary and the sufficient cause of inflation. An increase in wage rates in neither a necessary nor a sufficient cause. Without an increase in the money supply, an increase in wage rates would lead merely to unemployment. Increased wage rates lead to inflation not through economic necessity but through political pressure. First the government sets up or retains a legal framework (the Norris-LaGuardia Act, Walsh-Healey Act, minimum-wage law, Wagner-Taft-Hartley Act) under which wage rates are forced up. Then there are pressures from every
side to give everybody the additional monetary means to pay for the goods and services at the higher prices made necessary by the higher wage rates.

We can stop this “wage-price spiral” the moment we have the economic understanding and the political courage to do so. ♦

Cost-Push Inflation?
July 22, 1957

Within the last few months there has broken out in several places the theory that we are now confronted with a “new” kind of inflation. As described by Robert C. Tyson, chairman of the finance committee of the U.S. Steel Corp.: “Our new kind of inflation appears to be cost inflation pushing prices up, rather than price inflation pulling up costs through competition bidding for materials and manpower. We might think of it as a new cost-push type as distinguished from the conventional demand-pull type of inflation.”

Going even farther, a recent study of the National Industrial Conference Board declares: “Although money supply has been checkreined by Federal Reserve policy, business is still on the uptrend. . . . Since prices have continued to rise, the clear lesson of 1956 is that money and its rate of use are not the sole determinants of price. . . . Today, the critical question is: How adequate are monetary controls for coping with price pressures that arise from nonmonetary forces?”

NO STATISTICAL PROOF

Now these theories seem to me to mix truth with error. The Conference Board attempts to prove its case statistically. But as the U.S. Bureau of Labor Statistics pointed out on May 13 in a study of productivity, costs, and prices: “Where the figures indicate that prices and unit labor costs showed about the same increase, or that one or the other showed a greater increase during a particular year or period of years, this should be taken as a description of what happened and not necessarily as an explanation of what ‘caused’ the change. An increase in unit labor costs may lead to an increase in price, but conversely an increase in price can result in strong pressure for increases in wages. . . . The answer to the question of whether the wage increases cause the price increase or vice versa cannot be determined from the figures alone.”

The BLS report goes on to declare: “Average hourly compensation [of workers] in current dollars increased much more than productivity during the postwar period [1947–56]. The former increased by about 61 percent, the latter by 26 percent, leading to an increase in employee compensation per dollar of real product of about 28 percent.”

This sounds ominous, but only because it is confusingly stated. Four paragraphs farther down the report declares: “The increase of about 28 percent in employee compensation per dollar of real product was almost identical with the increase in price between 1947 and 1956.” In other words, the word “productivity” in the first quotation must mean productivity in real terms, not dollar-value terms. Multiply the 26 percent increase in “productivity” by the 28 percent increase in price level, and we get the same 61 percent increase as in hourly labor income.

ANTICIPATIONS

The Conference Board tries to prove that the increase in the money supply cannot be the cause of the price rise in the last two years, because the money supply has not gone up in this period. But this overlooks longer comparisons, and mistakenly assumes that changes in money supply must reflect themselves exactly proportionately in prices with neither time lag nor anticipations. Expansion of the money supply is both the necessary and the sufficient cause of inflation. Without such expansion, an excessive increase in wage rates would lead merely to unemployment.

I regret having to criticize what are otherwise two excellent and informative statistical reports. And insofar as they describe political pressures, the “cost push” theorists are right. Our politicians put irresponsible and irresistible power in the hands of union leaders, and then plead with them not to use it. They remove the natural economic penalties for recklessness, and then beg for restraint. If the Federal Reserve seriously tried to hold the line on money and credit, while the union leaders kept pushing up wage rates, it is the Federal Reserve, not the unions, that the politicians would blame for the consequent unemployment and recession.

As long as the political climate remains this unhealthy, a halt to inflation is impossible. But with understanding and courage, inflation could be halted overnight. ♦

Built-In Inflation
July 29, 1957

There are so many confusions of thought today concerning the causes and cure of inflation that in calling attention to one error one must temporarily ignore another. One is liable, as a result, to be accused of having fallen
into the error one has ignored. This is particularly true in any discussion of the respective roles that wage increases and monetary policy play in inflation.

In answer to the pure “cost push” theorists, I have pointed out that expansion of the money supply is both the necessary and the sufficient cause of inflation; and that without an increase in the money supply, an increase in wage rates would lead merely to unemployment. But while this generalization is essential to a correct theoretical understanding of what is now going on, it was never intended to be, and is certainly not, a comprehensive factual description of what is now going on. For if to the economic forces considered in isolation, we add political and institutional forces, we get a total picture of the present inflation in which wage increases play a crucial role.

**Political Pressure**

And they play this role because of governmental policy. Governmental policy in this respect has done two main things: (1) Through special legal privileges and immunities, it has built up the power of unions and union bargaining to a point where employers can no longer resist excessive wage demands. (2) When these demands have been granted, excessive pressure is put on the governmental monetary managers to create the money and credit necessary to sustain the wage increase (and consequent price increases) without unemployment. Thus wage, price, and money-and-credit increases act on a ratchet or endless-chain principle to keep the inflation going.

And the “cost push” theorists are right in this—that the political pressure for inflation today comes from the desire to keep “full employment,” to encourage constant wage increases, and to make both possible by low interest rates and credit expansion.

When the Federal Reserve lets interest rates up to the point to which excessive demand tends to pull them, when it seriously tries to keep money and credit from further expansion, it is denounced for a “tight money” policy. It is accused of discouraging home-building, “small business,” or what not. When the steel industry raises prices to meet the higher costs necessitated by excessive wage advances forced upon it, senators denounce the price rise as inflationary, but are silent about the wage rise that caused it. The President pleads for “restraint” on the part of business and labor, forgetting the elaborate legal framework which has made union leaders all-powerful and left employers impotent to resist wage-increase demands.

**Reappraisal Needed**

We do indeed have a built-in inflation. And it is built in by governmental policy. Among its foundation stones are the Norris-LaGuardia Act, the Walsh-Healey Act, the Fair Labor Standards Act, the Wagner-Taft-Hartley Act (and the mass of NLRB and court decisions), and the Employment Act of 1946. Under these laws the government has not merely encouraged but in effect forced the creation of industrywide unions with irresponsible private power to force continuous wage increases.

If the world were under a real international gold standard, with the natural penalties that this sets on excessive money-and-credit expansion, the result of these wage increases would be unemployment. But under nationally managed paper currencies the national managers everywhere are denounced for trying to sit on the lid.

There is no economic problem whatever to stopping inflation. It could be stopped overnight. But this would involve not only courage in the monetary field, but an “agonizing reappraisal” of the labor policy of the last 25 years that neither the Republicans nor the Democrats, as a party, have the courage to make. It is not merely that they do not have the courage to act. They do not have the courage to face the truth about the Frankenstein monster of uncurbed union power that they themselves have built.

**Contradictory Goals**

August 5, 1957

Last January the Guaranty Trust Co. of New York, in its monthly Survey, discussed a problem that has engaged the attention of leading European economists and is now becoming urgent here. This involves the clash in the economic objectives of governments which assume “responsibility” for the achievement of certain “goals.”

Our own government, for example, now follows Britain and France in pursuing three mutually contradictory aims. These are (1) constantly rising wages; (2) stable prices; and (3) full employment.

It should be obvious that these goals cannot all be achieved at the same time. Even in the short run, any two of these goals can be achieved only at the sacrifice of the third. Thus if we try to have constantly rising wages (regardless of productivity), we can have full employment only if we are willing to allow prices to go up to maintain profit margins, and only if we increase monetary purchasing power enough to enable consumers to pay the higher prices. But this is another way of saying that we must give up the goal of stable prices and encourage a continuous inflation.
Yet there is one way in which the three goals of rising wages, stable prices, and full employment (when these goals are properly understood) could all be achieved. This way is through the restoration of a sound currency and a genuinely free economy. In such an economy, it is true, wages could not for long rise faster than marginal labor productivity, but they would rise as fast as marginal labor productivity, though the rise in their real purchasing power might be reflected more in lower prices than in higher wage rates.

'Administered' Inflation
August 12, 1957

Gardiner C. Means, an economist who invented the term “administered prices” in the ’30s, has come up with the theory that the current inflation is an “administered” inflation. The solution, he thinks, would be for the President to call a conference of business and labor leaders, and get an agreement from them to “hold the line” for a year or two on wages and prices. But his theory of causation is false; and his proposed remedy is not needed, would not work, and would greatly aggravate the very evil it is supposed to cure.

Past inflations, he agrees, have been “monetary” inflations—the result of an increased money supply bidding for the available supply of goods and services. This is correct. And it applies to every inflation, including the present one. This can be shown by any set of long-term comparisons. At the end of 1939, the total supply of money and bank credit (total bank deposits plus currency outside of banks) was $64.7 billion. In March of this year it was $221.5 billion, an increase of 246 percent. In 1939 wholesale prices were at an index number of 50.1; today they are at a level of 117.4, an increase of 136 percent. The chief reason why wholesale prices have not gone up even more in this period is that there has also been a great increase in production. The increase in the money supply is a sufficient explanation of the present inflation. We do not have a “new kind” of inflation, and we do not need new explanations.

IT WOULD NOT WORK
But it would not even work. The moment an inflation is planned, acknowledged, and foreseen, the game is up. Inflation is a swindle. You cannot tell your intended victim in advance that you intend to swindle him. Slichter proposes his plan mainly in order to meet annual wage demands. But union leaders, if the plan were put into effect, would simply add 2 percent (or whatever the planned annual inflation was) on top of the demands they would have made anyway. In fact, lenders, investors, merchants, speculators would all mark up their demands or change their operations to beat the inflation, which, out of control, would race to a crack-up.

What is still understood only by an appallingly small minority even of the “experts” is that prices, in the early stage of an inflation, usually rise by less than the increase in the money supply, but in the later stage of an inflation always rise by more than the increase in the money supply.
Certain prices, it is true, are administered (within narrow limits) at levels different from those that a perfectly fluid competition would bring about. The outstanding directly administered prices are those administered by government. This includes all public-utility rates and railroad rates. But these are administered down rather than up. Farm prices have of course been supported by government above free-market levels. Farm products have risen 150 percent since 1939, whereas industrial products have risen only 116 percent.

By far the most important administered price is the price of labor. Wage rates have been administered upward by powerful industrywide labor unions. Since 1939 hourly wages in manufacturing industries have increased by 229 percent.

FALSE CURE
As a cure for all this, Means would have the President call a conference of business and labor leaders at which he would “get agreement from them to hold the line” on prices and wages. Now such agreements would be extremely harmful if they were uniformly adhered to. They would not allow for the relative changes in particular prices and wages necessary to adjust output to changes in supply and demand.

But all hold-the-line legislation or voluntary agreements in the past have broken down under political pressures, chiefly in favor of wage increases. The Means plan left-handedly recognizes this. His proposed agreements would allow “small” wage increases to take account of increases in productivity, and increases “where a major disparity in particular wage rates required correction.” Anyone who remembers our second-world-war experience must know that such loopholes would be exploited to the point where the hold-the-line agreements would become a farce. But even this would be better than their strict enforcement. For to try to hold a uniform line on prices and wages, particularly if the money and credit supply continued to be increased, would have a disastrous effect on production.

And the scheme is wholly unnecessary. All that is needed to stop the present inflation is a halt to the expansion of money-and-credit supply and repeal of the legislation that creates monster unions and gives them a coercive wage-raising power that employers are impotent to resist.

Easy Money Has an End
August 19, 1957

When four Federal Reserve Banks raised their discount rates as of Aug. 9 to 3½ percent instead of 3, bringing the level to the highest since 1934, there was the usual explosion by the Patmans and Kerrs in Congress against “tight money.” But as the Guaranty Trust Co. of New York pointed out in its July Survey, present rates appear high only in comparison with the abnormally low rates of the depression years and the artificially maintained rates of the war and early postwar periods.

Longer-run comparisons show, in fact, that present interest rates are still quite moderate for a time of active business. Rates on commercial paper, averaging about 4 percent, compare with 6 percent in 1929 and 7½ percent in 1920. Before 1929, a rate below 4 percent was exceptional. As for the preceding 3 percent Federal Reserve discount rate, never until 1930 did any Federal Reserve Bank set a rate below that level.

Nor is the rate structure in the United States high in relation to those elsewhere. Of the 32 foreign central-bank rates listed in the Federal Reserve Bulletin for July, only five are below that in the United States. This is in spite of the fact that many countries still maintain unjustifiably low central-bank rates. The maintenance of short-term interest rates at too low a level, in fact, is one of the main explanations of the continuance of inflation in those countries. Excessively low rates always encourage overborrowing, which means an expansion in the supply of money and credit, which in turn causes commodity prices to rise even further.

IT CAN’T GO ON FOREVER
What the Federal Reserve authorities and the Treasury Department have been doing in the last two and a half years has not been to make money tighter, but simply to allow the money market to tighten itself as the demand for credit increased.

It is possible, of course, for a government or a central bank to keep money rates low for a long time, either by printing money directly or by permitting the overborrowing and consequent expansion of credit to which excessively low money rates inevitably lead. What is less well understood is that cheap money cannot be continued indefinitely. It sets in motion forces that eventually drive interest rates higher than if a cheap-money policy had never been followed.

The expansion of money and credit that is necessary to hold interest rates down also raises commodity prices and wages. Higher commodity prices and wages make it necessary for businessmen to borrow correspondingly more in order to do the same volume of business. Therefore the demand for credit soon increases as fast as the supply. Later on, still another factor comes in. When both borrowers and lenders begin to fear that inflation is going to continue, prices and wages begin to go up more than the increase in the supply of money.
and credit. Borrowers want to borrow still more to take advantage of the expected further rise in prices, and lenders insist on higher interest rates as an insurance premium against expected depreciation in the purchasing power of the money they lend.

THE BRITISH EXAMPLE
When this happens in an extreme degree, we get a situation like that in Germany in November of 1923, when rates for “call money” went up to 30 percent per day. This phenomenon in mild degree is already evident in Britain. The First National City Bank of New York has just pointed out in its August letter, for example, that while the U.S. Treasury 2½s were trading around 86 in June, the British Treasury 2½s issued in 1946, “during the last dying gasp of the cheap-money policy of the United Kingdom,” could be bought at 50, or half the original purchase price. Yet corporate shares in Britain have been bid up to levels where returns to the investor are in many cases substantially lower than on gilt-edge bonds. As one London investment house explains the matter, “The argument is, indeed, put forward that, since the pound has been depreciating in the past decade at an average rate of 4¾ percent per annum, any investment likely to show a total net return on income and capital accounts over a given period of less than this amount is giving a negative yield and should be discarded.”

The new camouflaged devaluation of the French franc is not only one more humiliating economic experience for France itself, it is one more dramatic exposure of the bankruptcy of the whole postwar international currency scheme imposed on the world mainly by the late Lord Keynes and Harry Dexter White. This includes the cavalier rejection of the international gold standard as a “barbarous relic,” and the substitution of a built-in system of exchange control with a paper-currency unit pegged by each government at an artificial, arbitrary, and unreal valuation supported by police penalties, import quotas, import licenses, and import taxes, bilateral trade agreements, export subsidies, the International Monetary Fund, the European Payments Union, and similar futile substitutes for sound internal policies.

For a full century before 1914 the French franc, in terms of gold, sold without change at a rate about 145 times as high as it is today. In terms of living costs the situation is as if, in the U.S., a dollar today were to buy half as much as a cent did in 1914. Yet the tragedy of the French franc does not stand out in the world today as some glaring exception. It is, on the contrary, typical of what has been happening to nearly every currency in the world since the outbreak of the second world war.

WORLDWIDE INFLATION
In Newsweek a few weeks ago (July 1), I printed a table showing the percentage decline in the purchasing power of 56 different currencies between January 1948 and December of last year. The median decline of these 56 currencies in this nine-year period was 33 percent. The French franc, it is true, then showed a fall of 52 percent. But thirteen currencies had fallen more. The currencies of Chile, Paraguay, Bolivia, and Korea declined from 93 to 99 percent; the British pound sterling 34 percent, and the American dollar, the supposed world’s currency anchor, 15 percent. Each country has a theory that its own inflation is of some “new type” due to some malicious influence outside of its own control. But in each case the real cause is that the country has printed too much paper money.

When, in September of 1949, some 30 countries, following the example of the British pound sterling, devalued their currencies, reassuring statements were made nearly everywhere that thanks to this great major operation the cancer had been removed; the devalued currencies were now all at “realistic” levels, the balance of trade would once more be restored, and currency units would be permanently stabilized. It was forgotten that if the old practices continued, the process leading to further devaluation would simply start all over again.

For a full century before 1914 the French franc, in terms of gold, sold without change at a rate about 145 times as high as it is today. In terms of living costs the situation is as if, in the U.S., a dollar today were to buy half as much as a cent did in 1914. Yet the tragedy of the French franc does not stand out in the world today as some glaring exception. It is, on the contrary, typical of what has been happening to nearly every currency in the world since the outbreak of the second world war.

BUREAUCRATIC CHAOS
There is, unfortunately, no reason to suppose that the franc is any more likely to remain stable at its new level than it did at its 1949 level. For though some temporary reforms have been put into effect—an increase in the discount rate, a restriction of credit, a cut in government expenditures, an increase in taxes—France has retained the old system of arbitrary exchange controls, with a mere change and simplification of details. Instead of allowing the franc to be freely bought and sold at whatever prices buyers and sellers can agree upon—which would lead to an automatic restoration of the balance of trade—France continues to fix the franc at an arbitrary “official” level, and to try to balance trade artificially by offering a 20 percent subsidy on most exports and imposing a 20 percent tax on imports (except fuels and raw materials “vital” to French industry). Meanwhile, the French economy remains honeycombed with
The Keynes-White International Monetary Fund system, with its national paper moneys traded at government-pegged prices enforced by police power and a crazy quilt of bureaucratic controls, has led only to continuous inflation, trade disruption, and monetary chaos. There is no substitute for sound internal policies in each country. The only real cure for the present world inflation would be a return to the full international gold standard and the disciplines and restraints which maintain that standard.

Collapse of a System
September 2, 1957

The new devaluation of the French franc (counted by one researcher as its eleventh devaluation in 21 years) is a still further proof, if any were needed, of the weakness, instability, and bankruptcy of the paper-money exchange-control system built in by Lord Keynes and Harry Dexter White after the second world war under an International Monetary Fund. This system is a tour de force. It combines the alleged disadvantages of the international gold standard with all the real disadvantages of a floating paper-money standard, with none of the merits of the first and none of the compensations of the second.

A floating paper-money standard (as in Britain between 1931 and 1939) is, of course, inherently unstable, subject to every political pressure and bureaucratic caprice. It tends constantly toward more inflation. It is argued, however, as an “advantage,” that prices and wages in the country with a floating paper money can be kept “independent” of world prices and wages.

A floating paper-money system also has the (comparative) advantage that fluctuations of the currency in terms of other currencies do not too greatly disrupt trade between that nation and others, and do not create a “dollar gap” between its imports and exports. For when a country’s paper currency begins to depreciate, the rise of internal prices and wages is offset in the foreign-exchange market by a corresponding decline in the price of that currency in terms of other currencies. And a floating currency is always fully convertible at the market rate.

Masking Inflation
What happens, instead, under the present system? Within each country there is constant pressure to maintain “consumer purchasing power,” easy money, ever-rising wages, and “full employment”—in brief, inflation. So each country inflates. But there is an agreement with the International Monetary Fund to maintain the official exchange value of the inflated currency. This is done by forbidding people to buy and sell that currency except at the official rate. This official overvaluation of the currency encourages imports, discourages exports, and creates a “balance of payments” crisis. The inflating country then seeks to offset all this by a maze of import quotas, higher tariffs, export subsidies, and multiple exchange rates. The problem finally becomes insoluble, and then the bureaucrats kick the whole economy downstairs.

The result is a series of violent devaluations, such as the worldwide crisis in September 1949, and the new French crisis today. Devaluation is a drastic remedy, equivalent to cutting off a leg to save a life. Yet as France has illustrated since 1949, the remedy is at best temporary if the patient continues the same practices as in the past. Moreover, each devaluation intensifies fears of further devaluations, of that currency and of others, and so makes the maintenance of the whole system more and more precarious.

Return to Gold
The entire IMF system of exchange control of paper moneys at arbitrary rates should long ago have been abandoned. But the only official suggestion that this be done has come from Ludwig Erhard, Economics Minister of Western Germany. Other officials talk privately of another devaluation of the franc and a smaller one for the British pound. A still more astonishing proposal is that the pound sterling be left unchanged in value while the American dollar, German mark, and Swiss franc be “revalued” upward by 10 percent. Such proposals have been aptly described as prescribing surgery on the healthy to cure the sick.

The only real permanent cure is a return to the international gold standard. As Philip Cortney has put it: “It should have become obvious by now that none of the important problems (like the prevention of booms and depressions, the establishment of freely convertible currencies plus stable exchange rate, the expansion of multilateral, unhampered international trade, the union of Europe) can be solved without a return to the international gold standard. . . . The gold standard is the only protection of the politicians against extravagant expenditure requests from pressure groups of all kinds. It is the only safeguard against demagoguery and social disorder.”
What Makes Reuther Big
September 9, 1957

Walter P. Reuther, head of the United Auto Workers Union, has always been an adroit politician and propagandist, but his latest proposal to the three major motor companies is his masterpiece. It devotes 21 eloquent paragraphs to declaring that inflation is a bad thing and that someone should do something about it. So here’s the scheme. Let the automobile companies cut their profits. Let them reduce the prices of 1958 models “to levels averaging at least $100 below” 1957 models. In return, though his UAW will still presumably demand “the biggest wage increase in the history of the union,” he promises to give “full consideration” to the effect of the price reduction on the corporations’ earnings “in the drafting of our 1958 demands.” Such sacrifice is breath-taking.

It may be, however, that Reuther’s proposal will prove a propagandistic boomerang. The heads of the three big automobile companies have all made effective replies. Harlow H. Curtice of General Motors has pointed out that the straight-time hourly wages paid by GM have increased 72 percent since 1947, though the cost of living has gone up only 25 percent. He has also called attention to the “unmistakable similarity” of Reuther’s current proposal to the “publicity maneuver” that Reuther used during his union’s 119 day strike against GM in 1945–46. Then also he insisted that GM could lower the price of Chevrolets by $100 and still grant his wage demand. Then also he demanded that the company “open the books” to prove or disprove its “ability to pay.” And, as Curtice unkindly points out, Reuther also publicly admitted only a few days after the settlement of that 119-day strike that “the whole question of producing the books was merely a public-relations job on our part” to put the company “over a barrel.”

CUT WAGES FIRST?
L.L. Colbert, president of the Chrysler Corp., correctly characterized Reuther’s proposal in his own reply: “While you propose that we absorb all cost pressures already put upon us and ahead of us and, in addition, reduce the price of our 1958 cars, you merely offer to take into ‘consideration’ the financial effect of the proposed price reduction when you confront the automobile industry with your 1958 demands, which you have described as ‘the largest package we’ve ever demanded.’ Would it not be just as logical for the automobile industry to ask the members of the UAW to take an immediate and sizable wage cut, which the companies would then ‘take into consideration’ in pricing their 1958 automobiles?”

Henry Ford II, finally, for his own company, points out that since 1948 Ford wages have gone up 70 percent while the price of the 1957 Ford, “a far superior product to its 1948 counterpart in every respect,” has gone up only 30 percent—“less than half as much.” And Ford sums up: “Thus, having poured gasoline on the fires of inflation, you now stand by and tell us how to fight the blaze.”

THE MEAT HE FEEDS ON
It is easy to prove that Reuther’s proposal is an empty propaganda gesture, wholly without practical merit. It is perhaps more important to ask how it comes about that a single labor leader has acquired the power which this arrogant proposal reveals. The answer is simple. He has this enormous irresponsible private power because Congress has conferred it on him.

The automobile companies are rightly prohibited from combining to fix their prices against the buying public. They do not dare even to negotiate as a unit with Reuther. But he is aided and abetted by the law to monopolize the labor of the entire industry. He is free to play the automobile companies against each other by pulling a strike in one and not in its competitors. The auto companies, on their side, are compelled by law to bargain exclusively with his union, no matter how unreasonable its demands or how insulting its tone. The Norris-LaGuardia Act and the Wagner-Taft-Hartley Act are the meat upon which this our Walter feeds that he is grown so great.

This is the situation to which the Administration and Congress remain persistently and willfully blind. Their impotence is self-imposed.

Set Currencies Free
September 16, 1957

When the governors of the International Monetary Fund gather in Washington on Sept. 23 for their annual meeting, they may be counted on, if past experience is any guide, to deplore the worldwide inflation that has continued ever since the fund was set up twelve years ago. They will no doubt once again recommend that nations balance their budgets, reduce barriers to international trade, move toward convertibility of their currencies, and refrain from creating multiple exchange rates. Some delegates may even suggest that nations stop printing more paper money.

But after this collective homage to the economic virtues has been duly paid, one delegate after another will explain that his own country continues to face a
special situation and must continue to impose a few restrictions on convertibility, a few barriers to imports or subsidies to exports, till the “emergency” is over.

**EXCHANGE CONTROL**

Each year the pretense is kept up that despite “disappointments,” real “progress” has been made toward “convertibility” and “stability.” The blunt truth is that since the International Monetary Fund was established the depreciation and debasement of currencies has gone steadily on from year to year. Worldwide inflation is rampant. And it is governmental policy that permits or creates this inflation. It is the system of the International Monetary Fund itself which encourages, prolongs, and enforces exchange control. This in turn requires for its enforcement a network of internal and external controls, of artificial currency valuations, tariff barriers, import quotas and export subsidies, that regiment national economies, distort prices and production, create so-called “dollar gaps,” and unbalance and disrupt international trade.

The only ultimate cure for this is a return to the international gold standard. But the situation is too chaotic, the network of government controls is too extensive and demoralizing, and confidence has been too profoundly shaken, to permit this to be done overnight. No government knows at what gold value it could safely set and maintain its currency unit to prevent either a dangerous inflation or a dangerous deflation.

There is one indispensable first step. This is to dismantle the entire exchange control system supported by the International Monetary Fund and to let the exchanges go free. This is the step that Ludwig Erhard, West Germany’s Economics Minister, has been almost alone, among high government officials, in recommending. Let us see some of its results:

The so-called problem of convertibility would be solved. Free exchanges would automatically mean free and full interconvertibility of currencies. Tangier, to take an illuminating illustration, is a free money zone. A dispatch from Morocco to The New York Times of Aug. 31 declares: “In Tangier anyone can import anything from anywhere. . . . Since any kind of money is exchangeable into any other kind of money in Tangier’s banks at the free market—that is, uncontrolled—rate, there will be no difficulty in paying for hard-money imports.”

For similar reasons, the so-called problem of the “imbalance of foreign trade” would be solved. In the last week of August, French Finance Minister Gaillard released figures showing that, since the partial devaluation of the franc, France’s $118 million deficit with the European Payments Union had been transferred into a credit balance of $36 million. This is merely because the French franc was allowed to sell nearer to its free market value.

**TO RESTORE CONFIDENCE**

Free exchange rates, of course, would also solve the so-called “dollar shortage,” which is merely a result of overvalued foreign currencies.

Free exchange rates would not, it is true, solve the problem of inflation or monetary instability. But they would at least reveal such instability from day to day, instead of hiding it, as exchange control does, until the whole false front collapses. When exchange rates were free, they could be stabilized only by policies within each country calculated to restore confidence both of nationals and of foreigners in that country’s currency. Canada has shown the way. Stability begins at home. The only cure for inflation is to stop inflation.

**Creeping Inflationist**

September 23, 1957

As nearly everybody professes to be against inflation (even those who fervently advocate the very things that cause it) it is refreshing to encounter a writer like Sumner H. Slichter of Harvard, who frankly wants inflation and doesn’t think we can get along without it.

He is careful, it is true, to say that he is only in favor of “creeping” inflation, not galloping inflation, though he is often vague concerning the exact point where a creep becomes a canter. He has been at times indiscreet enough to suggest that a price rise of 2 or 3 percent a year would be about right. This proposal has been thoroughly discredited. It has been pointed out that even if we could control an inflation to a rate of 2 percent a year it would mean an erosion of the purchasing power of the dollar by about one-half in each generation.

Even so, this would not accomplish Slichter’s announced purpose. He thinks prices must go up this much in order to meet the unions’ annual wage demands. But the moment Slichter’s inflation scheme was openly put into effect, union leaders would simply add 2 percent (or whatever the planned annual inflation was) on top of the demands they would have made anyway. In fact, lenders, investors, manufacturers, retailers, speculators would all mark up their demands or change their operations to beat the inflation, which would thereupon race to a crack-up. A declining currency must eventually obey the law of acceleration that applies to all falling bodies.
HOW FAST IS A CREEP?
But Slichter is irrepressible. In the September-October Harvard Business Review he not only continues to commend a creeping inflation, but reprimands Neil H. Jacoby, a former member of the Council of Economic Advisers, and C. Canby Balderston, vice chairman of the Board of Governors of the Federal Reserve System, for being against inflation. Space does not permit a detailed analysis of all the errors and confusions in Slichter's article, but it may be helpful to cite a few examples.

He declares that it is "incorrect" to believe that "creeping inflation is bound sooner or later to become galloping inflation," because this hasn't happened in the last 25 years in the United States. Well, our cost of living has more than doubled in the last seventeen years. Pretty good for a creep. And Slichter might take a look at the French franc, which is at considerably less than one-hundredth of its 1914 purchasing power. Or at the median loss of one-third of their value by 56 different currencies in the last nine years alone (Newsweek, July 1).

Slichter is callous about the losses suffered in recent years by the thrifty. Of the millions of savings-bank depositors and holders of government bonds who have seen the purchasing power of their holdings shrink by a third or a half, he writes coolly: "These people have paid the penalty for poor investment judgment." Their poor judgment consisted, in brief, in trusting their country's money and in answering their government's appeal to buy war bonds. Did Slichter warn against buying war bonds when they were being offered? Is he candid enough to warn everybody that it would be poor judgment to buy future bonds as long as "creeping" inflation continues?

WHAT A WINS, B LOSES
Slichter's fixed idea is that constant creeping inflation is necessary to maintain full employment. This leads him to misstate an argument of Jacoby's as a "suggestion that prices be kept stable by not permitting unemployment to fall below 4 percent." The truth is that full employment or its absence has no necessary connection whatever with inflation, but depends wholly upon the maintenance of fluid and functional interrelationships between wage rates and prices. Slichter does not understand the argument that unions cannot raise the real wages of the whole body of workers, and his attempted refutation misses the point.

Finally, in his efforts to minimize the harm done by inflation, Slichter fails to see that when employment is as full as it is today, further inflation must hurt on net balance as many people as it helps, for the gains in dollar income resulting from inflation must be offset by the losses in dollar purchasing power.

Subsidizing Socialism
September 30, 1957

Just before he retired as director of the International Cooperation Administration on Sept. 12, John B. Hollister issued a farewell directive to the effect that: "The United States is convinced that private ownership and operation of industrial and extractive enterprises contribute more effectively than public ownership and operation to the general improvement of the economy of a country . . . therefore . . . I.C.A. will normally not be prepared to finance publicly owned industrial and extractive enterprises." This directive was promptly repudiated by the State Department, which was reported to be "flabbergasted" and "angered" by it.

The incident throws a brilliant light on the nature of our foreign-aid program. The New York Times account declared, for example: "More than half of India's industry is state-owned. Thus, an announcement that the United States intended to follow a harsh line against aid for state-owned industry might logically have been read in New Delhi as a studied public insult. In addition, the department was unhappy about the implication that the United States intended to use its aid program as a form of bribery to stop socialization abroad."

FOREIGN-AID DILEMMA
These comments reveal quite clearly the dilemma into which the foreign-aid program has landed us. We have been subsidizing, encouraging, and prolonging the continuance of socialism abroad. Therefore, by a strange, inverted logic, to stop subsidizing socialism in foreign countries is to interfere in their internal affairs! Not to subsidize India's grandiose socialistic program by an enormous further "loan" of about $500 million becomes a studied public insult. To stop subsidizing socialistic programs abroad becomes "a form of bribery" to get them to adopt free enterprise!

This dilemma could have been foreseen. I discussed it myself in a book Will Dollars Save the World? ten years ago: "Intergovernmental loans are on the horns of this dilemma. If on the one hand they are made without conditions, the funds are squandered and dissipated and fail to accomplish their purpose . . . But if the lending government attempts to impose conditions, its attempt causes immediate resentment. It is called
‘dollar diplomacy”; or ‘American imperialism”; or ‘interfering in the internal affairs’ of the borrowing nation.”

For ten years the champions of our foreign-aid program have not only failed to face this dilemma but have refused even to acknowledge its existence. When forced reluctantly to confess that their program does subsidize socialism, they reply that it would be “intolerant” to refuse aid to a country practicing socialism. This argument tacitly assumes that foreign socialism, like Epicureanism or Mohammedanism, is merely a private philosophy or religion quite irrelevant to the purpose of our aid. But socialism is a set of policies which reduce and distort production, perpetuate dependence, and nullify the very purpose of our aid.

**SUPPORTING DISRUPTION**

It is not merely socialism that our foreign-aid program has supported, but disruptive exchange controls, price controls, inflation, import quotas, and export subsidies. In fact, our foreign-aid dispensers once made it a condition of our aid that countries receiving it should discriminate against American goods! (This was called “limiting dollar imports.”)

If the “economic” part of our foreign-aid program were completely abandoned, foreign nations wishing to attract outside capital for development would have to appeal to private investors. This means that they would have to follow policies calculated to assure repayment of the loans made to them. But the free-enterprise policies necessary to create confidence on the part of private foreign investors happen to be precisely the policies that will most rapidly raise the production and living standards of the “underdeveloped” countries and balance their international trade.

The billions our government has given away have not merely failed of both their economic and political purpose, but they have delayed the return to currency convertibility and the restoration of private production incentives that would otherwise have taken place.

---

**How to Wipe Out Debt**

October 7, 1957

When it is pointed out to our Republican Administration, as it was to its Democratic predecessors, that our huge national debt continues to mount, a favorite defense is that it has not risen as a percentage of the national income. This reply ignores the fact that the national income has gone up (in dollar terms) largely because prices have gone up, and that prices have gone up because of the currency debasement brought about partly by the very deficit financing that increased the debt. What this defense amounts to, in short, is a boast that the burden of the national debt has not increased because it can now be paid off in debased dollars.

**UNAVOWED BANKRUPTCY**

There are few governments today that cannot make such a boast. At the bottom of this column I append a table, taken from the August issue of *Pick's World Currency Report*, showing what has happened in the last nine years to the national public debts of a dozen leading countries. Only three of them are smaller in terms of their own currencies; the other nine are all larger in terms of their own currencies. Yet in spite of the fact that they now owe more in nominal currency units than a decade ago, the United States, Brazil, France, Sweden, and the United Kingdom owe much less in real terms than a decade ago. Though the U.S. debt has increased 24 billion in dollars since 1948, the reduced purchasing power of the dollar has wiped out the equivalent of $42 billion of that debt. Though France increased its debt since 1948 from 3,412 billion to 6,506 billion francs, it also wiped out 3,383 billion francs of the 1948 purchasing power of such a debt.

This is the way governments are today cheating their creditors—precisely the citizens who responded to their patriotic appeals for help.

There is nothing new about this process. It was old when Adam Smith denounced it in *The Wealth of Nations* in 1776: “When national debts have once been accumulated to a certain degree, there is scare, I believe, a single instance of their having been fairly and completely paid. The liberation of the public revenue, if it has ever been brought about at all, has always been brought about by a bankruptcy; sometimes by an avowed one, but always by a real one, though frequently by a pretended payment.

“The raising of the denomination of the coin has been the most usual expedient by which a real public bankruptcy has been disguised under the appearance of a pretended payment. . . . A pretended payment of this kind . . . extends the calamity to a great number of other innocent people. . . . When it becomes necessary for a state to declare itself bankrupt, in the same manner as when it becomes necessary for an individual to do so, a fair, open, and avowed bankruptcy is always the measure which is both least dishonorable to the debtor, and least hurtful to the creditor. The honor of a state is surely very poorly provided for, when, in order to cover the disgrace of a real bankruptcy, it has recourse to a juggling trick of this kind, so easily seen through, and at the same time so extremely pernicious.”
Adam Smith then goes on to show how “almost all states . . . ancient as well as modern” have “played this very juggling trick.” It may be added that, since the substitution of paper for metallic money, the trick has become much easier and therefore more frequent. It may also be added that the debtor class today, including as it does most corporation stockholders, is probably as rich as the creditor class, which includes savings-bank depositors and owners of savings bonds.

**NATIONAL DEBTS**

**Paper-Money Blizzard**

October 14, 1957

The delegates to the International Monetary Fund, representing more than 60 nations, met, talked, heard speeches, and went home. No fundamental change was recommended. No one asked for a basic reappraisal of the whole tottering exchange-controlled paper-money system symbolized by the fund. The one general point of agreement seemed to be that U.S. taxpayers ought to dump more money in the fund to help bail other nations out.

Just before the fund met, however, the British Government made a courageous decision. It increased the bank rate from 5 percent to 7, putting it on the highest level since 1920. It was the only time in this century, except at the outbreak of the first and second world wars, that the bank rate had been raised by two percentage points in a single jump. In addition, Peter Thorneycroft, Britain’s Chancellor of the Exchequer, announced that the government had asked the banks to hold their loans during the next year to the level of the last year. And he pledged that expenditure by government departments and nationalized industries for building and expansion would be held at the present level for two years more.

**WHY SO DRASTIC?**

These measures are drastic. They will force the British Government and British business to pay substantially higher interest rates for new loans. They caused an immediate break in the security markets. And they were supplemented by a hint that the government would accept even unemployment in its determination to stop inflation and defend the pound.

But one question raised by this move seems to have been all but neglected. Why did Britain’s action have to be so drastic? The answer is that governments have broken their word so often regarding their currencies in the last quarter century that only the most drastic action will convince either foreigners or their own people that they mean to keep it now. The French franc has been devalued again only within the last few months. More than 50 different currencies have substantially depreciated in the last ten years. In Britain itself, Sir Stafford Cripps, in the months before he announced the devaluation of the pound on Sept. 18, 1949, had publicly denied a dozen times that he would devalue. Later, in defending this record, he declared self-righteously: “Even if we had then had some future intention of altering the rate of exchange . . . no responsible minister could possibly have done otherwise than deny such intention.”

**UNIVERSAL DISEASE**

But though the present drastic action by the British Government was necessary in the circumstances, the question may be asked whether it does in fact, even for the next year or two, give the assurance it was intended to give. British opposition leaders have already denounced the action. Another round of wage-increase demands is expected this autumn and winter. All the British Government can do, as long as Britain’s labor laws remain what they are, is to plead once more for labor-union “restraint”—a plea that has not proved very effective in the past.

Britain’s problem is a universal problem. It is merely a question of degree. When we look at France, India, or most of Latin America, the prospect of checking inflation is even darker. Even West Germany, which...
The Economic Consequences of ICBM
October 21, 1957

The Soviet earth satellite is first of all a smashing propaganda victory. This is primarily what it was intended to be. It will have immense political and military repercussions. Its most important implication is that the Russians may really have the intercontinental ballistic missile of which they boasted in August. They may be expected to make full use of this implication in stepped-up efforts to threaten, cow, divide, and conquer the free world.

The one possible advantage of the launching of the satellite, from our point of view, is that it may shake us out of complacency and remind us more urgently that we are in a life-and-death struggle between two ways of life. The great danger is that some of us may react hysterically, draw the wrong conclusions, and take the wrong actions.

One possible error is to overestimate the Soviet achievement. What the Russians seem to have proved is that, in the field of physics and military weapons, they have developed scientists and technicians equal to our own. But the Russians have not yet proved that their physicists and military-weapon technicians are ahead of ours. This may depend on a point of fact that has not yet been established, and on which some American scientists have expressed skepticism that their satellite weighs as much as 184 pounds, as the Russians claim.

HOW THEY GOT THE JUMP
How the Russians got the jump on us in launching an earth satellite is, in retrospect, clear. We divorced our earth satellite project from our military ICBM efforts, divided responsibility for it, overlooked its huge propaganda potentialities, talked and boasted freely, and published our planned techniques in detail. The Russians read what we published, but published practically nothing themselves, and secretly drove ahead. The “cooperation” on the “International Geophysical Year” was all one way. In addition, the Soviets have kept us infiltrated with spies.

But perhaps the most important factor is that the Russians acted on the assumption that they were at war with us and we acted on the assumption that we were at peace with them. They hardly needed to send so many spies. Dr. J. Allen Hynek, associate director of the American program set up to trace the course of our own satellite when launched, is authority for the statement that the Russians are watching their own satellite, at 75 stations, through telescopes copied from an American model which he and Dr. Fred L. Whipple gave the Russians in June. But while we thought we were cooperating in a world scientific project, the Russians knew they were competing to be the first to launch an enormously powerful propaganda weapon, as an evidence of their possession of an intercontinental ballistic missile. They took no chances either on coming in second or on public failure. They made no announcement until the satellite had succeeded.

COMMUNIST PRODUCTION
One false conclusion into which we should not hysterically rush is that the “Socialist society,” as the Russians like to call their system, can compete with our free-enterprise system in overall production. I should like to mention here once more the recent study by Prof. G. Warren Nutter (see this column, Newsweek, May 27), who concluded: “Soviet industry seems still to be roughly three and a half decades behind us in levels of output and about five and a half decades in levels of per capita output.” We know from information from a thousand sources that the masses of the peoples behind the Iron Curtain are still wretchedly housed, clothed, and fed. Only a few weeks ago the Central Committee of the Communist Party and the government of Russia announced that the present five-year plan would be scrapped at the end of next year and would be supplanted by a new seven-year production schedule covering 1959 through 1965. Authorities on the Soviet economy interpret this as a left-handed confession that the five-year plan has been failing.

The most serious false conclusion to which we are in danger of coming is that, because of the Russian achievement, all plans for economy in government must now be thrown to the winds. Certainly our
government-spending program has contained some false economies. But false economies are the inevitable result of false expenditures. True economy is another name for wisdom in spending. We must save on X to have enough to spend on Y. We must divide our expenditures in the most effective way. We allotted, for example, $110 million to our earth-satellite program. But since the end of the second world war we have spent some $40 billion to $60 billion on foreign aid—a ratio of about 500 to 1.

**ECONOMY STILL NEEDED**

It may now, indeed, have become pointless to increase our planned expenditures on earth satellites. But if we are really behind Russia, even slightly, in the development of an intercontinental ballistic missile, then we must make this immediately a “crash” program as well as a research program. For the Russian leaders, if they think they have a commanding lead for even a few months, are unlikely to sit idly by and give us time to catch up with them (as we gave them time to catch up on the atomic and nuclear bombs), but will immediately try to wring every possible diplomatic concession or surrender from us or our allies by veiled or open blackmail.

But if the “missile crisis” forces us to spend more in one direction, it can also enable us to save in other directions. If the threat of missile annihilation threatens countries near to Russia, we can obviously provide a far more effective deterrent by speeding our own missile program than by giving these countries more funds to support a few more token ground troops. And we can soon even cut out some present huge “defense” expenditures rapidly being made obsolete through technological advance.

Certainly neither our governmental expenditures nor our total taxes can be increased further without either weakening our economy in inflation or dangerously increasing the deterrents to total national production. Our long-run security depends as much upon the total strength of our economy as upon the development of specific weapons.

---

**Swindling Admired**  
October 28, 1957

Free West Germany and Communist East Germany each had a currency called the mark. East Germany had insisted on an official exchange rate of 1 to 1. But in the free market one West mark exchanged for 4½ East marks.

On Oct. 13, without preliminary announcement, Communist East Germany declared all its old currency worthless and called it in. The holders were allowed to turn in 300 old East marks (the purchasing equivalent of about $16) for new East marks. They were told they would receive credit in newly opened (government) bank accounts for anything they held above that amount—but all funds found to have been made in “speculative” ways would be confiscated. As the Grotewohl regime decides what “speculation” means, it can confiscate anything it wants from anybody it suspects or dislikes.

It is said that the East German Government did this to “halt inflation.” But the value put upon a country’s currency unit depends on the confidence in it. A fast overnight trick like this does not build confidence. East Germans will want to make sure not to get caught holding much currency in the future. They will get rid of it as fast as they can. But this will mean currency depreciation and inflation.

No doubt one purpose of the switch was to force every citizen to account for his holdings and to put a final squeeze on what little private business remained. In this sadistic aim the Communist regime should be successful. It has doubtless also succeeded in fleecing West Berlin banks and exchange offices of the 20 million or so East marks they had on hand. But the exchange value of these was only about $1 million—less than the U.S. Government spends every ten minutes. This seems a cheap price for a government to throw away what remains of any reputation for good faith. It has swindled most the very people who trusted it most.

Yet the “democratic” nations are in no position to throw stones. The East-mark swindle is more cynical and ruthless, but no different in principle from the New Deal gold-clause repudiation and gold seizure in 1933 and the steady erosion since then of the dollar, the pound sterling, the French franc, and 50 other currencies. What has happened morally even to the West is revealed in one sentence in a dispatch from Berlin: “Even among West Berliners there was grudging admiration for the surprise achieved.”

**A LESSON FOR THE EDUCATORS**

Some of the American responses to Sputnik have not been edifying. Several politicians now hysterically demand more spending on everything. Others are using the earth satellite as an argument for more appropriations for their own pet projects, no matter how dubiously relevant. Thus at the closing session of the
American Council on Education in Washington the speakers declared that the Soviet satellite had shattered the nation’s “smug complacency” about its schools and colleges, and it was no longer possible to maintain a topnotch school system on a “starved” budget.

The United States is already spending far more on education than any other nation on the face of the globe. It is a little hard to see how the earth satellite calls for still more courses in sociology, medieval history, business English, French, or folk dancing, however worthy such subjects may otherwise be. It is true, of course, that because of the kind of competition in weapons of wholesale destruction that Russian Communist fanaticism has forced on us, it may be advisable for the Federal government to grant scholarships to a certain number of exceptionally brilliant students, chosen by competitive examination, in, say, physics, chemistry, mathematics, and engineering. The whole of these scholarship funds might be charged against the defense budget.

Perhaps even more important, physics and mathematics might be made part of the required high-school curriculum, in place of some of the easy and trivial “elective” subjects that have been displacing them in the last half century. But this local reform would not require any added governmental appropriations, and so presumably does not interest the educationist pressure group.

The Cost-Price Squeeze
November 4, 1957

The dispute still boils concerning who or what caused the present inflation. “Labor” and “management” are now blaming each other. Insofar as this dispute is relevant, management has considerably the better of the argument.

The attack on management has been carried on by Walter Reuther on his own, and by other labor spokesmen in the Kefauver hearings. Reuther contends that “exorbitant” profits, not wages, have been the villain promoting inflation. Otis Brubaker, research director of the steelworkers’ union, declares: “Wage increases have not caused a single price increase in twenty years.”

In its October letter, the First National City Bank of New York points out in reply: “Regardless of what year is taken as a base [from 1939 on] wages and total employment costs in the steel industry have far outstripped gains in productivity. Measuring from 1940, the gain in productivity of 56 percent, while substantial, fell far short of increases in hourly earnings and total employment costs amounting to more than 200 percent. The result . . . was an approximate doubling of unit labor costs with inevitable pressure for higher prices.”

PROFIT-MARGIN FALL

A much wider study of the same problem was published by the National Association of Manufacturers in September. It finds that the history of manufacturing since the end of the second world war has been one of rising costs per unit of output—particularly labor costs and taxes. Compensation of employees rose 23 percent per unit of output between 1948 and 1956. Corporate taxes rose 32 percent on the same basis. But prices of manufactured goods rose only 10 percent. The result has been a reduction of 25 percent in profit per unit of output between 1948 and 1956.

The decline in the profit margin of manufacturing industries is particularly striking when it is expressed as a percentage of sales. It dropped from 4.9 percent in 1948 to 3.1 percent in 1956. (By way of comparison, the figure for 1929 was 6.4 percent; for 1937, 4.7 percent; for 1940, 5.5 percent.) Thus, concludes the NAM study, “between 1948 and 1956 profit margins as a percent of sales have fallen from a level characteristic of prosperity years to a level characteristic of recession years.” Higher costs cannot automatically be recouped by higher market prices.

WAGES AND OUTPUT

These statistical comparisons by the National City Bank and the NAM prove that the current inflation is at least not the result of the “greed” of manufacturers for exorbitant profits, as Reuther contends. But they do not prove that “the conclusion is inescapable,” as the NAM study puts it “that the current inflationary push is due to the rising costs of labor and the continuing heavy tax burden.”

The rise in wages, it is true, as both studies point out, has exceeded the rise in “productivity.” But the studies compare money wages to physical output. In any inflation, no matter how caused, money wages are practically certain to rise more than physical productivity. This is simply because both wages and prices rise in every inflation. It does not necessarily follow that the rise in prices has been caused by the rise in wages. Both may have risen from a common cause.

That common cause is not hard to find. Neither the wage rise nor the price rise since 1939 or 1948 would have been possible if it had not been fed by an increased money supply. The money-and-credit supply increased from $64.7 billion at the end of 1939, to $172.7 billion at the end of 1948, to $226.4 billion at the end of 1956.
There would have been no inflation, in short, in the last eight or eighteen years without the cooperation and connivance of the monetary authorities.

This does not mean, of course, that union pressure has had no responsibility for the result. Under present labor laws the government has not merely encouraged but in effect forced the creation of industrywide unions with power to impose continuous wage increases. Unless these excessive union powers are reduced they must either lead to unemployment by forcing costs above prices, or create political pressure for still more monetary inflation.

**Party of Inflation?**

November 11, 1957

Inflation has not been stopped by the Eisenhower regime. But it would be worse if the Democrats returned to power. This is the conclusion one is forced to draw from the economic statement issued Oct. 20 by the Democratic Advisory Council.

“This is the worst peacetime inflation in our history,” it tells us. The authors of that apparently don’t think the American public can either count or remember. In the nearly five years under Eisenhower, wholesale prices have risen about 5.4 percent, and consumer prices, 6.7 percent. Under the Democrats, in the three years from the end of 1945 to the end of 1948, wholesale prices rose 51.7 percent. In the seven years from the end of 1945 till the end of 1952 wholesale prices rose 62.2 percent and consumer prices 47.6 percent.

In those seven Democratic years total bank deposits and currency increased from $151 billion to $195 billion, or more than 29 percent. From the end of 1952 until now, under Eisenhower, they increased to $220 billion, or about 13 percent. The Republican inflation is “worse” than the Democratic only because it comes on top of it. But the annual rate of inflation has been lower.

The Democratic statement goes on to denounce the Republican Administration’s “characteristically negative” policy of “raising interest and tightening the money supply.” The truth is that the Republicans have expanded the money supply, which is now at record levels. What these Democrats must want is a still faster expansion—in brief, more inflation.

**HOW TIGHT IS MONEY?**

As for our so-called “tight money” policy, whereas the discount rate is now 3½ percent in the U.S., it has been within the last couple of months 4.28 in Canada, 4.5 in Germany, 5 percent in France, Holland, and Sweden, and 7 percent in Great Britain. Are all these central banks “negative” and sadistic, and bent on creating a depression in their own countries? Or are they, perhaps, at last trying to curb inflation?

The DAC statement charges that “tight money” is ineffective, and that it is too effective. “By the ordinary tests of results,” it says, “this policy has failed.” Well, prices have continued to rise. But so has the volume of money and credit. By the ordinary tests of logic, this should simply mean that interest rates were not raised enough to discourage inflationary borrowing. Yet the DAC statement is afraid that raising interest rates “may stabilize living costs by causing unemployment and economic recession.”

The attack of the DAC on Republican inflation is a self-contradiction and a fraud. It pretends to deplore inflation while denouncing the only policies that can stop it and recommending the very policies that create it. The DAC wants cheap money and more credit expansion, which is the essence of inflation. It is “committed unequivocally to the principle of a vigorously expanding economy”—i.e., to a policy of perpetual boom.

**BACK TO PRICE-FIXING**

Though the DAC statement expresses fear of “unemployment” even with rising prices, it nowhere admits that this could happen only under one condition—that wage rates rose faster than prices and squeezed out profit margins. But even the possibility of excessive wage rates is never mentioned, let alone any proposal to do anything about them. When it comes to prices, however, the DAC wants to get tough. “We must have an active, firm, and broadly based policy to insure price stability. . . . Those who do not respond to leadership in the public interest must understand that this is the course which leads inevitably to controls.” Here then, thinly veiled, is the Democrats’ program: Cheapen money, expand credit, increase inflation, and then “fight” it by discriminatory and totalitarian price controls. This is “repressed inflation,” a policy whose results are typified in present-day France.

It is true that the Democratic Advisory Council is made up mainly of political has-beens and assorted left-wingers; but it has the blessing of the Democratic national chairman. Until this statement is explicitly repudiated by the majority of Democrats in Congress, therefore, it makes the Democratic Party officially the party of inflation.
Message of the Sputniks
November 18, 1957

The immediate service of the Russian satellites has been to shake us out of complacency. Their immediate danger is that they may drive some of us into hysterical demands and panicky action. This danger is already evident in the widespread outcry that it is “economy” that betrayed us, and that our salvation lies in spending more in all directions.

So far as long-range missiles and new fuels are concerned, it is obvious that we should spend all we usefully can as fast as we can usefully spend it. But there is a limit to what we can accomplish now merely by spending. We have lost priceless time. And that time has not been lost only by the Eisenhower Administration.

When the Russians captured Peenemünde, the East German rocket-manufacturing center, in the second world war, they stripped it, took over every German scientist and technician that they could, and secretly ordered them to keep developing the rockets and extending their range. The fatal atomic and nuclear warheads, they stole from us. We, on our side, assumed that Russia was our great ally, sincerely seeking “peaceful coexistence,” and that whatever problems couldn’t be solved through the United Nations and foreign giveaways could be easily handled by “top level” conferences and agreements on a basis of mutual trust. On these assumptions we cut our defense expenditures from a level of $90 billion in the fiscal year 1945 to only $12 billion in 1948. Not until after the Korean war partially woke us up did we take an interest again in missiles—after we had given the Russians a six or seven years’ start. It is this appalling time handicap that we must now try to make up.

SQUANDERING NO CURE
It does not follow, unfortunately, that our progress will now be proportionate to our rate of spending, or limited only by what we spend. We cannot atone overnight for all our diplomatic and military mistakes of the last twelve years. Past false economies cannot be rectified by future squandering. Because we saved on the wrong things, it does not follow that it is wrong to save at all.

This is the point that seems to be missed by those who are now so loudly shouting for a great increase in overall spending. Suppose we have to spend now a few billions more a year in missile development? Does it follow that we must increase our total Federal budget by this sum? Or could we not take the amount out of other expenditures? Our nondefense spending alone now comes to something like $28 billion a year. Among items out of which a good deal of fat might be cut are some $4 billion for foreign aid, some $5 billion for veterans’ benefits, some $3.3 billion for “labor and welfare,” and some $5 billion for agriculture, mainly for price supports and subsidies for not producing.

SUBSIDIES AS USUAL
The political apostles of spending ought to know that they cannot get a quart out of a pint jug. They ought to know that out of a given volume of resources we can spend more in one direction only by saving more in another. But none of them have had the courage to suggest that the increased amounts they insist should be spent on defense should be taken from any of the welfare or subsidy programs with powerful pressure groups behind them. They want increased spending on missiles but spending-as-usual on everything else. It is only the taxpayers who earn the funds, not the groups they are compelled to subsidize, who are being asked to make sacrifices.

And if the apostles of increased spending do not talk about cutting nondefense expenditures, they are even more silent on the possibility of cutting expenditures on many of the “defense” items that are being rendered superfluous or obsolete by the revolutionary advances in missile warfare. As President Eisenhower rightly insisted in his television talk, “we cannot afford waste.” We will need better “selectivity in national expenditures of all kinds.”

In spite of the increased amounts that may be necessary for missile development it is still possible to cut the total Federal budget. It is still possible to remove from the present tax structure inequities and deterrents to investment and production, and so to increase our national strength.

Wake Up the Educators
November 25, 1957

EDUCATORS URGE WAKENED NATION. So ran a prominent newspaper headline not many days ago. Yet the facts indicate that it is not so much the public that needs to be awakened as the educators themselves.

This is brilliantly clear from the 226-page report just published by the U.S. Office of Education comparing education in the Soviet Union and in the United States. This study, as summarized by President Eisenhower, shows that “when a Russian graduates from high school he has had five years of physics, four years of chemistry, one year of astronomy, five years of mathematics and trigonometry, and five years
of a foreign language." In the United States, fewer than one-third of high-school graduates have taken a year in chemistry; only one-fourth have studied physics; only one-seventh have taken advanced mathematics. And we are far behind even in teaching foreign languages. Russian students learn more of all these academic subjects in ten years than ours do in twelve.

BEHIND EUROPE TOO
It is true that the Russian studies are primarily selected to make Russia powerful in war; that Russian schools are instruments of Communist indoctrination. Yet American education in mathematics and the sciences is backward not only as compared with Soviet Russia but with our principal European allies. A dispatch from Germany to The New York Times of Nov. 10 found that "The scientific preparation of West German high-school students for admission to universities and engineering colleges surpasses anything that is offered in the United States public-school system as a whole"; while "high schools in France, Britain, Italy, Switzerland, the Netherlands, Belgium, and the Scandinavian countries also give their high-school students a superior education in the sciences."

What the Office of Education's latest study also fails to emphasize is that the present American situation in scientific and mathematical education is an appalling deterioration even from half a century ago. In a biennial survey by the Office of Education itself, in 1951, a table was published comparing "percentages of pupils enrolled in certain subjects in the last four years of public secondary day school [high schools]." Here are some of the comparisons it showed:

<table>
<thead>
<tr>
<th>Subject</th>
<th>1900</th>
<th>1949</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physiology</td>
<td>27.4%</td>
<td>1.0%</td>

</tr>
</tbody>
</table>

MEETING 'LIFE-NEEDS'?
"Enrollments in both mathematics and foreign languages in the last four years of high school," the study stated, "were smaller percentages of the total pupil bodies in 1949 than in 1934. . . . Percentage enrollments in algebra, geometry, physics, and Latin have shown progressive decreases in all investigations since 1915."

Yet the Office of Education approved this trend. "For the most part," said its summary, "the changes are in the direction of more functional education. They represent efforts to meet life-needs of increasingly diverse bodies of pupils." Commenting on this, in his book The Restoration of Learning (1955), Arthur Bestor wrote: "It is a curiously ostrich-like way of meeting 'life-needs' to de-emphasize foreign languages during a period of world war and postwar global tension, and to de-emphasize mathematics and physics at precisely the time when the nation's security has come to depend on Einstein's equation E=mc²."

Just as some of our military administrators are now blaming our backwardness in missiles chiefly on "inadequate funds," so most of our educators are blaming their own failures on inadequate funds and calling for huge Federal subsidies. It is our educational system itself, however, and the flabby educational philosophy dominant for the last quarter of a century, that is first of all in need of reappraisal and reform. It is the dominant educationists who have been the real anti-intellectuals, fearful of everything that is difficult and disciplined, including the very knowledge most essential to survival in the modern world.  

A Shot in the Arm
December 2, 1957

The sudden reduction of Federal Reserve discount rates from 3½ to 3 percent was tantamount to a proclamation that the policy of monetary restraint is at least temporarily abandoned. The action was a victory for the forces attacking "tight money" and pressing for resumption of inflation. It raises once more some fundamental questions about monetary policy.

It is now generally recognized, even by the Federal Reserve authorities themselves, that the reduction of the discount rate from 2 percent in 1953 to 1½ percent in mid-April 1954 was a mistake. It led to a sharp upward spurt in bank loans, and hence to an inflationary expansion of the money supply. It had to be reversed a year later, by the first of seven successive increases—some of which would not have been necessary except for the unwise reduction.

It was once considered the orthodox rule of sound central banking that the rediscount rate should be kept above the rate to prime borrowing customers of the great city banks. This was on the theory that if a member bank overextended itself and had to borrow from the Fed, it should pay a penalty rate rather than make a profit on the transaction. Until recently the Federal Reserve authorities did make it a policy to keep the discount rate at least above the rate on three-month
Treasury bills. But Treasury bills were still selling at an average yield of 3.47 percent in mid-November. This did not justify a cut in the discount rate below 3½ percent.

**DISCOUNT RATE RULES**
A year ago the Bank of Canada announced that until further notice it would adjust its discount rate weekly to maintain it at ¼ of 1 percent above the latest rate on treasury bills. If our Federal Reserve authorities adopted this rule, they would at least make it clear that they were merely following the market and not making money tight out of pure cussedness.

It is often argued that under the American system the discount rate has a merely token importance as compared with open-market operations. This is largely true. This year, for example, member banks have been borrowing an average of less than $1 billion from the Fed as compared with their total reserves of about $19 billion and their total loans and investments of about $139 billion. Yet a sound discount rate should at least be consistent with open-market policy and reflect market interest-rate realities. To cut the discount rate mainly for the “psychological” effect, to give the economy a shot in the arm, is to set a dubious precedent. Was this the most appropriate time—just after the consumer price index had risen for thirteen consecutive months to a new high record—to send up a new inflationary signal?

**WHAT MONETARY POLICY?**
The new discount-rate reduction raises once more the whole question of just what should be the objectives of Federal Reserve monetary policy. Under a gold standard the primary objective was clear: It was to protect the integrity of the currency by maintaining gold convertibility at all times. Under a paper standard and a Keynesian ideology the objectives become confused. The Employment Act of 1946 declares that “it is the continuing policy and responsibility of the Federal government to use all practicable means... to promote maximum employment, production, and purchasing power.” Many interpret this as a standing order for inflation. Chairman Martin of the Federal Reserve Board has suggested that Congress should declare “resolutely—so that all the world will know—that stabilization of the cost of living is a primary aim of Federal economic policy.

A much better solution would simply be repeal of the Employment Act of 1946. But if that mischievous law is kept, it should at least be amended to add the requirement of price stability as an offset to the heavy inflationary bias in the law as it now stands. This is the kind of problem we create when we abandon the gold standard.

Regardless of the monetary objectives ultimately adopted, it remains to be seen whether the reduction in the discount rate will achieve its major objectives. If the unions persist in pushing up wage rates, the cut will lead to more inflation without necessarily leading to more employment.

**Our Moral Disarmament**
December 9, 1957

The main technical reason why the Russians are presumably ahead of us in long-range ballistic missiles, as Wernher von Braun has pointed out, is that “the United States had no ballistic-missile program worth mentioning between 1945 and 1951,” when the Russians secretly drove ahead.

But perhaps this technical lapse is symptomatic of a deeper weakness. The Oct. 26 issue of The New Yorker contained an article by Eugene Kinkead about the Army’s research into the factors which led (in the words of Assistant Secretary Hugh Milton of the Army’s Manpower and Reserve Forces) to “American troops turning renegade in such large numbers and apparently so casually” to Communist indoctrination. One out of every three American prisoners, according to the Army’s study, was guilty of some sort of collaboration with the enemy, and one out of every seven was guilty of “serious” collaboration. Practically none of this is attributed by Army doctors or psychiatrists to physical torture or to “brainwashing” in the commonly accepted sense, but to indoctrination which took the form of a blend of leniency and pressure by their Communist captors.

**ANTICAPITALISM**
The reasons for the ease with which so many of our prisoners went over to the enemy were complex. But surely one of them was that they had already been conditioned to an anti-capitalist ideology. In answers to American Army questioners, they frequently used the word Socialism (as Communist propaganda does) rather than Communism. They would say that “while Socialism might not work in the United States, where the people are for the most part well off to begin with, it was a good thing for China and other less advanced nations.” It did not occur to them that this country was not pretty well off “to begin with,” but got that way precisely because it followed the principles of free enterprise.
We face in the world today a supreme irony. Millions of people are fanatically devoted to the slave system called Communism and are willing to die for it. Yet few of us are zealously devoted to its opposite, the system of capitalism, or willing to die for it by that name. True, the name itself is a smear word invented by Marx and Engels in order to imply that economic freedom and private property constitute a system run by and for the capitalists. But few of us are willing to make sacrifices to preserve this system even when it bears a truer name, such as free enterprise. Many of us do profess to be devoted to “democracy,” but fail to understand that democracy with individual freedom is impossible except on a basis of private property and freedom of enterprise.

SICKNESS OF THE WEST

This paradox is discussed in the course of a brilliant new philosophical work by Ludwig von Mises, *Theory and History* (Yale University Press, $6). Mises points out that the slavery and debasement under Russian Communism, or any system of complete Socialism, are not accidental: “If an omnipotent authority has the power to assign to every individual the tasks he has to perform, nothing that can be called freedom and autonomy is left to him. He has only the choice between strict obedience and death by starvation.”

Yet leading writers and scientists of the West are contemptuous of economic freedom, the basis of all freedom, and speak with admiration of a system that eclipses all tyrannies of the past in pitiless persecution of dissenters: “It did not occur to the liberal philosophers of the eighteenth and early nineteenth centuries that a new ideology would arise which would resolutely reject all the principles of liberty and individualism and would proclaim the total subjection of the individual to the tutelage of a paternal authority as . . . the most noble end of history.”

This is the weakness and sickness of the West, which is abandoning, in favor of statism and Socialism, the very free-market capitalism which has brought it not only individual liberty but the unparalleled material progress of the last 200 years. “True,” grimly concludes Mises, “Western civilization is decadent. But its decadence consists precisely in the endorsement of the anticapitalistic creed.”

To Remove Uncertainty

December 16, 1957

It may not seem important to many that the stock market drops violently whenever anything serious happens to the President’s health. But the stock market is our great business barometer. Its fall reflects the uncertainty that develops through the whole economy. And this, in turn, reflects wider uncertainty regarding our national ability to take instant and proper action in response to any internal or external threat. It is not doubt concerning the policies of the President’s successor that creates most anxiety, but the fear of governmental paralysis in a crisis.

Yet this uncertainty is entirely needless and easily removable. Let us look once more at the constitutional provisions regarding Presidential resignation and disability. Article II, Section 1 reads: “In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.” (My italics.)

CONGRESS HAS POWER

This provision is said to be vague concerning what or who determines Presidential “inability” if a President himself is unwilling or unable to do so. But it explicitly gives Congress power to decide all such details by legislation. If Congress, under this provision, explicitly authorized the President to transfer the powers and duties of his office temporarily, it is inconceivable that the Supreme Court would hold that Congress had acted beyond its constitutional powers.

The President’s right to resign at any time is constitutionally beyond doubt. Even here, however, clarifying legislation is desirable. If a President’s health is such as to force him to consider the grave step of resignation, he should not be confronted with the additional problem of financial sacrifice. Congress should provide that in the event of such forced resignation his salary would continue until the end of his term. Appropriate legislative provision also needs to be made concerning the salaries and expenses of both the President and Vice President during any period in which the latter temporarily assumed the powers and duties of the former.

TO DECIDE ‘DISABILITY’

Nor is this all that Congress should and could do by simple legislation. It has the clear power, under the constitutional provision just quoted, to say who should pass upon a President’s disability in the event that he himself is unable to do so. And clearly the only body that should be entrusted with the power of relieving
the President of the duties of his office, even temporar-
ily, is Congress itself. Congress, in fact, already has this
constitutional power under the impeachment provision.
Disability legislation could follow this precedent by
providing for a President’s removal for disability by a
majority vote in the House confirmed by a two-thirds
vote in the Senate.

It is reassuring that the Eisenhower Administration
itself is now pressing for speedy Congressional settle-
ment of the problem. This matter is so urgent, in view
of the repeated crises in President Eisenhower’s health
and of the present perilous international situation, that
it would justify calling a special session of Congress
immediately if we were not so near to the regular ses-

ion. Even now, important time could be saved if the
appropriate Congressional committees could immedi-
ately frame enabling and clarifying legislation to be sub-
mitted to the full Congress as the first order of business.

As Arthur Krock has put it: “There is no real sub-
stitute in the American governing system for constant
hour-by-hour Presidential leadership.” The first need is
to enable a President to turn over the powers and duties
of his office at least temporarily to the Vice President,
and to enable him to do so with clear legal authority
and an untroubled mind.

There are wider problems concerning the
Presidential succession that might require constitu-
tional amendment. But they can wait.

†

Salvation by Spending?
December 23, 1957

It will be some time before we feel the full impact of
the blow to American prestige caused first by the sensa-
tional launching of the two Russian satellites and then
by our own dismal failure at Cape Canaveral. Had any
of the excuses so freely offered after the failure been
put forward as clear warnings even 24 hours before it,
they might have had the desired effect. As it was, the
elaborate advance build-up caused the fiasco to do us
the maximum harm. It was not reassuring to be told
after the event that failure might have been expected
because “this was our first attempt.” This merely under-
lines our irretrievable loss of six years when the Russians
were laying the groundwork for their missile program
between 1945 and 1951. That loss cannot be made up
overnight. Our very excuses concede that the Russians
are far ahead of us in satellite development—and, pre-
sumably, in long-range ballistic missiles.

What is disturbing is not merely our present humil-
iation but the wrong lessons being widely drawn. Most
of the Democrats in Congress now blame our pres-
ent predicament on the alleged “economy-mindedness”
of the Eisenhower Administration. This is a strange
accusation to bring against an Administration that pre-
sented a year ago the record-breaking peacetime spend-
ing budget of $72 billion. We are in our present plight
not because of “economy,” but because of fantastic mis-
spending. On our entire earth-satellite program we
have spent only $110 million out of a total 1958 budget
nearly 700 times as great.

WHERE WE CAN CUT
The present pious professions of inability to cut the
overall budget ignore the flagrant facts. It has been
repeatedly pointed out that our non-defense spend-
ing alone now comes to something like $28 billion a
year. This includes $5 billion for thoroughly mischie-
vous agricultural price supports and subsidies for not
producing. It includes grossly swollen items like $4
billion for foreign aid, $5 billion for veterans’ benefits,
and some $3.3 billion for “labor and welfare.” Yet with
all the talk in Washington of the nation’s peril, nobody
dares suggest slashing these items. It is only the tax-
payers, those who earn the money from which these
handouts are taken, who are being told they must make
further sacrifices.

And what of so-called “defense” spending itself? One hears not a word now of the huge wastes in over-
building, overbuying, and overstaffing pointed out by
the Hoover commission. (In 1954 the Army had a
ten years’ supply of women’s uniforms. The Navy had
enough canned hamburger to last for 60 years, though
it barely keeps for two.) We are still busily turning out
obsolete weapons. The most careful study needs to
be given to the persuasive proposals of J. Sterling
Livingston in the Harvard Business Review that (1)
technical problems of future weapons development
should be taken out of military hands and put in a civil-
ian agency and (2) private firms should be given greater
profit incentives and more freedom to pursue their own
research and development.

FUTILE FOREIGN AID
The most irrational response to the Russian sputniks
and our own failure is the proposal to increase still fur-
ther the huge sums we are giving away to foreign coun-
tries. We have already granted them some $60 billion
since the end of the second world war. This did not in
the least deter the press of these countries from taunting
and jeering us when our Vanguard fizzled. Suppose we
had given them not a cent, and instead of dissipating
our strength had used a fraction of that sum to keep
unchallengeably ahead of Russia in military weapons
and research? We would have helped those nations, as
Mitchell pays pious lip service to three “general principles.” Present labor law, and his own recommendations, violate all three.

His first announced principle is “to protect by law the right of American working men and women to organize into unions and to bargain collectively through representatives of their own choosing.” The Taft-Hartley Act, as we have seen, thwarts this second right. And the right of the individual worker not to join a union is denied by the Secretary.

His second announced principle is that labor and management “each be free from governmental domination.” But through our network of Federal labor laws both the individual worker and the individual employer are dominated by government. The freedom of the individual worker to get and keep a job without joining a union is denied. The freedom of the employer to seek employees of his own choice, or to replace them, is greatly abridged.

No Right-To-Work Law

Mitchell’s third principle is “to protect the basic rights of individuals.” But our Federal laws and regulations abridge the basic rights of the individual in favor of the coercive privileges of the group.

Specifically, the Labor Secretary declares, the Administration “will not recommend a so-called national right-to-work law and we will oppose such legislation if it is proposed.”

This brings us close to the heart of the issue. The Taft-Hartley Act contains a self-contradiction. Sec. 8a declares: “It shall be an unfair labor practice for an employer . . . by any term or condition of employment to encourage or discourage membership in any labor organization.” But the “encourage” is canceled by a provision validating the compulsory all-union shop. Mitchell still wants to impose compulsory union membership.

The Taft-Hartley Act should either be amended by a consistent Sec. 8a, which would outlaw the compulsory union shop as well as the compulsory non-union shop (prohibiting an employer or a union from making any hiring stipulation either way), or, if the unions refuse to accept such a two-sided enactment, the Taft-Hartley Act should be repealed. We need not start passing “anti-labor” laws, but we might try repealing a few anti-management laws. Perhaps the best course, in fact, would be the repeal of all labor legislation except that forbidding force, fraud, coercion, or intimidation by anyone.
To Control Spending
January 6, 1958

With the present missile scare and deflation scare, the outlook for government economy is even dimmer than it was a year ago. The main hope of those who would like to see the Federal budget under some sort of responsible control lies in reforming the budget-making process itself. An opportunity exists in the very fact that Congress will probably be asked to raise the debt ceiling again. If Congress feels forced to do this, it can and should exact a price.

The minimum price should be a reform urged by the Hoover commission—that Federal expenditures be placed on an “annual accrued basis.” This technical term means simply that Congress should provide funds only for work done or services and goods actually received by the government in the fiscal year. Only by this reform can Congress regain the “power of the purse”—the control over annual spending—that it has lost.

Our Federal fiscal practices have become so complicated and involved that few laymen—and, in fact, few congressmen—understand them. It is still not clearly and generally understood that the Federal government has two budgets—the obligation budget and the expenditures estimates. Congress has control today only over the money it appropriates in any year; it does not have control over how much money is actually spent each year. Its present practice is to appropriate the entire sum necessary to complete a given Federal project regardless of how many years that project actually will take. This practice has resulted in some huge annual “carry-overs” of unexpended Federal funds. These now are in the neighborhood of $70 billion.

HOW CONTROL IS LOST
The results of this practice were brought out graphically by Sen. Harry F. Byrd in a statement on Oct. 2 last: “On the last day of the session I estimated that the President’s January appropriation requests had been reduced by $6 billion or more, and I called upon the President to reduce expenditures by the same amount. The President’s mid-year review clearly indicates that these reductions in appropriations will result in virtually no reductions in Federal expenditures this year. Obviously the President will use unexpended balances in previous appropriations to keep expenditures at the level he estimated last January, or higher. This is contrary to the intent of Congress, which expected a substantial part of the reductions in appropriations to be reflected in this year’s expenditures.” The situation, the senator concluded, “clearly shows that Congress has lost control over Federal expenditures and makes it imperative that this control be recaptured.”

ANNUAL REVIEW
In a twelve-page pamphlet just published by the Citizens Committee for the Hoover Report, the case for “annual accrued expenditure budgeting” (or “pay-as-you-get”) is very clearly and ably presented, and objections systematically answered. I should like to deal here with one argument not covered by the committee’s report because it seems to me typical of the kind of objection now most likely to be heard. It was voiced by Hanson W. Baldwin in The New York Times of Aug. 22: “The Defense Department does not exist to show a profit-and-loss statement or to keep nicely balanced books. It exists for one purpose only—national security and combat effectiveness. If we emphasize the business ideal of cost accounting at the expense of combat effectiveness, we are lost.” This is clearly a false antithesis. Proper accounting practices are designed precisely to increase effectiveness and to detect and prevent misspending of limited resources. Wholly apart from the undemocratic nature of such a system, it would not increase combat effectiveness to deprive Congress of the right of annual review and control of expenditures.

H.R. 8002, the House bill which provides for placing Federal expenditures on an “annual accrued basis,” has twice passed the Senate unanimously in an even stronger version. It has been endorsed by the President, by former Secretary Humphrey, by the Director of the Budget, and unanimously endorsed by the House Committee on Government Operations. It should be budget reform No. 1.

Convert the Communists
January 13, 1958

In this new year we face what may be the gravest crisis in our history. The very survival of the United States as a free nation, the survival of civilization, may be at stake.

Our predicament is, at least in part, the result of our own slack policies. We allowed our atomic and nuclear secrets to be quickly and easily stolen. We neglected for six irretrievable years the development of long-range ballistic missiles. So we have helped to bring about the alarming rise in neutralism and appeasement sentiment among other NATO members—which has led them, in turn, to put pressure on us not to strengthen the alliance, but to seek negotiations with the Kremlin.
Yet probably the worst thing that could happen to the West would be to get a disarmament agreement with Russia. Any sense of security it gave would be illusory. It would bind us, but it would not bind the leaders of the Kremlin. They have shown that they will stop at no crime and at no treachery. They are the same leaders who, a week after announcing that they had ordered withdrawal of their forces from Budapest, returned with armored divisions and bombers to machine-gun and massacre men and women in the streets.

THE NEW MACHIAVELLI
The Soviet leaders have not discovered any brilliant new form of diplomacy. The methods they have followed were described more than four centuries ago by Machiavelli:

“It is much safer to be feared than loved, if one of the two has to be wanting. Men in general are ungrateful dissemblers, anxious to avoid danger, and covetous of gain. As long as you benefit them, they are entirely yours, when the necessity is remote; but when it approaches, they revolt. The friendship that is gained by purchase is bought but not secured. Men have less scruple in offending one who makes himself loved than one who makes himself feared; for love is held by a chain of obligation which, men being selfish, is broken whenever it serves their purpose; but fear is maintained by a dread of punishment which never fails. . . . Men are so simple and so ready to obey present necessities, that one who deceives will always find those who allow themselves to be deceived.”

Our own proper course lies neither in appeasement nor in extending still more foreign aid to undependable allies. Does our sole reliance, then, lie in keeping ahead of Russia in a desperate and endless armament race? We need not come to so grim a conclusion. There is real hope in an additional course. We can try to convert the Communist countries to capitalism and private enterprise.

TEACH CAPITALISM
Such a proposal is likely to be greeted by our pseudoliberal with howls of derision. Yet the tactic has been used successfully enough against us. The Russian Communists, by lies and confusions, are constantly making new converts to Communism. The leaders in one country after another turn to government planning, to socialism, to Communism, because they have been led to think this is the way to economic salvation.

What we must do, if conversion to capitalism is to succeed, is to answer the Communists with truth and clarity on every intellectual level. We must point out that government ownership and operation are grossly inefficient that socialism does not create wealth but impoverishment; that dialectic materialism is nonsense; that the whole class-struggle argument is false; that workers and managers, employees and employers, are essentially cooperators in production; that the whole system of private capitalism is a marvelous system of social cooperation.

These things can only be taught by those who understand them. Western politicians and official propagandists are certainly not the ideal group to teach them. Most of them lack economic understanding and believe in the welfare state. But the stakes, for survival and civilization, are too enormous to abandon the effort in despair. And the outlook is far from hopeless. The conversion of a Djilas in Yugoslavia, the magnificent revolt in Hungary of a whole population subjected to years of indoctrination and terror show what might happen, even within Russia or China, with a little intellectual guidance from the West.

How to Destroy Jobs
January 20, 1958

Our chief economic danger in 1958 is that we may get inflation and unemployment at the same time. The combination would not be, as some writers seem to think, “something new under the economic sun.” The combination has occurred frequently in Europe and in Latin America. It can occur whenever wage rates move upward faster than prices, unduly squeezing profit margins.

The January letter of the Guaranty Trust Co. of New York contains an able analysis of the danger. “Only a few months ago,” it points out, “spokesmen for organized labor were criticizing manufacturers for raising prices of their products at a time when sales were tending to decline. [Yet] in December, when the demand for labor had been weakening steadily for four months, the AFL-CIO announced its determination to press for higher wages, shorter hours, and expanded fringe benefits in 1958.”

Such policies, as the bank points out, must tend to price union members out of jobs. Unless these policies are corrected, the general business downturn now under way will be needlessly deepened and prolonged, billions of dollars’ worth of potential industrial output will be lost, and the entire economy will suffer—labor most severely of all.

WAGES AS COSTS
Yet union spokesmen declare that employment is declining not because wages are too high but because they are
too low. This is merely a revival of the old “purchasing power” fallacy—the theory that the reason production and employment are not “full” at any given time is that there is not enough purchasing power to take the output off the market. The bank’s letter argues:

“An understanding of purchasing power is impossible without a grasp of the basic principle that every portion of the money value of every commodity and service produced is income, or purchasing power, to someone. Purchasing power is derived from output and, in the final analysis, is identical with output. It may be consumers’ purchasing power in the form of personal income. It may be business purchasing power in the form of net profit after taxes. It may be governmental purchasing power in the form of tax revenue. . . . It follows that purchasing power is automatically maintained as long as output is maintained. . . . The exclusive emphasis upon wages as a source of purchasing power is a fallacy fatal to clear economic thinking. Wage income is, of course, a form of purchasing power, like any other type of income. To the managers who make business decisions and create jobs, however, wages are primarily costs. At a time when cost-price relationships are already tending to make it unprofitable for business concerns to maintain and expand operations and thus to create jobs, nothing could be more short-sighted than to aggravate the difficulty by insisting upon a further increase in the cost of employment.”

**WAGE RATES VS. INCOME**

Though this analysis is correct, there is another and perhaps simpler way of pointing out the fallacy. The error seems to stem largely from a simple confusion between hourly wage rates and total wage payments, because the word “wages” is loosely used to cover both. It is seldom assumed that if a manufacturer increases his prices his dollar volume of sales will rise in direct proportion. In such a case few people confuse a price with an income. They recognize that a rise in prices, greater than justified by demand, will reduce volume of sales. In the same way a rise in hourly wage rates, greater than justified by labor’s marginal productivity, must reduce employment and probably reduce total payrolls and purchasing power.

The Guaranty Trust Co.’s letter ends with a well-timed warning:

“Spokesmen for the workingman have always been prone to quarrel with the employer’s profits. They have never been able to reconcile themselves to the fact that those profits are really the workingman’s best friend. It is the prospect of profits that creates the job, and it is the realization of profits that maintains the job. . . . When profits are squeezed and demand is faltering, the attack [on the employer’s profits] becomes a formula for unemployment.”

---

**Notes on the Budget**

January 27, 1958

**Forgotten Billions:** Officially estimated expenditures of $73.9 billion in the 1959 Federal budget would by themselves constitute record peacetime spending. But in addition there will be expenditures out of government trust funds (mainly for social security and highways) of $16.4 billion. Even when interfund payments are deducted, this means that actual total expenditures will be more than $86.7 billion. Expenditures are not reduced, nor is the total burden of taxes, by hiding part of them in special segregated budgets.

**Wishful Thinking:** It seems highly probable that estimates of both receipts and expenditures for 1959 err on the optimistic side. Last year the President made both errors. Instead of the surplus of $1.8 billion he then promised for 1958, there is a prospective deficit of $400 million. He now promises a budget surplus of $500 million for 1959. But if he has made merely the same-size dollar error for 1959 as for 1958, this $500 million surplus would become a $1.7 billion deficit. It could even be much larger. In an acknowledged period of declining business, the President wishfully estimates budget receipts from the same taxes at $2 billion more in 1959 than in 1958. And Democratic leaders (and some Republicans) are demanding even higher spending.

**Nondefense Spending:** It is when we come to nondefense spending that we get our greatest shock. Federal nondefense expenditures recommended for 1959 reach a new high record of $28.1 billion (not including the $2.5 billion for the highway program), compared with $28 billion in fiscal 1958, $25 billion in 1957, and $21.2 billion in 1954. If we compare these recommended 1959 nondefense expenditures with those of 1957, for example, we find that they are higher in every major category except "general government." They are higher, in other words, in foreign economic aid, veterans' benefits, "welfare," farm subsidies, natural resources, and housing.

So here, where huge cuts were possible, we have instead mainly increases. In his Oklahoma talk of Nov. 13, the President declared that new expenditures for missiles would have to come out of nondefense programs: "Savings of the kind we need can come about only through cutting out or deferring entire categories of activities. This will be one of the hardest and most distasteful tasks that the coming session of Congress would face."
At his press conference of Jan. 15, President Eisenhower must face, and pressure groups will wail in anguish.” But when the moment came, Mr. Eisenhower himself had little stomach for the task. He has, it is true, asked for some peripheral “welfare” economies. But these, even if enacted, would not mean significant savings until 1960 or later. Yet the tax burden and strain on our resources are enormous, and economies which are always advisable have now become imperative.

**Defense Spending:** There will be an increase of $3.3 billion in 1959 over 1957 just for missiles, nuclear weapons, etc. Total missile-program spending for 1959 is estimated at $5.3 billion. (In 1953 we spent only $1 million on long-range ballistic-missile development.)

It may be, as so many congressmen and others are contending, that even these increases are not enough. But it is probable, as the Hoover commissions and Congressional investigations have repeatedly shown in the past, that there is huge extravagance and waste concealed in other parts of so-called defense spending. Total defense spending, in any case (including $3.8 billion for foreign military aid), is estimated at $45.8 billion for 1959, compared with $44.8 billion for 1958 and $44.4 billion for 1957.

**How to Cut:** There is no real problem in knowing where cuts in nondefense spending could be made. The whole $4.6 billion farm subsidy is an economic outrage. Most of the $5 billion foreign-aid program is demonstrably futile. The $5 billion of veterans’ benefits is shamelessly swollen. But all this has been pointed out many times before—to no avail.

One hope, at least, lies in getting some reforms in budget procedure. We should put government appropriation requests on an accrued expenditure basis and grant the President an item veto for appropriation bills. Mr. Eisenhower has asked for both.

**Salvation by Deficit?**

February 3, 1958

At his press conference of Jan. 15, President Eisenhower declared that if revenues in the fiscal year 1959 failed to come up to the optimistic expectations of his budget message, the economy would require “a needle rather than a checkrein.” And he let it be explicitly understood that by a “needle” he meant deficit financing.

This statement cannot be dismissed as a mere slip of the tongue. The President’s 199-page Economic Report expresses the same philosophy, though in a more guarded way. The report pays the customary lip service to “policies that will help prevent inflation” and maintain “a free competitive economy.” But it ends with more than 40 recommendations, nearly all of which, if adopted, would either be inflationary or extend still further the domain of government intervention and creeping socialism. The two outstanding exceptions are the proposals to extend the Trade Agreements Act and to lower price supports on basic agricultural commodities.

**THE ROTTING DOLLAR**

The report boasts in its opening paragraph that the nation’s output of goods and services in 1957 totaled $434 billion, and personal income $343 billion, and that “both were 5 percent larger than in the preceding year.” Only later are we explicitly told that “four-fifths of this increase was accounted for by rising prices,” and that therefore “in physical terms, the increase was only about 1 percent.” This shows the deceptiveness of national income figures. Germany, in 1923, could boast that its national income had increased about a trillion times over its national income in 1913, for the simple reason that inflation had reduced the value of the mark to one-trillionth of its prewar value.

In spite of its length, there is no mention in the report itself of the extent to which the value of the dollar has declined since 1939. But from tables in the back of the report we can find, by making our own calculations, that wholesale prices at the end of 1957 had risen 136 percent as compared with 1939; that the consumers’ price index in the same period had risen 105 percent (reducing the purchasing power of the dollar to less than one-half); that the total supply of money and credit, as measured by total bank deposits and currency, increased 260 percent in this period, and as measured by demand deposits and currency had increased by 282 percent.

The price rise, in short, came in spite of a great increase in the production of goods. It has been solely the result of money-and-credit inflation. It is government policy, and not “unwarranted” price or wage increases, that is primarily responsible for this. It is money-and-credit expansion that makes price-and-wage increases possible, if not inevitable.

**FAITH IN DEFICITS**

This faith in the efficacy of deficit financing and inflation is apparently even stronger in most of the Democrats in Congress. Representative Wilbur D. Mills, the chairman of the powerful House Ways and Means Committee, thinks that before the end of the year we may have to reduce taxes, “even though it would mean deficit financing,” to get us out of the slump.

Yet the belief that employment and sound prosperity depend on or vary with the volume of government spending or deficit financing can be disproved both by
logic and statistics (see this column, *Newsweek*, Oct. 3, 1955). Contrary to nearly everything now being said in Washington, inflation does not necessarily increase employment. It has this effect (following unemployment) only if it makes prices rise faster than wage rates. What is essential is a working equilibrium between wages and prices. When that exists, we can have full employment without inflation. But if wage rates rise faster than prices, squeezing out profit margins, we can have heavy unemployment even with inflation.

Salvation does not lie in deficit financing or monetary inflation. It lies in maintaining fluid and functional relationships between wage rates and prices. We can do this chiefly by ceasing to confer special monopolistic powers and immunities on labor unions. But we cannot squander ourselves into prosperity. And we cannot assure prosperity by still further eroding the value of the dollar.

### Inflation Arithmetic

February 10, 1958

Most of us still give lip service to the ideal of preventing further inflation; yet we advocate the very policies that increase inflation. Even the banking community is not exempt.

A few weeks ago, the Economic Policy Commission of the American Bankers Association proposed a general lowering of reserve requirements against deposits. The reserve requirements against checking deposits are now 20 percent for banks in “central reserve” cities (New York and Chicago); 18 percent for banks in 48 “reserve” cities; and 12 percent for “country” banks. The ABA recommends that these be reduced eventually to only 10 percent against demand deposits for all member banks no matter where located. In addition, it recommends that reserves against time deposits be reduced from 5 percent to 2 percent, and finally that vault cash be counted as part of required reserves.

**FED PLANS**

The member banks are not alone in such recommendations. Serious Washington reports indicate that the Federal Reserve Board is planning to increase the nation’s supply of bank credit sharply by reducing bank reserve requirements, and has failed to reach agreement merely about the exact timing of the announcement and the specific plan. It is meanwhile significant that the cut in the Federal Reserve discount rate from 3½ to 3 percent in mid-November was followed by a further cut in late January to 2¾ percent.

The huge inflationary potential in the ABA proposal can be seen from a simple calculation. On Dec. 25, the required reserves of all Federal Reserve member banks came to $18.9 billion. Calculating these respectively for central reserve city banks, reserve city banks, and country banks, we find that they would have permitted the member banks to make sufficient loans and investments to create demand deposits totaling about $117 billion. In other words, the average required reserves worked out to about 16 percent of demand deposits. If, now, the member banks are allowed to keep reserves of only 10 percent against demand deposits, they could create demand deposits of $189 billion—an increase of more than 60 percent in this part of the money supply.

We have still to consider the existing inflationary potential of the Federal Reserve Banks themselves. At one time they were required to keep gold and cash reserves of 35 and 40 percent against deposit and note liabilities respectively. But since 1945 they have been required to keep only 25 percent reserves in gold certificates against deposit and note liabilities combined. On Jan. 29, they kept a gold certificate reserve of $22 billion, or 47.3 percent, against combined note and deposit liabilities of about $46.7 billion. If they increased their own liabilities to reduce their gold certificate reserves to only 25 percent, those liabilities would go to some $88 billion. Depending on the percentage of the increase that went into creating deposits for the member banks, those deposits could increase from the present $19 billion to $40 billion or even to $60 billion. If the member banks then kept only 10 percent reserve against deposits, their demand deposits would increase from the present $117 billion to $400 billion or even $600 billion!

**POTENTIAL INFLATION**

Several conclusions are suggested by these theoretical calculations. There are enormous inflationary potentialities even under the present Federal Reserve law. These inflationary potentialities could and should be cut off by a change in the law. If the private banking community, the Federal Reserve authorities, or Congress want to cut off these possibilities, this is the place to begin. The big city banks are right when they argue that the present differentials in reserve requirements are obsolete and unfair. But the way to cure this discrepancy is not to lower the reserve requirements for everybody, but to equalize them (over a long period) at the present average level.

The agitation for lower reserves shows the inflationary psychology that follows when the gold standard is abandoned. If the reserves themselves are only paper, even bankers begin to wonder why it is necessary to keep them at all.
Wage Rates and Jobs
February 17 1958

A day does not pass now without someone in Washington proposing a new inflationary scheme. All these schemes are based on a common set of assumptions. It is taken for granted that under no conditions can the government permit a recession or even a comparatively mild readjustment. It is taken for granted that it is a “responsibility” of government to maintain “full employment” at all times. It is taken for granted that the government not only has the power to do this, but knows exactly how to do it. It can be done, it is assumed, either by heavy government spending, or heavy deficits, or forcing down interest rates, or an increase in the money supply, or all four.

The sole point of dispute among these inflationist groups concerns the exact dose of added spending, tax reductions, or money creation that is necessary to maintain “full employment.” The “conservative” inflationists want a comparatively mild dose—just enough to achieve “full employment,” but not enough to bring “true” inflation. The lunatic fringe wants to spend money with a steam shovel and to print it on a rotary press.

WAGE-PRICE RATIO
But all these groups are wrong in their fundamental assumptions. The truth is that neither government spending nor an increase in the money supply is either a necessary or a sufficient condition for the existence of full employment. What is necessary for full employment and prosperity is a proper relation among the prices of different kinds of goods and a proper balance between costs and prices, particularly between wages and prices. When this balance exists, so that the prospect for profits exists, full employment and maximized production and prosperity will follow. When this balance does not exist, when wage rates are pushed above the marginal productivity of labor, and profit margins are doubtful or disappear, there will be unemployment. The presence or absence of monetary inflation is by itself irrelevant.

If the proper relationship exists between costs of production and prices, between wage rates and prices, there can be full employment without inflation. And there will be unemployment even with a rampant inflation if wage rates are too high as compared with prices so that profits are distorted or on net balance negative.

What leads to the great contemporary faith in inflation as the cure-all for unemployment and other economic ills is the fact that under special conditions inflation may raise prices more than wage rates and so restore comparative equilibrium and workable profit margins. After an inflationary boom, there may be a depression accompanied by a collapse of prices. If labor unions then refuse to accept corresponding reductions in wage rates, a money-and-credit inflation, if not accompanied by a further rise in wage rates, may raise prices enough to restore profit margins, production, and employment.

WAGE RATE VS. INCOME
But today, we are given to understand, economic adjustment is never to be made by reducing wage rates, but always by more inflation to raise prices. The unions, going farther, insist that not only must wage rates never be reduced under any circumstances, but that they must be advanced each year, in monetary terms, especially when things get bad, for that will “increase purchasing power.”

This argument is, of course, wholly fallacious. It confuses wage rates with total wage payments; it confuses a price with an income. Higher wage rates, by excessively raising costs of production and wiping out profit margins, may create unemployment, and so reduce total labor income. It is in the interest of the whole body of labor itself that equilibrium wage rates should be established that maximize employment and labor income.

But today opinion is confused. One school of thought believes that wage rates ought not to be reduced under any circumstances; another school holds that in fact they will not be reduced because unions will never accept a reduction. That is why, unwilling to face up to the need for curbing the union monopoly powers that our labor laws have conferred in the last generation, so many people can see no way out but the dangerous and desperate road of more inflation. ⋆

Hair of the Dog
February 24, 1958

It is only a few weeks since the President reported that the nation’s output of goods and services in 1957 totaled $434 billion, the highest figure on record. In December 1957, moreover, the average hourly earnings of manufacturing workers, at $2.11, were also the highest on record. But suddenly, overnight (if you believe the Democratic speeches in Congress), we are in a cataclysmic depression. Mass unemployment and starvation stalk the land, forcing soup kitchens and bread lines. (It is true that official estimates of unemployment rose to 5.8 percent of the labor force in January as compared with 5.2 percent in December.)

The Democratic politicians are almost praying for a depression so they can have the privilege of saving us
from it this November, and again in 1960. And they have not the slightest doubt about the remedy. It is, as you might have guessed, for the government to spend more money. Especially we must start more “public works.” The question is not whether they are needed, but how much “employment” they will provide, and how much they will add to “purchasing power.” It is assumed that every dollar spent by government somehow magically multiplies itself in increasing national income. Given this theory, economy in government is not only unnecessary but antisocial and wicked; and squandering and waste are the height of economic wisdom.

NO MAGIC IN DEFICITS
It seems necessary to point out all over again that the government-spending theory has been repeatedly disproved in practice. In the fiscal year 1944, the Federal government spent $95 billion; in the fiscal year 1947, it spent only $39 billion. Here was a drop in the annual spending in this three-year period of $56 billion. A budget deficit of $51 billion in 1944 was also turned into a budget surplus of $754 million in 1947. Yet instead of a recession in this period there was a substantial increase in employment, wages, and prices. Again, in the fiscal year 1953, the Federal government spent $74 billion; and in the fiscal year 1955, only $64 billion. The budget deficit also dropped from $9.4 billion in 1953 to $4.2 billion in 1955. Yet in the calendar year 1955 the gross national product increased $28 billion above that of 1953.

I have repeatedly tried to explain in this column not only that the government-spending nostrum or government-deficit nostrum does not work in practice but that it is theoretical nonsense as well. This leads us to the depression remedy that the “conservatives” and Republicans are now suggesting, which is a cut in taxes. President Eisenhower has said that he would favor a tax cut to brake the recession unless the economy turns up by midyear. Now a tax cut would at least have several advantages as compared with an increase in expenditures. It is a smaller invitation to reckless government spending. A wisely made tax cut, moreover, could increase incentives. But this is not what anybody is suggesting. What is being mainly suggested is an increase of $100 or more in the personal income-tax exemptions which would take millions of people off the income tax entirely, leaving the confiscatory rates on higher incomes and the excessive rates on job-giving corporations.

WAGE RATES AND JOBS
The President wisely pointed to the danger of “going too far with trying to fool with our economy,” and implied that he would want such a tax cut only if it would not be inflationary. But the very purpose of such a tax cut would be to resume inflation. What is proposed, in short, is a cut in taxes without a cut in expenditures, to increase the size of the deficit, and to get “recovery by deficit.”

The worst of all remedies for the recession is that proposed by Walter Reuther and the AFL-CIO. It is a further increase in wage rates to “increase purchasing power.” As I pointed out here last week, a further increase above present peak wage rates would simply increase costs of production, squeeze out more profit margins, price more goods and more labor out of the market, increase unemployment still more, reduce payrolls, reduce labor’s total income, and turn recession into real depression.

The country may well pray to be saved from its saviors.

Wage Boosts vs. Jobs
March 3, 1958

One would suppose that, before politicians and “experts” rushed forward with sure cures for the recession, they would at least try to discover its causes. They would find most of them in the great length and extent of the preceding boom.

On the investment side, many industries have greatly expanded their capacity in the last few years. They are not planning to expand further until demand comes abreast of enlarged production. On the consumption side, many families have now acquired most of the durable goods they can absorb, and plan merely to replace these as they wear out or become obsolete. Moreover, much of their future buying power is already mortgaged. Installment credit outstanding has swollen from a total of $2.5 billion at the end of 1945 to $34.1 billion at the end of 1957—a thirteenfold increase.

The chief effect of installment credit is to enable people to buy right away what they could not otherwise buy until the next year or two. It makes one year more prosperous, in other words, at the expense of its successors. As it grows, the volume of repayments must grow. It is highly probable that the installment repayments in January and February this year exceeded the amount of new credit extended. But would it be wise to try to force up the total volume of installment credit still further?

BREATHING SPELL
What we are chiefly suffering from today is a hangover from the constant overstimulation of the economy in
them become excessive we must increase inflation and depreciate the dollar more and more, to make them payable.

Buying Unemployment
March 10, 1958

There is real danger that the present recession will be prolonged and intensified by some of the proposals most often put forward to cure it. One of these measures is bigger unemployment compensation for longer periods. The other is payment of still higher wage rates.

Not only labor-union leaders but academic economists have been assuring us that the repetition of a major depression is now impossible, chiefly because of what they are fond of calling "built-in stabilizers." Foremost among these "built-in stabilizers" is thought to be unemployment compensation. The theory is simple. When there is unemployment, this compensation helps to maintain "consumer purchasing power." So the recession tends automatically to correct itself.

What this beguiling theory overlooks is that the payment of overgenerous benefits may itself encourage and prolong unemployment. These act in the labor field somewhat like the price-support program in agriculture. Just as the farmer can overprice his crops as long as the government stands ready to buy and store whatever unsold surplus the excessive price creates, so unions can more easily overprice labor the more generous the government plan is to finance whatever unemployment an excessive wage-rate creates.

A dramatic illustration came on Feb. 19, when United Automobile Workers delegates voted to ask the Chrysler Corp. to re-establish a 44-hour week for its workers and to lay off those it could not employ full time. The union declared that many of the workers on a short-week schedule (some, they said, on only eleven hours) would make more money through unemployment benefits if they were made idle. A union official declared that with unemployment compensation and supplementary benefits, many would earn two-thirds of their regular pay, about $58.50 a week. Here is an appeal from a union for more unemployment on the ground that its members can "earn" more by not working than by working!

WAGE RATE VS. PAYROLL

As for the "cure" of paying still higher wage rates, I have pointed out in several recent columns that when wage rates rise to or above the "equilibrium" level,
further increases do not increase payrolls and purchasing power but reduce employment, payrolls, and purchasing power.

The statistical record now proves that this is precisely what has been happening. At the bottom of this column I reproduce two illuminating and significant charts, published without comment, and among other material, in the Feb. 14 issue of Business Statistics, put out weekly by the U.S. Department of Commerce. What these charts show is that, for the period they cover from the beginning of 1955, hourly wage rates in manufacturing have been rising steadily month by month to a new peak (about $2.10) in November, December, and January. But from the end of 1955, both working hours and employment have been falling. Fewer hours and less employment in combination have more than offset higher hourly rates since the end of 1956, and total manufacturing payrolls have taken a sharp dive—of nearly 13 percent—from a maximum index number of 171.4 in December 1956, to 149.5 in January 1958. A rise in wage rates, in brief, can mean a fall in payrolls.

---

**Adjust—Or Inflate**

March 17, 1958

To those of us who lived through the Great Depression, there is a curious familiarity about the schemes put forward to get us out of the present slump. On June 12, 1931, for example, the Chase National Bank of New York published a pamphlet by its economist, the late Benjamin M. Anderson, called “Equilibrium Creates Purchasing Power.” Anderson there drew a contrast between two opposing schools of thought. The school to which he adhered found the cause of the slump in “a disturbance of economic equilibrium.” The other found its causes in “deficiencies of purchasing power.”

The purchasing-power school was inflationist. It advocated “cheap-money policies,” farm price supports, and heavy spending on “public works.” It argued that “reductions in wages are on no account to be permitted.” “The general picture which the purchasing-power school presents is that of production running ahead of buying power.” As against this, Anderson advocated the restoration of equilibrium, mainly through adjustments of free and flexible prices and wages. He called for the restoration of a proper balance among the various types of production, among prices, and particularly between prices and costs of production, including wages, so that profits would be possible and stimulate enterprise.

**PRICES AND COSTS**

“When goods are produced in proper proportions,” he wrote, “they clear the markets of one another. . . . Production itself gives rise to the income which supports consumption. Production and consumption expand together. The 120 millions of people in the United States consume vastly more than the 400 millions in China, because they produce vastly more. . . . The problem is merely one of keeping the different kinds of production in proper proportion. This is accomplished under the capitalist system by the movement of prices and costs. Labor and capital tend to get out of lines where return is low and to move over into lines where return is better. The smooth working of this system calls for flexible prices, competitively worked out, which tell the truth regarding underlying supply and demand conditions.”

Anderson went on to point out that the purchasing-power theory was not working. “We have had extremely cheap money for over a year.” Inflexibility of industrial wage rates, while prices were falling, had led to increased unemployment. “Real” industrial wage rates between June 1929 and March 1931 had risen 11
percent, indirectly helping to force down “real” farm wages 17 percent.

But, as we know, the purchasing-power school—the inflationist school—won out. We had cheap money, inflexible or rising wage rates, and heavy government deficits for the next ten years. As a result, we also had mass unemployment for the next ten years—until the Second World War finally bailed us out.

TRIUMPH OF KEYNES
Today the chief ideological change is that there can hardly be said to be two schools of thought. Practically everyone in Washington seems to agree that we can easily float ourselves out of the slump through more inflation. We need merely give ourselves a sufficiently big dose—of increased spending, or tax reduction, or anything else that will produce a whopping deficit. The new Bible is Keynes’s *General Theory*, which denies Say’s Law and ignores any need for specific wage and price adjustments. The Administration disagrees with the Democratic inflationists only about the question of timing. It hopes everything will cure itself in the next few months. If it doesn’t, it promises to take “positive government action”—today’s euphemism for more inflation.

Meanwhile, neither political party calls attention to the fact that as factory wage rates have risen, unemployment has increased and payrolls have fallen. Neither party asks whether even massive inflation can restore employment as long as powerful unions have escalator contracts under which wage rates soar faster than living costs, preventing restoration of profit margins or lowering of prices. The only remedy proposed is bigger and longer unemployment compensation to help strong unions preserve upward-spiraling wage rates.

Stampede to Inflation
March 24, 1958

The President began with some sound and brave words in his March 8 letter to the Republican leaders of the House and Senate. The function of the government, he declared, “must necessarily be to stimulate private production and employment, not to substitute public spending for private spending, nor to extend public domination over private activity.” He expressed concern “over the sudden upsurge of pump-priming schemes” urging “wholesale distribution of the people’s money in dubious activities under Federal direction.” Having said all this, he proceeded to recommend a whole nest of pump-priming schemes, with wholesale distribution of the people’s money on loans, grants, and spending on dubious projects.

Just two days before this letter, the Federal Reserve Board ordered another cut in the discount rate from 2¼ to 2½ percent. Two days after the letter, Vice President Nixon suggested a tax cut that would enlarge the deficit. Most of the Democrats in Congress complain only that these inflationary measures are not big enough. Even Republicans demand the scalp of Secretary Benson for suggesting some moderation and sense in farm price supports.

Both political parties, in short, are getting panicky. Both are urging policies which, though reckless, are unlikely to cure unemployment.

INSURANCE VS. RELIEF
The President recommends that Federal funds be used to “extend for a brief period” unemployment compensation benefits for workers who have exhausted their existing benefits. Some Democrats call for an extension to 42 weeks, compared with the 26 weeks or less in most state laws.

Our whole system of unemployment benefits needs basic reexamination. Present proposals may pervert what set out to be an unemployment “insurance” system into a glorified Federal relief system. Once the Federal government starts contributing funds, it will be called upon for more and more. The “insurance” may become a Federal relief system permanently. If we recall the history of “emergency” farm relief, the “emergency” RFC (now alias SBA), “temporary” veterans’ benefits, “temporary” foreign aid, and the constant expansion of Federal grants-in-aid, we will not deceive ourselves about the “temporary” character of the present proposal.

The purpose of unemployment insurance is to mitigate the hardships of unemployment without increasing or prolonging unemployment itself. We are losing sight of the second half of this objective.

ESCALATORS VS. JOBS
But the reason why even reckless inflationary measures may not cure the present unemployment is that the basic cause of the unemployment is being ignored. This is the excessive height to which the hourly wage rates of powerful key unions have now been pushed. As Prof. Ludwig von Mises recently reiterated: “The height of wage rates at which all those eager to get jobs can be employed depends on the marginal productivity of labor. . . . If wage rates, either by union pressure and compulsion or by government decree, are raised above this height, lasting unemployment of a part of the potential labor force develops.” Even Sen. Paul Douglas, in 1934, when he was still an economist, concluded in
a 625-page book on wages: “If wages are pushed up above the point of marginal productivity, the decrease in employment would normally be from three to four times as great as the increase in hourly rates so that the total income of the working class would be reduced.”

Today, not only do excessive money wage rates show no signs of being adjusted to present realities; they are still rising because of built-in escalator contracts. In its December Monthly Labor Review, the Department of Labor tells us that “approximately 4 million workers in about 530 major bargaining situations will have their pay increased in 1958 by amounts specified in agreements negotiated in earlier years.” This includes not only built-in “productivity” or other automatic increases, but automatic increases based on the rise of the Consumer Price Index. Even further monetary inflation cannot cure unemployment by raising prices when it increases wage rates even more.

**Insuring Unemployment**
March 31, 1958

The history of unemployment insurance in this country is a classic illustration of how a “welfare” program keeps expanding almost automatically while the safeguards against abuses keep dropping away.

The Social Security Act, under which the individual states were in practice forced to set up unemployment-insurance plans, was passed in August 1935. The average weekly benefit of $10.54 paid to the unemployed in 1940 has about tripled to $30.11 in January of this year. This rise in itself is not surprising. The average weekly wages of covered workers went up from $26.60 in 1940 to slightly more than $80 now. But the same inflation that raised wages forced up benefit payments.

Most states started by requiring a waiting period of two to three weeks before benefit payments began; the waiting period in all states has now been reduced to one week or less. More significantly, in 1937 the most frequent maximum duration period for the payment of unemployment benefits was sixteen weeks; by 1955 this had risen to 26 weeks.

**INSURANCE INTO RELIEF**
New York State has just jumped the maximum weekly benefit from $36 to $45. It is variously proposed by the Administration and by Democrats that the Federal government pay unemployment benefits out of its own funds or deficits for up to thirteen or sixteen weeks beyond the maximum provided by the states. Anyone acquainted with the realities of politics or the “welfare” history of the last 25 years should know that once the Federal government adopts this “emergency” proposal its contribution will probably be permanent and increasing. It will turn an insurance plan into thinly disguised relief.

An ideal unemployment-insurance plan, if it could be realized, would be one that reduced the hardships of unemployment without increasing or prolonging unemployment itself. But there is a strong presumption that our present system tends to increase unemployment in three main ways:

1—It weakens the incentive of many workers to get a new job as soon as possible. The overwhelming majority of American workers, of course, prefer work to unemployment and charity. The number of outright shirkers or chiselers is probably negligible. But there is a less negligible number of people whose incentive to get a new job is or will be reduced as their unemployment benefits are increased or prolonged.

A U.S. Department of Labor pamphlet suggests that the weekly unemployment-benefit payment should be “at least 50 percent of weekly wages,” and that for low-wage earners it ought to be “70 percent or more.” Suppose a textile worker has been earning $60 for a 40-hour week, is laid off, and gets $42 a week, or 70 percent, as unemployment benefit. Even if he could get his old full-time job back at $60 before the expiration of his benefits, he may ask himself: “Why should I work for only $18 a week?” And if he could get the same hourly wage for a 27-hour week, he is asked to work, as he sees it, for less than nothing.

2—The present unemployment-insurance systems put a direct penalty on earning money by work. In most states a man is disqualified from unemployment benefits if he earns more than $5 or $6 a week during the period. This foolish deterrent could be removed by the simple device of reducing his benefits by, say, 50 cents for every $1 of outside earnings. In this way he could always increase his income by at least half the net amount he earned from casual work. At no point would he be out of pocket for taking such work. The states might treat “supplementary unemployment benefits” in the same way. To make (as 40 states now do) no deduction whatever for them, discriminates in favor of members of strong unions and subsidizes increased unemployment in such unions.

3—The most important way in which unemployment insurance increases unemployment is indirect. It subsidizes the unemployment created by excessive wage rates and relieves the pressure on powerful unions to bring wage rates down to the level at which full employment could be restored. It may be gravely doubted, in
short, whether unemployment insurance, as it exists at present, is a “built-in stabilizer.”

**Priced Out of Jobs**
April 7, 1958

Both political parties in Washington are convinced that there is only one way to cure existing unemployment, and that is by a still further and bigger dose of inflation. Both want to make our paper money cheaper and more plentiful. Both want a thumping deficit, “to increase purchasing power.” The only points they can’t agree on are exactly how big they want to make this deficit, whether they should get it mainly by more spending or by a tax cut, and exactly when they ought to start. But when it comes to the principal cause of the present recession, which is the excessive wage rates of the strong unions, and the escalator clauses they have been able to impose, Washington is deaf, dumb, and blind. It seems ready to adopt any inflationary scheme, however reckless, rather than suggest that these wage rates be readjusted.

**WHERE THE JOBS ARE**

Let us see where present unemployment is mainly concentrated. The government has estimated that 7.7 percent of the civilian labor force was unemployed in February. (Seasonally adjusted, the percentage was 6.7.) Here is the percentage of unemployment in some leading industries in February, and the latest available figures on hourly earnings of the workers employed in them:

<table>
<thead>
<tr>
<th>Industry</th>
<th>Unemployment</th>
<th>Hourly Wages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Construction</td>
<td>21.3%</td>
<td>$2.99</td>
</tr>
<tr>
<td>Automobiles</td>
<td>15.7%</td>
<td>2.48</td>
</tr>
<tr>
<td>Primary metals</td>
<td>13.5%</td>
<td>2.56</td>
</tr>
<tr>
<td>Mining</td>
<td>11.5%</td>
<td>2.61</td>
</tr>
<tr>
<td>Fabricated metals</td>
<td>10.9%</td>
<td>2.22</td>
</tr>
</tbody>
</table>

The average unemployment in all manufacturing industries in February was 9.8 percent; the average hourly earnings of workers in them was $2.10. In nondurable manufacturing industries unemployment averaged 8 percent and hourly earnings $1.92.

Such comparisons, of course, are not in themselves conclusive. Wage rates in certain industries may average higher than in others because of differences in skills, mechanization, growth, etc. But it is at least significant that present unemployment tends to be above average where wage rates are above average and highest where wage rates are highest.

The comparison is still more significant between the incidence of unemployment and of escalator wage contracts. I quote from the December Monthly Labor Review of the U.S. Department of Labor:

“At the beginning of 1958, almost ten years after the first agreement between General Motors and the United Automobile Workers to provide annual improvement factor increases and cost-of-living escalation, more than 4.3 million workers will be covered by cost-of-living escalator clauses. To a substantial degree, these same workers are also scheduled to receive deferred [the department’s euphemism for contractually mandatory] increases, since the majority of the workers covered by contracts incorporating provisions for deferred increases are also covered by automatic cost-of-living escalator clauses. . . . At the end of 1957, cost-of-living escalator provisions covered a greater number of workers than at any previous period.”

The article ends by pointing out that about half the wage increases granted in 1957 to railroad, automobile, and basic-steel workers came from cost-of-living escalator clauses and half from other mandatory increases.

The leaders of the strong unions who have been able to exact these automatic wage increases have no intention of adjusting their labor contracts to the existing purchasing power of consumers of the products their unions make. They insist that their unions’ excessive wage rates and unemployment be subsidized out of Federal funds poured into state unemployment-insurance plans. They demand that the government pump more paper dollars into the economic system so that others can buy the products they make at the soaring prices that their own excessive wage rates have made necessary. They have no stake in stopping inflation because their own members are protected by escalator wage contracts. But their remedy, though reckless, will not work. For if further inflation raises purchasing power and prices it will also raise escalator wage rates still more, making a further rise in the price of key products necessary. And so ad infinitum. ☞

**Insurance or Politics?**
April 14, 1958

Since its inauguration more than twenty years ago, our state unemployment-insurance program has steadily expanded while safeguards against abuses have been relaxed. Since 1940, as I have already pointed out
is really temporary, as it professes to be) as against the unemployed in future years.

Not the slightest evidence is offered that the states need these forced loans. State unemployment reserves now total $8.5 billion. This is where they stood at the end of 1956, their highest point except for the $8.9 billion at the end of 1953.

**IMPROVISED SCHEME**

The Administration proposal has obviously received no serious thought. It is a hastily improvised political gesture. Even as an “anti-recession” measure it is dubious. It may tend to prolong unemployment by reducing the incentive of many workers to get a new job as soon as possible, and by reducing pressure to adjust excessive wage rates.

The plan would destroy unemployment insurance. It would put the Federal government permanently into relief masquerading as insurance. Unemployment insurance as such can only be preserved if it is strictly separated from relief. What we really need now is not to desert the insurance principle but to return to it more strictly. A big step in that direction might be to have the workers themselves contribute directly toward the premiums, as they have always done in Britain, and in our own Federal old-age insurance system (OASDI).

**Is the Dollar Doomed?**

April 21, 1958

Three events temporarily helped to slow down the panicky stampede in Washington to more inflation. The first was Bernard Baruch’s testimony before the Senate Finance Committee that “we must prevent further deterioration of the credit of the United States” and “reject all tax reduction and pump-priming proposals which require deficit financing.” The second was President Eisenhower’s warning the next day against hasty actions, including a major tax cut, to combat the slump: “You just are not going to get the economy . . . inspired and stimulated just by spending Federal money.” The third event was the Easter recess of Congress.

Unfortunately there are still serious factors on the other side. Baruch’s testimony was spoiled by his implied endorsement of price and wage controls. Within a few days of the time the President sounded his warning, he advocated an ill-considered increase in unemployment insurance, signed a $1.8 billion “emergency” housing bill, and abolished even the 2 percent down-payment requirement on mortgage loans guaranteed by the Veterans Administration. Congress rushed through
several huge spending bills, including one to pump $1.8 billion in new Federal and state funds into highway construction, and the Federal Reserve Board proposed legislation to permit still further expansion of bank credit.

HALF ALREADY GONE

A warning of where such measures are likely to lead us, as well as an arresting summary of where they have already taken us, has just appeared in a study by Franz Pick: *The United States Dollar: Requiem for a Dead Half* (Pick Publishing Corp., N.Y., 30 pages, $25). “Whenever a currency loses more than half of its value in less than a generation,” he begins, “the unit is doomed. The United States dollar, in seventeen years . . . has declined to less than half of its 1940 buying power. This erosion cannot be halted.”

I hasten to say that I do not accept Pick’s defeatism concerning the American dollar. That defeatism seems to stem from a strange contradiction in his own economic philosophy. Though he is unsparingly sarcastic about the deceptions and consequences of inflation, he shares with the inflationists the belief that, “at a stable purchasing power of the dollar, the country cannot maintain full employment.” Neither theory nor history justifies this conclusion.

But Pick tellingly sums up what inflation has already done. It has debased the national debt. While that debt increased from a nominal dollar value of $49 billion in 1940 to $273 billion now, the purchasing power of this $273 billion debt, in 1940 terms, is only $133 billion. The government’s creditors, its bondholders, have been cheated out of billions in purchasing power.

GNP ILLUSIONS

One of the great illusions created by inflation concerns the growth of the national economy. Thus the gross national product (GNP) was estimated in 1940 at $101 billion and in 1957 at $433 billion. Here is an apparent growth of 330 percent. When the lowered purchasing power of the dollar is allowed for, this becomes a real increase of only 111 percent. When the increase in population is allowed for, this falls to a real per capita increase of only 61.2 percent. This, Pick tells us, means a per capita growth of gross national product in stable dollars “averaging not more than 3.6 percent per year.” Even Pick here understates his case. For if we figure, as we should, the average rate of increase from each year to the next, it falls to only 2.85 percent. Inflation has worked no miracles of real expansion.

I have said that Pick is wrong in contending that the erosion of the dollar cannot be halted. But no one familiar with the history of the last quarter century, or with the present Washington climate, will have the hardihood to argue that it will not be. The whole present clamor for increased spending on public works, major tax reductions, deficits, cheaper money, is a clamor for more inflation, for further deterioration of the national credit and further erosion of the dollar, in the desperate and delusive belief that this is the only alternative to recession and unemployment. ✷

Deficits vs. Jobs

April 28, 1958

I pointed out here in the issue of March 17 that, after 1930, “We had cheap money, inflexible or rising wage rates, and heavy government deficits for the next ten years. As a result, we also had mass unemployment for the next ten years—until the second world war finally bailed us out.” As we are trying to adopt now precisely the remedies that failed in the ’30s, let us look at that period in more detail. Here are the deficit, number of unemployed, and percentage of unemployed to the total labor force, year by year in that decade:

<table>
<thead>
<tr>
<th>Year</th>
<th>Deficit (billions)</th>
<th>Unemployed (millions)</th>
<th>Percentage of Unemployment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1931</td>
<td>5.5</td>
<td>8.0</td>
<td>15.9%</td>
</tr>
<tr>
<td>1932</td>
<td>2.7</td>
<td>12.1</td>
<td>23.6%</td>
</tr>
<tr>
<td>1933</td>
<td>2.6</td>
<td>12.8</td>
<td>24.9%</td>
</tr>
<tr>
<td>1934</td>
<td>3.6</td>
<td>11.3</td>
<td>21.7%</td>
</tr>
<tr>
<td>1935</td>
<td>2.8</td>
<td>10.6</td>
<td>20.1%</td>
</tr>
<tr>
<td>1936</td>
<td>4.4</td>
<td>9.0</td>
<td>16.9%</td>
</tr>
</tbody>
</table>
Another point to be noticed in this table is that in the ten years from 1948 to 1957 inclusive, average unemployment was 4.3 percent of the total labor force. Yet this period was one of unusually high employment, even of “labor shortage.” But if four persons out of every 100 are “normally” unemployed, then the present “abnormal" unemployment is only three persons out of every 100. This is serious, especially for those directly concerned. But it hardly justifies reckless deficit spending or further dilution of the dollar in an effort to cure it. We could more profitably look at the relation of key wage rates to prices and consumer demand.

In this article I have taken official unemployment estimates at their face value. Next week we shall try to find how accurate these estimates are.

### THE RECORD

### How Many Jobless?

May 5, 1958

When, in the 1930s, some economists began seriously discussing just what is statistical “unemployment,” old Hugh Johnson retorted in one of his angriest columns: “Ask the man who’s out of a job!” But the problem does not yield to mere invective. You can find lots of people in Miami or Las Vegas who have no particular job but are not worried. Millions of women and children are without jobs. In fact, the population of the United States is about 173 million, and as there are only some 62 million employed, there must be today not merely 5 million, but 111 million “unemployed.”

For the statisticians, however, the “unemployed" consist only of those in the “labor force” who are not employed. Just how is the line drawn between the 67.5 million who are counted as part of the labor force and the 105.5 million who are not?

Here is how the U.S. Bureau of the Census describes how it decides: “Monthly estimates of the population of working age [14 years and over] showing the total number employed, the total unemployed, and the number not in the labor force are obtained from a scientifically selected sample of about 35,000 interviewed households in 330 areas throughout the country.” So the estimate of unemployed is in large part based on a sample of only one in every 1,400 households in the country.

### SHIFTING ‘LABOR FORCE’

The bureau goes on: “The unemployed total includes all jobless who were looking for work.” How is the number of such persons estimated? From replies to the interviews. What constitutes realistically looking for work? The interviewers must rely in large part upon the realism of the replies. The labor force is not even a constant percentage of the total (“noninstitutional”) population. In July of last year it was 60.6 percent; but in December only 58.1 percent.

Some paradoxical results emerge. The last monthly report, for example, opened as follows: “Employment rose by 300,000 between February and March . . . while
unemployment was unchanged.” How is that? The layman would naturally expect that if employment rose 300,000 in March unemployment would drop that much. The statisticians’ answer is that the “labor force” increased by that much.

The “labor force” increases partly by census estimates of the population reaching working age, etc., but also partly by changes in people’s decisions. Suppose a man has a good job, with a wife at home and a son and daughter in college. He loses his job, whereupon not only he, but his wife, his son, and his daughter start looking for work. Because one person has lost his job, four persons are now “unemployed.” So “unemployment” goes up faster than employment goes down. There were 1.4 million more persons employed this March than in 1954; yet 1.6 million more were unemployed.

DEFINING UNEMPLOYMENT

Let’s turn now to the Department of Labor: “Effective January 1957, persons on layoff with definite instructions to return to work within 30 days of layoff and persons waiting to start new wage and salary jobs within the following 30 days are classified as unemployed. Such persons had previously been classified as employed. . . . The combined total of the groups changing classification has averaged about 200,000 to 300,000 a month in recent years.” So the “unemployed” have increased some 300,000 since the end of 1956 simply by a change of definition!

Among the conclusions to be drawn from all this are: (1) The government figures of unemployed are merely estimates, subject to error. (2) Statistical unemployment of several millions, or 3 or 4 percent, may exist even when there is a definite “labor shortage.” (3) Not every “unemployed” person is necessarily in distress. (4) The existence of some statistical or “frictional” unemployment is not necessarily an evil. There are always some people who prefer to be temporarily unemployed rather than accept or keep a job or wage that does not suit them. In a free economy, 100 percent “full employment” is never realized. But in such an economy there is always a tendency toward full employment, if prices and wages are flexible, without the need for perpetual inflation. ✂

‘Curing’ the Recession

May 12, 1958

It is not surprising to find politicians like Harry Truman and Lyndon Johnson blaming the recession on Republican “tight-money policy” and demanding “bold, prompt, confident action”—which always turns out to mean deficit spending and inflation. What is far more disturbing is to find committees of businessmen or economists plumping for the same inflationary policies.

I cite as outstanding examples the Committee for Economic Development and the Rockefeller Brothers Fund. The program committee of the CED called in March for increased spending for “public works,” but above all for “a large temporary cut in personal-income taxes to stimulate private spending.” This would mean “a cut of one-fifth in personal-income-tax rates”—or about $7.5 billion a year. “It is necessary that in a recession the budget be allowed to run a deficit . . . . The small decline in the money supply . . . should be halted and reversed.” If this is not a recipe for inflation I do not know what to call it. The Keynesian ideology concerning the cause and cure of crises is swallowed whole.

INFLATION AS REMEDY

Turn now to the report of the Rockefeller Brothers Fund. It has some sensible things to say about long-range tax reform and farm policy. It even has a sentence saying: “Business and labor must exercise restraint, the former in its pricing policies, the latter in its wage demands.” But it too recommends inflation as the cure for the slump. It advocates an immediate tax cut (amount unspecified). It wants to “accelerate public works,” and to set up “a permanent shelf of projected public works.” And it wants the Federal Reserve System to “increase the supply of money and credit as long as the economy is declining.”

Prof. Seymour Harris of Harvard, himself a Keynesian, has hailed the Rockefeller report as “virtually 100 percent Keynesian.”

For the long run, in fact, the Rockefeller report has even more inflationary implications than the CED report. The CED report looks only a year ahead, and proposes a tax cut only for that period. But the Rockefeller report looks forward for ten years, and what it looks forward to is steadily expanding government controls and government spending and a steadily expanding welfare state. It comes up with the remarkable discovery that an economic “growth rate” of 5 percent a year will lead to a bigger growth in ten years than a 3 percent rate or even a 4 percent rate. It assumes without argument that the way to get higher growth rates is for the government to spend more (and to tax us more to pay expenditures).

Of course if the government continues to inflate the currency and debase the dollar it can get (in dollars) any “growth rate” it wants. Let us remember that if there had been no inflation since 1939 (i.e., no increase in prices) the same real gross national product in 1957
would make more money per week through unemployment benefits if they were made completely idle.

**PENALTY ON WORKING**

This sort of consequence is the result of defects in the state unemployment insurance laws that the states themselves could remedy without the need for Federal intervention. Few people seem to realize that present state unemployment insurance systems put a direct penalty on earning money by work. In the great majority of states a worker is disqualified from unemployment benefits if he earns more than $5 or $6 a week during his benefit period. A handful of states have different formulas, but all of them put a positive penalty on earning above a certain amount.

This foolish deterrent to part-time work and earnings could be removed by a simple device. For every $1 of outside earnings that a man received during his benefit period, his weekly benefit could be reduced by 50 cents. In this way he could always increase his net weekly income by at least half the amount he earned from casual work. Suppose the weekly benefit to which the unemployed worker was entitled was $30. Then if he earned $10 by casual work in a given week he would not be completely disqualified from unemployment benefit but would receive $25, making his net income $35. If he earned $20 his benefit would be reduced to $20, making his net income $40. If he earned $30 his benefit would be reduced to $15, making his net income $45.

**PREMIUM ON IDleness**

It probably would not be wise to continue this formula beyond the point at which a man's outside earnings exceeded his benefit. The primary purpose of unemployment insurance, after all, is to provide some minimum income during unemployment, not to supplement income from employment. But even if outside earnings exceeded the amount of the full benefit payment, it would be cruel and stupid, and defeat the purpose of unemployment insurance, to disqualify the unemployed worker completely. From that point on his weekly benefit could simply be reduced by the full amount of his additional earnings. This would mean, for example, that if a worker entitled to a $30 benefit earned $35 his benefit payment would be reduced to $10.

To prevent the formula I have suggested from being exploited as a subsidy for part-time work by any collusion between unions and employers, unemployment benefits, as now, should begin only after a worker had been laid off. And any part-time earnings from employment by the same firm that had laid him off, if they occurred during the benefit period, would be fully deducted against the benefit payment.
Under such a system the worker would at least never be out of pocket from accepting part-time or casual work, and in most cases he would gain by it. The states should, of course, treat “supplementary unemployment benefits” in the same way, deducting, say, 50 cents of unemployment benefit for every $1 of SUB. To make (as some 40 states now do) no deduction whatever for SUB, not only discriminates in favor of members of a few strong unions, but discriminates in favor of income from not working against income derived from work.

The Foreign-Aid Fiasco
May 26, 1958

The treatment of the Nixon party in South America—the face-spitting, the rock-hurling, the desecration of the American flag—is an end result of our policy of total foreign entanglement in the last dozen years, and in particular of the foreign-aid program.

It may not be possible to determine the exact extent to which the South American riots were inspired by organized Communist plots directed locally or from Moscow, and to what extent they reflected genuine national feeling. In any case, the Communists won another major propaganda victory, and our own world prestige suffered another major blow. The Nixon tour was primarily an effort to woo South American goodwill and to secure a demonstration of it. Instead, our Vice President and his wife were insulted, physically attacked, and shamefully humiliated. The rioters successfully showed that they hate us and do not fear us. From this standpoint it is hard to deny the Moscow radio’s triumphant claim that the Nixon tour was a “fiasco.”

WE CAN’T BUY ALLIES
A few months ago (Jan. 13) I quoted here a passage from Machiavelli in which he pointed out that, in international affairs, “it is much safer to be feared than loved, if one of the two has to be wanting” and that “the friendship that is gained by purchase is bought but not secured.” James Burnham, in National Review (May 17), has taken an even more appropriate quotation from the same source: “When things are so managed in a government, that the neighbors purchase its comity, and make themselves its pensioners, ‘tis a certain sign of the potency of that government; but when the neighbors on the contrary receive money from it, ‘tis as infallible a sign of its weakness.”

From the very beginning, one of the main purposes of our foreign-aid program, in whatever euphemistic forms it may have been expressed, has been to buy the friendship and good will of other nations—to buy allies. It has not only failed to do so; it has done the opposite. We overlooked the elementary fact that the recipient of alms feels humiliated in accepting them. They wound its national pride; they advertise its dependence on the giver. The recipient resents any *quid pro quo* or any conditions, even when these are in its own interest. One of the signs carried by the mob that attacked Nixon in Lima was PERU IS NOT FOR SALE. Even if this was composed by Communists, they could count on it to inflame anti-American feeling.

GET RICH BY GIVEAWAY?

For many other reasons our foreign-aid policy has produced exactly the opposite results from those its supporters expected. To woo a country with bribes or their equivalent is to make that country feel that any alliance is primarily for our benefit rather than for its own. It regards such offerings as a sign of weakness. We lose respect by them. We have extended foreign aid to some 80 countries. The crowning irony is that nations that should have got not a cent from us are resentful and embittered because they get less than other nations.

The “economic” case for foreign aid is even worse. If there had been no economic foreign-aid program, countries wishing private American capital for development would have had to adopt sound political and economic policies to attract it. Government-to-government foreign aid has made this unnecessary. It has supported and prolonged foreign-exchange control, inflation, confiscatory taxes, and Socialism. And so it has on net balance retarded, not advanced, world production and economic recovery.

The *reductio ad absurdum* of all the economic arguments for foreign aid has been solemnly put forward by the Secretary of State. “The great bulk of our Mutual Security funds—over three-fourths,” he said on March 24—“are spent in the United States. . . . To cut these funds would be to cut employment here at home.” This is the argument that we get rich by giving our goods away. We could, of course, “create” the same employment by making the same goods to dump into the sea. If we want to subsidize our exporters, there are cheaper ways of doing it than giving away $100 for every $5 or $10 of net profit that exporters might get from added foreign sales.
Reform Our Labor Law
June 2, 1958

The demand for real reform in our labor laws has reached a point where the Democratic Majority Leader, Lyndon Johnson, has promised action at this session in the Senate. But there is little prospect of action by the House and, if legislation does emerge, no prospect whatever that it will be anything but innocuous or positively mischievous.

The dilemma of the present recession is that nothing but politically unpalatable measures will permanently help, while nothing but politically popular measures are being proposed. A score of measures have been taken, and scores more are pending, to increase deficit spending and inflation. These measures may have a temporary effect in increasing national-income figures. But they merely pile up greater difficulties for the longer future. And they divert attention from the need to curb the present power of the giant industrywide unions to impose wage rates which either disrupt production and employment or force continuous inflation to try to make such excessive wage rates payable.

LABOR LAW ‘HOLIDAY’

This big-union power could be curbed, not by any “repressive” or “punitive” or “union-smashing” legislation, but merely by repealing most of the New Deal Federal labor legislation passed since 1932. This legislation has turned the Federal government, in effect, into a union-organizing agency and put the full machinery of government behind the union monopolists.

None other than John L. Lewis has several times proposed that we try a “holiday” of a year or two from present Federal labor legislation. But this proposal is probably too far out of accord with the way in which public opinion has been conditioned in recent years to be regarded as politically feasible. Something close to the same practical result, however, could be achieved by following the recommendations of Prof. Sylvester Petro in a recent pamphlet, Personal Freedom and Labor Policy, published by the Institute of Economic Affairs at New York University.

While a good many union leaders have been shown to be cheap crooks and embezzling scoundrels, he points out, still more laws against stealing will do no good; we already have such laws. They deal with only the most superficial symptoms of the things that have gone wrong in labor relations. We need to return to basic common-law principles.

FREE EMPLOYEE CHOICE

Petro declares that the legal reforms needed “may all be subsumed under a single heading: Unqualified supremacy of the principle of free employee choice.” In detail, this would require:

1—A broad prohibition of restraint and coercion by employers and unions of the right of employees to make up their own minds on the question of union membership or participation in strikes.

2—A specific provision of law to the effect that picketing, even when “peaceable,” is subject to ban when it has or is intended to have coercive effects, either physical or economic.

3—A specific declaration that the ban on restraint or coercion applies to the economic coercion implicit in all “agreements” proposed by unions or employers which make union membership or nonmembership a condition of employment. (“Integrity demands that if unions be allowed to impose compulsory unionism agreements, employers must be allowed similarly to impose nonunion agreements.”)

4—A clear prohibition against secondary boycotts.

5—Emphatic repeal of the exclusive-bargaining, majority-rule principle. This would include a positive statement that unions shall be the exclusive bargaining representatives of only those workers who expressly delegate such authority to them. The present statutory and doctrinal requirement, imposing a legally enforceable duty upon employers to bargain only with majority unions, would then need to be deleted.

Finally, Petro adds, defects in labor-law administration and enforcement are as grave as the defects in the law itself. He would repeal all anti-injunction legislation, abolish all labor-relations boards, and return administration of justice in labor relations to the courts.

Trade, Yes; Aid, No
June 9, 1958

Perhaps nothing this country could have done could have prevented the crisis in France. The diseases of French democracy are of long standing. In 1872, in a preface to his English Constitution, Walter Bagehot pointed out that the French Assembly “is divided into parties and into sections of parties” which habitually “scream”; that “real discussion is impossible,” that the French “Parliament can neither choose men nor measures”; that, as the French Premier would not have “the power of dissolving the Assembly... the Assembly...
would be always changing its ministry, that having no reason to fear the penalty which that change so often brings in England, they would be ready to make it once a month.”

The defects of the French system were never corrected. The Fourth Republic is (was?) more unworkable than the Third. Even in his desperate last-minute proposals for constitutional reform, Premier Pflimlin never dared ask for the unequivocal power of dissolution. It was precisely the pathological fear in France of the man on horseback that led to the built-in executive weakness which caused the return of the man on horseback.

**Futility of Aid**
Not only has our postwar policy in France proved to be futile, but serious question must be raised whether it did not actually help to precipitate the crisis. Passing over our political interference and considering economic measures alone, if we had not so freely poured in government economic aid, and sponsored such unsound institutions as the International Monetary Fund, with its support of exchange control and artificial currency rates, France would have had to try to attract private capital. In these circumstances, it would not have plunged so heavily into draining, socialistic adventures. It would have had to abandon paper-money inflation and to stabilize the franc.

Much the same might be said of the end results of our aid to South American countries. As in France, that aid has proved to be futile either in preventing currency deterioration or in getting them to like us. Yet the response of the Administration to demonstrated failure, to insults and violence, has been to suggest still more aid! As James Burnham summarized the situation in National Review (May 31), how can “a nation that abandons its consuls—like Angus Ward—to Asian jails, that stands passive while its soldiers die slowly in Siberian slave camps, its aviators are brainwashed in filthy Chinese cells, its planes shot down by an Adriatic gangster, its diplomatic establishment smashed and burned, its flag cursed,” command respect? “If we do not respect ourselves, why should others respect us? And the nation’s response to the Nixon rocks? Abjectly confess how badly we have behaved. Pour out more money to the nations that have allowed these things to come to pass.”

**Description of Trade**
Yet there is one respect in which foreign nations do have a just complaint against us on economic grounds. This concerns our trade policy. It concerns our farm policy of first trying to make our farm exports arbitrarily expensive by crop controls and support-prices, then disrupting and demoralizing foreign markets and production by dumping our surpluses abroad at absurdly low prices. It concerns the vagaries of our government stock-piling and price-support for foreign metals. It concerns our policy of keeping out imports by excessive tariff rates or actual quotas. It concerns our sudden boosts or threatened boosts of tariffs whenever foreign competition seems on the point of succeeding.

We do not owe France or any South American nation any free gravy at all. Our giveaway program costs us dearly but does them no good. It merely degrades our relations. But we did owe and do owe France, Latin America, and every free country freedom to trade with us, on settled and predictable terms. And we should adopt lower tariffs not as a favor to them, but primarily in justice to our own consumers, who should be able to buy what they want where they can get it on the best terms. In brief, we should adopt seriously and literally the slogan that has received so much empty lip service in recent years: Trade, not Aid. ♣

**How to Increase Jobs and Payrolls**
June 16, 1958

There are mounting indications that the recession has been flattening out. A few important industries have been turning upward. Even more clearly hopeful has been the turn in political thought. Only a couple of months ago the great majority of labor-union leaders, politicians, “research groups,” and academic economists who got into print were shouting that the only way to stave off disaster was an immediate massive public-works program and/or a huge tax cut of $5 billion to $10 billion or more to give us a thundering inflationary deficit.

Though much harm has been done by the inflationary spending programs that Congress so hastily approved (and that already give us a prospective deficit for the coming fiscal year of more than $10 billion), we have been at least temporarily saved from much worse consequences by the firmness of Secretary Anderson and (after initial wavering) of President Eisenhower. There has not for a long time been so admirable an example of economic sense and political courage as the President displayed in his speech of May 20. I quote some outstanding sentences:

“Reckless expenditure in the name of economic stimulation is both wrong and self-defeating. . . . I would like to nominate for oblivion . . . the idea that the consumer is not price conscious any more . . . the notion that without paying the piper in higher prices, we can as a nation overpay ourselves for what we produce . . . the
idea that large annual wage increases can be regarded as a matter of course. . . . And, finally, we must be disabused of the thought that a competitive enterprise economy can be free of all loss, failure and disappointment, and that government can take all the bumps out of the road of business.”

**BLOCKS TO ADJUSTMENT**

A free-enterprise economy is self-adjusting. But it must be permitted to adjust. Much of the recent improvement in the business picture has been the result of the adjustments that have already taken place—in some better products, some lowered production costs, and especially in inventories. But the chief stumbling block to further adjustment and recovery is the excessive wage rates of some industry-wide unions and the insistence of these unions on still greater wage boosts.

Outstanding examples exist in the steel, electrical, and automobile industries. For half a year the steel industry has been operating at only about 50 percent of capacity. The normal adjustment of a free economy to such a situation would be a reduction of steel prices to stimulate and restore demand. But on July 1 (as the third installment of wage boosts called for in the current three-year contracts), wages of the United Steelworkers union are due to go up another 20 cents an hour or so. The unions obdurately refuse to forgo this automatic increase. So the companies are planning to raise steel prices to meet the added cost.

**GM WAGE PATTERN**

In 1955, General Electric negotiated five-year agreements with more than 100 unions. These agreements not only provided a cost-of-living escalator arrangement, but substantial wage increases in addition which come automatically regardless of what happens to the cost of living and regardless of whether there is prosperity or recession. “Now,” the company has said, “we look ahead to the fourth and largest increase yet, just when we are trying to pull ourselves out of recession. This increase will be a deterrent to the development of the better product values which are needed for recovery and re-employment.” The company has also expressed the opinion that “any [general] wage increase at all now holds back recovery.”

The wage-contract pattern which General Electric was forced to follow in 1955 was set by the General Motors formula of 1948. This combined automatic cost-of-living increases with automatic “annual improvement” increases. Together these have already reached a total of 90 cents an hour.

Thus the chief “beneficiaries” of this wage formula have been a few great industrywide unions. But what Walter Reuther and the automobile, electric, and steel unions are now chiefly suffering from is too many victories. It is mainly where wage increases have gone farthest that there is heaviest unemployment.

Those of us who have insisted on the need of wage adjustment to promote enduring recovery are sometimes accused of wanting to “squeeze down the workers.” Such an accusation can be honestly made only by those who fail to understand either what is being proposed or what the real effect of the proposal would be. It is not being suggested that wages should be cut generally or by, say, some flat uniform percentage. What is being proposed is that the wage rates should be cut only of the still-employed members of those top-level unions who are monopolistically profiteering at the expense of higher living costs for all the rest of the workers. And the purpose of this wage-rate cut is not to reduce the purchasing power of the class of workers whose wage rates would be cut, but to increase their living standards and purchasing power. The purpose, in brief, is to cut certain hourly wage rates in order to increase total employment and payrolls.

**WAGE RATE VS. PAYROLL**

What has been happening under the steadily mounting hourly wage rates in manufacturing was shown in this column of March 10. The situation has become even more striking since then. Whereas average hourly gross earnings increased from $2.05 in December 1956 to $2.11 in April of this year, manufacturing payrolls fell from an index number of 171.4 in December 1956 to 139.6 in April of this year. In other words, an increase of 3 percent in wage rates has meant a fall of 18 percent in wage payments.

The word “wages,” in short, is ambiguous, and may mean two entirely different things. A cut in the price of labor may be necessary for a rise in the employment and total income of labor. Failure to understand this elementary distinction has prevented many workers from recognizing where their real interests lie. About 20 percent of the automobile workers are unemployed because Reuther’s wage victories have priced American cars into a lower volume of sales. The remedy is clear.

**U.S.A. vs. U.S.S.R.**

June 23, 1958

One of the groundless myths encouraged by the Russian sputnik is that Khrushchev is on the verge of achieving his boasts of “catching up and surpassing the United States in per capita production” and “conquering capitalism with a higher standard of living.”
Allen W. Dulles, director of the Central Intelligence Agency, made a speech on April 28 which seemed to give color to this claim. He declared that in the recent rapid growth of the Soviet economy, “at a rate roughly twice that of the economy of the United States . . . we have the most serious challenge this country has ever faced in time of peace.”

Now all published Soviet figures are designed primarily as propaganda, not as objective information. In Newsweek of May 27, 1957, I discussed here the careful study by Prof. G. Warren Nutter covering 37 leading industries from which he concluded that “Soviet industry seems still to be roughly three and a half decades behind us in levels of output and about five and a half decades in levels of per capita output.” He has now published a supplementary study (American Economic Review, May 1958) emphasizing the growth rate of the Soviet economy in the short period of 1950 to 1955. He calculates that the annual growth rate in the Soviet economy in these five years ranged from 7.7 percent to 11.7 percent as compared with an annual growth rate in the same five years in the U.S. of only 4.6 percent. This is apparently the comparison that so impressed Allen Dulles.

PRODUCTION COMPARED
But just how significant is this comparison? Germany and Japan have shown equally striking growth rates following catastrophes. And the United States, in the war period 1939–43, showed the astonishing annual growth rate of 21 percent, based on the Federal Reserve index of industrial production, and even of 10.5 percent based on Geoffrey Moore’s index of industrial-material production. This wide difference even in American indexes shows how tricky and elusive growth-rate comparisons can be even when they are honestly and conscientiously compiled.

The most nearly reliable comparisons we can make are of physical output. A pamphlet just published by the National Industrial Conference Board of New York (Economic Comparisons, U.S.A., U.S.S.R., $1.50) shows that in Russia there is one agricultural worker for every 10 sown acres as against one worker for every 60 sown acres in the U.S. Yet Russia produces only a third as much meat, half as much sugar, and half as much grain per capita as the U.S. The Russian occupies less than a fifth as much dwelling space as an American. “In the U.S.S.R.,” said a study prepared for the Joint Economic Committee of Congress, “most families have only a single room in which all members sleep.”

OVERALL VS. MILITARY
Even these comparisons ignore quality. Once an economy gets beyond the subsistence level, economic growth—in food, clothing, housing, amenities—is reflected less and less in quantitative terms and more and more in qualitative terms. We must question, therefore, the conclusion of Professor Nutter that there is “a long-run tendency . . . for the industrial growth rates to slow down, or retard, as the level of production gets higher.” Physical growth rates slow down; but not necessarily economic growth rates in the wider sense. All belief that Russian Communism can compete with American capitalism in overall growth must be dismissed as baseless.

But this does not mean that we can be complacent about the Russian military threat. Allen Dulles declared that the Russian gross national product in 1950 was about 33 percent that of the United States, and had increased to about 40 percent in 1956. Suppose, for the sake of argument, we accept these comparisons as meaningful. We are spending about one-eighth of our national income on defense. Suppose Russia is devoting one-half of its own national production to war purposes. One-eighth of 100 is only 12½, but one-half of 40 is twenty. Such a hypothetical comparison reminds us that a much inferior economy can outmatch us in military growth by a more determined and ruthless concentration on such growth.

Preventive Cold War
June 30, 1958

In an all-out war between this country and Soviet Russia there would be no victor. If Communist Russia attacks us first, with nuclear missiles, we may have less than a few hours’ warning. It will be impossible to prevent appalling destruction and loss of life. It will be small consolation to know that we may have enough striking power left to devastate Russia also.

Perhaps the greatest problem mankind has ever faced is how to prevent such a war. One indispensable way is to keep even and if possible ahead in nuclear striking power. The Russian leaders must know at all times that any attempt on their part to attack us, no matter what its initial success, will be suicidal for them.

There is no substitute for this necessity. Those who like daydreams may put their faith in securing an agreement for the abolition of atomic and nuclear weapons. But there is no reason to suppose that the Russian leaders would ever keep such an agreement. Its chief result would be to give the West a false and perhaps fatal sense of security. It is easy to talk of guarantees through a “foolproof inspection system.” But the more we consider what would have to be done to assure a really
We must convince our own people, we must convince

Soviet Russia has been conducting a systematic cold war upon us. Massive retaliatory power would only partly achieve this goal. We must dissolve the Marxist ideology. We must do nothing less than try to convert the Communists to capitalism.

Our own ideology has already been undermined by Communist and socialist propaganda that most of our officials will regard such a goal as fantastic. For more than 40 years Communist propaganda has been successfully converting increasing numbers in the Western world either to Communism or to the halfway house of “democratic socialism.” At best our own counterpropaganda has been sporadic, apologetic, defensive and usually inept and incompetent.

The basic reason is not organizational. The basic reason is that our officials have themselves only a feeble faith in and a confused understanding of the virtues and strength of free private enterprise. They already half suspect that the Communist and socialist systems may be more productive than our own. How else can one account for the flood of statistical and economic fallacies from such official agencies as the CIA and the State Department, warning us, not of Russian military output, but of total overall production, and calling the economic challenge “the most dangerous of all,” more dangerous even than the threat of war? How far such a belief is from the truth, how enormously comparisons of production and of living standards are in our favor, I tried to show in this space last week.

OUR WILL TO RESIST

For years Soviet Russia has been conducting a systematic cold war upon us. Its primary purpose has been to sow dissension, to undermine our faith in our own economic and political institutions, to encourage appeasement among us, to weaken our will to resist—in short, to soften us up as easy prey to a hot war or even to make any hot war unnecessary for their final victory.

And they have been incredibly successful so far. Not until a few years ago did most of us even realize that this cold war existed. Most of us still treat it as a figure of speech rather than as a reality. Yet if we hope to avoid an unlimited nuclear war we must recognize the existence of a cold war and wage it systematically, intelligently, and untiringly. The facts and the ideological weapons are on our side if we know how to use them. We must convince our own people, we must convince the democracies of the West, we must convince the socialists and neutrals of the East, and finally we must try to convince even the Communists themselves, that a free-enterprise system is infinitely superior to a socialist or Communist system for production, for social cooperation, for peace, and for freedom.

Preventive Cold War: II

July 7, 1958

Just when our own official propagandists were warning us that Russian Communism was outpacing American capitalism in overall production, Khrushchev announced another major reform in the Soviet agricultural system that is interpreted as a step toward “the farm-commodity market of capitalist countries.”

Harry Schwartz of The New York Times describes it as follows: “In essence, the decision indicates that the key lesson learned by the Soviet agricultural officials who visited the United States three years ago is now being applied to the collective farms. That lesson is simply that the market forces of supply and demand, price and cost, profit and loss are more effective stimuli for an efficient agriculture than the government exhortations and orders the Soviet Union has relied upon for three decades.”

Whether the new reform does in fact go as far as this will be better known as more details become available and further decisions are announced. But there can be no doubt that Khrushchev, in spite of his daily denunciation of capitalism, has been moving in the direction of the capitalistic free market. This is shown in his attempts to decentralize industrial production decisions, to permit collective farms to own rather than rent tractors, and to set up what he calls a planned system based on “incentives.”

WHY WE ARE LOSING

It is true that the new system will be still far from a free market. The government will still set an arbitrary price and will still fix compulsory production or delivery “quotas.” Unfortunately, we cannot contrast our own system too sharply with this. We too, in agriculture, have abandoned the market system, at least for so-called “basic” commodities. These are supported by an arbitrary government-set price which creates wasteful surpluses and diverts land, labor, and capital from more needed output.

But with the growth of welfare statism at home, our own bureaucrats have come more and more to accept the socialist premises. That is why they are impressed by fallacious comparisons of Russian production with our
own. That is why they believe that the road to world salvation lies in government-to-government foreign economic aid. That is why they are not only willing but eager to subsidize India’s socialistic Five Year Plan, an obvious imitation of Russian models.

And that is one of the main reasons why we have so steadily been losing the cold war. For this cold war is chiefly a war of propaganda. It is a struggle for men’s minds. And, if our leaders have only a feeble faith in our own system, if they do not understand its virtues and how to explain them, if they do not understand the Marxist philosophy and its weaknesses, they are putty in the hands of the trained dialecticians and determined propagandists of Moscow.

**EDUCATE THE RUSSIANS**

Marshal Zhukov once told General Eisenhower that the Soviet system “appealed to the idealistic” whereas ours appealed “completely to the materialistic.” “I was very hard put to it,” the President confessed at a press conference a year ago. “I had a very tough time trying to defend our position.” Two months ago Khrushchev told our American ambassador that when the Communists win the economic competition with the capitalistic world, “we shall also re-educate you.” And Ambassador Thompson merely stared at the floor with a faint smile.

Yet it is we who, for our own survival, must re-educate the Russians. It is their philosophy that is materialistic; it is the Western philosophy of economic, political, religious, and cultural freedom that is idealistic. If our economic system is also immensely more productive than Communism, it is precisely because it releases intellectual and spiritual energies.

A subordinate organization like the Voice of America, with its effort to penetrate the Iron Curtain by radio, can perform only a minor role in explaining all this. It must be explained at the summit. Our political leaders must know the right things to say. And, like their opposite numbers in Russia, they must say them persistently, systematically, daily. The fact that such a program will not cost billions or even millions is not a good reason why it can be neglected.

**Government by Favor**

July 14, 1958

There cannot be two opinions regarding the impropriety of Sherman Adams’s relations with Bernard Goldfine. Goldfine paid hotel bills for Adams of more than $2,000, gave him a vicuña coat, loaned him an Oriental rug worth $2,400. Adams communicated with the Federal Trade Commission and the Securities and Exchange Commission regarding cases involving Goldfine, made an appointment for him, received an FTC memorandum, and transmitted it to Goldfine. These actions, in combination, were more than “imprudent,” as Adams confesses; they were improper.

There is a curious parallel between the defenses now offered for Adams and those put forward centuries ago for Sir Francis Bacon. Bacon himself admitted accepting presents from suitors in cases pending before his court, but his defense was that they had not influenced his decision! He insisted that he was “the justest chancellor... since Sir Nicholas Bacon’s time” and this, as the *Encyclopaedia Britannica* puts it, “on the plea that his intentions had always been pure and had never been affected by the presents received.” Macaulay ridiculed this defense in his famous essay in 1837. “It is plain,” he wrote, “that, long before Bacon was born, the accepting of presents by a judge was known to be a wicked and shameful act, that the fine words under which it was the fashion to veil such corrupt practices were even then seen through by the common people.”

**THE NIXON DEFENSE**

The strangest defense of Adams’s actions is that put forward by Vice President Nixon, who argues that members of Congress not only have a right but a duty to intervene with Federal agencies in behalf of their constituents. “It is proper for a member of Congress to write or call an agency in order to get information. It is proper to ask for justice for a constituent... [Otherwise] we would wind up having a dictatorship by bureaucracy.”

Let us see. Nearly all the Federal agencies involved are called “quasi-judicial” agencies. Suppose they really were judicial agencies; suppose they were courts. Would Nixon regard it as proper for a congressman to write or call a Federal judge “to ask for justice” for a constituent? Such a request would be improper and insulting. It is taken for granted that a judge will dispense impartial justice to all parties before his court, and not merely to those for whom a special request has been made by a congressman. Would Adams have thought it proper to call a judge presiding in a case involving Goldfine and ask about the status of the case or arrange an appointment for him? The question answers itself.

Why, then, are the Federal quasi-judicial agencies considered fair game? Why is it thought not only right but necessary that individual congressmen or outside officials should intervene and put pressure on them in behalf of individual constituents or “lifelong friends”? Why are the agencies considered a real or potential “bureaucratic dictatorship”?

---

*Business Tides*
RIGHT OF APPEAL
The answer is that this is the way Congress has set them up. They are part of the vast growth of government power and intervention in the last few decades. Whenever Congress has not known how to solve a problem it has set up a new agency and delegated broad discretionary powers to it. A judge is bound by the law; his function and duty is to interpret and apply known law to particular cases. But the executive agencies, with their vast discretionary and quasi-legislative powers, and their exemption, over wide areas, from judicial review or reversal, are free to be arbitrary and capricious. This is government by special favor.

Many of the Federal agencies set up in recent years are both needless and pernicious. Those that are not abolished outright should have their irresponsible discretionary powers drastically cut down. Aggrieved parties before them should always be free to have recourse, not to a particular congressman or “an old friend,” but to the courts. They should be entitled to appeal from either questionable factual findings or punitive rulings. These principles should be applied to the FCC, the FTC, the SEC, the ICC, the NLRB, and the whole bureaucratic jungle.

Inflation Disrepute
July 21, 1958

The effort to create a common European market calls attention to the radical reforms necessary in present-day economic and monetary policy even to move toward such a goal. The International Chamber of Commerce recently issued a statement dealing with the monetary problems of the European Economic Community. Among the major recommendations two stand out:

1—The member governments should agree not to ask their central banks for new credits “save in exceptional circumstances recognized as such in accordance with agreed criteria, by a competent body designated by them.”

2—The present claims on governments held by the central banks should be gradually transformed into negotiable securities bearing interest rates to make them attractive on the international monetary markets.

The purpose of the first recommendation is obviously to try to stop deficit spending by governments, financed by monetizing of new government debt. The purpose of the second recommendation is to restore liberty of action and transferability of assets to the central banks.

HOW FAR FROM FREEDOM
It is instructive to notice that the best experts of Europe are growing skeptical of the blessings of deficit spending and monetary inflation just when Washington has decided that this is the way to cure any recession. The chairman of the commission that prepared the ICC statement was Maurice Frere, formerly head of the Central Bank of Belgium. Among those who cooperated with him were Emmanuel Monick, formerly governor of the Bank of France, Herman Abs of the Deutsche Bank, Camille Gutt, former managing director of the International Monetary Fund, and other distinguished European bankers.

There is no doubt whatever that if the recommendations of the ICC were followed they would constitute an immense step toward currency stability and greater freedom of international trade. Yet they also emphasize how far away the “free” world, with all its beautiful talk about international cooperation and common markets, still is even from the amount of freedom and international cooperation that existed prior to the second world war, not to speak of the amount of freedom and international cooperation that existed prior to the first world war.

The most immediate international monetary need is the restoration of full currency convertibility—to any amount, and at any rate that those who wish to exchange currency find mutually agreeable. This convertibility could be restored overnight. All that is needed is that the governments of the world should permit it. But this is precisely what the International Monetary Fund and exchange control exist to prevent.

FORWARD TO GOLD
It is true, of course, that with practically every country on a paper-money basis, and subject to varying degrees of inflation, there would be wide fluctuations in the exchange rates between currencies. But these would be cured if the countries returned to a gold standard.

The final paragraphs of the statement by the ICC declare wistfully that the reforms it recommends “should result in creating among the common-market countries a ‘monetary community’ which may perhaps lead them one day, when political conditions make it possible, to a single currency. This would be the last stone crowning the edifice.” But this “single currency” was, in effect, what virtually the whole world enjoyed, under the international gold standard, prior to 1914. When every currency unit was freely convertible on demand into a specified weight of gold, there was a de facto common currency. The ICC statement declares...
that a single currency today would be “premature and “artificial” until nations “coordinate and harmonize their monetary policies.” It was precisely the requirement of constant gold convertibility that forced them to coordinate and harmonize their monetary policies prior to 1914. No elaborate international bureaucratic machinery was necessary.

In currency matters the world of 1958 has an enormous distance to go before it can even catch up with the nineteenth century.

Piano and the Stool
July 28, 1958

In 1936, Prof. Jacob Viner, reviewing John Maynard Keynes’s new book The General Theory of Employment, Interest, and Money, ventured a prediction that has proved, at least in part, remarkably prophetic:

“Keynes’s reasoning,” he wrote, “points obviously to the superiority of inflationary remedies for unemployment over money-wage reductions. In a world organized in accordance with Keynes’s specifications there would be a constant race between the printing press and the business agents of the trade unions, with the problem of unemployment largely solved if the printing press could maintain a constant lead and if only volume of employment, irrespective of quality, is considered important.”

There may be some doubt whether the problem of unemployment has been “largely solved.” But we have certainly been trying to solve it since 1936 in accordance with Keynes’s specifications, and we have certainly embarked upon a race between the printing press and the trade unions.

Take the current recession. There has been some recovery from the bottom. Moderate increases have occurred in industrial production, retail sales, housing starts, the factory work week, and total employment. Particularly striking has been the maintenance of personal income, the rise of farm income, and the continued high level of consumer spending.

PLANNED INFLATION
But it is precisely the maintenance of high personal monetary income, in a period of smaller output, that points to the existence of inflation. With the index of industrial production down about 10 percent from a year ago, wholesale prices have risen and the consumer price index for this May was 3.3 percent higher than in May of 1957. The development that has caused most optimism in some quarters—the recent rise of the stock market to new high levels for 1958—finds a more plausible explanation in the fear of further dollar-erosion than in the trend of corporate earnings.

The 1958 inflation, like all inflation, is not the result of some inescapable plague. It is the deliberate creation of governmental policy. Part of this is the approval by Congress of inflationary spending programs, to be paid for by a deficit expected to reach $10 billion to $12 billion in the current fiscal year. Part of it is the result of Federal Reserve policies reducing bank-reserve requirements and forcing interest rates once more down to ultra-low levels (with Treasury bills yielding less than 1 percent). These policies have been reflected in an increase in total bank deposits and currency of $10 billion between April this year and a year ago.

WE ADJUST TO REUTHER
But has all this inflation worked? Has it, in fact, cured unemployment? True, the official estimate of employment was 920,000 higher in June than in May. Yet because of the flood of new graduates looking for jobs, the estimate of unemployment rose to 5.4 million, a seventeen-year high. This unemployment is still largely concentrated in such industries as automobiles and steel, with the steel industry still operating below 60 percent of capacity. American automobiles and steel are being priced out of a full-capacity market by high prices caused by excessive production costs. Yet instead of any move to lower wage rates to adjust to reduced demand, the powerful nation-wide unions in these industries have been forcing wage rates to new high levels.

A famous European clown used to have an act in which he would try to play a grand piano but find himself persistently thwarted because the stool was always in the wrong place. Whereupon he would try futilely to push the piano around to adjust it exactly to the stool. This is the Keynesian prescription. This is how we are trying to cure the present recession. We have legally made the unions so powerful that they can dictate their terms to the nation. Instead of, say, some 10 percent of the workers adjusting their excessive wage rates to the realities in their own industries, 170 million people are being forced to pay higher prices for everything in an effort to adjust the whole economy to the demands of the Reuthers and McDonalds. Meanwhile most of our politicians remain studiously ignorant of the real situation.
‘Have-Not’ Countries?  
August 4, 1958

Surely the overturn in Iraq has supplied one more lesson in the folly of foreign aid. The economic and military aid that we poured into Iraq has not only gone down the drain, but we shall be lucky if these resources are not ultimately used against us.

Once more it has been proved that our foreign aid does not buy allies or even friendship. Once more it has been proved that it does not turn a country “away from the Communist camp.” In a book I wrote eleven years ago, *Will Dollars Save the World?* I pointed out that “the comparatively easy decision to give more of the American taxpayer’s money away cannot be regarded as a substitute for the hard political and diplomatic decisions that any serious program of countering Russian Communist aggression must involve.”

The political folly of the foreign-aid program is exceeded only by its economic folly. One of its economic assumptions is that foreign aid will “raise living standards” and so “discourage Communism.” The statistical evidence fails to show that any recent rise in living standards has discouraged Communism. Nor is there any convincing evidence that the rise in living standards actually achieved in Europe or the Middle East in the last decade has been mainly the result of our foreign aid. On the contrary, whatever rise in living standards has occurred in the Middle East in the last ten to twenty years has been mainly brought about by the exploitation of oil.

**WHERE THE OIL IS**
The tremendous significance of this has been almost wholly lost on our own statesmen and on our socialistic “liberals.” One of their favorite themes in the last decade is that this country is rich because it has been blessed far beyond others with “natural resources,” whereas the “underdeveloped” countries are poor because nature has given them no natural resources. So we, the Have nation, must give to the Have-Not nations to satisfy their “legitimate aspirations.”

Turning to reality, let us look at one of the most vital of all national resources for modern industry, wealth, warfare. Last year the Middle East produced 23 percent of the oil output of the free world. True, great as this is, it was only about half the oil brought to the surface in the United States, which accounted for 47 percent of the free-world total. But when we turn from current production to oil reserves, we get the reverse of this picture. According to the estimates of *The Oil & Gas Journal*, Middle Eastern lands contain proven oil reserves totaling 170 billion barrels, or 71 percent of the West’s still untapped crude petroleum, compared with known U.S. reserves of only 33 billion barrels, or only 14 percent of the free world’s holdings. The Middle East, in other words, has more than five times the known oil reserves of the United States.

**RESULT OF CAPITALISM**
Which then are the Have, which the Have-Not nations? In proportion to its area and population, the Middle East may be more richly endowed than ourselves, not only with oil, but with total natural resources. Some day, instead of giving aid to the Middle East, we may be asking for it.

Why, it may be asked, if the Middle East is so richly endowed, is its general standard of living so far below our own? I suggest that the reason is because America has followed the way of private competitive enterprise, the way of freedom and capitalism, whereas in the Middle East, generally speaking, private property and private capital, foreign or domestic, has never been safe from burdensome regulations or taxes, seizure, or socialism. Even the oil development that the Middle East has had has been almost wholly achieved through discovery and exploitation by American or British private enterprise.

But none of these facts has seemed to make the slightest impression on the semisocialist ideology of our Washington bureaucrats, whose cure for every crisis in foreign relations is still bigger American handouts. It is not easy to see how we can extricate ourselves gracefully, and without losing face, from our present awkward involvement in the Middle East imbroglio. But it is still not too late to reappraise some of the preconceptions and policies that chronically lead to such involvements.

---

**Time-Deposit Inflation**
August 11, 1958

The recent dramatic rise in the stock market has been hailed by many as a sign that the recession is over. But the rise has been quite disproportionate to the recovery in business. The Dow-Jones industrial average rose from 420 on Oct. 22 last year, and from 437 on Feb. 25 this year, to 505 on Aug. 1, an overall increase of 20 percent.

The Federal Reserve index of industrial production, on the other hand, which stood at 142 last October, was only 130 in June of this year, a decline of about 8 percent. Unemployment was estimated at 2.5 million last October and is now estimated at about 5 million.
Well, it may be said, the stock market isn’t supposed to reflect actual conditions at the moment, but anticipated conditions; it is forecasting further recovery. But perhaps what the stock market really is reflecting is current credit inflation and the belief in a further shrinkage in the dollar.

The continued existence of inflation is plain enough not only from the rise in the stock market while unemployment is substantial and the level of output is down, but from the rise of both wholesale and retail prices in the face of this lower activity. The dollar has lost about 3 cents in purchasing power in the last twelve months. And it has done this because government (and Federal Reserve) policy has been increasing the number of dollars.

**SWOLLEN MONEY SUPPLY**

There are many economists and statisticians who contend that this has not occurred. The money supply, they argue, consists of demand bank deposits and currency outside of banks. The total of demand deposits, they point out, was $104.8 billion at the end of May 1957 and only $105.8 billion at the end of May this year. For the same period, currency outside of banks was $27.9 billion in 1957 and $27.8 billion in 1958. So for the twelve months the total money supply was almost unchanged.

This picture alters, however, as soon as we take account of time deposits. Between the end of May 1957 and the end of May this year, these increased by nearly $10 billion.

Here is where the expansion of bank credit—the inflation—has taken place. Since the end of 1951, demand deposits have increased only 8 percent and currency outside of banks only 5 percent, but time deposits have increased from $61.5 billion to $94.6 billion, or 54 percent. It is common to think of time deposits as “savings.” That is why their growth has been rather complacently regarded. But another interpretation may now be called for.

**1958—AND 1928**

There is a striking parallel between the present situation and that exactly 30 years ago. In June of 1928 Benjamin M. Anderson analyzed the situation in two bulletins for the Chase National Bank. “Since July of 1927,” he wrote, “there has been an immense expansion of bank credit flowing into the securities market. . . . The most conspicuous effect of cheap money and bank expansion has been in the speculative rise in the prices of securities and real estate, but this rise has in itself had a very marked effect upon the volume of consumer demand.” He went on to show how the Federal Reserve authorities, by lowering the rediscount rate and by other means, had brought about an expansion of bank credit which had taken the form primarily of increased time deposits. In the seven years ending in April 1928, whereas the net demand deposits of the reporting banks of the Federal Reserve System had increased 34 percent, their time deposits had increased 135 percent.

“The fact,” he continued, “that an immense expansion of bank credit has taken place, unneeded by commerce and industry, has made it inevitable that a high percentage of this increase would take the form of time deposits rather than demand deposits. . . . The greater part of time deposits in great cities” are not true savings deposits but “represent the temporarily idle funds of business corporations. . . . Most of the growth of the time deposits . . . is a product of bank expansion rather than of savings.”

All this applies to the present situation. Bank credit has expanded. Out-of-line wage rates have not been adjusted. So we have a booming market with continued unemployment.

**More Inflation Ahead?**

August 18, 1958

The signs are becoming unmistakable that the recent rise in the stock market is more a reflection of the belief in further inflation (i.e., in a further shrinkage in the dollar) than a reflection of business recovery.

Certainly stock prices are not reflecting current earnings reports. The First National City Bank of New York reports that net profits after taxes of 809 corporations in the first half of this year were 30 percent under those for the corresponding period last year. The automobile industry suffered a 56 percent drop in profits; the railroads, a 61 percent drop.

No one would suspect anything about this by looking at the recent stock market. The Dow-Jones industrial average went up from 420 on Oct. 22 last year to 513 on Aug. 8. This has created some surprising relationships between prices of stocks and the earnings and dividends of the companies. Barron’s, the financial weekly, has pointed out that the stocks in the Dow-Jones industrial average, as of Aug. 1, were selling at a rate of about 17.3 [times] net earnings. This is higher than any “earnings multiplier” rate in the entire 1949–57 upswing. And The New York Times has called attention to some extraordinary examples, such as Universal Cyclops Steel selling at 100 times its current annual earnings rate and Crucible Steel at 110 times.
STOCK VS. BOND YIELDS
No less significant is the relationship recently established between the dividend yield of stocks and the interest yield of bonds. Normally the yield on common stocks, because of higher risk and uncertainty, is substantially above the yield on high-grade bonds. But as of July 30 the yield on Standard & Poor's index of 500 common stocks was 3.87 percent, or only .13 percentage point above the 3.742 percent yield on its Al+ bond average. This is the closest the two yields have come together since July 1957, when for a short time stocks were actually yielding less than Al+ bonds. It was the first time this had happened in more than twenty years.

This situation is usually thought to be paradoxical. In fact, the near-approach of the yields on common shares and bonds is often followed either by a fall in the price of common shares or a rise in the price of bonds. But there is one situation in which the convergence or crossing of stock yields and bond yields is a logical response. This is when investors and speculators believe that still further monetary inflation is threatened. In that case stocks are valued abnormally high in relation to current earnings or dividends. Bonds, on the other hand, are valued abnormally low, because the purchasing power of the principal is expected to decline, and lenders insist on a higher interest rate as an “insurance premium” against this.

EVER-MOUNTING DEBT
If there is a fear of further depreciation of the dollar, the blame rests squarely in Washington. Congress and the Administration, between them, are responsible for the prospect of a $12 billion deficit in the current fiscal year. Even if we admit that the Federal Reserve authorities either can or should try to “stabilize the economy,” they made an extravagant overresponse to a mild recession, slashing the discount rate from 3½ to 1¾ percent, reducing required reserves of member banks, and engaging in massive support-buying of government securities. Whatever the immediate effects may be of the restoration of stock-margin requirements from 50 percent to 70 percent, it is unsound and ultimately futile to encourage a general inflationary flood and then try to dam off its effects in one or two directions.

And now the Treasury wants a further $8 billion boost in the national-debt ceiling to $288 billion. It is time to ask some blunt questions of Congress and the Administration. Do you ever expect the debt to be paid off? Do you ever intend even to reduce it? If so, at what rate? Under what conditions? Are the conditions likely to be realized? Do you intend to pay off either principal or interest in dollars of even present (48 cent) purchasing power, or do you mean to keep short-changing the government’s creditors by further depreciation?

President Eisenhower has expressed great concern which, however, must still be translated into policy.

Rates of Growth
August 25, 1958

Is it true, as we are now so frequently told, that Communist Russia’s economic “rate of growth” is faster than ours, or that we cannot survive unless we increase our own “rate of growth”? There are at least five main reasons why rate-of-growth comparisons are untrustworthy.

1—In the midst of daily glib comparisons of national income and particularly “gross national product,” or GNP, it may come as a shock to many to learn that these figures are in large part arbitrary. It is impossible to compare the national income of Russia with that of the U.S. We do not know whether the Communists are telling the truth about specific output figures. Even if they were, their figures would have little comparative meaning. They have no true market prices, but only arbitrary government prices and wages. The production of specific goods is not determined by consumer demand. The comparative purchasing power of the convertible paper ruble and the U.S. dollar can only be guessed at.

2—It would take a book to describe all the arbitrary judgments and guesses that enter into even our own national income figures. They measure only the values that pass through the market. When a man marries his cook, for example, the money value of her services disappears from the national-income accounts. Inflation constantly changes the value of the dollar in terms of which everything else is measured.

The President’s last annual Economic Report boasted in its opening paragraph that the nation’s output of goods and services in 1957 totaled $434 billion, “5 percent larger than in the preceding year.” Only later in the report were we explicitly told that “four-fifths of this increase was accounted for by rising prices,” and that therefore “in physical terms, the increase was only about 1 percent.” This July, however, all national-income estimates were revised again. It seems the government statisticians now think our GNP in 1957 was not $434 billion but $440 billion and that our 1956 GNP was not $415 billion but $419 billion. Yet in “1957 prices” our 1956 GNP was $435 billion.

3—It may be thought that we can make meaningful comparisons between the Russian economy and our own in physical terms. In certain homogeneous terms,
Within a period of ten days the Federal Reserve author-
ities illustrated first the wrong and then the right way

to control inflation. On Aug. 14 they raised the margin
requirements for buying stocks from 50 to 70 percent.
On Aug. 14 they permitted the Federal Reserve Bank
of San Francisco to raise its discount rate from 1¾ to
2 percent. The first method is what is called “selective”
credit control. The second is what is called general credit
control. Only the second is equitable and effective.

The targets of selective credit controls are always
politically selected. The stock market is the No. 1 tar-
get because those with no understanding of its role and
function in the American economy regard it as a sort of
glorified gambling casino. As G. Keith Funston, presi-
dent of the New York Stock Exchange, said in a speech
last October:

“I sometimes wonder at our sense of proportion. A
man can borrow up to 75 percent to buy a car, 100 per-
cent to buy a washing machine, and 94 percent to buy
a house. But he can borrow only 30 percent to buy an
interest in the company that makes the car, the washing
machine, or the house. We have made it much easier
to borrow in order to spend, than to borrow in order
to save.”

THE CREDIT FLOOD
In addition to being discriminatory, these rigid restric-
tions on stock-buying margins are also in the long run
futile. We cannot encourage a general inflationary flood
and then expect to dam off its effects in one direc-
tion. Credit, like water, seeks its level and leaks through
every crack. If a man is determined to buy shares, and
does not have the required legal margin, he can mort-
gage his house or other assets and use the proceeds in
the stock market.

Raising stock-market margin requirements sel-
dom has the intended effects. No statistics can show,
of course, what might have happened to stock-market
credit or prices if margins had not been changed. But
most margin increases have shown little effect on stock-
market credit.

Nor is it easy to justify the latest rise of margin
requirements on this ground. As Funston has pointed
out, customers’ net debit balances on June 30, 1958,
totaled $3.1 billion, which represented only 1.4 percent
of the market value of all stocks listed on the New York
Stock Exchange on the same date, a ratio almost exactly
the same as it was a month earlier or a year before. He
might have gone on to point out that it was only half the
ratio of 2.8 percent that prevailed in 1955, in the whole
period from two to six months after margin require-
ments had been raised to 70 percent in April.

RED LIGHT
Increases in margin requirements have sometimes tem-
porarily halted the upward movement of stock prices,
but never for more than a month or two. In fact, in
every instance of a margin increase from February 1945
through April 1955, stock prices six months later aver-
aged at least 12 percent higher than in the six months
before the margin change. That is what we might have
expected. The price that people pay for stocks is pri-
marily determined by the expected yield from those
stocks and the capitalization of that yield as affected
by interest rates.

But because the increases in legal stock margin
requirements have not had their intended effect, it does
not follow that they have done no harm. Their main
effect, careful comparisons show, has been to reduce the
volume of trading—sometimes as much as 25 percent.
This does not merely mean that brokers lose commis-
sions. It reduces the liquidity of the market and throws
damper on the willingness and ability of corporations
to raise new money through stock issues.

An increase in the Federal Reserve discount rate is
a move in the right direction. Yet it is not the Fed’s bad
judgment in forcing the discount rate down to 1 3/4 per-
cent that is being criticized by the apostles of inflation,
but its return toward mild restraint. It is an ominous
sign—on both sides—when the majority of standard
common stocks sell at a lower yield than long-term gov-
ernment bonds. Some brokers are calling this a “flight
from the dollar.” We will disregard this red light at our
peril.

A Century of Cycles
September 8, 1958

In a study just issued by the National Bureau of
Economic Research, a private organization, Geoffrey H.
Moore finds that recent data support earlier indications
that the current business contraction may be drawing to
a close. Most measures of aggregate economic activity,
he finds, have risen above their lows of April or May
and personal income has regained its pre-recession level.

These immediate facts are largely known. What I
find most interesting in the study is the elaborate com-
parisons of past business cycles, particularly the com-
parisons of 24 cycles over a period of a century, from
1854 to 1954. These disprove some hardy myths about
business cycles.

Perhaps the hardest of these myths is the belief in
the “regularity” of the business cycle. This belief is found,
for example, in Keynes’s General Theory of Employment,
Interest and Money: “There is some recognizable degree
of regularity in the time sequence and duration of the
upward and downward movements. . . . The duration
of the downward movement [has] an order of magni-
tude which is not fortuitous, which does not fluctuate
between, say, one year this time and ten years next time,
but which shows some regularity of habit between, let
us say, three and five years.”

MEASURING RECESSIONS
Now measuring business cycles is an extremely difficult
(and partly arbitrary) task. Different indicators of eco-
nomic activity have different amplitudes of movement.
All reach their relative peaks and troughs at different
times. But the statistical studies of the National Bureau
of Economic Research are the most complete and
meticulous yet made. And we find from Dr. Moore’s
tables that the average duration of the downward move-
ment of the 24 cycles in the period from 1854 to 1954
was just twenty months.

But this statistical average conceals a wide range of
duration. The contraction beginning in August 1918
lasted only seven months; that beginning in October
1873 lasted 65 months. In spite of Keynes’s impression
of regularity, here is a difference in duration of almost
ten times as much in one case as in another.

Had Keynes been discussing the average duration
of the whole cycle, instead of merely the downward
phase, his guess would have come near the mark. The
expansion and contraction phase together, of the 24
cycles, add up to just 50 months, or slightly over four
years. But this average again conceals wide differences.
For whereas the average expansion phase of the 24
cycles lasted 30 months, the range was from as low as
ten months to as long as 80 months.

PRICES VS. WAGE RATES
Statistics by themselves cannot provide either forecasts
or remedies. We also need a study of the reasons behind
the statistics. Moore points out that with the exception
of the 1929 depression, the typical length of the con-
traction period seems to have shortened since 1920. I
suggest that the main reason for this is that since 1933
we have followed an almost continuous policy of infla-
tion. This has restored a workable relationship between
costs and prices not by reducing costs but by further
raising prices.

But it does not follow that we need the evils of
inflation to cure the evils of recession. There is a strik-
ing and instructive comparison between 1920 and 1929.
Judged by almost any standard, the crisis of 1920–21
was far more severe than the crisis of 1929–30. Here,
for example, drawn from Moore’s tables, are the per-
centage declines in selected indicators in one year in the
first period as compared with the second:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Industrial Production</td>
<td>-23</td>
<td>-21</td>
</tr>
<tr>
<td>Corporate Profits</td>
<td>-90</td>
<td>-57</td>

</tr>
<tr>
<td>Residential Construction</td>
<td>-57</td>
<td>-40</td>
</tr>
<tr>
<td>Industrial Construction</td>
<td>-77</td>
<td>-46</td>
</tr>
</tbody>
</table>
Why is it, then, that the recovery from 1921 was astonishingly rapid, whereas the depression of 1929 got steadily worse? The chief answer will be found in what happened in the two periods to wage rates. In the first they were still flexible downward as well as upward; they adjusted to lower prices, and allowed a quick recovery.

20 Ways to Giveaway
September 15, 1958

Administration policy is difficult to follow. On Aug. 27, President Eisenhower told reporters that he would campaign for a Republican Congress this fall on the issue of “getting down these deficits and keeping our money sound.” On the same day he deplored the cut by Congress in foreign-aid spending as “my greatest disappointment.” On the day after that, the Administration announced it would participate in a $350 million aid plan to keep India’s grandiose socialist development program afloat. And on the day before that, in an exchange of letters with Secretary Anderson, the President had urged a still further addition to an expansion of government agencies devoted to pouring U.S. taxpayers’ money into foreign countries.

There is already a bewildering maze of agencies for this purpose. There is the World Bank, the International Monetary Fund, the International Finance Corporation, the U.S. Export-Import Bank, the Development Loan Fund, the Agricultural Trade Development and Assistance Act. Now the Secretary and President propose to set up still another agency, an International Development Association, to make “loans” so soft and dubious that even the existing government agencies are forbidden to make them. In addition, larger U.S. Government guarantees are to be made to the World Bank and still more money is to be poured into the International Monetary Fund.

ALL PILED ON TOP
The proposal to expand the facilities of the Bank and the Fund might have something to be said for it, as a transitional measure, if it were meant to replace our foreign-aid program. But there is not the faintest suggestion of such a replacement; all these new schemes are to be piled on top of existing foreign aid. And that foreign aid—which in all forms has already run to more than $60 billion since the end of the second world war—is presumably to be itself enlarged and perpetuated.

What is the purpose of all this aid? Does experience show that the aid has helped to accomplish its purpose?

The President’s letter declares that two of the purposes are to encourage “financial policies that will command the confidence of the public, and assure the strength of currencies” and “to avoid hampering restrictions on the freedom of exchange transactions.”

We have now had these institutions and foreign aid for more than a decade. The public never had less confidence in the financial policies of governments. If this were not so, governments could borrow all they really needed from private sources. Inflation is still rampant everywhere. The war that gets the blame ended more than a decade ago. Latin America, where some of the worst inflations are still going on, was relatively untouched by the war. Restrictions on the freedom of exchange transactions were never more widespread. They are all but universal. They are built into the very concept of the International Fund.

RESCUING SOCIALISM
The truth is that not only have the Fund and foreign aid done nothing to cure this condition; it exists largely because of the Fund and foreign aid. If the restrictionist, spendthrift, and socialistic governments of the world did not know that these guardian angels were standing by to rescue them from the results of their own folly, if they knew that there would be nobody to go to but hardheaded private lenders with a prejudice in favor of getting their money back, or of getting solid guarantees, they would long ago have been forced to return to the path of fiscal sanity. In brief, dramatic “rescues” effected by the Fund and our own foreign aid have encouraged the very socialist planning and fiscal irresponsibility that have made the rescues necessary.

Instead of adding further to our foreign-aid and intergovernment lending institutions, which subsidize foreign socialism, inflation, and exchange control, we should be thinking of how to taper off and terminate such programs; how to stop confusing political with economic goals, and how to return the business of foreign investment to private hands. Not until we have done this will the world get back to stable, hard, and convertible currencies, to private enterprise, and to real economic progress.

Bipartisan Inflation
September 22, 1958

So far as economic principles are concerned, it grows increasingly difficult to detect any difference between the two major parties. The President has said that he is going to stress “getting down these deficits and keeping
our money sound.” A look at the record does show that the Democrats are more openly the party of inflation and massive spending than the Republicans. But it does not show any excessive devotion to economy on the part of the Republicans.

Let us glance back at the economic record of the last session of Congress, and begin with the credits. The list is short. It extended the Reciprocal Trade Act. It alleviated some of the difficulties of the railroads and other taxpayers by repealing the 3 percent tax on freight transportation and the 10 percent tax on passenger fares. Most important of all, as a result of the courage and persistence of Secretary Benson, it reduced the price supports for cotton, rice, and corn, and gave us a less expensive and outrageous farm law.

**SUPER-SPENDING**

On the debit side the list is much longer. Congress began furiously to “fight the recession,” i.e., to start a new round of inflation. It hastily passed a spate of “emergency” spending measures, including $1.8 billion for Federal housing loans and another $1.8 billion to speed up Federally aided highway programs. It increased and prolonged unemployment-insurance benefits. It offered a $500 million Federal loan guaranty program to rescue railroads from the results of excessive Federal regulation. It appropriated another $3.5 billion for foreign aid. It voted Federal aid (which the President fortunately vetoed) for “depressed areas.”

Nobody in Congress had time to keep count. When the session was over, the Tax Foundation, a private research group, announced that a peacetime record of $83 billion in appropriations and other forms of spending authority had been voted. The Treasury looks forward to a $12 billion deficit for the current fiscal year. So Congress raised the Federal debt limit to $228 billion.

The Kennedy-Ives labor bill did not become law, but that was fortunate. The bill contained no effort whatever to deal with the basic sources of union monopoly and coercion. Under the pretense of correcting union abuses it placed more burdens and restrictions on management.

**SOCIAL INSECURITY**

But if the record of the last session of Congress, and of both political parties, was typified by any one measure, it was the new social-security amendments. For the fourth successive election year, Congress approved a bill to “liberalize” the benefits. It had done this substantially in 1950, 1952, 1954, and 1956. This year’s amendments provided another 7 percent general increase. The one thing to be said in extenuation was that Congress did have the candor to provide higher social-security taxes to pay for the higher benefits. Effective next Jan. 1, employers will each have to pay 2.5 percent in payroll taxes, and the self employed 3.5 percent.

This is a tax on employment. It reduces the current living standards of self-supporting people. It does not increase the supply of goods and services, but places added burdens on production. There is no serious discussion of the long-range costs of this program or the dangers of overexpansion. Once more Peter is robbed to pay—Peter.

Worse, for the fifth time in twelve years, Congress provided for an increase in the Federal share in state public-assistance programs. The President not only signed this bill but hailed it as “a significant forward step.” He did object to the successive increases that have raised the Federal share of old-age assistance from 45 percent in 1956 to an estimated 58.5 percent under the new bill Last January he recommended gradual reduction in the Federal share to 50 percent. But why not, in accordance with the moderate suggestions of the Life Insurance Association of America, and in accordance with a purpose of the original Social Security Act, a gradual but complete elimination of any Federal contribution to state old-age assistance?

As of now, a vote for either party is a vote for more inflation. ✺

**Inflation by Spending**

September 29, 1958

In its September budget review, the government confirmed that it expects a deficit of more than $12 billion in the current fiscal year.

This is treated as nobody’s fault. It is all blamed impersonally on “the recession.” When the current budget was presented in January we were promised a surplus of $500 million. The present deficit is accounted for by an estimated increase in expenditures of $5.3 billion to $79.22 billion, and by an estimated decline in receipts of $7.4 billion to $67 billion. One way in which this was restated in some news stories is that 60 percent of the present expected deficit is accounted for by the impact of the recession on receipts and 40 percent by higher spending.

It is possible, however, to apply a different kind of analysis. This would begin by pointing out that the original January estimates were not realistic. This column was not alone in making such comments as the following (on Jan. 27): “It seems highly probable that estimates of both receipts and expenditures for 1950 err on the optimistic side. . . . In an acknowledged
period of declining business, the President wishfully estimates budget receipts from the same taxes at $2 billion more in 1959 than in 1958. And Democratic leaders (and some Republicans) are demanding even higher spending.

BLAMING THE RECESSION
Can the higher spending be blamed on the recession? Well, unemployment-insurance payments are now expected to be $585 million higher than expected in January, and expenditures on housing are expected to be more than $1 billion higher because of the “emergency anti-recession” mortgage-buying program. But it is not the recession or the panicky actions caused by it, but record crops (encouraged by the subsidies themselves) that account for the estimated increase of $1.8 billion in farm price supports. And the increase of $591 million in the estimated postal deficit was caused mainly by a retroactive pay increase.

Altogether estimated expenditures have increased over January by $5.3 billion. The planned expenditures even in January were far too high. The nondefense expenditures then recommended, in fact, reached a new high record of $28.1 billion (not including the $2.5 billion for the highway program) compared, say, with $21.2 billion in 1954. Proposed non-defense expenditures in January were higher for 1959 than for 1957 in practically every major category—for foreign economic aid, veterans’ benefits, “welfare,” farm subsidies, natural resources, and housing.

Estimated spending under the cash budget (which includes the operations of the government’s trust funds for social security and jobless pay) now comes to the staggering total for 1959 of $94 billion.

ARE WE HELPLESS?
Yet we are told that there is nothing we can do about this, and that we must resign ourselves, not only to a $12 billion deficit this year, but probably to at least a $6 billion deficit in the next fiscal year.

The truth is that, if a healthy public opinion made itself felt, and if the will existed in Washington, the nondefense budget could be cut now by an annual rate greater than the estimated $12 billion deficit, and with all-round advantage. The $6 billion farm-subsidy program is an economic outrage. Most of the $4 billion foreign-aid program is demonstrably futile. The $5 billion of veterans’ benefits is shamelessly swollen. All of which has been pointed out before.

But under our present budget system (or lack of system) responsibility for reckless expenditure and inflationary deficits cannot be fixed. Congress and the President shift the blame to each other. We will never have a responsible budget until we adopt the system that prevails in, say, Great Britain, and is approached in many of our states, under which the legislature cannot make any appropriation not recommended by the Executive, or in which the Executive can at least veto or reduce any item in an appropriation bill beyond his recommendation. This constitutional change, it is true, would not be in itself sufficient to assure fiscal responsibility. But it is highly improbable that such responsibility will ever be secured without it.

Balanced Labor Law
October 6, 1958

The new bargaining victories of the United Automobile Workers, in the face of the heavy unemployment already in their ranks and the fall in sales of American cars, may be attributed to the bargaining skill of Walter Reuther or the bargaining ineptitude of the companies. But a “third force” in the background exercised the determining effect. This is the one-sided labor laws and decisions that give enormous bargaining power to union leaders and bargaining weakness to management. A further recent illustration of the effect of these laws was the order issued by the United Steelworkers of America expelling the “ringleaders” of a rebel faction of “traitors” that polled nearly a quarter-million votes in the union’s election last year.

FREE EMPLOYEE CHOICE
It is facts like these that emphasize the irrelevance and futility of measures like the Kennedy-Ives bill, which divert attention from the real labor reforms that need to be made.

One of the few lawyers who do have a sense of the urgency of these reforms, and who combine it with political courage and an understanding of the basic economic as well as legal principles involved, is Prof. Sylvester Petro of the New York University School of Law. In a book and in numerous pamphlets and articles, Petro has emphasized “free employee choice” as the guiding principle of labor legislation. He has supported the Taft-Hartley Act and the state right-to-work laws to the extent that they are built around this principle. But he has criticized the provisions of the Taft-Hartley Act that sanction compulsory-unionism agreements or accept the exclusive-bargaining, majority-rule principle.
In a recent speech before a meeting of the Mont Pelerin Society at Princeton, Petro tried to clarify “free employee choice” further by outlining how a brief law might read. I quote some of his principal suggestions:

“1—Employees shall have the right to join or not to join labor organizations and to participate or to refuse to participate in collective bargaining and other concerted activities.

“2—It shall be unlawful: (a) for any employer or trade union by picketing or otherwise to coercively restrain employees in the exercise of the rights stated in Section 1 . . . and provided further that no party subject to this act shall be required to meet, treat, or bargain with any other party or person subject to this act; (b) for any party or person subject to this act to condition employment or to cause or to attempt to cause the conditioning of employment upon membership or nonmembership in any labor organization; (c) for any employer to induce or encourage any other employer or any other person to visit reprisals upon any employee for his exercise of the rights stated in Section 1; (d) for any trade union to induce or encourage any other trade union or any other person to cease or interrupt any economic relationship. . . . Provided that nothing in this act shall prohibit employees during a dispute with their own employer over their own wages, hours, or other conditions of employment from leaving their employment in an orderly way and to go on strike. . . .

I have omitted several provisions because of the requirements of space. In addition, Petro would add a third set of provisions abolishing the National Labor Relations Board, repealing the National Labor Relations Act and all laws restricting the jurisdiction of the courts in labor disputes and giving full jurisdiction at law and in equity to any court, state or Federal, having jurisdiction over the parties to any case arising.

STOP UNION VIOLENCE

Petro has performed a service in trying to formulate a specific labor law to embody his central principle of free employee choice. By doing so he has helped to point up the one-sidedness of our existing labor laws drawn in the interests of maintaining union-boss power rather than in the interest of the individual worker, employer, or consumer. His accompanying discussion has brought out the unreality of present labor law that ignores the central problem of trade-union violence. The rule of law means rules that apply equally to all persons, not rules framed to favor on group at the expense of another.

Interest-Rate Tides
October 13, 1958

It was the contention of John Maynard Keynes, still accepted by many academic economists, that interest rates are a purely monetary phenomenon. In his own words: “The rate of interest is the reward for parting with liquidity for a specified period . . . a measure of the unwillingness of those who possess money to part with their liquid control over it.”

This theory not only ignores or contradicts most of what has been written by economists for the last two centuries, but is clearly contrary to the facts it presumes to explain. If Keynes’s theory were right, short-term interest rates would be highest precisely at the bottom of a depression, to overcome the individual’s reluctance to part with cash then. But it is in a depression that short-term interest rates tend to be lowest. If the “liquidity-preference” theory were right, short-term interest rates would be lowest at the peak of a boom, because confidence would be highest then, and everybody would be wishing to invest in projects and “things” rather than in money. But it is at the peak of a boom that short-term interest rates tend to be highest.

It is not easy to prove this relationship statistically, partly because so many influences govern interest rates, and partly because there is no “pure” index of “depression” and “prosperity.” But Geoffrey H. Moore, associate director of research of the National Bureau of Economic Research, who has done much work along this line, has at my request kindly furnished the data, and H. Irving Forman of the same organization has prepared the accompanying chart, comparing the Federal Reserve index of industrial production with bank rates on short-term business loans in the ten-year period running from 1948 through part of 1958.

The industrial production scale on the left and the interest-rate scale on the right are ratio scales, in order to bring out more clearly the proportional changes in the two indexes.

MONEY-RATE AND OUTPUT

The results show that the two indexes tend to go up or down together. Or, more strictly speaking, the industrial production index leads, and the interest-rate index lags. This is what we might expect. When production has been low, demand for loans is low and interest rates are low. As production increases, the demand for loans to expand production increases, and if the money and credit supply is not too “elastic,” interest rates tend to rise, but with a time lag. There is also a reciprocal and inverse influence of interest rates on production. Low interest rates tend to encourage borrowing
Economic Community, EEC) is now, at least on paper, a fact. Under the Treaty of Rome the six countries of Belgium, France, Germany, Italy, the Netherlands, and Luxembourg have established a customs union which is to reduce and finally abolish tariffs among the six over a period of twelve to fifteen years, and maintain a common tariff, equal to the present average tariffs of the six, against all non-member countries.

The British, partly because of their ties with the other countries of the Commonwealth, and partly because of the political nature of the proposed common market, have refused to join but have proposed, as an alternative, that Britain, the six, and ten other countries, now members of the OEEC (Organization for European Economic Cooperation), form a free-trade area that would reduce and abolish tariffs among the seventeen members over a fifteen-year period, but would allow each to retain its own tariff schedule against non-member countries.

Reginald Maudling, who heads the committee negotiating for Britain, has objected to the proposed common market of the six on the ground that British goods would have to pay a higher rate of duty in the Dutch market, say, than German goods. He regards this as “discrimination.” He has expressed the fear that the six countries may pursue “inward-looking” or “trade diverting” policies rather than “outward-looking” or “trade creating” policies—in other words, they may concentrate more on expanding trade among themselves than on maintaining imports from “traditional suppliers.”

All these objections seem thoroughly justified. But if they seem valid for the British, they seem equally valid for ourselves. Why have American officials encouraged a common market from which the U.S. is to be excluded? Why, for that matter, are they encouraging a free-trade area from which the U.S. would be excluded? One can understand how they might take the position that it is no business of ours either way—unless discrimination against American goods turned out to be more serious, on net balance, after the EEC or the FTA became actualities. But it is a strange double standard of economic theory or economic morality for our officials to give their direct encouragement to a common market or a free-trade area for other countries, on the ground that freer trade among them is the best economic medicine, while we ourselves refuse to have anything to do with it, preferring to maintain protection, high tariffs, quotas on imports, and export subsidies, and dumping as a result of our farm price support program, and

**Why Don’t We Join?**

October 20, 1958

LONDON—The first thing that impresses the traveler who makes infrequent visits to a country is the change in the physical appearance. London in 1947 was still in large part a scene of ruins. By 1951 incredibly little progress had been made. Today, though there are still here and there jagged brick walls and unfilled excavations, the restoration, with many modern office buildings and new housing developments, seems almost complete. The improvement in the dress of the people, since 1947, is dramatic. The shops present a similar contrast—but the prices seem incredibly high, and comparing them with British wage statistics, one wonders where the purchasing power comes from.

The physical change in England is, of course, confirmed in the national income statistics, in the improvement in dollar and gold reserves, and in the strength of the pound sterling. Transferable nonresident sterling has reached practically complete convertibility. One of the most remarkable developments of the postwar period, in retrospect, has been the way in which the British have been able to maintain the pound sterling as the dominant currency of international trade, though it is tied, not to gold, but to the dollar. The tail, so to speak, has triumphed over the kite. The explanation is complex; but part of it is the superiority of British banking brains and British financial know-how.

**COUNTERPROPOSALS**

A chief topic of discussion here is the new common market and the British counterproposals for a free-trade area. The common market (or European Economic Community, EEC) is now, at least on paper, a fact. Under the Treaty of Rome the six countries of Belgium, France, Germany, Italy, the Netherlands, and Luxembourg have established a customs union which is to reduce and finally abolish tariffs among the six over a period of twelve to fifteen years, and maintain a common tariff, equal to the present average tariffs of the six, against all non-member countries.

The British, partly because of their ties with the other countries of the Commonwealth, and partly because of the political nature of the proposed common market, have refused to join but have proposed, as an alternative, that Britain, the six, and ten other countries, now members of the OEEC (Organization for European Economic Cooperation), form a free-trade area that would reduce and abolish tariffs among the seventeen members over a fifteen-year period, but would allow each to retain its own tariff schedule against non-member countries.

Reginald Maudling, who heads the committee negotiating for Britain, has objected to the proposed common market of the six on the ground that British goods would have to pay a higher rate of duty in the Dutch market, say, than German goods. He regards this as “discrimination.” He has expressed the fear that the six countries may pursue “inward-looking” or “trade diverting” policies rather than “outward-looking” or “trade creating” policies—in other words, they may concentrate more on expanding trade among themselves than on maintaining imports from “traditional suppliers.”

**DOUBLE STANDARD**

All these objections seem thoroughly justified. But if they seem valid for the British, they seem equally valid for ourselves. Why have American officials encouraged a common market from which the U.S. is to be excluded? Why, for that matter, are they encouraging a free-trade area from which the U.S. would be excluded? One can understand how they might take the position that it is no business of ours either way—unless discrimination against American goods turned out to be more serious, on net balance, after the EEC or the FTA became actualities. But it is a strange double standard of economic theory or economic morality for our officials to give their direct encouragement to a common market or a free-trade area for other countries, on the ground that freer trade among them is the best economic medicine, while we ourselves refuse to have anything to do with it, preferring to maintain protection, high tariffs, quotas on imports, and export subsidies, and dumping as a result of our farm price support program, and
even accept discrimination against American exports in order to go it alone with our protectionism.

French Revival
October 27, 1958

PARIS—The overwhelming popular endorsement of the new Constitution, which meant the overwhelming popular endorsement of the leadership of de Gaulle, has given a great lift to the French spirit and to French hopes. This increased confidence is, of course, primarily political and military. If de Gaulle is able to unify France, if he is able to bring peace in Algeria, if he is able to make France once more a bastion of NATO, the whole outlook for the West will become brighter. This surge of confidence has had its immediate economic effect in encouraging a return of capital to France. It improves the long-term economic outlook. But the immediate problems are still grave, and above all the problems of the budget and of inflation. The officially estimated deficit for the present calendar year is 600 billion francs (about $1.4 billion), but most observers think it will run higher. And the budget for 1959, though it has not yet been presented, is widely expected to run to still larger expenditures and a still larger deficit. This is because increased authorizations have been voted or promised in the past. De Gaulle himself has promised increased spending for his Algerian development program.

MOUNTAIN OF SUBSIDIES

Among those who are concerned by this situation, however, there is widespread hope that de Gaulle and Finance Minister Pinay may make a thorough re-examination of the budget to find economies that will offset the promised new expenditures in Algeria. These economies, of course, will be tremendously difficult politically. For what unbalances the French budget is truly a mountain of welfare programs and subsidies—for “investment,” for social security, for the railroads, for coal, for wheat, for gasoline, for milk, for beet sugar, for chocolate.

Moreover, some authorities who have analyzed the French inflation point out that even the budget deficit, great as it is, has not been the chief cause of the inflation of the last six years. They blame the policy of the Bank of France. Between December of 1952 and September of this year, for example, the bank’s advances to the government increased by 464 billion francs. But the bank’s extension of “medium-term” credits increased by 1,004 billion francs. In other words, only about a third of the inflation (i.e., of the resulting increase in the money supply) was the consequence of the budget deficit, whereas about two-thirds came from the increase in medium-term credits. These credits are chiefly for housing; others are for the purchase of machinery by French industry. They are actually twenty-year loans; but they are called medium-term (moyen terme) because the government has agreed to take them off the bank’s hands at the end of five years.

TIGHTENED CREDIT

Critics of this policy contend that it is a gross violation of all central bank principles to discount loans running for twenty or even for five years. They argue that it is absurd to discount three-month bills at 5 percent, and to discount twenty-year paper at an effective rate of only 4 percent.

In the last year or so credit has been considerably tightened, but through quantitative controls rather than through a flat increase of the discount rate. Ceilings are now placed both on the borrowing of each commercial bank from the Bank of France and on the loans that the commercial banks may make. There are a series of such ceilings. The first amounts to 65 percent of the ceiling on a bank’s borrowings as of July 1, 1957. On such borrowings the commercial bank paid a 5 percent (now reduced to 4½ percent) discount rate. On any borrowing above this of 10 percent or less it paid in addition a penalty rate of 2 percent. If it broke through this second ceiling it paid a penalty rate of 4 percent up to a third ceiling.

These quantitative controls and penalty rates have slowed down the inflation considerably. But they take nearly all the flexibility out of the money market. They favor established borrowers at the cost of new enterprises. They lead to an uneconomic allocation of credit and production.

But the new government seems more determined than its predecessors to make courageous reforms.

Why Do We Apologize?
November 3, 1958

BRUSSELS—Now that the Brussels World’s Fair has closed, we may take stock of the American exhibit. On net balance it must be set down as a missed opportunity. Our exhibit had, of course, virtues as well as faults. The American pavilion, from the outside, was a circle of golden beauty, especially at night. And some individual exhibits, like the Circarama, were first-rate, and made one proud to be an American. But that exhibit
was made possible by a grant from the Ford Motor Co. Fund.

There were two rational objectives for an American exhibit, one narrow, one broad. The narrower objective would have been to show foreign visitors the range and quality of goods that America has to sell to the world. This would have helped to increase American exports, as well as impressed foreigners with American economic strength, versatility, and skill. This task was hardly even attempted. The only automobile shown was a 1903 Ford. The few industrial exhibits of, say, model kitchens, office machines, TV, radio, etc., were scattered and haphazard, inferior to what one might find in a typical New York showroom. In fact, the American exhibit was notable for wasted space. All this contrasted sharply with the magnificent exhibit put on by the Federation of British Industries.

PEOPLE'S CAPITALISM
The wider objective of our exhibit might have been to display the merits of the American free-enterprise system. It would not have been to show how well off we were, but how we got to be that well off, and how other nations, by following the same policies, instead of the economic dead-end street of statism, socialism, or Communism, could achieve a like result. It would have been to show, in other words, how “people’s capitalism” had provided the American masses with comforts and amenities that a king could not enjoy a century ago.

It would be unfair to say that this objective was entirely neglected. The visitor who went through the American exhibit very carefully could have found small signs telling him that one of the great secrets of American productivity was that American industry had invested an average of $14,500 per worker to provide the tools and machinery responsible for this enormous productivity.

But none of this was dramatized or pictured. The signs were so small that one wonders whether one in a hundred visitors noticed them. On the other hand, great space was devoted to apologies. There were immense black-and-white pictures of New York and Chicago that seemed deliberately intended to emphasize drabness and ugliness. In accompanying signs visitors were told that Manhattan’s buildings are “generally without rhythm in the artless gridiron,” that they “have shot up without reference to any overall scheme—merely in answer to the law of supply and demand, tempered by the owner’s judgment.”

‘PLANNING’ BIAS
Much else reflected this “planning” and anti-free-market bias. The point is not whether such criticisms were warranted, but whether they had any place in an exhibit the primary purpose of which should have been to give the best, not the worst, impression of America. No other nation whose pavilion I visited seemed to have thought it necessary to exhibit its slums and its sore spots, or to make any apology for its shortcomings.

The model for what we should have done was of course not the Russian exhibit, with its display of ruthless power, its obsession with gigantic machines, its blatant propaganda and lies (there were cars on exhibit which the well-informed say will not be in production until 1962), but the British exhibit, which, with a much smaller budget than ours, turned in a thoroughly first-rate job. Ironically, the one photograph at the fair that showed lower Manhattan as a thing of beauty was a large colored transparency at the British exhibit advertising BOAC.

Somehow the United States exhibit at the fair seemed to symbolize an attitude of national apology and mea-culpism that has grown up in our officialdom in recent years in our relations with foreign countries. We are afraid to call attention even to our real virtues for fear that foreigners will think us boastful or will feel offended.

Ten-Year Miracle
November 10, 1958

BONN—The economic history of present-day Germany begins on a single day—June 21, 1948. This was the day of what is usually described as “the currency reform.” On that day two things happened—the old currency was abolished and a new currency substituted; and price controls (with the exception of rent controls) were abolished overnight. The very next business day, goods appeared in the shops, and enterprise began to spurt forward.

In most discussion, both in Germany and the outside world, it is “the currency reform,” rather than the abolition of price control, that gets the chief credit for the resulting economic “miracle.” But an analysis of the facts does not seem to support this conclusion. It is said that the old currency had become “worthless”—but it was “worthless” only because nobody would sell anything at the ridiculously unrealistic controlled prices. It was this that drove the Germans into a primitive barter economy. This is not to belittle the importance of the currency reform, with its insurance of a relatively stable value; but, as France and Italy have proved, with relative freedom from absurd price controls, a nation’s economy can function even after a huge inflation and
with a currency unit with a value of a fraction of an American cent.

INCREDIBLE PROGRESS
After ten years the German economic miracle continues, and the most impressive evidence is in the incredible amount and quality of new building. Practically all the leading cities suffered terrific destruction in the second world war, ranging from 60 to 90 percent. Taking the country as a whole, it is estimated that before the war the number of dwelling houses (or dwelling “units”) was 11.5 million. Of these about 2,250,000 were totally destroyed and 2.5 million so damaged as to become uninhabitable, making a total effective destruction of some 4,750,000. The proportional damage to office buildings and factories was presumably much worse, because of the concentration of bombing in the center of big industrial cities. Yet one can stand at many points of Bonn, Cologne, Düsseldorf, and Frankfurt and see nothing but new buildings, nearly all looking modern, substantial, even luxurious. Since 1950 Germany has built new dwelling units at an annual rate of 540,000. If this rate is continued, the housing target of the government will be achieved by 1962 or 1963.

The Germans themselves attribute their economic miracle, in the recent words of Karl Blessing, president of the Bundesbank (Germany’s central bank), to their trust “in a free-market economy and in private initiative.” And this explanation is correct. But it is necessary to add that the German economy, like the Swiss, is only relatively, not absolutely, a free-market and private-initiative economy.

PERSISTENT PROBLEM
Take housing, for example. A large percentage of it, renting for certain maximum rents, has been built with the help of state subsidies. Like all subsidized housing, in England, France, or at home, it can usually be quickly recognized by its regimented or barracks-like quality. For new non-subsidized housing or office buildings, there is no rent control, but rent control is still kept on old housing, which explains why it is so seldom renovated or adequately repaired.

In spite of the incredible economic renaissance of Germany, and its success in maintaining, with Switzerland, one of the two hardest currencies in Europe, it has not wholly escaped from the problems and dangers of inflation. Since 1951 the consumer price index has risen from 108 to 119, though it has been steady since January. The inflationary pressure comes from three sources. Wages, particularly in the building industry, have been pushing upward. The favorable balance of trade has led to the domestic money supply increasing more than the domestic supply of goods. And there are heavy and increasing drains on the budget. As one example, social-security payments now go up automatically with a rising wage index.

The political problem of inflation in Germany, in short, is not unlike that in the United States; and our present election results are likely to make our own inflationary pressures greater rather than less.

That ‘Common Market’
November 17, 1958

ROME—The clash between the British and French over the proposed free-trade area for seventeen countries versus the common market for six has underlined the fact that the difference between the two is not merely technical but one of basic concept. The free-trade area contemplates a mutual lowering of tariffs among seventeen European nations over a period of fifteen years, with each nation free to set its own tariffs against nonmember countries. The common market plans a mutual lowering and final abolition of tariff barriers among six nations (France, Germany, Belgium, the Netherlands, Luxembourg, Italy) over twelve to fifteen years, but insists these countries must maintain a common tariff, equal to the present average tariffs of the six, against all nonmember countries.

Each plan has its difficulties. The French point out that in the proposed free-trade area exporters of nonmember countries could ship their goods to whichever of the seventeen countries had the lowest tariff for their particular products, and that it might be extremely difficult to prevent transshipment free of duty to other countries within the free-trade area. The French seem to have little faith in the British schemes for certificates of origin, compensating duties, and so on. On the other hand, when the two projects are compared, it becomes increasingly clear that the British proposal for a free-trade area would really tend toward freer world trade, whereas the French-inspired common market might tend toward a perpetuation of protectionism, discrimination, planned economies, and inflationary pressures.

WORKABLE? DESIRABLE?
There are two main questions to be asked about the common market. Would it work as planned? And, assuming that it would work, would it be desirable?

When we consider the first question, we are confronted by a problem that is being treated very lightly and casually but which is central and crucial. This concerns the soundness and stability of each national currency. If any nation of the six has more inflation than
another, if the real value of its currency falls with relation to the others, it is obvious that the common market will break down. Unless there is complete convertibility of each currency into the others, the common market is merely a name. But if there is such convertibility, and if one currency, say the French franc, is overvalued in the official rates of exchange, then France will develop a chronic deficit in its balance of payments, and the other countries will not be willing to extend it credit indefinitely for the purpose of subsidizing its internal inflation.

Even if we assume that this problem can be successfully surmounted, however, we must ask whether the common market would be desirable. And in regard to this question there have been rising doubts, not only among officials in countries outside the proposed common market, but among thoughtful persons within the common-market countries, and among genuinely liberal economists.

THE DANGER

Outstanding among the critics, for example, is the German-Swiss economist Wilhelm Röpke. Röpke points out that if each country concerned were willing to return to an internal free market economy and monetary discipline, and to lower tariffs of its own free will, for the benefit of its own consumers, there would be no need of a formal common market. On the other hand, if any one of the member countries fails to accept a market economy and monetary discipline the common market cannot function. The common market will not relieve any member country of the necessity of re-establishing free convertibility for its money.

Yet there is great danger that the countries in which inflationary pressures, the welfare state, a planned economy, and a philosophy of “full employment at any price” have gone farthest will push the other member countries in the same direction in order to “harmonize” production costs by raising rather than lowering them. And the greatest danger is that the common market, instead of “integrating” Europe, may disintegrate it by breaking it into rival blocs discriminating against each other.

Why Cheap Money Fails

November 24, 1958

The late Lord Keynes preached two great remedies for unemployment. One was deficit financing. The other was artificially cheap money brought about by central bank policy. Both alleged remedies have since been assiduously pursued by nearly all governments, and are still being assiduously pursued by our own. The result has been worldwide inflation and a constantly shrinking purchasing power of monetary units. But the success in curing unemployment has been much more doubtful.

In Newsweek April 28 I published a table comparing the deficits and unemployment for the ten years from 1931 through 1940. The average annual deficit in this ten-year period was $2.8 billion (equivalent to nearly $16 billion today as a comparable percentage of national income), yet unemployment then averaged nearly 10 million, or 18.6 percent of the total working force.

Does cheap money have any better record as a cure for unemployment? Here is a table covering the twelve years from 1929 through 1940 inclusive, comparing the average annual rate of prime commercial paper maturing in four to six months with the percentage of unemployment in the same year. Both sets of figures are from official sources.

</table>

In sum, over this period of a dozen years low interest rates did not eliminate unemployment. On the contrary, unemployment actually increased in years when interest rates went down. Even in the seven-year period from 1934 through 1940, when the cheap-money policy was pushed to an average infra-low rate below 1 percent (.77 of 1 percent), an average of more than seventeen in every hundred persons in the labor force were unemployed.

Let us skip over the war years when war demands, massive deficits, and massive inflation combined to bring overemployment, and take up the record again for the last ten years:
MADRID—Spain today has one foot in the present age, the other in the past. It is trying to jump without intermediate steps from the candle to the fluorescent light, from the burro to the Buick. One drives out of a beautiful, expanding modern Madrid to villages where people live much as they did centuries ago. In comparison with all other Western European countries (except Portugal), the Spanish people still have an extremely low standard of living. As one editor put it to me: “We have an Arab economy—without the oil.”

If Germany is the most dramatic example in Western Europe of the miracles of recovery and production that can be brought about by monetary discipline and a free economy, Spain is the outstanding demonstration of how an economy can be unbalanced and shackled by socialism, government planning, and a tangle of interventions and controls.

Take the situation in automobiles. Unless you are a diplomat or have special governmental pull, it is practically impossible to import a foreign car. In fact, the hardest thing to get in Spain seems to be an import license for almost anything at all. Major auto companies are directly or indirectly government-owned or government-operated.

**HOW TO GET A CAR**

If you want a SEAT (licensed by Italy’s Fiat), you must first file an application accompanied by $400 (translating pesetas into dollars at 50 to 1). A year or so later you may be notified that your car is ready. You must then pay, before delivery, 100 percent of the price of the car—say $2,800. A month or two later you may get actual delivery. But if you sell the car on the black market you may get almost double what you paid for it. At present, I am told, there are 22,000 signed orders for SEAT’s, each accompanied by $400, yet the total production of SEAT’s this year will be only 10,000 and 12,000 next year.

American industrialists here tell me that they could sell 20,000 farm tractors over the telephone if they could get the import licenses. But the government insists that the farmers can wait until domestic industrial production is adequate to take care of their needs. All this, of course, slows down both Spanish agricultural and industrial growth.

Special permission must be obtained not merely to go into a new business, but to manufacture a prescribed maximum of a specific thing. Thus in September a number of firms were finally authorized to make television sets. The Spanish Marconi Co. was allowed to

It will be noticed that though the commercial paper interest rate in this period averaged 2.23 percent, or three times as high as that in the seven years from 1934 through 1940, the rate of unemployment was not higher, but much lower, averaging only 4.3 percent compared with 17.7 percent in the 1934–40 period.

And within this second period itself the relationship of unemployment to interest rates is almost the exact opposite of that suggested by Keynesian theory. In 1949, 1950, 1954, and July of 1958, when the commercial paper interest rate averaged about 1½ percent, unemployment averaged 5 percent and over. In 1956 and 1957, when commercial paper rates were at their highest average level of the period at 3.56 percent, unemployment averaged only 4 percent of the working force.

In brief, neither deficit spending nor cheap-money policies are enough by themselves to eliminate even prolonged mass unemployment, let alone to prevent unemployment altogether.

The only real cure for unemployment is precisely the one that the Keynesians and inflationists reject—the adjustment of wage rates to the marginal labor productivity or “equilibrium” level—the balance and coordination of wages and prices. When wage rates are in equilibrium with prices, there will tend to be full employment regardless of whether interest rates are “high” or “low.” But regardless of how low interest rates are pushed, there will be unemployment if wage rates are too high to permit workable profit margins.

*Unemployment percentages before 1957 are based on Department of Commerce “old definitions” of unemployment; for 1957 and 1958 they are based on the “new definitions,” which make unemployment slightly higher—4.2 percent of the labor force in 1956, for example, instead of the 3.8 percent in the table. \*
make 5,000; the Standard Electric, 5,000; the Spanish RCA, 3,500 sets, etc.

WHY IT FUNCTIONS
There is extensive price fixing and completely unrealistic rent control. As a result there are periodic shortages of, for example, oil, eggs, potatoes. Most new apartments are not rented but sold. There are periodic power shortages in Madrid, and the electricity is rationed or turned off. There has been great inflation. Between 1950 and 1957 the wholesale price index advanced 84 percent. Between July 1957 and July of this year the official cost-of-living index jumped 13 percent. The official rate for the peseta is 42 to the dollar, but the free-market rate in Tangier has been between 58 and 60.

What is amazing is how such an economy functions at all. And yet it does, and in some directions shows surprising growth. One reason seems to be that many of the controls that exist on paper are evaded or laxly enforced. It is widely admitted that the Spanish economy has been saved from grinding to a halt by the smugglers and the black marketeers.

The other main reason for Spain's recent economic progress is that Franco has brought and kept domestic peace and order. All criticism of his economic policy (voluble in private conversation, but prohibited in the press) is tempered by the feeling that Franco is still the only alternative in Spain to the nightmare of Communist rule. Peace and order have enabled people to work, and the workers work hard for incredibly long hours. But Spanish recovery would jump forward dramatically if Franco could be brought to see that while a rich country does not need socialism, monopolies, and controls, a poor country cannot afford them.

Our Policy in Europe
December 8, 1958

A visit to seven European countries in a total of eight weeks is apt to produce kaleidoscopic impressions, but one or two stand out clearly. The first is a striking growth in prosperity compared with ten or even five years ago. Everywhere people are better dressed. Almost everywhere there is an astonishing amount of new building. This is most impressive in West Germany; but almost as remarkable is the new building in Belgium and in the northern half of Italy.

This new building has gone on in spite of—and even partly because of—rent control. All seven countries (except Belgium) have retained some sort of rent control. This usually takes the form of rent control on old houses and freedom from it on new ones. The result is increasing disrepair in old housing but some incentive to new housing, to which is commonly added the incentive of direct or indirect state subsidies. Where, because of the extent of inflation, rent control is most out of line with realities, as in France, the dilapidation of old housing and comparative lack of new housing is most noticeable.

BRANDS OF SOCIALISM
What stands out is not the differences in the economic policies of the various countries of Europe but the similarities. This applies even to Spain, which is under a dictatorship and still seems in large part cut off from the rest of Europe. Though all of Europe has been moving in the last five or ten years toward a relaxation of controls, most European economies are still marked by a continuation of socialism, protectionism, deficits, and inflation. While European “democratic” leftists have for twenty years been denouncing the “reactionary,” “dictatorial,” and “Fascistic” policies of Franco, it is hard, economically, to distinguish between their policies and his.

It is not easy to describe the difference, for example, between Italy's Socialism of the left and Franco's Socialism of the right. The Italian Government, through its holding company, Istituto per la Ricostruzione Industriale, popularly known as IRI (pronounced Erie), controls or owns stock in most large Italian industrial companies. The Spanish Government owns or controls large industries through a similar agency, Instituto Nacional de Industria, the INI. Both organizations came into existence because of an alleged emergency, but neither government seems in any haste to sell its securities back to private hands. If Italian industry has forged ahead faster than Spanish it is partly because IRI makes more effort to emulate the principles of private enterprise than INI, and partly because Italy does not put the appalling obstacles in the way of new private industry that Spain does.

WHAT WE COULD DO
Yet what is most puzzling in Europe is American policy. Why, for example, do we give our actual support and blessing to the proposed six-nation “common market”? This would discriminate against American goods, make it more difficult on net balance for American exporters to sell to the countries involved, divide Europe into rival trade blocs, and tend to increase, and perpetuate bureaucratic controls and protection rather than to move toward free trade. Why do we in Spain (or anywhere else) pour in American aid that obviously goes to subsidize foreign socialism and to prolong government
controls, which in turn retard rather than promote economic growth and freedom?

There are two main things that we could do, in the economic sphere, for Europe and the rest of the world. The first would be to keep the dollar strong and beyond suspicion, a hitching post and a model for other currencies until they are restored to soundness. The second would be to open our markets to European goods, to encourage European industrial growth through the self-supporting and self-respecting method of trade, not aid. We are doing neither. At home we are pursuing policies of inflation, undermining the integrity of the dollar. In trade we are moving toward more protectionism, exclusionism, and quota systems. Abroad we are subsidizing, at the expense of the American taxpayer, exchange control, socialism, and inflation. Our so-called “foreign economic policy” is in need of thorough reform.

Defense Will Not Win
December 15, 1958

During the second world war there appeared a book called Defense Will Not Win the War, by W.F. Kernan. Its chief importance lay in the title, which stated a self-evident truth. No war is ever won by defense alone.

This applies also to a so-called cold war. We are in the present cold war whether we want to be or not; it is being persistently and relentlessly waged against us. And if we lose it, through appeasement, retreat, or by trying to pretend that it is not going on, we shall surely lose the total war if it comes or be forced to surrender before the mere threat of such a war.

The present Berlin crisis is “new,” and yet depressingly familiar. We accepted an arrangement in 1945 that enables Russia to put the squeeze on Berlin at any time it sees an advantage in doing so. It did so in 1948. Why were we taken by surprise by the new threats? Why did we act as if we were improvising an answer to a totally unexpected move? Why, above all, was our answer (until recently) merely defensive, and in at least one statement by Secretary Dulles, even ambiguous?

If we had warned Russia immediately that we meant to stand by our obligation to defend and maintain the status of Berlin against any breach by threat or force; if we had replied at the very beginning that we would be willing to discuss a peaceful change in the status quo in Germany but proposed that this should consist in a free and unintimidated vote of the East Germans as to whether they wanted to reunite with West Germany, much needless anxiety might have been saved.

ANSWER EVERY LIE

We might even have used the occasion to suggest that Russia keep her treaty agreements to allow free and secret elections in Poland, Rumania, Hungary, and Bulgaria for governments of their own choice. If Russia were shown that her diplomatic and propaganda offensives might boomerang, she might be less quick to try them.

This need to take the offensive in the cold war, for our own ultimate peace and safety, was emphasized by George F. Kennan in a lecture last year. Speaking of the way in which we often dismiss Soviet lies as “just propaganda,” he said:

“T’m always startled at the phrase ‘just propaganda.’ Why just? Is not propaganda a serious and important force in world affairs? . . . A wise Western policy will insist ‘no single falsehood or distortion from the Soviet side should ever go unanswered.’ This will be tiresome. We do not like repetition. But we cannot afford to dispense with it. Truth does not win over error on its merits. It, too, has to be assiduously propagated.

“I have asserted that there is nothing that could be said to Soviet leaders in the space of a few days that would change their strangely corrupted mentality. But there are things which could be said every day over the course of years which would exert a useful discipline upon them, would make it harder for them to ignore the distinction between the real and the unreal, and would place limitations on their use of falsehood as a weapon of political policy.”

ABSORB OUTPUT CLAIMS

To apply this to the particular purview of this column, in recent months a flood of nonsense has been pouring almost unanswered through the American press and through scores of speeches in which increasingly absurd claims of Communist Russia and Communist China regarding not merely military, but overall civilian production, are solemnly accepted as fact. The effect of this nonsense is to condition people to assume that the terror, force, and regimentation of Communism can increase production and even living standards faster than the freedom in choice of jobs and the free consumer choice of capitalism. Many officials of our own government seem to accept these claims at face value. Their real duty is to check the evidence, or lack of evidence, for every such claim, whenever made, and constantly present the enormous counterevidence. It is important to determine the truth about Russian military production. It is no less important not to be taken in by the brazen propaganda about production miracles and soaring living standards in Russia or Communist China.
Why We Lose Gold
December 22, 1958

The recent concern about our loss of gold cannot be dismissed as unwarranted. Between Feb. 19 and Dec. 10, 1958, the United States gold stock declined by $2.2 billion, a drop already exceeding that for any previous year.

This country, it is true, still holds $20.6 billion, more than one-half of the free world’s monetary gold. Yet behind the recent rate of gold loss is a situation that is more serious. Of our gold reserves of $20 billion on Dec. 3, $11.7 billion was required as the 25 percent legal cover for Federal Reserve note and deposit liabilities. This left “free” gold reserves of only $8.3 billion. And United States short-term liabilities to foreign countries on official as well as private account amounted in August 1958 to $14.2 billion.

The United States, in other words, owes foreigners more in dollars than it holds in excess gold reserves. If these foreigners elected to withdraw all their liquid dollar assets in the form of gold, they would more than wipe out the “free” gold we now have. It is also worth keeping in mind that if Congress had not reduced the gold-reserve requirements in 1945 to only 25 percent, instead of the previous 35 percent against deposits and 40 percent against notes, the amount of “free” gold today would be only $2.2 billion.

TO RESTORE TRUST

The probability that foreigners would actually seek to withdraw all their dollar balances in the form of gold is at the moment low. They can do so only through their central banks. They prefer, moreover, to keep a certain amount of dollar balances here because they earn interest, and because they are needed for working capital. In addition, foreigners owe American creditors dollars on long-term account.

But we cannot remain complacent about the situation. As the First National City Bank of New York points out in a sober discussion:

“A flight from the dollar—not only by foreigners but by Americans as well—might well be touched off if the idea gained ground that conditions were developing under which a rise in gold price would appear inevitable. Because of the strategic importance of the United States and the dollar, foreign bankers, businessmen, and investors are—understandably—watching how we handle our monetary and fiscal affairs. What counts is the determination of the United States Government and of the Federal Reserve System to safeguard economic and monetary stability and thus prevent—by deeds, and not by words alone—spread of doubts concerning the assured maintenance of dollar stability. The fact that excess gold reserves are still so far above minimum requirements gives time—but not indefinite time—to repair policies that hurt trust in the dollar.”

FIVE POSSIBLE STEPS

Here are some of the specific steps we might consider to keep or restore confidence in the dollar:

1—Let the Federal Reserve definitely abandon cheap-money policies. Moderately firm interest rates will not only discourage the withdrawal of foreign balances but will stop encouragement to credit expansion.

2—Congress could show its own determination to protect the integrity of the dollar either by restoring the pre-1945 Federal Reserve gold-cover requirements or by otherwise limiting further credit expansion.

3—The situation plainly calls for a drastic reduction in foreign aid. It is absurd to increase inflation here, and to undermine our own currency unit, by giving away more dollars to countries that already have deposits or short-term claims here in excess of our free gold supply.

4—We must immediately put our own fiscal house in order, drastically reduce our prospective $12 billion deficit in the current fiscal year, and try to eliminate any deficit in the next fiscal year. This could be accomplished by drastic cuts in foreign aid, in farm subsidies and price supports, and in a score of other directions.

5—Revise the Federal laws that put grossly excessive bargaining power in the hands of union leaders, make it all but impossible for employers to prevent “wage inflation,” and adversely affect our competitive position and our balance of trade.

How to Halt Inflation
December 29, 1958

Senator Johnson, the Majority Leader, wants Congress to investigate inflation. “We have no clear-cut idea,” he says, “of what is causing inflation and what should be done to prevent it.”

This is a disheartening comment. Inflation has been progressing in this country for a quarter of a century. Though there may be difference of opinion about details, there is no longer any excuse for ignorance of its main direct cause and cure. The direct cause of inflation is the continuous increase in the supply of money and credit. Most of this is in turn caused by a chronic budget deficit.

The cause of the present inflationary fears is precisely the “liberal” spending policies that Senator Johnson and his Democratic majority will be pushing for in the new Congress. The cure would be to abandon these policies.
Though the action of security prices since last summer has been flashing a warning signal for all to see, this warning is being smugly ignored in Washington. Officials offer assurances for the immediate future. But it is the long-range considerations that are causing uneasiness. These have been admirably summarized by the Guaranty Trust Co. of New York in its December survey:

THE LONG-TERM VIEW

“In connection with the Federal budget, for example, misgivings do not arise merely from this year’s prospective deficit of $12 billion...serious as that is. They arise from the fact that this deficit is symptomatic of a rising tide of expenditure over which no one seems to have any real control. The situation has been developing for a generation and, far from showing signs of correcting itself, appears to be going from bad to worse. Economy drives by the Administration and Congress tend more and more to end in futility. There are too many continuing ‘programs’ that involve commitments for years in advance—the defense program, the highway program, the housing program, the social-security program, the farm program, the foreign-aid program, veterans’ programs, and all the rest.

“Each of these programs, of course, has its own pressure group or groups and its own army of bureaucrats whose jobs depend upon it—and most of whom, no doubt, sincerely believe that, however desirable governmental economy may be as a general principle, their own program is so worthy that it should not only be continued but expanded. The combined result of these programs is a swelling volume of expenditure which, despite tax rates rising to almost confiscatory levels, has produced deficits in 23 of the last 28 fiscal years.

“Yet nowhere in government is there serious talk of abandoning any major spending program. The most that anyone hopes for, apparently, is to retard the rate of growth and oppose the addition of still other programs. This is becoming increasingly difficult as state and local governments call upon Washington for aid. . . .

“It is not the fear of the 1959 deficit, unfortunate as this is, that basically causes distrust of the dollar. It is the growing fear of deficit financing as a ‘way of life’.”

REMEDIES

What can be done about inflation and the growing fear of inflation? We might put detailed remedies under four heads:

1—Futile as it sometimes seems, those who (like Budget Director Stans, Secretary Benson, Senator Byrd, editors, writers, private organizations like the Tax Foundation, and chambers of commerce) have been pointing out in detail where budget economies should be made, must keep up their insistence on specific savings.

2—We are unlikely to get reform until we have a really responsible executive budget. This means that the President must be given at least as much control over (and responsibility for) the Federal budget as, say, the governor of New York has over his state’s budget. (For details, see this column, Nov. 23, 1953.)

3—We must recognize the fallacies in the Keynesian ideology, dominant for 25 years, which regards inflation as necessary for full employment and economic growth.

4—We must take the kind of measures spelled out here last week to curb excessive union-leader power and restore confidence in the dollar. ✉
1959
The GNP Fetish
January 5, 1959

The “national income approach,” once part of the abracadabra of a few statisticians, has now become so widely popularized, not only in economic textbooks but in newspaper discussions, that almost anyone is likely to ask you, or tell you, what “GNP” (gross national product, for the still benighted) is going to be for 1959. Yet a close examination does not justify the exaggerated reliance now placed on these figures. At least five major cautions ought to be kept in mind. Here are two of them:

1—The national income or gross national product figures are arbitrary, and from a strictly scientific standpoint, indeterminate. This was recognized in the pioneer studies. Simon Kuznets, in his two-volumed book National Income and Its Composition, published in 1941, pointed out: “The statistician who supposes that he can make a purely objective estimate of national income, not influenced by preconceptions concerning the ‘facts,’ is deluding himself; for whenever he includes one item or excludes another he is implicitly accepting some standard of judgment, his own or that of the compiler of his data. There is no escaping this subjective element.”

WHAT DO WE INCLUDE?
Kuznets went on to show that estimates of the national income necessarily involve legal and moral considerations. Should we include “the compensation of robbers, murderers, drug peddlers, and smugglers”? And how shall we “draw a line between economic activity and economic goods on the one hand and active life in general and its stream of satisfactions on the other”? Should “washing, shaving, and playing for amusement on the piano” be treated as economic activity? “When judged by the attributes of satisfaction-yielding, scarcity, and disposability, they do not differ from the same activities carried on for money as services to other people (nursing, barbering and giving concerts).”

And yet Kuznets decided (as do practically all national-income statisticians) to include only items that “are dealt in on the market.” This of course excludes all do-it-yourself activities, which in total are now probably enormous. More, it excludes all the products of the family economy, including the activities of housewives. So we get such paradoxes as these: When a man marries his cook, the value of her work disappears from the national-income accounts. When an opera singer sings professionally, she is considered as adding the equivalent of her salary to the national income. When she sings for charity or for friends, it doesn’t count.

GROSS VS. NET
2—So what we include in or exclude from national income involves arbitrary decision. But a second serious problem is how and where to set the difference between gross and net. How are we to prevent double counting at a thousand points? A married man earns an income of $10,000. That is the joint income of himself and his wife. He becomes a widower and hires a housekeeper for $4,000 a year. His income, and their joint income, is still $10,000; but the national-income accounts would now call it $14,000. The same problem occurs daily and everywhere. If we count the income of doctors and dentists should we, or should we not, deduct it from the income of patients?

Sliding by this awkward point, how do we separate gross national product (the famous GNP) from national income? Our official statisticians do it by deducting from their GNP figure a “capital consumption” allowance, mainly a “depreciation” charge, and also “indirect business tax and non-tax liability.” But depreciation charges are the results of estimates. The “right” amount of depreciation is never precisely known. Contrary even to the belief of many businessmen, a depreciation deduction is not so much an estimate of past loss as a forecast of future probabilities. It is never known, for example, when an old machine is going to be made obsolete by a new discovery or a new invention. And particularly in a period of monetary inflation, orthodox depreciation charges fail to allow for ever-mounting replacement costs.

There are even more serious defects in national-income estimates, but they will be reserved for a subsequent article.

More GNP Defects
January 12, 1958

Last week we discussed two of five major defects in the national income or GNP estimates. One was the arbitrary inclusions and exclusions. The other was the difficulty of avoiding duplicate counting or of separating gross from net. Here we will consider the three remaining major defects.

3—National income, to be estimated at all, must be reduced to a common measure—in our case, the dollar. But the value of the dollar is itself constantly changing. In a period of inflation all values are falsified. For 1939 our GNP was estimated at $91.1 billion; for 1957 it was estimated at $440.3 billion. Here is an apparent quadrupling, or better, of “gross national product.” But when the government statisticians restate the
The fetish made of GNP also leads to false policies. Part of the official GNP total of $440.3 billion for 1957 was arrived at by including $87.1 billion for “government purchases of goods and services.” Planners easily jump to the conclusion that if it had not been for these $87 billion of government purchases the GNP would have been just that much less. Yet whatever government spends it takes away from somebody in taxes.

If the national income falls short of some “goal” by $x billion dollars, economic planners are tempted to assume that the $x billion dollars could easily be supplied by that much deficit financing, or even by printing that much money. We can raise national income to any figure we want, in fact, not by increasing output and consumer satisfactions, but simply by shrinking the measuring rod—by inflation, by depreciating the dollar enough to raise prices to reach that income.

Heed the Red Lights
January 19, 1958

Since I last wrote here (Nov. 17 and Dec. 8, 1958) about the common market and the free-trade area, major decisions have been taken which mark great steps forward.

The first effects of the rivalry between the six common-market countries—France, Germany, Italy, Belgium, the Netherlands, and Luxembourg—and the proposed free-trade area that would include eleven other European countries have been unexpectedly good. For the common-market countries, in order to blunt British charges of “discrimination,” agreed at the last moment to extend their 10 percent tariff cut, which went into effect Jan. 1, not only to each other but to all nations subscribing to GATT, including the United States. They also offered extension of the first 20 percent increase in quotas to the eleven other European nations.

And when Britain, partly to counter the common market, announced that the pound sterling would be made completely convertible for nonresidents, all the principal European nations felt encouraged or obliged to make a similar announcement. France felt that in order to do so it had to make a still further devaluation of the franc, this time of about 15 percent—from an official rate of 420 to 493.7 to the dollar. In order to offset the shock to confidence, France at the same time announced an anti-inflation program and a “revaluation” of the franc. It dropped two zeros from each unit of 100 francs to create a “heavy franc” with 100 times the purchasing power of the old franc, making it once
more about five to the dollar. It remains to be seen whether the steps France takes will in fact be adequate to convince the world that this is its “last devaluation.”

**FREER TRADE ABROAD**

Nevertheless, the overall effects of the European announcements during Christmas week are of the first importance. The establishment of the common market—together with the initial extension of its benefits to the rest of the Western world—is the most dramatic step taken since the end of World War II toward a lowering of international trade barriers. The establishment of convertibility for the pound and other currencies is the most important single step taken since the war toward a restoration of international monetary order, stability, and discipline.

There have been two other significant developments. The new “heavy” franc is not tied to a round number of American dollars, but made equal to 18/100 gram of fine gold. The European Payments Union, with its automatic credits right, will go out of existence; it will be supplanted by the European Monetary Agreement, under which debt balances must be settled entirely in gold. Perhaps the restoration of the international gold standard is not the vain dream that so many have supposed.

**INFLATION AT HOME**

But while Europe has been taking giant forward steps, what of the United States? We have been preaching all these fine reforms to Europe, but show no desire to take our own medicine. As Europe is moving toward freer trade, we are moving toward more protection, and particularly toward more import quotas—on farm products, metals, petroleum.

We believe in getting out of recessions, not by internal adjustments, but by more inflation. In the twelve months ending November 1958, notwithstanding unemployment averaging between 6 million and 7 million, average hourly wage rates were pushed up from $2.11 to $2.17. We look forward to a budget deficit this fiscal year of $12 billion. In the twelve months ended October 1958, the country’s money supply, as represented by total deposits and currency, increased $13.6 billion. This was chiefly brought about by the monetizing of government securities. The violent rise of the stock market to new high records, in the face of mediocre corporate earnings, is flashing a signal of lack of confidence in the future value of the dollar. And so is the loss of gold. “Our gold outflow,” says the First National City Bank of New York in its January letter, “is saying that the government is spending too much.”

The dollar, like Caesar’s wife, must be above suspicion. When are we going to heed these signals? *]

---

**Lessons of a Strike**

January 26, 1959

There were many excellent recommendations in the President’s State of the Union Message, but his proposals for labor legislation failed to go to the heart of the matter. If we want a glaring example of what our present labor laws and enforcement agencies permit or encourage, we have merely to look at the recent nineteen-day New York newspaper-deliverers’ strike.

Let us recall what happened. The deliverers were getting a basic wage of $103.82 for a 40-hour week for day drivers. The publishers offered them the same package increase previously granted to the Newspaper Guild—$7 a week spread over two years, $4 the first year and $3 the second. This would have made, as of now, about $108 a week. (Average nationwide manufacturing earnings are $87 a week.)

The union leaders, after a one-day strike, accepted this offer; but the striking members themselves turned it down by a vote of 877 to 772. Thus 105 men, in effect, precipitated a strike that threw about 17,000 of the 20,000 employees of the nine New York papers out of work. In other words, each man in the plurality that voted to strike forced more than 160 others out of work. The newspapers estimated their loss in revenue at $25 million. Nearly 6 million readers were deprived of papers.

The indirect losses (even passing over those of big merchants or theaters) were incalculable. Ten thousand of the city’s 16,000 newsstands were forced to close during the strike. Candy-store sales dropped violently. People who had rooms to rent couldn’t advertise. Job hunters didn’t know where to look for work.

**WHO GAINED?**

Who gained by the strike? Certainly not the strikers. They lost nineteen days’ work and pay—at the Christmas season. (The strike ran from Dec. 9 to Dec. 28.) It is difficult for an outsider to see any net advantage in the contract they finally accepted over the contract they struck to reject. According to the publishers’ spokesman, they merely accepted the old offer in revised form: Instead of $4, only a $3.55 wage increase for the first year, plus Columbus Day as an additional holiday; and instead of $3, only a $1.75 increase for the second year, plus three days of paid leave for illness or other personal reasons.

Suppose the strikers, instead of buying a “paid” Columbus holiday for $23.40 (45 cents a week less, times 52 weeks) had actually gained a paid holiday net by the strike? It would still take nineteen years of such Columbus Days to make up the strike loss. Even if we accept the claim of union members that they “gained”
30 cents a week net, it will take them seven years of work to make up their average strike loss of more than $400 each. And by inflicting heavy strike losses on the newspapers, they reduced the funds available for future increases in jobs or wages.

WHAT MADE IT POSSIBLE
What made it possible for 105 men to silence the press of the greatest city in the world? This is the question the President and Congress should be asking themselves. Part of the answer is the physical intimidation or coercion the strikers were able to impose. As in 1945, they put a limit on the number of copies (five or six) that an individual was allowed to pick up at the publishing plants. The local police in effect enforced such rules. Plenty of truckers were willing, if they had been peacefully allowed to do so, to perform the functions the strikers had abandoned. Some truckers did, in fact, deliver papers all the way from Philadelphia.

What the law and law-enforcement agencies ought to have done, and should do hereafter, is clear. (1) They should forbid mass picketing, or all picketing, however ostensibly “peaceable,” that has in fact an intimidatory effect. (2) They should cease compelling an employer to negotiate with strikers. He should be free to announce that all strikers not back at work at a given time would be considered to have resigned their jobs and that others would be permanently hired in their place.

Or do we believe that a tiny but muscular minority should have the right, at will, to close down the press of a great city unless its demands are met?

Schizophrenic Budget
February 2, 1959

Because the Democratic majority in Congress seems bent on reckless inflationary spending, and is criticizing only the economies and not the extravagances in the President’s budget, there is a temptation to defend that budget as it stands and to praise it as at least an effort toward a balance. But the budget cannot be defended as it stands and it is hard to believe in the “balance” it depicts.

This balance is precarious on its face. To get his estimated budget receipts up to $77.1 billion, the President had to assume an increase in tax revenues of $9 billion for the fiscal year 1960 over 1959, with practically no increase in tax rates or levies. To get his estimated expenditures down to $77 billion, he had to assume a drop of $3.9 billion compared with 1959 in spite of proposed increases in many spending programs and his own failure in the last calendar year to veto huge Congressional appropriations that he had not asked for. Most of the “decline” in 1960 expenditures, moreover, is achieved by charging the $1.4 billion proposed increased subscription to the International Monetary Fund against expenditures for the current year instead of against 1960.

PAST MISCALCULATIONS
Nor does the record of the past two years increase confidence in the accuracy of Mr. Eisenhower’s present estimates. For the fiscal year 1958 he projected a budget surplus of $1.8 billion; we emerged with a deficit of $2.8 billion. For 1959 he predicted a surplus of half a billion; we now face a deficit of $12.9 billion. Receipts of the present fiscal year will be $6.4 billion less than his estimate a year ago; expenditures will be $7 billion more.

Even if we take the new budget at face value, we must remember that it is the biggest budget Mr. Eisenhower has ever proposed. Nor can this be blamed on defense necessities. For it contains the highest non-defense expenditures ever recommended. These total $31.2 billion, compared with $28.1 billion recommended for 1959 (though increased in actuality), and with nondefense expenditures of $27.8 billion in 1958, $25 billion in 1957, and $21.2 billion in 1954. In brief, nondefense expenditures alone are $10 billion greater than in 1954.

Nor does even this tell the full truth about the overall budget. In recent years, the cost of government activities such as social security and highways has been hidden in special segregated budgets. When we put them in a “consolidated” budget, we find that Mr. Eisenhower is really planning to spend in 1960 a total of $92.9 billion.

THE ITEM VETO
And Mr. Eisenhower’s latest budget suffers from the very “schizophrenia” toward economy and spending of which he accuses its critics. On the one hand, he insists that we must “keep our financial house in order” and “examine new programs and proposals with a critical eye. Desirability alone is not a sound criterion for adding to Federal responsibilities.” We must “restrain the forces that would drive prices higher, and thereby cheapen our money and erode our personal savings. The first step is to avoid a deficit by having the government live within its means, especially during prosperous, peace-time periods.” But then he recommends continuation of and increases in so many welfare programs that there is not space to list them here. He even declares proudly that we must “carry forward current public-works programs—now larger than ever before.”
But there is one recommendation in the President’s message that can be endorsed with the sole reservation that it does not go far enough. This is that the President should be given the constitutional power not only to veto individual items in appropriations bills, but to reduce the amount of any appropriation. This power would not in itself, of course, insure a responsible budget. But we can never have a responsible budget, or anything approaching a responsible budget, until this power exists. At present the so-called executive budget is merely a speech which Congress is free to ignore. The President cannot fairly be held responsible for the budget until he has the power to carry out that responsibility. Congress is in no position to blame him for a result that he lacks the power to control.

Who Makes Inflation?
February 9, 1959

The Economic Report of the President reflects the same schizophrenic attitude toward spending vs. economy, inflation vs. dollar-integrity, as his Budget Message. At one point he declares: “An indispensable condition for achieving vigorous and continuing economic growth is firm confidence that the value of the dollar will be reasonably stable in the years ahead.” But most of the report endorses policies that would clearly undermine this confidence.

Describing governmental actions that helped “to bring about a prompt and sound recovery” he says: “Monetary and credit policies were employed vigorously to assure ample supplies of credit. Legislation was enacted to lengthen temporarily the period of entitlement to unemployment benefits. Numerous actions were taken to spur building activity. Steps were taken to accelerate Federal construction projects already under way and to speed up projects supported by Federal financial assistance. Activities under a number of Federal credit programs, in addition to those in the housing field, helped counter the recession. And the acceleration of defense procurement exerted an expansive effect.”

WHO PRINTS MONEY?
Every one of these policies was inflationary. All of them meant pouring new money and credit into the system, increasing the supply of dollars, reducing their individual purchasing power. In a later part of the report it is admitted that the Federal Reserve policies enabled the commercial banks “to add nearly $10 billion in loans and investments to their assets,” largely by “additions to their holdings of U.S. Government securities.” This in turn added $13.6 billion to the total money supply (including inflated time deposits), and helped to boost living costs.

Yet the President’s report blurs responsibility for inflation and tries to shift it onto consumers, business, and labor. The “individual consumer” is advised to “shop carefully for price and quality”—as if he couldn’t be depended upon to do that without urging. The government in effect is saying to consumers: “Here are $10 billion or more additional paper dollars; but don’t be reckless enough to spend them, because it will make you responsible for raising prices.” “Businessmen” are told they “must wage a ceaseless war against costs”—as if self-interest and self-preservation did not insure that. But nothing is said about Federal labor laws (including compulsory exclusive “bargaining”) which render the employer all but impotent in resisting excessive demands. And “leaders of labor unions” (after having been granted monopolistic bargaining powers by law) are urged not to ask as much as they can get under these conditions. This means that they would not last very long as labor leaders.

THE REAL CULPRIT
The President goes on to declare: “If the desired results cannot be achieved under our arrangements for determining wages and prices, the alternatives are either inflation, which would damage our economy and work hardships on millions of Americans, or controls, which are alien to our traditional way of life and which would be an obstacle to the nation’s economic growth and improvement.” What the President seems to be saying is that it is consumers, businessmen, and labor leaders who threaten to bring inflation by lack of “self-discipline and restraint,” and that they may “force” government controls. But the real culprit is government. Government must stop deficit spending, stop flooding the country with more paper dollars, and stop encouraging monopoly in the labor field while blaming “our free competitive economy” for rising wages and prices.

Perhaps the most important recommendation in the Economic Report is that Congress “amend the Employment Act of 1946 to make reasonable price stability an explicit goal of Federal economic policy, coordinate with the goals of maximum production, employment, and purchasing power now specified in that act.” Well, if the mischievous Employment Act of 1946 is to be retained, this amendment on net balance would probably make it less mischievous, because the act has been constantly interpreted as a directive to inflate. But an immensely better solution would be to repeal the act altogether.
What Russian Trade?

February 16, 1959

In past articles I have called attention to some of the fictions and fallacies in recent hysterical comparisons between Soviet Russia’s alleged “rate of economic growth” and our own. But supposedly responsible American publicists, in and out of government, continue not only to swallow the Soviet boasts without adding even a grain of salt, but to draw conclusions that would be flagrantly fallacious even if the boasts were reliable.

One of the latest developments to arouse these viewers-with-alarm has been “the Soviet challenge in foreign trade.” In their front-page anxiety about this they are merely acting as megaphones for official Communist propaganda, as illustrated, for example, in Mikoyan’s statement in Moscow on Jan. 31 in favor of “peaceful competition in cooperation with other countries in developing the economies of the underdeveloped nations,” etc. Before we ask how “peaceful” this “competition” has been or is likely to be, we may begin by putting the subject in factual perspective. Just how important, relatively, has Russian buying and selling been? How does Russia rank in international trade?

It should not be too difficult to answer that question, at least in approximate terms. The official figures are available. It is merely necessary to have sufficient enterprise and industry (like Alice Widener, for instance, in U.S.A. magazine for Feb. 13) to dig them up and interpret them. They are to be found among the 777 pages of the United Nations Yearbook of International Trade Statistics.

SOVIET ‘STATISTICS’

According to the U.S.S.R.’s own official figures, it had total exports of 17.5 billion rubles in 1957 and 15.8 billion of imports. If we accept these figures at face value, the next question is how to convert them into dollars for purposes of comparison. The official rate of the ruble is 4 to the dollar. The U.N. tables solemnly convert it at that rate. Even at that rate, we find that the Soviet Union did only 2 percent of world trade in 1957. And we find that total U.S.S.R. exports to the free world in 1957 (after deducting “trade” with the Russian satellites and Red China) amounted at that rate to only $966 million. This is less than 5 percent of the total exports of West Germany ($9 billion), and it is about equal to the exports of little Switzerland ($1.6 billion) with a population 1/40th as large as the Soviet Union. And it is by no means certain that a conversion rate of 20 or 25 to 1 for rubles into dollars would not be more realistic than the tourist rate of 10 to 1.

Nor can these ridiculously small exports be attributed to American “discrimination” against Russia since 1947. Soviet Russia has always been a negligible factor in world trade. In 1938, the last full year before World War II, American exports to the Soviet Union were valued at about $70 million, and our imports from the U.S.S.R. in the same year were valued at about $24 million.

Finally, as the Russian satellites and such reluctant victims as Finland have discovered, “trade” is something that Soviet Russia forces on weaker neighbors as a form of tribute or extortion. But that’s another story.

Uncurbed Union Power

February 23, 1959

No one concerned for the protection of the public interest against the almost unlimited power of labor bosses can become enthusiastic about either the Kennedy-Ervin or Administration bills now before Congress.

Both bills, it is true, purport to protect union members against corrupt or unscrupulous union bosses. But both mistake the means. Congress, having by the enactment of special privileges and immunities created the Frankenstein monster of lawless union power, now seeks by still more government intervention to curb a few of the abuses of this power. Both bills carry elaborate provisions requiring financial statements from unions, and opposing bribery and corruption. There are already enough laws against robbery, embezzlement, and misappropriation of funds. It is merely necessary to enforce them. The real evils are compulsory
mainly on the assumption that labor bosses can do no wrong except to union members. The plight of non-union workers, employers, and the consuming public is largely ignored. The central evils of legalized violence and monopolistic compulsion are left untouched.

Real steps to reform would be amendment of the Taft-Hartley Act to remove the exclusive bargaining powers granted to unions, and to prohibit all devices that tie employment to union membership. Still another would be complete repeal of the Norris-LaGuardia Act. As Prof. Sylvester Petro puts it: “There is no excuse for a law which denies injunctive relief to persons suffering irreparable injury from clearly and plainly unlawful conduct.”

The ‘Growth’ Game
March 2, 1959

A few weeks ago Nikita Khrushchev, in the course of a seven-hour speech, called for an 8.6 percent annual increase in Soviet production. He said that the United States’s annual increase was only 2 percent. This set off a fresh alarm among the 5-percent-or-bust addicts over here.

Edwin L. Dale, Jr., in The New York Times, went Khrushchev one better. In allowing us a growth of 2 percent a year, he wrote, Khrushchev “was being unnecessarily kind because “after correcting for higher prices” our own growth rate since the end of the Korean war “has averaged less than 1.5 percent.” Barbara Ward, also in The New York Times, demanded an “Atlantic world” growth of 5 percent a year, to be achieved by an “increase in government activity.” Walter P. Reuther, head of the United Automobile Workers, told Congress that the nation could solve most of its problems by achieving a 5 percent annual growth in the economy—by (as one might guess) more spending and “higher wages.”

WHY 5 PERCENT?

It is difficult to know where to begin in analyzing all the confusions and false assumptions involved in these rates-of-growth comparisons. I discussed five of them in an article last summer (Newsweek, Aug. 25, 1958). There is space here only to mention two: (1) There is no reason for assuming any Russian statistic to be honest. (2) It is more than doubtful whether overall “economic growth” is accurately measurable even by “objective” statisticians. All such measurements rest on arbitrary assumptions.

But suppose we ignore these fundamental difficulties. Why the mania for a growth rate of 5 percent? Of course once the magic figure of 5 percent is suggested
as a “goal,” no one dares to say that he would be smugly content with a growth rate of a miserable 3 or 4 percent. But why don’t our starry-eyed “liberals” really set their sights high? Why don’t they at least try to better the Khrushchev goal of 8.6 percent per year? What’s wrong with a growth rate of 10, or 20, or 50 percent a year?

If we are trying to talk about realities rather than dreams, it becomes pertinent to ask just how realistic the 5 percent growth figure is. One of the few hard-headed comments I have seen on this is that of Jules Backman of New York University, who points out that an annual rate of growth of 5 percent in gross national product, compounded, would result in a gross national product sixteen times that of the present figure within slightly more than half a century.

PERCENTAGE TRICKS
In my article last August, I pointed out that our “unfavorable” growth rate compared with Soviet Russia depends in part on a trick of percentage figures. The smaller the base from which you start, the easier it is to attain a high percentage growth rate; the bigger the base, the harder.

Take the history of a specific economic product—television. Output in 1946 was 7,000 sets. In 1947 it was 200,000—growth rate, 2,757 percent. In 1948, it was 975,000 sets—growth rate, only 387 percent. In 1949 output rose to 3,029,000 sets—but growth rate was only 211 percent. In 1950 production jumped to 7,464,000 sets; but growth rate was only 146 percent. Though output was accelerating enormously in absolute amounts, percentage rate of growth was constantly falling. And since 1950 the rate of growth has stopped entirely. Yet we have continued to turn out from 5 million to 7 million sets a year.

This brings us to steel. Grave concern has been expressed because United States steel output fell to 78 million metric tons in 1958 from 102.5 million in 1957, whereas Russian steel production increased to 54.9 million tons from 51 million in 1957. But the U.S. increased steel capacity 6 million tons last year, compared with an apparent Russian increase of 4 million. Our percentage rate of increase was less than Russia’s. But our real increase was more. This means that, in real terms, we are even farther ahead of Russia in steel capacity than we were a year ago! As long as we can maintain such an absolute annual lead, Russia can never catch up.

Our rates-of-growth alarmists are scared stiff by their own false assumptions and statistical fallacies. ✺

Wrong Aims and Means
March 9, 1959

The recent agitation for a high “rate of economic growth” tends to divert attention from the real menace that confronts us. That menace is the immediate striking power of the Soviet Union. While public attention is focused on the danger of intercontinental ballistic missiles, some Navy specialists think that a much more immediate danger is Russia’s 450-odd submarines. Rear Adm. John S. Thach, on Feb. 17, estimated that if the Russians had submarines firing effective ballistic missiles, as they have contended, and if as many as a dozen could get through our defenses undetected, they could wipe out 70 percent of the nation’s industry in one surprise blow.

Now such a menace cannot be countered by producing more automobiles and stereophonic sets, or by competing with Russia for a mere overall rate of economic growth. In the type of war most probable tomorrow, or even today, general economic potential is unfortunately likely to count for little compared with immediate 24-hour striking power or retaliatory power.

PRODUCTION VS. RATES
This of course is not the only way in which the rate-of-growth fetishists misconceive our real goals. They are victims of an elementary statistical fallacy. This fallacy, as I pointed out here last week, is dramatically illustrated by output of television sets since 1946. Though rate of growth has dropped below zero, absolute growth has been enormous. Between 1946 and 1947, output of television sets increased by an absolute amount of 193,000. This was at a rate of 2,757 percent. Between 1949 and 1950, output increased by an absolute amount of 4,435,000 sets. But this was at a rate of only 146 percent. Since 1950 there has been no net increase in the rate of television output, but a decrease. Yet present output is about 5 million sets a year, compared with 7,000 in 1946. And the total number of television sets in use is greater than ever.

The same pattern of growth (though, of course, at different rates and over different periods) can be traced for housing, railroads, automobiles, airplanes, radio or hi-fi sets, or any product whatever. The pattern can be found even in the growth rate of human beings. From the day of birth a boy grows in weight an average of 195 pounds in his first year—a record which he never even approaches thereafter.

The trick is to start from a small enough base. Insofar as even a provisional credence can be given to Soviet statistics, this is the chief explanation of Russia’s higher rate of industrial growth compared with our own.
Economically, for special products, in sum, the rate or curve of growth is steepest at the beginning and then tends to level out. This falling rate of growth is both inevitable and sane. When practically every family has an automobile, a refrigerator, or a television set, there is no reason for further production except for replacement. And this eventually tends to become true even of total levels of consumer goods output and consumption. As even Barbara Ward admits: “If a family has an income of $20,000 a year it should in all sanity be content with a smaller increase than a family with only $2,000.” Unfortunately, her subsequent discussion forgets this momentary flash of insight.

Finally, practically all the rate-of-growth agitators propose exactly wrong means to achieve their declared aims. Most of them want to do it by mere inflation—i.e., by deficit spending and money printing so that the same physical product is priced higher every year in terms of rotting dollars. Barbara Ward wants an “increase in government activity”—i.e. more deficit spending and more hampering interventions which can only reduce production and divert it products that consumers desire less. Walter Reuther has the worst suggestions still more punitive taxation and a still further increase in automobile wage-rates which would further discourage both production and employment.

None of the growth raters mention the one thing that would do most to increase real wages and national productivity—policies to encourage more saving and capital investment.

1985?
March 16, 1959

Some of us thought that George Orwell, in 1984, had portrayed the horrible daily life and terror of a totalitarian socialist regime with classic power and finality. But today actualities surpass what even first-rate scientists were able to imagine.

A vivid report from Red China, for instance, was recently made in three articles for the Associated Press by an Indian social scientist, Dr. Sripati Chandrasekhar. Except for their final paragraphs, these articles are written in a detached tone. They even make some favorable generalizations, though these violate probability. Admitting that there was famine three years ago, the articles say, for example: “No one starves in China now.” No one! That would be a risky statement to make even about the United States, the best-fed country in the world. It becomes particularly implausible about Red China when we recall the chronic famine among its estimated 650 million population, the starvation in Soviet Russia and elsewhere whenever swift collectivization was imposed, and the 2 million landlords that the Red Chinese are estimated to have executed. The official claims of a 100 percent increase in food production in 1958 over 1957 are preposterous on their face.

NIGHTMARISH PICTURE
Not that the Chinese Communists are not making great efforts. A Hong Kong dispatch to The New York Times of Feb. 23 tells how “factory and office workers, students, housewives, and army units from towns and cities have joined the rural population in a massive shock campaign of manure collection.” As the People’s Daily of Peking points out: “Manure can be found everywhere.”

But to return to Dr. Chandrasekhar. When he is not merely retailing Chinese official propaganda, but reporting what he actually saw, he paints a nightmarish picture. It is a picture of men and women of all ages working day and night. He personally counted eighteen structures being built around the clock, with the aid of artificial light at night.

“Everyone, men and women of all ages, is dressed in blue trousers and buttoned-up coats,” looking like “an endless army of blue ants.” No one can escape the ubiquitous wired radio loud-speaker. “The radio blares away at you in the bus, in the train, in the trolley, in sleepers and dining cars, on street corners, in villages, towns and cities.” What it blares out is how to make a smelter, how to defeat the American “imperialists,” how to be a good Communist, how to denounce the rightists. The relaying loudspeaker “cannot be controlled and cannot even be turned off.”

Chinese women have achieved “equality.” That is, they do the work of men, and “can and do denounce their husbands at party meetings if they suspect them of rightist and bourgeois tendencies.”

A CHINESE COMMUNE
Chinese Communist officials are proudest of their latest development, the communes, where they have gone beyond the Soviet Union. Dr. Chandrasekhar describes the “best” one, a “showpiece.” It was made up of 68 villages. “The houses, the land, the implements, the cottage industries, and the kitchen utensils were all owned by the commune.” It managed 228 public canteens where all adults ate in hostel-type dining halls. The adult population was distributed over 146 productive “teams.”

Men and women wake up in the morning to the blare of loudspeakers in the streets. After half an hour of exercise in the open air they go off to the canteens for a communal breakfast. After the day’s toil in the fields
and factories, all attend regular classes. There they listen to propaganda on the radio. Last is the party meeting, which every worker attends. People rise up, confess their failings, and criticize their colleagues.

At the end of his factual report, Dr. Chandrasekhar sums up: “This is the commune where human beings are reduced to the level of inmates in a zoo. But there is a difference. The animals in a zoo do not have to work hard, and, what is more, they do not have to listen to the quasi-compulsory radio. The lack of peace and quiet in the countryside, where no one can retire and reflect, and the lack of privacy and solitude are to me more terrifying than all the hells put together.”

Spending and Taxing
March 23, 1959

The spenders and the inflationists are in the saddle, both in Congress and in an influential part of the press. Actual advocacy of inflation (as typified by Sumner H. Slichter) becomes constantly more open, as does advocacy of still more reckless spending. And now a new type emerges—the defender of increased spending in all directions who professes at the same time to be against inflation, and who therefore proposes even more burdensome taxation.

Take, for example, a column by Walter Lippmann in The New York Herald Tribune of March 5. “Neither the Administration nor the Congress,” he writes, “shows any sign of being willing to vote the taxes which are absolutely essential if the budget is to be balanced. As of now, both parties regard as untouchable the income-tax rates which were fixed in 1954, the date of the Eisenhower reduction”; these are accepted as “sacrosanct.”

What Lippmann is saying, in effect, is that every dollar of the $77 billion (really $93 billion) that the President is proposing to spend in the fiscal year 1960 is a sacrosanct and untouchable expenditure. Not once does he suggest in his article that any saving is possible anywhere. Every dollar, he implies, that either the Administration or the Democrats want to spend is essential to meet our “needs.” Among these he specifies not only national defense, but foreign aid and “education and public facilities.”

COST OF NONDEFENSE
Let us look at this budget; and let us, for the sake of argument, grant the spenders’ tacit assumption that there is no waste whatever in any category of our military expenditures and that all of these are indeed untouchable—except in an upward direction. We still find that nondefense expenditures proposed for 1960 come to a record $31.2 billion, compared with $21.2 billion in 1954. This is an increase of $10 billion. But the spenders apparently cannot think of a single place to cut it.

Lippmann thinks we are “too soft and too timid to tax ourselves enough.” I suggest that we are, on the contrary, too soft and too timid to call a halt to the preposterous handouts to special pressure groups. We are spending more than $6 billion a year for farm subsidies alone. These raise food prices for city workers at the same time as they bring into existence huge unsalable farm surpluses that we try to dump abroad. If we swept out the whole farm-subsidy program it would save $6 billion, bring us a far healthier economy, and vastly improve our foreign relations. Veterans’ aid at $5 billion a year is shamelessly swollen. We have little to show except suspicion and resentment (e.g., Bolivia) for the $62 billion we have lavishly distributed since World War II in foreign aid. All this is not to mention Federal aid to education, Federal housing, aid to “distressed areas,” and the rest.

CONFISCATORY RATES
Now let us look at the soft and timid income-tax rates that Lippmann is so eager to raise. Personal income-tax rates now rise to the confiscatory level of 91 percent. How much higher would he raise them? And how much additional revenue would the increase in rates bring in? The Tax Foundation has pointed out that in 1956 (the latest year for which data are available) all the rates above the lowest-bracket level of 20 percent brought in only 14 percent of the total income-tax yield; the other 86 percent came from the 20 percent rate. We also know that all rates over 50 percent brought in less than $800 million, or only 2½ percent of the total income-tax yield.

It does not follow that halting the top income-tax rate at 50 percent would mean the loss of this small revenue. On the contrary, there is every reason to suppose that with such lower rates actual revenues would increase. The government’s revenues in 1954 were $64.7 billion. Three years after the tax cuts were made which Lippmann now deplores, revenues rose to $71 billion.

Those who want to raise tax rates even further now, instead of cutting government extravagance and waste, forget how much our existing personal and corporate tax rates already retard potential economic growth, and how dangerous to our productivity a still further rate increase would be.
More Inflation Ahead?
March 30, 1959

Notwithstanding all the reassurances from Washington, the American public believes that inflation is here to stay. It has been saying this by its actions—most dramatically in the stock and bond markets. On March 13 the Dow-Jones industrial average reached 615, up 175 points from April 7 of last year. As one shrewd observer put it: “The stock market is in orbit. It has been thrust free of the gravitational pull of a declining bond market.” The Dow-Jones stocks have been selling at 21 times their $29 1958 earnings and at seventeen times even of a projected $36 for 1959 earnings. As of March 11, the average yield of 500 common stocks, as compiled by Standard Statistics, was only 3.23 percent, compared with an average yield of 4.20 percent for A-1 bonds.

The rise of stocks and the decline of bonds have been twin results of an inflationary psychology. Momentary breaks do not necessarily herald a reversal of this long-time trend. Regardless of what stocks are at present yielding, holders believe that inflation will cause them to sell still higher in the future (if only in terms of a further depreciated dollar), and that they will receive, if not a good yield, at least a “capital gain.” For the same reason “safe” bonds even at a 4 percent yield do not interest investors when they expect the dollar face value of these bonds to decline in real purchasing power.

REASONS FOR FEAR
This spreading belief that inflation is here to stay, this resignation and adjustment to it, is premonitory. It helps to create or intensify the very consequences it fears. And it is not set at rest, but increased, by complacent assurances from congressmen that there is really nothing to it—just a baseless bugaboo. For the business and financial community merely draws the conclusion that Washington even now refuses to recognize the danger, or to take the steps necessary to avert it.

The business community judges the outlook not merely by what is said but by what is done. Here are reasons that lend substance to its fears:

1—After twenty years of inflation most congressmen still do not understand that the basic cause of inflation is the increase in money and credit. The active money supply has been expanded from $36 billion at the end of 1939 to $138 billion at the end of 1958—an increase of 283 percent.

2—With one rationalization after another, there have been 25 budget deficits in the last 29 years, during which the national debt has risen from $16 billion to $285 billion. The public believes that deficits are here to stay. Few persons believe that even the President’s proposed budget for 1960 would really balance at $77 billion. We are certain to have a dangerous deficit if the Congressional spenders have their way.

3—The Federal Reserve authorities showed reassuring courage when they raised the discount rate of four reserve banks from 2½ to 3 percent on March 6. But this also called attention to the lack of courage and wisdom they showed in dropping the discount rate from 3 percent to the inflationary level of 1¾ percent last year. In the last quarter-century the Federal Reserve Board has been under practically continuous pressure to keep inflating. Over the long run it has yielded to this pressure. When it acts with restraint and courage, as now, it is subjected to a political barrage. Typical is the statement of Senator Douglas (who knows better) that: “This action certainly seems extraordinary in view of the 4.7 million people who are fully unemployed and the equivalent of another 1 million who suffer from involuntary part-time employment.”

4—The chief reason for present unemployment, with inflation, is the excessive wage rates imposed on employers, particularly by industrywide unions such as those in automobiles and steel. These unions have been pricing their members out of the market. Yet as long as they keep automatic escalator clauses in their contracts, even more inflation is unlikely to float them into full employment.

5—The only way in which this process can be stopped is by modification or repeal of Federal labor laws passed since 1932 which make employers impotent to combat unreasonable demands. But Congress shows not the slightest interest in or stomach for such reform.

Inflation as a Policy
April 6, 1959

In his classic little history of fiat money inflation in the French Revolution, Andrew D. White points out that the more evident the evil consequences of inflation became, the more rabid became the demands for still more inflation to cure them. Today, as inflation increases, apologists emerge to suggest that, after all, inflation may be a very good thing—or, if an evil, at least a necessary evil. The chief spokesman of this group is Prof. Sumner H. Slichter of Harvard.

Slichter’s testimony and writings overflow with fallacies. I confine myself here to three: (1) That a “creeping” inflation of 2 percent a year would do more good than harm. (2) That it is possible for the government to
plan a “creeping” inflation of 2 percent a year (or of any other fixed rate). (3) That inflation is necessary to attain “full employment” and “economic growth.”

I long ago pointed out (Newsweek, Sept. 23, 1957), as did others, that even if the government could control an inflation to a rate of “only” 2 percent a year, it would mean an erosion of the purchasing power of the dollar by about one-half in each generation. This cannot fail to discourage thrift, to produce injustice, and to misdirect production. Actually inflation in the United States has been much faster. The cost of living has more than doubled in the last twenty years. This is at a compounded rate of about 4 percent a year.

**IT CAN’T BE PLANNED**
The moment a planned “creeping” inflation is announced or generally expected in advance, it must accelerate into a gallop. Even Slichter now recognizes that, if lenders expect a 2 or 4 percent rise of prices a year, they will insist that this be added to the interest rate otherwise paid to them to maintain the purchasing power of their investment. But he still fails to see that all businesses will be forced to offer a correspondingly increased gross rate of return to attract new investment, even new equity capital. He still fails to see that if there is a planned price rise, union leaders will simply add the expected amount of that rise on top of whatever wage demands they would have made anyway. He still fails to see that speculators and ordinary buyers will try to anticipate any planned price rise—and thereby inevitably accelerate it beyond the planned percentage. He still fails to see that inflation forces everybody to be a gambler.

The burden of Slichter’s argument now is that “a slow rise in the price level is an inescapable cost of the maximum rate of growth”—in other words, that inflation is a necessary cost of “full employment.” This is simply not true. What is necessary for maximum “growth” (i.e., optimum employment and maximum production) is a proper relationship or *coordination* of prices and wages. If some wage rates get too high for this coordination, the result is unemployment. The cure is to correct the culpable wage rates. To attempt to lift the whole level of prices by monetary inflation will simply create new maladjustments everywhere.

**COORDINATION NEEDED**
In brief, if a real coordination of wages and prices exists, inflation is unnecessary; and if coordination of wages and prices does not exist—if wages outrace prices and production—infation is worse than futile.

Slichter assumes that there is no way to restrain excessive union demands except by “breaking up” unions. It never occurs to him that we need merely repeal the special immunities and privileges conferred on union leaders since 1932, especially in the Norris-LaGuardia and Wagner-Taft-Hartley acts. If employers were not legally compelled to “bargain” with (in practice, to make concessions to) a specified union, no matter how unreasonable its demands; if employers were free to discharge strikers and peaceably to hire replacements; and if mass picketing and violence were really prohibited, the natural competitive checks on excessive wage demands would come into play.

Slichter argues that labor unions are much the most important cause of present-day inflation, yet contends at the same time that a general wage increase is just the right medicine for the economy right now! His delusion is that we can inflate ourselves out of the inflation.

**What Is Competition?**
April 13, 1959

*The Roots of Capitalism*, by John Chamberlain (Van Nostrand, $5.50), is a book unapologetically in praise of the American system of free enterprise. It is a history of the ideas, the men, and the deeds that produced the capitalism of the present day. The ideas include liberty, freedom of choice, private property, limited government, and contract. The men include the economic theorists from Adam Smith to Ludwig von Mises, the political theorists from John Locke to James Madison, and inventors and enterprisers like James Watt, Eli Whitney, and Henry Ford.

Chamberlain interweaves fascinating thumbnail biographies and portraits with a discussion of abstract principles. As he writes in his preface, for years the system we call capitalism was on the defensive, because it existed in the here-and-now, and its imperfections, whether inherent or not, were plainly apparent to everybody. When contrasted with a dream of perfection, such as socialism, capitalism was manifestly at a disadvantage. But since the advent of socialist economies, as in Communist Russia and China, and of the semi-socialist or “mixed” systems of Scandinavia, Britain, and New Deal America, capitalism “no longer requires apologists. Under any comparative audit of systems it comes out very well indeed.”

**‘ADMINISTERED PRICES’**
Chamberlain defends capitalism against some of the more persistent current criticisms of it. One of these is that real competition has disappeared in America, and has been supplanted by “administered prices,” by monopoly or “oligopoly,” or by “imperfect” or “monopolistic” competition.
The term “administered prices” was invented by Gardiner Means in the early New Deal era and is being exhumed today by Senator Kefauver. It turns out to be merely a sinister name for a price established or quoted by the seller. Quoted prices are immemorial. As Roger Blough of the U.S. Steel Corp. has pointed out, they can be found anywhere, from the corner newsstand to Macy’s. It is only when a firm has the “market power” to make the “established” or the “quoted” price stick through periods of declining sales and unused manufacturing capacity that competition ceases to be the governor of market transactions.

And as Chamberlain conclusively shows, this power very seldom exists in present-day America. The presence or absence of competition seems to have very little to do with the size of the units involved. “It can be absent in a small town . . . where the barber or the hardware-store proprietor has a local monopoly. It can be present among automotive giants when they are engaged in a dingdong battle for sales leadership.”

**ROLE OF INNOVATION**

This is being illustrated afresh by the present plight of the Buick. In 1955 it was the most popular medium-priced car. But it has now dropped from third place to sixth in its share of the American market. Its sales are down so far in 1959 (according to *The Wall Street Journal* of March 24), 61.2 percent from their best pace. Chamberlain brilliantly shows the terrific price as well as quality competition that the American automobile companies are under. For example, there are upwards of some 50 million cars on the roads of the U.S., and “each one of the 50 million is in the hands not only of a buyer but also of a potential seller.”

Recent economists have gone sadly wrong in their postulate of something they call “perfect” competition. Compared with this, all actual competition seems to them “imperfect” or “monopolistic.” As F.A. Hayek pointed out a dozen years ago, their “perfect” competition, on analysis, seems to mean “the absence of all competitive activities.”

Chamberlain follows up the Hayek lead with a beautifully lucid exposition of what real competition means today. The characteristics of the so-called “perfect” market—an undifferentiated product, many buyers and sellers, no trade secrets—are built on the analogy of the wheat market. They have never applied to industrial competition. Industrial competition is not merely competition in prices; it is competition in product, in improvement, in innovation—in short, in the very “differentiation” that the theorists deplore as an “imperfection.”

**Why There Are Jobless**

April 20, 1959

On April 7 the government triumphantly announced that employment rose 1,106,000 and unemployment dropped 387,000 between mid-February and mid-March to 4,362,000. The drop for the two months was the largest in any year since 1950. But though there is cause for some gratification in this, it is not the basic answer to the barrage of propaganda from the labor-union bosses and the left-wing Democrats seeking to pin the blame for unemployment on the Administration. The basic answer is that existing unemployment is mainly the result of the very policies that the labor-union bosses have followed and that the left-wing Democrats want to carry still further.

Unemployment is caused mainly by wage rates that have become excessive in relation to productivity or demand. The price of labor services is like the price of anything else. If it is too high in relation to demand, part of the supply will go unsold. The cure for a commodity is to reduce the price to the point where the entire supply can be sold. The cure in the case of labor is to reduce wage rates, in the lines where they are unworkable, to the levels where full employment can be resumed.

**ESCALATING WAGES**

The policy of the union leaders has been the exact opposite of this. They are constantly pushing wage demands beyond the point of productivity. It is significant that precisely where the unions have been most powerful and most successful—in the automobile and steel industries, for example—recent unemployment has tended to be highest. This is partly because these unions have succeeded in getting automatic escalator clauses in their contracts under which their wage rates rise automatically with increases in the cost of living and also at set periods, regardless of what happens to productivity. Hence even their favorite cure for unemployment—more inflation, a further rise in prices—is now largely ineffective, because automatically escalating wage rates rise even faster than prices and prevent return to workable relationships. Hence we have what the baffled left-wingers call the “paradox” of unemployment with inflation.

The unions keep blaming unemployment on the wrong things, such as “automation.” This is not a cause of net unemployment, but itself partly a consequence of excessive labor costs.

If we look at the remedies for unemployment that the union leaders and left-wingers propose we find that they all consist in various inflationary devices, most of
which would intensify the very evil they are supposed to cure. Increased and prolonged unemployment compensation tends to increase and prolong unemployment. It relieves the pressure on the less conscientious workers to look for or take a new job as soon as possible. It relieves the pressure on the union to readjust wage rates to a level that would permit full employment. It takes the burden of providing for a union’s unemployed off the particular unions whose policies have caused it, and throws it on the general taxpayer.

AN ‘EXTRA BILLION’
This subsidizes the aristocrats of the automobile industry earning an average of $2.65 an hour, or of the steel industry averaging $3.03 an hour, compared with the average in all manufacturing industry of $2.19 an hour or of $1.74 in retail trade.

The belief that the cure for unemployment is a still further increase in wage rates rests on a nebulous “purchasing power” theory. Thus the United Steelworkers of America are running ads implying that a still further wage increase for the steelworkers would somehow bring an “extra billion dollars” into existence. It is not explained where this extra billion dollars would come from—unless an equivalent extra amount of steel were produced. Otherwise whatever added amount the workers got would have to come from the steel companies, and reduce their purchasing power for inventories or reinvestment in plant. The most probable result of a further increase in steel wage rates would be to increase steel prices and reduce markets, employment, and “purchasing power.”

The Reuthers and McDonalts who most loudly complain about present unemployment are the very people who have done most to bring it about.

How to Denationalize
April 27, 1959

In the last decade the political appeal of an orthodox socialism—i.e., of government ownership and operation of the means of production—has been fading to the point of disappearance, at least in the U.S. and in Western Europe. Even the parties of the left no longer openly propose further nationalization, but busy themselves chiefly with more “welfare” programs. Yet the nationalization that has already taken place has remained practically undisturbed. It is even carried on, in Britain and elsewhere, by conservative successors of its original socialist sponsors. The prevailing assumption has been that socialization is an irreversible process.

It has remained for Western Germany to find a politically acceptable route to the restoration of private enterprise. A few weeks ago it offered “people’s shares” of the capital stock of Preussag A.G., a government-owned mining and machine-building concern, for private subscription. Sales were limited to persons with a taxable income of not more than the equivalent of $3,800 a year, and each buyer was limited to five shares at the equivalent of $33 each. The issue was oversubscribed three times. And now the West German Government has begun preparations for the sale, through a similar plan, of the extremely successful government-owned Volkswagen company.

Here is an example that the British, French, Norwegians, Italians, and Spanish, among others, would do well to study and to emulate. The “others” include the citizens of our own country. Let us take two outstanding examples: The New York subways and the Tennessee Valley Authority.

NEW YORK SUBWAYS
New York City has operated its own “independent” system since 1932. It bought the rights and properties of the IRT and BMT from the private companies in June 1940. Prior to that time the great issue had been the sanctity of the 5-cent fare. Politicians had made a living by denouncing the “profiteering” and “gouging” of the private companies. But under municipal ownership and operation, the fare jumped from 5 to 15 cents by 1953, an increase of 200 percent. This cannot be blamed solely on “inflation.” In the same period the general consumer price index increased by only 91 percent. Even a 15-cent fare now fails to meet municipal-operation expenses. The deficit in the fiscal year ended June 20, 1958, was $11 million. It is expected to be around $17 million in the current fiscal year.

These subway deficits have helped to bring about New York City’s present fiscal headaches. The issue of private operation has now been revived by the dramatic offer of a group of investors to negotiate for the purchase of the city’s entire transit system. The particular terms suggested may not be acceptable, but the re-privatization of the subways is greatly to be desired. The city might well offer “people’s shares,” with a maximum amount purchasable by any individual, and perhaps a preference to present employees. If any shares remained unsold, the city could open up the rest to free competitive bidding. In any case it would have to give guarantees against imposing fare-controls that would threaten solvency.

AND THE TVA
When we turn to the TVA, we find its political champions still pushing for ever more expansion and special
privileges. For the fifth consecutive year, Congress is being asked to authorize the TVA to finance its new requirements for outside capital by issuing revenue bonds to the public. The April survey of the Guaranty Trust Co. of New York points out the dangers of this “blank check” precedent for government agencies. TVA, the bank shows, has always operated under conditions that make a mockery of the “yardstick” idea that was part of the excuse for its origin. “TVA pays no Federal income tax and nothing in lieu thereof. . . . It receives its capital funds from Congress and yet has never paid any interest to the Federal government on any Congressional appropriation. These are not operating economies but special privileges bestowed on the people of one area at the expense of the taxpayers at large.”

It would not be difficult to devise a plan to sell TVA to small investors, perhaps giving prior choice to residents of the territory TVA serves.

**Uncurbed Union Power**

May 4, 1959

Congress is now debating a labor bill which is irrelevant to the real crisis in labor today. If enacted in the form in which it came out of the Senate committee, it could only intensify that crisis. For this bill proposes an unpromising method of curbing misuse or embezzlement of union funds by union leaders, and does nothing whatever to curb the privileged monopoly of unions, their resort to intimidation and violence, and their power to paralyze production until their demands are met.

Yet while the great majority in Congress still seem blind to these problems, there has been increasing recognition of them in the academic world. This was evidenced by the appearance two years ago of *The Labor Policy of the Free Society*, by Prof. Sylvester Petro of New York University, and by the appearance a year ago of a symposium, *Labor Unions and Public Policy*, containing contributions by Dean Roscoe Pound, Profs. Edward H. Chamberlin and Philip D. Bradley, and by Gerard D. Reilly.

It is evidenced now by the appearance of two more books. Again one of them is a symposium, *The Public Stake in Union Power*, edited by Philip D. Bradley (University of Virginia Press), and containing lectures delivered at the University of Virginia by sixteen different writers, including such eminent economists as Profs. E.H. Chamberlin, Frank H. Knight, F.A. Hayek, Gottfried Haberler, and David McCord Wright. And again one is a book by Professor Petro, *Power Unlimited—The Corruption of Union Leadership* (Ronald Press, $5).

**Naïve Assumption**

It would be unfair and impossible to attempt to summarize in this limited space the diverse views of sixteen independent economists. Yet there has obviously been a profound change since the days, 25 years ago, when it was naïvely assumed both in academic and in political circles that labor unions could do no wrong, and that the main if not the sufficient solution of the whole problem was to encourage bigger and stronger unions. As a result the government itself was in effect put into the union-organizing business, and employers were forced to “bargain” with unions set up by government-controlled processes.

Now we find an outstanding economist like Frank H. Knight writing: “Bargaining” is a misleading, essentially dishonest use of a word. . . . What ‘collective bargaining’ obviously means in our case is simply monopolistic action on the part of a labor union. And the union, like any other seller, can secure a price above the free-competitive level only by arbitrarily restricting the quantity offered for sale, obstructing access to work in the union’s jurisdiction.” And F.A. Hayek writes that unions “have become what they are largely in consequence of the grant, by legislation and jurisdiction, of unique privileges which no other association or individuals enjoy. They are the one institution where government has signally failed in its first task, that of preventing coercion of men by other men—and by coercion I do not mean primarily the coercion of employers but the coercion of workers by their fellow workers.”

**McClellan Record**

These abstract statements receive overwhelming documentation in the Petro book. Petro has performed the herculean task of working his way through the 40 volumes which make up the record of the McClellan Senate committee, and has arranged, summarized, and interpreted the results. It is an appalling record of corruption and violence, ranging from the embezzlements of the Becks to the mass violence (in the Kohler strike, for example) engineered, authorized, and financed, but piously deplored, by the Reuthers.

Few men are better qualified to summarize this record than Petro, who, though now a professor of law, worked in the steel mills as a youth and took an active part in the CIO’s organization drive in the mid-1930s. In addition to presenting the facts, he has presented his own recommendations for corrective legislation and law enforcement.

If every congressman could be persuaded to read this absorbing and powerful book, Congress would
certainly adopt a vastly different law revision from that proposed in the original Kennedy-Ervin bill.

Steel Strike Ahead?
May 11, 1959

The Kennedy bill, in the form in which it passed the Senate, would do nothing to mitigate the central labor problem in the United States today. One way to judge how irrelevant it is to that problem is to ask how it affects, if at all, the overhanging threat of a nationwide steel strike.

If ever a strike threat was completely without justification, this one is. Both absolutely and relatively, the steelworkers have made gains far beyond the average. In a January bulletin, the U.S. Department of Labor declared: “According to 1957 gross average hourly earnings data for 318 separate manufacturing industries and groups . . . production workers in the primary iron and steel industry ranked fifth from the top. . . . A study of changes in hourly earnings between 1950 and 1957 reveals that the earnings position of the production worker in primary iron and steel manufacturing improved steadily in relation to that of the average factory worker.”

The position of the steelworker has been further improved since 1957. In January 1959 only one industry—flat glass—paid higher earnings than steel. In 1940 the steelworker was already getting 18.3 cents an hour above average earnings in all manufacturing. In January 1959 he was getting 83.03 an hour—84 cents above. He was also getting 38 cents more than the auto-worker, whom he once trailed. Steel wages have far outpaced the rise in living costs. Since 1940 living costs have increased 106.7 percent; steel wages have increased 259 percent.

PRICES AND PROFITS
The result has been to force up steel prices. The claim of the steel union that the companies have used the situation to make exorbitant profits is not borne out by the long-term record. In 1958, out of 41 manufacturing industries, steel ranked 27th from the top in its return earned on net assets. Where its rate of profit on sales had been 8.1 percent in both 1940 and 1950, it was only 7.3 percent in 1957 and 6.3 percent in 1958. Without profits in our economic system, there would soon be neither tools, nor production, nor jobs.

Yet the steel unions are threatening to strike when their contract expires on June 30. When, on April 10, the steel companies made a proposal for a one-year wage freeze, David J. McDonald, the union’s president, replied: “I reject it out of hand.” One can imagine the political and legal reaction if the companies had made any such retort to a proposal by the union. “Collective bargaining” is still a one-sided requirement.

LOSSES OF STRikers
If a steel strike now does occur, it will probably hurt the steelworkers most of all, whether they “win” or lose. This was the result of the 1956 steel strike. Comparing what they won with what they had been offered without a strike, I pointed out in Newsweek of Aug. 13, 1956, that each worker had lost about $600 as a result of six weeks’ idleness; that even at the end of the three-year contract he could make up (assuming a 40-hour week) only $190 of this, leaving him still $410 worse off than if he had not struck. I added: “In the long run higher costs of production will . . . mean less employment of steelworkers.” This is what happened. In May of 1956, 646,000 men were employed in the steel industry; the number fell to 500,000 in May of 1958.

Yet our Federal laws encourage strikes. Roger M. Blough, chairman of the board of the United States Steel Corp., testified in 1957: “The union has struck our plant five times in the past eleven years. . . . Hardly has one of these strikes begun before there is a nationwide demand that we settle it. . . . And ultimately—if we do not settle—we may face the threat of government intervention, as happened five years ago when the then President of the United States seized our plants illegally and sought to grant the union demands in full.”

One factor must be added to this. Because of the attitude of the law and the law-enforcement authorities, no struck steel company today dares to try to carry on its business by hiring workers to replace the strikers. If it did, it is the company, and not the strikers, that would be accused of “provocation” and “violence.”

The political cards are stacked in favor of unjustified strikes and inflationary wage increases.

Giant Step Backward
May 18, 1959

The Kennedy bill, as it passed the Senate, is much worse than no labor bill at all. It would on net balance increase the appalling power of union bosses. And it would do nothing to reform real abuses.

The quickest way to recognize the faults of the bill is to ask ourselves what a sound and balanced labor law would seek to do. It would either not interfere in industrial labor relations at all (as in the days before the Wagner Act), or it would make it illegal for an employer
to require either membership or nonmembership in a union as a condition of employment. The Taft-Hartley Act, like the Wagner Act, piously professes to do this in Section 8a. It declares it an “unfair labor practice for an employer . . . by discrimination in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage membership in any labor organization.” And then, in flagrant contradiction of this balanced principle, it explicitly authorizes a union shop under which an employer can and must fire a man who does not become a member of a union.

The basic requirement of any sound and balanced labor law would be to illegalize beyond the shadow of doubt every practice, including mass picketing, which involves violence, intimidation, or coercion. A guiding principle of labor law should be to protect free employee choice.

**UNION ABUSES**

The union abuses that any labor law will have to correct are outlined in all their grisly detail by Prof. Sylvester Petro of the New York University School of Law in his recent book *Power Unlimited—The Corruption of Union Leadership*. The appropriate legal remedies are outlined both in that book and in the same author’s *The Labor Policy of the Free Society*.

Let us apply to the Kennedy bill the test of the basic principles just stated. We find that, under the guise of correcting union abuses, it would actually increase the stranglehold of the union bosses. It makes a mockery of the principle of free employee choice. By allowing the building trades unions to fasten a completely closed shop on unwilling workers, it takes an enormous step backward. By prohibiting certain narrowly specified types of organizational picketing, it in effect permits other types of organizational picketing that are probably illegal under present law.

One of the worst features of the new bill is that repealing the present explicit provision of the Taft-Hartley Act which forbids voting by replaced strikers in representation elections. The Kennedy bill would now permit the former employees, who had been replaced by a fair employer as a result of a strike, to vote in an NLRB election. This is like permitting people who have moved out of New York to continue to vote in New York local elections. As some critics have pointed out, this could result in certification of a union not wanted by a single employee on the job. Under this provision the government would in effect throw its support behind every strike, and encourage arrogant abuse of the strike power. This provision alone throws doubt on the integrity of the whole Kennedy bill.

**WHERE THE BILL FAILS**

And the Kennedy bill completely fails to deal with the true causes of union abuses. It gives no protection to employers who are being subjected to shakedowns by racketeers. Its union disclosure requirements add nothing substantial to existing law. Union members already have the right to go to court whenever their officers mistreat them or steal from them. They do not go to court now simply because they are afraid of the physical reprisals which are a favorite technique of unions run by gangsters. The Kennedy bill in no way eliminates the threat of a beating which now intimidates so many union members.

What is chiefly needed today is the repeal of bad labor law—e.g., the Norris-LaGuardia Act. What the Kennedy bill seeks to do is to correct the evils caused by present bad labor law by piling on still more bad labor law, and by interfering still more in the internal affairs of supposedly voluntary associations.

The Kennedy labor bill, if enacted, would be simply one more huge step in the wrong direction.

---

**The Gold Outflow**

May 25, 1959

Last year the United States lost the record amount of $2.3 billion of gold. The outflow slowed down in the first three months of this year to only $92 million. But in April and the first two weeks of May it rose to $197 million for the six weeks.

It is sometimes said that any concern about the present outflow of gold is premature. The reasons given are that, even though the United States gold stock has declined from its peak of $24.6 billion in 1949 to its present level of $20.2 billion, this is still a tremendous sum and more than half of all the monetary gold in the world. It is also contended that this loss of gold is actually healthy because it makes for a sounder distribution of gold reserves and strengthens the currencies of other countries.

Any complacency about the situation, however, is unwarranted. Though some $20 billion is still held in the United States, it is not, strictly speaking, owned by the United States. The “free” gold supply is comparatively small. The notes and deposits of the Federal Reserve Banks are required by law to be backed by 25 percent of gold. As of May 6, this called for a gold cover...
of $11.7 billion, leaving the Treasury with only $8.5 billion of “free” monetary gold.

(It is also instructive to recall that if Congress had not reduced the reserve requirements to only 25 percent as a “war” measure in 1945, and had kept the previous requirements of 35 percent gold reserve against deposits and 40 percent against notes, the amount of “free” gold today would be only $2.5 billion.)

WHAT THE THREAT IS
As against the Treasury gold holdings, banks in the United States already have short-term liabilities to foreigners totaling $16.6 billion. So if foreigners really elected to withdraw their deposits and short-term assets in gold, and could do so through their central banks, the situation would become very serious.

One of the explanations most frequently offered for the loss of United States gold in the last sixteen months is a “deficit in the balance of payments with the rest of the world.” This explanation confuses cause and effect, and suggests the wrong remedies. The chief reason for the outflow of gold is distrust of the future of the American dollar, brought about by our inflationary policies. These policies also cause the deficit in the balance of payments. Unless we have the sense and courage to halt these inflationary policies in time, the withdrawal of gold could become accelerative.

FOUR POSSIBLE STEPS
Discussing this subject in Newsweek of Dec. 22, 1958, I listed a few specific steps we should consider to restore confidence in the dollar. I repeat the substance of them here, with some change in emphasis and detail:

1—The Federal Reserve Board should definitely abandon the effort to make money artificially cheap by open-market purchases, further reduction in reserve requirements, and similar measures. Firm interest rates will not only discourage the withdrawal of foreign balances but stop encouragement to credit expansion.

2—The Administration and Congress should take dramatic steps toward slashing the deficit and balancing or even overbalancing the budget. They should do this not by increasing taxes still further (which would only act as a deterrent to production) but by slashing unjustified expenditures. Swollen veterans’ aid and the whole farm subsidy and price-support program are obvious candidates for the ax.

3—It makes no sense to continue and even to expand an enormous foreign-aid program when our problem is already inflation, excessive government spending, the loss of gold to foreigners, and a deficit in the balance of payments. Our military-aid program should be much more selective. Our economic-aid program, which rests on dubious socialistic assumptions, should be discontinued. Particularly ill-timed is the pending subscription of some $1.3 billion by our government to the International Monetary Fund, which operates on questionable monetary assumptions.

4—Revise the Federal legislation and NLRB decisions that enable labor leaders to force excessive wage rates on employers and tend to price our products out of world markets. ☞

Communist Strategy
June 1, 1959

We got into the Foreign Ministers’ meeting at Geneva, and into all the plans for a “summit conference,” by yielding to Soviet propaganda and pressure. There never has been any sincere desire in Moscow for “peaceful coexistence” or for a just “settlement.” “Negotiation,” to them, is merely a technique of warfare. They want the West to negotiate its own surrender—or, failing that, to make concessions that will further weaken its military or moral position. At the very least they want a conference to give them a world loudspeaker for their propaganda against the West.

We have been lured into these conferences by not knowing how to get out of them. How can we refuse to “negotiate” for peace? But the question confuses means with ends. The goal is peace with justice. A summit conference, or even a Foreign Ministers’ conference, is at best a means. Both means are unpromising for the West. Neither is necessary. The West could have said long ago, and there is time to say still; that if Khrushchev has any proposals for a Berlin, a German, or any other settlement to make to us, our Ambassadors in Moscow are always there to hear them, to transmit them, to negotiate concerning them. This in fact is the precise reason why our Ambassadors and their staffs are there.

AMBASSADORIAL LEVEL
If the Foreign Ministers’ conference fails, therefore, we could keep the door open, instead of passing the problem on to a futile summit conference, by suggesting that the negotiations be continued quietly at the ambassadorial level. This is the chief raison d’être for the whole traditional ambassadorial system. If it is to be bypassed every time matters of importance arise, it becomes an expensive farce.

At a press conference on May 5, President Eisenhower seemed to minimize what the forthcoming Foreign Ministers’ meeting could achieve by saying: “All of us do know that within the Soviet regime there is only one man who can talk authoritatively.” But
the fact that the consent of a head of state is necessary for final ratification of an agreement need not mean that all negotiations must be with him directly, and by other heads of state. The very day before the President said this, our Ambassador at Moscow had presented to Khrushchev a demand for information on eleven American fliers, missing since the crash of a C-130 transport in Soviet Armenia last September. This is the proper procedure. If it is not effective, it is because the head of state does not really want a settlement.

FEAST—OR FAMINE?
These thoughts are suggested by an important book that has just appeared under the auspices of the Foreign Policy Research Institute at the University of Pennsylvania—Protracted Conflict, by Robert Strausz-Hupe, W.R. Kintner, J.E. Dougherty, and A.J. Cottrell (Harper, $3.95). The book is the most acute study of Communist international strategy that I have yet seen. It describes in detail the political, economic, psychological, and military techniques that the Communists have been using against the West since 1945, as well as the sporadic, halfhearted, and purely defensive responses of the Western democracies. There are separate chapters on the Soviet’s “Monopoly of the Initiative” and on their strategy of “Deception and Distraction.” And one of the devices of deception treated is the “deliberate falsification of economic data.”

This continues to be successful because gullible Westerners continue to play into the Communists’ hands. Even within the last two weeks Lord Boyd Orr, for example, speaking from Moscow, endorsed the extravagant claims of the Chinese Communists by saying that they appeared to have raised food production by “50 to 100 percent” in three years. Yet three days after that estimate, a dispatch from Hong Kong in The New York Times reported that “residents of Shanghai have been unable to get bread of any kind for two and a half months,” while “the rice lines in all large cities were increasing steadily in size and rations were decreasing.”

Those who are so ready to give credence to Communist lies about production betray a weak faith in our free economic system. ✽

The First Step
June 8, 1959

The hospital strike in New York City threw a brilliant light on what is basically wrong with our labor law and law enforcement. Hospitals, it is true, are exempt from the labor-law provisions that apply to profit-making business. They are not forced to bargain with a particular union. They are free to apply for an injunction against mass picketing. The besieged New York hospitals did apply for injunctive relief and were granted injunctions by courts in Manhattan and Brooklyn. But mass picketing nonetheless continued. The mayor and police of New York were slow to enforce the injunctions.

The situation exposed the absurdity of the slogan, dear to muddleheaded “liberals,” that one must never pass a picket line. Let us hope that for the peace of their souls none of these people had seriously ill friends or relatives who were patients at any of the hospitals affected.

But the incident also serves to expose the hollowness and irrelevance of the Kennedy bill passed by the Senate. That bill is now opposed by labor-union leaders on the ground that it interferes in detail in the internal affairs of ostensibly voluntary organizations. This is a proper ground for opposition. But a far more serious reason is that the Kennedy bill and its sponsors remain completely blind to what is fundamentally wrong in our labor law. This is that it permits violence, intimidation, and lawlessness.

NEED FOR REPEAL
What is needed is not more Federal labor legislation but less. What is needed is repeal—above all repeal of the Norris-LaGuardia Act.

Few people realize what this law really does. It is commonly believed that it merely prevents the Federal courts from enjoining “strikes.” But the right of workers peaceably to quit work, and even to do so collusively, was not denied by the Federal courts prior to the enactment of the Norris-LaGuardia Act. What the courts had been enjoining, in the words of Prof. Sylvester Petro, was “the violent, intimidatory, coercive activity of trade unions, not strikes for higher wages and better working conditions.”

The Federal courts had enjoined only unlawful conduct which threatened irreparable harm. But in the Norris-LaGuardia Act of 1932, Congress, instead of defining boundaries for union conduct, chose to make practically all union conduct unenjoinable. To prohibit Federal judges from issuing labor injunctions, on the assumption that they cannot be trusted to act impartially, is an insult to the integrity of our courts. It implies distrust of the judicial system itself.

PICKETING AS COERCION
The evil begun by Congress has been compounded by the “new” Supreme Court. During the past twenty years it has provided a succession of additional privileges for aggressive union action. Until recently, it even identified the coercive economic weapon of picketing with
“freedom of speech.” Under such reasoning, the United Automobile Workers were simply exercising “freedom of speech.” when they set up a line of 2,000 pickets around the Kohler plant, forming a human barricade, making entrance to the plant impossible, and harassing, assaulting, and humiliating nonstrikers.

Where the Norris-LaGuardia Act bars employers and nonunion employees from going to the Federal courts for immediate relief from irreparable injury, the Supreme Court’s more recent pre-emption doctrine even bars them from going to the state courts. Chief Counsel Kennedy and some members of the McClellan committee heaped scorn as well as direct accusations of impropriety upon employers who had yielded to shake-downs. Yet it is Congress itself that has made it impossible for the victims of trade-union wrongdoing to secure any help from the law.

The primary need is to restore the principle that every man who feels himself aggrieved by unlawful conduct has a right to a day in court. And local officials, instead of courting the so-called “labor vote,” must have the courage to enforce the laws and judicial decisions against violence or intimidation.

It is because it is completely oblivious of such primary needs that the Kennedy bill would be a mockery of labor-law reform.

The Open Conspiracy
June 15, 1959

Thirty years ago—in 1928, to be precise—H.G. Wells published a minor propagandistic novel called The Open Conspiracy. Though I reviewed it at the time, I’ve forgotten now exactly what that open conspiracy was. But the description seems to fit with peculiar aptness something that is happening in the United States today. Our politicians, and most of our commentators, seem to be engaged in an open conspiracy not to pay the national debt—certainly not in dollars of the present purchasing power, and apparently not even in dollars of the same purchasing power.

There is of course no explicit avowal of this intention. The conspiracy is, rather, a conspiracy of silence. Very few of us even mention the problem of substantially reducing the national debt. The most that even the conservatives dare to ask for is that we stop piling up deficits so that we do not have to increase the debt and raise the debt ceiling still further. But anyone with a serious intention of eventually paying off the national debt would have to advocate overbalancing the budget, year in, year out, by a sizable annual sum.

Today one never sees this problem seriously discussed. We see hundreds of articles and hear hundreds of speeches in which we are told how we can or should increase Federal expenditures or Federal tax revenues in proportion to the increase in our “gross national product.” But I have never seen an article that discusses how we could begin and increase an annual repayment of the debt in proportion to the increase in our gross national product.

285 YEARS TO PAY

When we look at the dimensions the problem has now assumed, it is not difficult to understand the somber silence about it. If someone were to propose that the debt be paid off at an annual rate of $1 billion a year, he would have to face the fact that at that rate it would take 285 years, or nearly three centuries, to get rid of it. Yet $1 billion a year is even now no trivial sum. Republican Administrations, after World War I, did succeed in maintaining something close to such a steady annual rate of reduction between 1919 and 1930; but they were under continual fire for such a “deflationary” policy. Because of such deflationary fears, one would hardly dare mention a higher rate today.

One suspects that there is at the back of the minds of many of the politicians and commentators who sense the dimensions of the problem an unavowed belief or wish. This is that a continuance of inflation will scale down the real burden of the debt in relation to the national income by a constant shrinkage in the value of the dollar, so reducing the problem to “manageable proportions.” Such a policy would be indignantly disavowed. But this is precisely what our reckless spending is leading to. On the debt we contracted twenty years ago we are paying interest and principal in 48-cent dollars. Are our politicians hoping to swindle government creditors by paying them off in dollars twenty years from now at less than half the purchasing power of the dollar today?

A ‘JUGGLING TRICK’

This trick, alas, has a long and inglorious history. “When national debts have once been accumulated to a certain degree,” wrote Adam Smith in The Wealth of Nations in 1776, “there is scarce, I believe, a single instance of their having been fairly and completely paid. The liberation of the public revenue, if it has been brought about at all, has always been brought about by a bankruptcy; sometimes by an avowed one, but always by a real one, though frequently by a pretended payment [i.e., payment in an inflated or depreciated monetary unit]. . . . The honor of a state is surely very poorly provided for, when, in order to cover the disgrace of a real bankruptcy, it has recourse
to a juggling trick of this kind, so easily seen through, and at the same time so extremely pernicious.”

Our government is not forced to resort, once more, to such a “juggling trick.” It is not too late for it to face its responsibilities now, and to adopt a long-term program that would eventually pay off its creditors with at least the present 48-cent dollar, without plunging us further into inflation or deflation.

**The Egg in Politics**

*June 22, 1959*

A crisis has developed among the poultry farmers, the result of a huge overproduction of eggs. Eggs have been selling in recent months below their cost of production for most small farmers. The result, as usual, has been pressure on the government to “solve” the problem, and the Department of Agriculture has been forced to promise to step up its egg-buying program. It has already bought some 500 million eggs, dried or frozen, and perhaps the race has just begun.

Of course the effect of this program, to the extent that it is “adequate,” can only be to encourage continuance of overproduction. Without this government buying, adjustments would soon set in to bring the overproduction to a halt. But, at least as far as farmers are concerned, most politicians consider the adjustments brought about by supply and demand as too callous and cruel; every farmer must at all costs be protected from them. The congressmen who take this view do not see that what they are refusing to accept is the whole principle of the free market, which is the central principle of free enterprise.

**WHAT FREE MARKETS DO**

It is the principle of the free market that regulates the relative price and production of thousands of different commodities to meet the relative wants and consumption of millions of consumers. When there is too little of a desired commodity, the demands of consumers will lift its price relative to other commodities; and more of that commodity will be produced because of the higher profit margin, until the price falls again. When there is too much of a commodity, its price will fall below the previous marginal cost of production, and the highest-cost or least-efficient producers will have to turn to something else.

This sometimes means great hardship for the individuals affected. But this finely graduated system of rewards and penalties, of incentives and deterrents, leads in the long run to the greatest production, growth, and general welfare provided by any economic system. And this same system, which politicians think “intolerable” as applied to farmers, is in fact accepted in nearly all other fields. The annual figures of industrial failures are a constant reminder. Government studies have shown, to cite only one statistic, that only three-fifths of firms in retail trade survive their first year, and only a sixth reach the age of ten years.

The practice of price support must involve favoritism. It simply cannot be universalized. We cannot subsidize everybody at the expense of everybody else. One of the very things that the egg farmers are chiefly suffering from, in fact, is the price supports and subsidies to the grain producers. These have raised the price that poultry raisers are forced to pay for feed. Nothing could help the egg farmers more than the termination of price supports on grain.

**FIASCO IN WHEAT**

The price-support program in wheat grows more and more fantastic. In a statement on June 1, President Eisenhower pointed out that the existing program had piled up $3 billion worth of wheat, a supply equal to two and a half times our annual domestic needs; that storage, handling, and interest charges alone for this wheat will cost the American taxpayers close to half a billion dollars during the next fiscal year, and that “continuation of this legislation for another year leads the wheat program one step closer to disaster.”

These programs, which increase the price of feed for cattle and poultry raisers, and the price of food for city workers, are costing the taxpayers some $6 billion a year. Grain farmers are growing crops for government storage rather than for markets. *The Wall Street Journal* reports that some farmers are even deliberately growing inferior-quality wheat in order to take advantage of the government’s generosity.

Secretary Benson’s proposed solution is to reduce the price support to 90 percent of the average market price for the three years preceding the crop year. This would certainly reduce the dimensions of the problem. But any price support at all, to the extent that it is effective, must encourage excess production and storage. Today’s “farm problem” is government-created.

**The Interest Ceiling**

*June 29, 1959*

The President, the Secretary of the Treasury, and the chairman of the Federal Reserve Board are all urging Congress to remove the present legislative ceiling of
4½ percent on the interest rate that the government can pay on its new issues of bonds with a maturity of five years or more. The reform is urgent. Some long-term Treasury bonds have already been selling in the open market at prices that yield about 4½ percent. The government cannot sell new long-term bonds at yields below going market rates. The only effect of the present limit is to force the government to finance its needs through short-term borrowing. But this merely drives up rates (on which Congress has been wise enough not to put any ceiling) on short-term borrowing, and forces the government to keep coming back to an uncertain market every few months.

Some of the Democrats in Congress have been cool to the suggestion that the rate ceiling on long-term bonds be removed. They are full of counter-proposals, typical of which is that the Federal Reserve System support or buy in long-term government bonds at prices that would keep their yields 4½ percent or below. Such proposals would not only destroy once more the hard won independence of the Federal Reserve Board, but they would be violently inflationary.

**HOW INFLATION COMES**
The Federal Reserve System was forced to peg the government bond market through the second world war and until early in 1951. One result was a huge inflation. As Secretary Anderson explained the process anew in his recent testimony: The Reserve banks would buy Treasury securities, paying for them by creating deposits in the Treasury’s name. As the Treasury paid out this money to individuals, the Treasury checks would be deposited in individual banks, thus adding to those banks’ reserves because such checks are the equivalent of cash. This increase in the banks’ reserves would provide for a multiple addition to the banks’ lending and investing power. Direct sale of Treasury issues to the Federal Reserve, in short, would “provide the basis for a highly inflationary expansion of the money supply.”

The purchase of government securities by the Federal Reserve System is inflationary even when it buys short-term securities. But the situation would be much worse if it supported long-term securities also. Federal Reserve economists have pointed out that when the system buys, say, three-month bills, longer maturities are also affected in at least some degree by substitution or arbitrage transactions. In any case, increased bank reserves, which increase by a multiple factor the supply of funds available for loans and investments, are provided just as effectively by operations in bills as by operations in bonds. And there is a further consideration. The purchase of long-term bonds might have to be endless and astronomical to hold down the long-term interest rate. Such bond purchase, therefore, would ultimately be enormously more inflationary than bill purchase.

**A FALSE ‘SAVING’**
Some congressmen honestly think they are saving the taxpayers’ money by forbidding higher interest payments on government bonds. But the inflation they would force through Federal Reserve buying to keep down the bond yields means, as the President has put it, that “the additional cost to the government alone for increased prices of the goods and services it must buy might far exceed any interest saving.”

The irony is that the very congressmen who are now complaining about higher interest costs for the government are among those who have done most to bring them about. By insisting on artificially cheap money in the past, they increased the present extent of inflation. Part of the interest rate that the government must now pay for long-term borrowing is in effect an insurance premium that lenders are asking as a hedge against further depreciation of the dollar.

The chief contribution that Congress can now make is to balance the budget, remove fears of further inflation, stop agitating for cheap money, and let the Treasury meet whatever competitive rate is necessary to sell its bonds.

---

**The Strauss Aftermath**
July 6, 1959

The consequences of the Senate’s rejection of the nomination of Lewis L. Strauss as Secretary of Commerce will be felt for a long time—and few of them seem likely to be good.

Strauss was eminently qualified for the position. Few of his predecessors in the office, indeed, have had equal qualifications. These were revealed in the eight months he had served as Secretary and in his previous long record of public service. As Arthur Krock summed up the case in *The New York Times*, the rejection of his nomination “marks a Senate repudiation of the type of highly talented, self-sacrificing citizen that it has become increasingly difficult for Presidents to recruit for government service except in time of war. [Strauss] had served and been commended by four Presidents, awarded five of the highest national decorations, was an officer in the Naval Reserve who rose to rear admiral, and who, as he vastly understated it in his comment on his rejection, had ‘done the best I knew how to do to protect and defend the national security when that
was not the recognized, nor easy, nor popular course of action at the time’ (the decision to produce the H bomb)."

Yet Strauss was the first Cabinet appointee to be rejected by the Senate in 34 years, and only the eighth such rejection in our history.

**THE REASONS FOR IT**

When one seeks the reasons for this, the last place one finds them is in the explanations most frequently offered. We are told that he had grave personality faults. For example, when he was violently attacked, he defended himself! When he was accused of all sorts of wrongdoing, he refused to admit it! This proved his “arrogance.” Also, the Administration was accused of “lobbying.” That is to say, when Strauss’s enemies in the Senate resorted to personal vituperation, almost daily calling him a “liar,” Administration supporters had the impudence to put in a quiet word in his behalf! We were told at the same time that the senators who voted against him did so because his answers were “evasive and unresponsive,” and because he insisted on replying to every charge. He further infuriated his questioners by bringing in documents that disproved their charges.

Suppose we look at the real reasons for Strauss’s rejection, most of which were not hidden.

The first is that he really stood for private enterprise, and had the courage to try to slow down the steady expansion of the socialized and subsidized public-power empire represented by the Tennessee Valley Authority. He had continued to stress private rather than public development of nuclear power.

**SOME CONSEQUENCES**

The second is that Strauss was too aggressively and persistently anti-Communist. The Senate committee that passed on the nomination listened to a delegation from the Federation of American Scientists. These gentlemen complained that Strauss had been responsible for the dismissal of J. Robert Oppenheimer; had urged construction of the H bomb; had favored restrictions on the dissemination of scientific secrets, and had opposed suspension of bomb testing.

The third reason for Strauss’s rejection is that Democrats in Congress, playing the most petty type of partisan politics, wanted to “rebuke” the President and show that “the veto can work both ways.”

The action of the Senate majority was vindictive and irresponsible. By repudiating the President’s nominee, they violated the long-standing tradition that a President should be free to choose the members of his official family. They have weakened the President’s prestige in foreign negotiations at a time when it is imperative to strengthen it. They have discouraged men of dignity and stature from accepting nominations to Cabinet posts that may subject them to the insult and vituperation that was poured upon Mrs. Luce and Admiral Strauss. They have shown that they will punish nominees who are in favor of private enterprise rather than socialized enterprise; who are hesitant about releasing defense secrets; who have the courage to remove security risks; or who take a leading part in developing weapons, like the hydrogen bomb, that constitute our greatest source of national security.

**Saving Is the Key**

*July 13, 1959*

For 25 years the Western world, and particularly Washington, has been dominated by the economic philosophy of *The General Theory of Employment, Interest, and Money* by John Maynard Keynes. That philosophy, as commonly interpreted, supports a program of deficit financing and inflation, of ever-rising money wages (never to be adjusted downward) and of low interest rates under all conditions. Above all the Keynesian philosophy deplores saving, which it calls hoarding or “liquidity preference,” and blames as the primary cause of slumps.

In my book *The Failure of the ’New Economics’* (Van Nostrand, $7.50), I examine the *General Theory* chapter by chapter and theorem by theorem, calling attention to its many fallacies, contradictions, and errors of fact. But Keynes’s own book might never have been written if he had devoted some of his days and nights to a careful study of the Austrian economist Eugen von Böhm-Bawerk (1851–1914).

Böhm-Bawerk’s two volumes on *Capital and Interest* had been published respectively in 1884 and 1889. English translations by William Smart appeared respectively in 1890 and 1891. But Böhm-Bawerk subsequently made extensive revisions and additions, and published second and third editions, also adding a third volume, over the following 25 years. These were never translated. English-reading economists based their interpretation of Böhm-Bawerk, at best, on the Smart translation. Now, however, a new translation has appeared, by George D. Huncke and Hans F. Sennholz, of the whole three volumes of the fourth (posthumous) Austrian edition of 1921 (Libertarian Press, South Holland, Ill., $25).

**CAPITAL AND INTEREST**

Böhm-Bawerk made greater contributions to the theory of capital and interest than any other economist. Knut Wicksell called *The Positive Theory of Capital* (the second volume) “one of the finest achievements of economic
But what does this tell him about the comparative state of the Russian and American motor industries? What does the Russian car cost to produce? How does it run? Is it actually in mass production? How many are turned out? How many Russians could afford one?

American automobile engineers tell us that the Chaika, for example (a car made only for officials), is not mass-produced, that there is no original engineering in it, that the Russian designers are imitating even our mistakes. But most of the questions above are questions that even an American engineer cannot answer. A better expert is someone who has lived in Russia. Max Frankel, who spent two years in the Soviet Union as correspondent for The New York Times, tells us that a visitor to the Russian show can see far more there in two hours than he was able to see in his two years in Russia—"far more especially of the stuff of Soviet wishful dreams."

**IMAGE of ABUNDANCE**

"The products and models at the exposition are a distinct surprise to someone who works and travels in the Soviet Union... The Soviet exhibition strives for an image of abundance with an apartment that few Russians enjoy, with clothes and furs that are rarely seen on Moscow streets, and with endless variations of television, radio, and recording equipment, cameras and binoculars that are not easily obtained in such quality or range in Soviet stores... The men and women employed as guides have been hastily dressed in American suits and dresses... The restraint in showing toys and drugs and household goods reflects the low priorities assigned to such goods in the Soviet Union... The large, sleek Packard-like limousine Zil is produced exclusively for chauffeured government duty. The small Moskvich advertised as an 'economy' car would cost a Russian worker at least a year's wages and many years of patient waiting...

"The majority of Russian city folk must still live in communal apartments, four and more to a room, sharing bathroom and kitchen with two and more families. Few Russians enjoy built-in kitchen cabinets like those in the model apartment. A few similar sets caused a sensation in Moscow last year when imported from Finland. Shower curtains are hard to find. A visit to the Soviet Union exposes glaring paradoxes of ugly slums and palatial subways, muddy roads and huge jet planes. These contrasts are glossed over at the Coliseum."

**REAL FACTS ON OUTPUT**

To those who have followed factual studies of the Russian economy there should be nothing surprising...
in this report. In *Newsweek* of May 27, 1957, I discussed the careful study of Prof. G. Warren Nutter covering 37 leading industries, from which he concluded that “Soviet industry still seems to be roughly three and a half decades behind us in levels of output and about five and a half decades in levels of per capita output.” More recent studies have shown that in Russia there is one agricultural worker for every 10 sown acres as against one for every 60 sown acres in the U.S. Yet Russia produces only a third as much meat and half as much grain per capita as the U.S. The Russian occupies less than a fifth as much dwelling space as an American. Most families have only a single room in which all members sleep.

These facts reveal how ludicrous are the Russian claims that they are about to equal or surpass us in “peaceful production” or living standards for their people. In this respect they are still enormously behind not only the U.S. but nearly every country in Western Europe. But we should carefully distinguish between production for peace and production for war. In the latter Russia has made giant technological strides—precisely because she has put that goal first.

And in propaganda she is enormously our superior. She can put on an exhibition that gives false impressions of merit, whereas our own exhibition at Brussels exhibited and apologized for our slums, and the new one at Moscow will have a painting lampooning our generals.

**Why a Steel Strike?**

*July 27, 1959*

Whom does a steel strike hurt? It hurts, of course, the companies against which it is ostensibly directed. When forced to suspend operations, they must face losses instead of profits. And if they are forced to settle at higher labor costs, these must either squeeze or wipe out profit margins, or force the companies to charge higher prices for their steel. This, in turn (except as it may be offset by a new round of monetary inflation), must shrink markets and volume of sales.

A steel strike hurts the whole country. For the nation produces less steel, not only during but perhaps after the strike. It loses export markets, and even part of its domestic market, to foreign producers of steel. This slows down the long-term growth of a key defense industry.

A steel strike hurts workers in other industries. During the strike many of these workers are laid off, because of shortage of raw or semi-finished steel. If the strike is settled by an uneconomic wage rise, these other domestic industries suffer through an increase in their costs.

**THE 1956 RESULTS**

What, finally, of the steelworkers themselves? During the strike, they are hurt worst of all. Their wage income is totally cut off, and they do not know when it will resume again.

The results of the 1956 steel strike are instructive. Comparing what the steelworkers had won with what they had been offered without a strike, I pointed out in *Newsweek* of Aug. 13, 1956, that each worker had lost about $600 in wages as a result of an average of six weeks’ idleness; that even at the end of the three-year contract he won he could make up (assuming a 40-hour week) only $190 of this, leaving him still $410 worse off than if he had not struck. I added: “In the long run higher costs of production will . . . mean less employment of steel workers.” This is what happened. In May of 1956, 646,000 men were employed in the steel industry; the number fell to 500,000 in May of 1958. Though it increased in the first half of this year (mainly to fill orders in anticipation of a strike) the net loss to the whole body of steelworkers is clear.

Why, then, another steel strike?

Who wanted it, and why? One answer might be framed in terms of the psychology of a single man—David J. McDonald, the president of the steel union. He had made such sweeping demands that he could not back down without losing face.

**UNION IDEOLOGY**

But this view is too narrow. The psychology of McDonald must be viewed in a wider setting. Each union leader seeks to show that he can get more for his union, relatively or absolutely, than other leaders get for theirs. It has come to be the established expectation of each of the major unions that every year, and above all at every new contract, there must be a substantial increase in wage rates, beyond any rise in living costs no matter what level wage rates have already reached.

Hence the mere fact that steel wages in the last twenty years have increased both relatively and absolutely more than almost all other wages, and that they stood just before the strike at $3.10 an hour compared with an average of $2.23 an hour in all manufacturing industries, was considered no argument against a still further increase now. Nor was the fact that the American steel industry, on important items, was already being priced out of foreign markets.

For it is part of current union ideology that wages are not determined by marginal labor productivity but by tough “bargaining”; that increases are not the result...
of competitive demands of employers for workers but of strike threats. Another item in this ideology is that an increase of wages for one group of workers helps all other groups. This is the doctrine of labor “solidarity.” The truth is that any increase of wages for the workers in any line that goes beyond the point justified by marginal labor productivity is at the expense of the workers who must be laid off as well as of the living costs of all other workers.

And union ideology is reflected in our labor law, which confers exclusive bargaining powers, sanctions compulsory unionism, and tolerates mass picketing. So a word from the head of a single union can bring a national industry to a halt overnight.

On Not ‘Interfering’

August 3, 1959

President Eisenhower has said that he will not interfere in the steel strike at this stage. And certainly he has not interfered in the sense, for example, that Mr. Truman interfered when he seized the companies in 1952 and tried to impose big wage increases on them. Mr. Eisenhower is ostensibly following a “hands-off” policy, to permit “free voluntary collective bargaining.” Yet the Federal government has been in fact interfering, and interfering every day, on the side of the union leaders and of greatly increasing the effectiveness and coercive power of a strike. It is interfering through the Federal labor laws already on the books (with the help of lack of local law enforcement against union coercion and violence).

The Norris-LaGuardia Act, for example, in effect prevents employers or nonunion employees from going to the Federal courts for immediate relief from irreparable injury. Mass picketing is tolerated, and has proved in fact so intimidatory that the steel companies have not even attempted to carry on production in any of the six national steel strikes that have been called since the end of World War II. As one news item matter-of-factly put it a few days ago: “Any ‘back-to-work’ drive under company sponsorship would touch off picket-line violence of a type that has been unknown in the steel industry since the strikes of twenty years ago.” Even in the present strike, picket lines stranded an estimated 500 supervisors in three Jones & Laughlin plants. The stranded personnel was made up of a stand-by corps to prevent deterioration of equipment, maintain essential utilities, and keep a fire watch.

**COMPULSORY BARGAINING**

Government interference, in fact, began long before the strike. The phrase “free voluntary collective bargaining” has become a mockery. The employer’s “bargaining” is neither free nor voluntary. He is compelled by law to “recognize” and “bargain with” one specific union. No matter how unreasonable the demands of that union may be, he is forbidden to deal with anybody else with whom he might make a more acceptable voluntary agreement. This is a discrimination that the law does not make in favor of any other private group. It supplies corrupt or ruthless labor leaders with a weapon of extortion and shakedowns. Moreover, an officially “recognized” union, though it may originally have represented only 51 percent of a given group of employees, is legally granted exclusive bargaining rights for that group. This means that dissenting individuals or minority unions are denied the right of freely bargaining for themselves.

**ONE MAN’S POWER**

And so it comes about that one man, one private individual, has the power to bring practically the entire steel industry to a halt overnight. And other single individuals can bring the automobile industry, or the coal industry, or the aluminum industry, or the railroads, or the airlines to a halt. And then the country is helpless. There seems no way of ending the paralysis except by forcing the employers to give in, to grant the union demands, so that union leaders will permit us to start producing steel or aluminum or coal again. No way is even contemplated of resuming production without their consent.

The government’s impotence, of course, is of its own making. But what, meanwhile, does Congress do? It acts as if the whole situation did not exist. It is now tinkering with a labor bill that deals with none of the primary or central problems, but only with secondary and peripheral problems; and even for most of these it proposes the wrong remedies. Congress acts as if there were only one problem—the corruption of some labor-union bosses, or their excessive power over rank-and-file members. Any injustice or harm to nonunion employees, or to employers, or to the public is treated either as if it did not exist or as if it did not matter—as if nobody but union members had any rights that anyone was bound to respect.

This is the ideology behind present Federal law and its discussion. It forgets, finally, that industrywide unions cannot raise wages by coercive strikes except at the cost of bringing on either unemployment or additional inflation. The steel union did both by its strike in 1956.
Ordering Inflation
August 10, 1959

The Democratic majority in Congress has been playing transparent politics with the nation’s fiscal and monetary system. The effect of the policies it advocates would be to let loose a more dangerous inflation than any the country has yet experienced.

On June 8, the President requested Congress to eliminate the 4½ percent legal limit on rates the Treasury may pay on new issues of bonds with a maturity of more than five years. As a result of the rise in interest rates, the Treasury can no longer count on selling long-term bonds below this rate.

After pondering a full month, the House Ways and Means Committee, on July 8, instead of simply removing a legislative ceiling that should never have been there at all, gave the President, as a sort of favor, the right, for not more than two years, to disregard the interest-rate ceiling when he found higher rates necessary “in the national interest.” The obvious political intent of this was to try to make the President seem personally responsible for paying any higher rate that market conditions might make necessary. The Democrats went even farther. An amendment to the proposed authorization read:

DOUBLE-SPEAK
“...the Federal Reserve, while pursuing its primary mission of administering a sound monetary policy, should to the maximum extent consistent therewith utilize such means as will assist in the economical and efficient management of the public debt, and that the system, where practicable, should bring about needed future monetary expansion by purchases of U.S. securities of varying maturities.”

Here was a beautiful specimen of double-speak. The Federal Reserve System was to bring about more inflation by monetizing public debt, short-term or long-term, but to do this only to the "extent consistent" with "sound monetary policy." It was to give us inflation and sound money at the same time.

When the Federal Reserve and the Treasury objected to the inflationary implications of this, Sam Rayburn, Speaker of the House, angrily declared that the Federal Reserve authorities considered themselves "immune to any direction or suggestion by the Congress, let alone a simple expression of the sense of Congress."

There are several issues involved here. The first is whether the provisions of the measure approved by the House Ways and Means Committee are inflationary. To this there is only one answer: They certainly are. They would put pressure on the Treasury to continue with short-term rather than long-term financing. They would put pressure on the Federal Reserve to expand the currency by monetizing the debt. Both proposals, it is obvious, would be inflationary.

BAD REFUNDING

True, our debt management record since the end of World War II is not one of which successive Secretaries of the Treasury can feel very proud. At practically any time up to 1956 the Treasury could have funded the debt in long-term bonds at 3 percent or less. It kept failing to do so because short-term rates (largely as a result of inflationary Federal Reserve policies) were lower still, sometimes falling to 5/8 percent. The Treasury acted as if this situation would last forever. It kept missing opportunities because it assumed that short-term rates would stay low or that long-term rates would go lower. Now it must pay more than 4½ percent for long-term money. A few weeks ago it paid 4.7 percent for one-year money. But it must be said that the Treasury and Federal Reserve authorities acted through the post-war years with the inflationists in Congress constantly breathing down their necks.

A final question has to do with the independence of the Federal Reserve System. Certainly it should be free from direct political interference, dictation, or pressure. But a further question is whether any governmental administrative body, no matter how set up, can be granted wide discretionary power without excessive political pressure being put upon it to inflate. What is necessary is to reduce the range of administrative discretion, to move in the direction of fixed, almost “automatic,” rules. The most important step in that direction would be a return to the gold standard.

Nobody Wins a Strike
August 17, 1959

The losses suffered through a strike—by the companies, by consumers, by the country, by the strikers themselves—are obvious to nearly everyone. Why, then, are there strikes? Surely there must be a gain somewhere—that more than makes up for all the anxiety and hardships and losses suffered.

This at least is the assumption on which strikes are called. But it is amazing how seldom this assumption is subjected to statistical test; how seldom, either before, during, or after a strike, anybody bothers to draw up a profit-and-loss sheet. Yet in most cases this calculation would not be difficult. It is already clear,
Business Tides

580

of $219.67 per employee. Prior to the strike the companies had offered a 15-cent-an-hour increase if they were allowed to raise steel prices. The intervention of President Truman forced the companies to pay an 18½-cent increase, or 3½ cents an hour more, for a one-year contract. This meant that at the end of a full year’s work at a 40-hour week the steelworkers had earned back only $72.80 additional, and were still about $146 worse off than if they had not struck.

In the four major postwar steel strikes (excluding the twelve-hour strike of 1955) the total direct loss in wages to all the strikers, it can be calculated, came to more than $830 million, most of which was never recovered by the strike “gains.”

Nobody wins a prolonged strike. The strikers lose most of all, even when “victorious.” The union leader, of course, gets in the headlines. He strikes Napoleonic poses and displays his immense power. But if the union members kept a score card, it would considerably change their attitude toward melodramatic strike calls. Y

Real Labor Reform
August 24, 1959

None of the legislative proposals now being debated in Congress deal with the central labor problem today. That problem is symbolized by the present steel strike. Regardless of what comes out of the House and Senate, it will clarify our thinking to ask ourselves what real labor-reform legislation would seek to do.

In his broadcast to the nation of Aug. 6, the President made the remarkable statement that “The legislation we need has nothing to do with wages, or strikes.” But wages and strikes—the power of a single man to bring a nationwide industry to a halt unless his inflationary wage demands are granted—are precisely the main problems we need to deal with. The corruption of a few labor leaders is also a problem; but it is not the central one, and it would probably disappear if the main problem were courageously dealt with.

There is no doubt that the reforms the President asks for are needed. The question is whether they go far enough. For example, it is clear that a union official ought not to be allowed to put “a picket line outside the plant, to drive away customers, to cut off deliveries” in order to “force the employees into a union they do not want.” But should a union be allowed to use intimidating mass picketing to enforce any other demand, even a “legitimate” one? Does the end justify the means? Is not all coercive picketing “blackmail” picketing?
MASS PICKET LINES
Yet all major steel strikes have been enforced by mass picket lines. Because of this the companies have not dared to try to continue production in any of the major steel strikes since the end of World War II. Workers who would have found the terms offered by the companies acceptable have not dared to apply, or to continue work.

The overwhelming majority in Congress not only calmly accepts all this, but a group under the leadership of Senator Symington is pressing a resolution calling on the President to appoint a special fact-finding board to recommend settlement terms. This is, in effect, an attempt to do for David McDonald what he cannot do for himself, even with the one-sided advantage that existing labor law already gives him. These senators must know very well that their “fact-finding” board would not dare to bring in a recommendation for a settlement that would award no more than the companies have already offered. They know that McDonald would not accept such a settlement. What they are proposing, in effect, is compulsory arbitration that would force the companies to yield enough of the steel union’s demands so that McDonald would consent to let the country make steel again.

‘THE RIGHT TO WIN’
Yet, in a way, these senators are only taking the next step to which existing legislation and union ideology logically lead. If employers are to be legally compelled to “bargain with” a specified union, no matter how unreasonable its demands; if this union is legally assigned exclusive bargaining power for all employees in a unit, and not merely its own members; if this union is allowed to set up mass picket lines to prevent an employer from offering the jobs abandoned by the strikers to other workers, and to prevent other workers from applying for them; and if, even with the cards thus stacked against them, the employers do not yield to the strikers’ demands, then the only way to get the industry going again is for the government to interfere still further and order the employers to grant enough to satisfy the strikers.

Thus the right to strike has come to be interpreted as the right to win a strike. A built-in inflationary process is set up by which unions are to win new rounds of wage increases without end, while the monetary authorities are directed to insure full employment, at no matter what wage level, by offsetting excessive money wages with more inflation.

What is needed is not new legislation, which the union leaders can assail as a “legalistic strait jacket,” but primarily the repeal of special union immunities and privileges, above all of the privilege, not granted to any other group, of private coercion. Once that privilege were removed, the problem of labor racketeering would easily sink to manageable dimensions. ●

How the Spiral Spins
August 31, 1959

For years we have been talking about the inflationary wage-price spiral. But Washington (by which is meant both the majority in Congress and officials in the Administration) talks about it for the most part as if it were some dreadful visitation from without, some uncontrollable act of nature, rather than something brought about by its own policies.

Let us see just how those policies, over the last 25 years, have produced the wage-price spiral. First of all, under a series of laws beginning most notably with the Norris-LaGuardia Act of 1932, followed by the Wagner Act and by its later modification, the Taft-Hartley Act, we decided that labor troubles developed chiefly because there was not enough unionization and because unions were not strong enough.

Therefore, we in effect put the Federal government into the union-organizing business. We compelled employers to deal exclusively with the unions thus quasi-officially set up, regardless of how unreasonable the demands of these unions might turn out to be. Though illegalizing all efforts to deny employment to workers who joined unions, we explicitly legalized arrangements to deny employment to workers who did not join unions.

THE RIGHT TO COERC
But worst of all, we gave to the unions and union members a privilege not granted to any other associations or individuals—the power of private coercion and intimidation. By the Norris-LaGuardia Act we in effect prevented either employers or nonunion employees from going to the Federal courts for immediate relief from irreparable injury. We refuse, contrary to legal practice in every other field, to hold a union liable for the acts of its agents. We tolerate mass picketing, which is intimidating and coercive, preventing employers from offering to other workers the jobs abandoned by strikers, and preventing other workers from applying for such jobs. And then we are astonished and indignant when these special privileges, against which we provide no effective legal protection, are “abused.”

The inevitable result of these laws is that we have built up huge unions with the power to bring basic
national industries to a halt overnight. And when they have done this, we can think of no way of getting an industry started again except by giving in to the demands of the union leaders who have called the strike.

This accounts for the upward push on money wage-rates. But it does not account for the inflationary spiral. The effect of pushing wage-rates above the level of marginal labor productivity, taken by itself, would simply be to create unemployment. But as F.A. Hayek has put it: “Since it has become the generally accepted doctrine that it is the duty of the monetary authorities to provide enough credit to secure full employment, whatever the wage level, and this duty has in fact been imposed upon the monetary authorities by statute, the power of the unions to push up money wages cannot but lead to continuous, progressive inflation.”

NOT FACING THE ISSUE

Soon or late our Federal lawmakers and administrators must face up to the labor-union-boss dictatorship and the wage-price spiral that their own laws and actions have created. But they refuse to do this when each new crisis arises. When a nationwide steel strike is prolonged they become panicky. They seek to settle it by the only means that seem possible to them—by giving in once more to union demands, by granting still another wage increase and setting off a new upward wage-price spiral.

Senators demand that the President appoint a “fact-finding” board to “recommend,” i.e., to impose, in effect, compulsory arbitration that would compel the employers to grant another increase to employees who (at $3.10 an hour, compared with average factory earnings of $2.23 an hour) are already among the highest paid workers in the country.

Thus one government intervention begets a further government intervention. Because government has failed in its primary task—that of preventing private coercion—senators ask, in effect, for price and wage-fixing; and we are driven toward totalitarian controls.

Painting Ourselves In

September 7, 1959

The labor laws and administrative and court decisions of the last 27 years have finally produced a situation where there seems no way of settling a strike except by forcing employers to give in to each succeeding union demand for higher wages or fringe benefits.

One reason Presidents have been slow to resort to the injunction provisions of the Taft-Hartley Act is that they have recognized that such a step does not assure any solution. People do not cool off during the 80-day “cooling off” period. If negotiations got nowhere in all the weeks before the strike, there is little more reason to expect them to succeed during the 80 days. And union leaders, like David J. McDonald, have a plausible excuse for calling the forced return to work a “slave labor” device.

Recognition of the weaknesses of the “cooling off” period brings pressure for compulsory arbitration, under whatever thin disguise. One such disguise is government “fact-finding.” But the fact-finding report recently made public by Secretary Mitchell, though as full and impartial as could reasonably be desired, merely served to emphasize the truth of the President’s earlier remark that the “facts” in the steel strike were already pretty well known. Each party emphasizes the particular facts or interpretations that serve its case.

FACTS THAT STAND OUT

The facts most likely to impress the public are that hourly earnings of the steelworkers have increased 85 percent since January 1950, and were $3.10 an hour just before the strike compared with $2.23 in manufacturing as a whole. Any further increase in steel wages, even apart from its effect on steel prices, would be certain to provoke a new round of demands for wage increases by other workers determined to catch up.

Contrary to a widely held opinion, “fact-finding” does not unerringly indicate what the “right” settlement of a wage dispute should be. There is no scientific formula by which we can determine a “correct” price or a “just” wage. In a free economy, prices and wages are determined by supply and demand. Competition and comparative incentives determine particular wages, prices, and cost-price relationships. It is failure to recognize this that brings political pressures for compulsory arbitration. This would lead directly into government wage-and price-fixing, throw every wage and price into politics, and finally produce the suffocating controls of a totalitarian economy.

The injunction provisions of the Taft-Hartley Act were an attempt find a substitute for the rights taken away from employers and non-strikers by the Norris-LaGuardia Act of 1932. That act denies injunctive relief to persons suffering irreparable injury from unlawful conduct. By it the government has abandoned its first duty—that of preventing private coercion.

TOLERATING COERCION

That the performance of this duty would be the first step toward halting the wage spiral and solving the labor problem is beginning to be recognized. As Edward H.
Chamberlin, the Harvard economist, wrote in the June Atlantic Monthly:

“The threat of potential violence and intimidation through the device of the picket line are powerful factors—so powerful, in fact, that nowadays a firm rarely attempts any operations at all if a strike has been called, although it would be within its legal rights to do so. For all practical purposes the alternative of making a bargain with anyone other than the union has been removed. . . . Should a union be allowed to strangle a business economically by arranging with the teamsters to cut off its transportation? It seems to me we might as well ask if a physically strong customer in a retail shop should be allowed to twist the arm of a shopkeeper in order to drive a better bargain with him.”

The right to strike is too often interpreted as the right to win a strike. But if it is unthinkable that any strike should be broken, if no strike is to be lost, then every strike must be won. The tolerance of mass picketing gives enormous incentive to irresponsible strike-calling and to the wage-price spiral. Until our lawmakers face the implications of this, the labor problem will grow.

Shortcut to Inflation
September 14, 1959

If the Democrats in Congress object to being called the Party of Inflation, it is hard to understand why they do so many things to earn the title. Nothing so greatly increased the probability of more inflation as the action of the Democratic leadership in the House Ways and Means Committee in shelving the President’s request to remove the statutory 4¼ percent interest ceiling on government bonds running five years or longer.

The law that set this ceiling was passed more than 40 years ago, in 1918. It did no harm as long as it remained completely academic—that is, as long as the market rate for government bonds was well below the ceiling. But when the market rate the government must pay is higher than the ceiling, as now, any statutory limit becomes pernicious.

The President first requested Congress to remove the statutory 4¼ percent interest-rate limit on June 8. After a month, the House Ways and Means Committee replied with a transparently political solution giving the President the right, as a sort of personal favor, to disregard the interest-rate ceiling for a period of not more than two years if he found higher rates necessary “in the national interest.” Then, suddenly, the committee decided not to recommend even this.

HAND TO MOUTH
The practical effect is to prevent the government from offering any long-term bonds whatever, and to force it to do all its borrowing on a hand-to-mouth basis a few months at a time. If the result of such a restriction would be grave for any business concern or corporation, the evil is multiplied enormously when applied to the Federal government, compelled to manage a national debt of almost $290 billion, and forced to borrow $85 billion in the next twelve months simply to cover maturities, redemptions, and seasonal cash needs. The President’s second message of Aug. 25 clearly described the probable consequences of this:

“The vital interest of all Americans is at stake because excessive reliance on short-term financing can have grave consequences for the purchasing power of the dollar. The issuance of a large amount of short-term Treasury debt would have an effect not greatly different from the issuance of new money. Because these securities are soon to be paid off, their holders can treat them like ready cash. Moreover, short-term securities are more likely to become lodged in commercial banks. When a commercial bank acquires a million dollars of governmental securities, bank deposits rise by a million dollars. This is the same as a million-dollar increase in the money supply. When the money supply builds up too rapidly relative to production, inflation is the result. The piling up of an excessive amount of short-term debt poses a serious threat that may generate both the fear and the fact of future inflation at an unforeseeable time.”

FALSE ECONOMY
There are many congressmen who sincerely believe that they are “saving the government money” by forbidding the Secretary of the Treasury to offer long-term bonds at a rate to yield more than 4¼ percent. The irony is that their prohibition will have exactly the opposite of its intended effect. When the long-term market rate is higher than 4¼ percent, the Treasury is forced to do all its borrowing at short term. This concentrates the demand for funds on the short-term market, and forces up short-term rates.

Already, in recent weeks, the Treasury has had to pay 3.9 percent interest for 91-day borrowing, the highest since the dark days of March 1953. It has had to pay 4.5 percent interest for 182-day borrowing, the highest ever paid for this term. And it has had to pay 4.7 percent for one-year borrowing. The belief that short-term borrowing is always necessarily cheaper than long-term borrowing is a myth.
And the crowning irony is that it is precisely the cheap-money zealots who have brought on the inflation that has forced the government to pay double price for everything. They have finally created a situation that is forcing both more inflation and higher borrowing rates. For lenders seek to protect themselves against erosion of their dollar principal.

Oil Import Quotas
September 21, 1959

The action of the Eisenhower Administration, first in calling for voluntary” restrictions on oil imports, and finally, last March, in imposing mandatory import quotas, has been in need of a thorough, balanced analysis. This analysis is now supplied in a 70-age pamphlet by William H. Peterson, associate professor of economics at New York University, published by the American Enterprise association of Washington.

Dr. Peterson’s study fails to find any adequate cause to justify restriction of oil imports. On the contrary, he believes that the program must hurt our foreign relations, weaken national defense, deplete domestic oil reserves and undermine the vitality of the American oil industry. In addition, it is costly to U.S. consumers and establishes precedents for still further government interventions incompatible with a free economy. He recommends that the entire quota program be disestablished as promptly as possible.

SOME CONCLUSIONS
Here are some of his conclusions:

1—Our national defense does not depend solely on oil wells within our continental borders. Previous administrations encouraged American oil investments overseas precisely to strengthen national security. In both world wars imported oil, American- or foreign-owned, was essential to us. Our air, land, and sea bases, around the globe, depend on foreign oil.

2—American oil investments have raised living standards in many foreign countries. By importing their oil we gave convincing demonstration of the benefits of “trade—not aid.”

3—Our oil import quotas violate the policy of greater international trade and invite retaliation against American exports.

4—Long-range studies show that U.S. reserves of economical oil are wholly inadequate to meet national consumption. The U.S. consumes 54 percent of the free world’s current consumption, but has only 13 percent of the free world’s reserves.

5—From 1954 to 1958, U.S. demand for petroleum products rose by 15.5 percent. Domestic crude-oil reserves, despite unprecedented drilling and exploration, increased only 2.8 percent. “It would therefore hardly be in the national security interest to consume domestic crude reserves at the fastest possible rate and at the highest possible price.”

6—Competition from natural gas in recent years has had far greater adverse impact on the domestic crude-oil industry than have oil imports. Yet since natural-gas production is essentially a part of the domestic petroleum industry, governmental restrictions can hardly be applied.

7—Oil import restrictions force up the prices of fuel oil and gasoline, penalizing every American consumer. An unnecessary bureaucracy must be maintained.

8—Oil import quotas, whether on a historical basis or on a basis of refinery capacity, stifle competition and inevitably create inequities. It is impossible for bureaucrats to determine the “proper” level of imports or a non-“excessive” price for petroleum products. Such decisions will be influenced by political pressures from domestic oil and coal producers.

9—If restrictionism is still believed necessary to achieve national security aims (which Dr. Peterson does not concede) the fairest and least injurious way to restrict would be through tariffs, not through quotas.

NEW POWER SOURCES
I subscribe to all these conclusions, and would add only one. The way to provide for our long-term economic productivity and national defense needs is not to restrict imports of foreign oil, but to develop, through research, new sources of heat and power—solar energy, nuclear power plants, “fuel cells” producing electricity from chemical reaction, etc. Oil companies, in self-protection, might take the lead in such research.

Meanwhile, what seems called for is encouragement of oil imports rather than restriction. A barrel of crude imported means practically a barrel of crude left in the ground, whether proved or as yet undiscovered. After World War II, the Navy bought substantial amounts of Middle Eastern oil explicitly, in the words of Navy Under Secretary W. John Kenney, to “reduce the drain on our essential reserves at home.”

‘Managed’ England
September 28, 1959

LONDON—The coming election may be crucial for the British economy. If the Conservatives win, as they...
are widely expected to, the issue of nationalization will be dead; if the Laborites win, attempts at denationalization will be doomed—and it is by no means certain that further nationalization will be attempted.

But though England seems fed up with traditional socialism, both major parties accept the controls and other implications of the welfare state. Looking at the situation from the perspective of New York, it had seemed that with the imposition of a 7 percent Bank Rate in September 1957, followed last year by the convertibility of sterling and the active efforts toward a free-trade area, England was making rapid strides in the direction of a free economy. But action, it is now clear, was moving faster than ideology.

To see how much England is still ruled by a controlist philosophy, it is merely necessary to look at the Conservative Party’s manifesto. The party promises to “double the British standard of living in this generation”; to “rehouse at least another million people from the slums” by 1965; to “take no further action to decontrol rents” in the next Parliament; to provide a road program over the next five years “twice as big as over the last five years”; and to “remodel and strengthen our powers for coping with local unemployment.” This last policy could involve the most detailed government intervention, for example, by “offering capital grants to encourage the building of new factories where they are most needed, as an addition to subsidizing the rent of government-built factories.” One can imagine the political pressures and economic distortions arising from such a program.

MONEY AND CREDIT
Not less significant of the trend of British thinking is the recent Radcliffe Committee report. In May of 1957, the then Chancellor of the Exchequer, Peter Thorneycroft, appointed a committee, headed by Lord Radcliffe, “to inquire into the working of the monetary and credit system, and to make recommendations.” The report, consisting of 375 closely printed pages, was published on Aug. 19. It is based throughout on the assumption not only that managed money is here to stay, but that management of money is not enough. According to the committee, it is only part of a general economic policy which must have complex aims.

Further, not only does the committee fail to insist on the independence of the Bank of England in monetary policy, as we do on the independence of the Federal Reserve, but it declares, in effect, that monetary and credit policy decisions are and ought to be political. “In our view the true responsibility for decision [on the Bank Rate] lies today with the Chancellor of the Exchequer, not with the Bank; and it would be better that this should be made explicit.” Long experience not only in England, but in nearly every country in the modern world, shows that political control of money and credit policy leads either to continuous inflation, or at best to a bumpy economy of inflation followed by jolts of deflation or stabilization crises.

NATIONALITY OF GOLD
The committee’s report takes permanent monetary management for granted. It treats the old international gold standard as naïve and hopelessly outmoded. “Before 1914,” it says with a patronizing smile, “the maintenance of convertibility at a fixed gold value of the pound was sufficient definition of the duty of the Bank of England.” It now assumes that the economy has become too complicated for producers and consumers, but can be easily managed by bureaucrats who will know just what strings to pull and which buttons to press. It regards the national debt as “an integral part, even an indispensable part of the web of claims and counterclaims that gives strength to the structure of financial institutions”—a statement that moved George Schwartz of The London Sunday Times to give ironic thanks to Hitler. Finally, the report assumes that economic salvation is to be achieved through government manipulation of interest rates, without explicitly recognizing what this will do to inflate the money supply, what political pressures it will generate, and why it must eventually break down.

Art of Forecasting
October 5, 1959

Is “scientific” forecasting possible? Can we, by studying enough statistics, and inventing more ingenious statistical methods, tell just when business conditions are going to get better or worse, and by just how much? Is there, perhaps, some single indicator, if we could only find what it is, that would point the future course of the whole economy?

There are many professional forecasters who would like to give that impression—by the solemnity and confidence of their tone, if not by explicit assurance or the size of their fees. But a recent eighteen-page pamphlet by Henry M. Platt, Economic Indicators: Their Use in Business Forecasting, published by the Amos Tuck School of Business Administration at Dartmouth College, makes as lucid and intelligent an effort as one is likely to find to answer that question, and does not end with assurance.

Dr. Platt takes off from the work of the National Bureau of Economic Research, particularly in the
revised form adopted by Geoffrey H. Moore in 1950. Dr. Moore selected 21 business indicators, and divided them into eight indicators that ordinarily lead, eight that tend more or less to coincide with, and five that generally lag behind cyclical turning points.

THE 21 INDICATORS
The eight “leaders” are: Number of new incorporations, new orders for durable goods, industrial stock prices, wholesale prices of basic commodities, commercial and industrial construction contracts, residential construction contracts, the average work week in manufacturing, and business failures.

The “coinciding” indicators are: The Federal Reserve Board index of production, nonagricultural employment, unemployment, bank debits outside of New York City, freight-car loadings, wholesale prices (except of farm and food products), corporate profits, and the gross national product.

The “lagging” indicators are: Personal income, retail sales, consumer installment debt, bank rates on business loans, and inventories.

Now though these indicators were chosen empirically, Dr. Platt tries to show that there are good reasons for each of them to act or turn as it generally does in relation to general business activity. He begins by briefly describing what he calls the “self-generating cycle,” according to which a revival, once begun, tends to be cumulative, to reach a peak, then to break, and to turn into a cumulative downswing or recession, which in turn reaches a bottom and generates forces that bring about revival again.

Dr. Platt tries to show why, for example, the eight “leading” indicators tend to lead. The first six all represent or reflect investment commitments. Investment commitments are present actions based largely on plans or expectations for the future—that is to say, on “economic forecasts.” Similarly, he tries to show why the coinciding indicators coincide and why the lagging indicators lag.

THEY CAN’T PREDICT
But when he is all through, he is obliged to conclude that “Economic indicators cannot predict when a business turning point will occur.” Further they “can give no idea of how intense a revival or recession will be, or how long it will last, until it is well under way”—i.e., until it is too late.

Dr. Platt also gives some of the reasons for this disappointing conclusion. “Genuine reversals in some series usually cannot be confidently distinguished from random fluctuations until some time has elapsed.” “It takes time to gather and transmit the data that show an indicator’s curve has turned.” Though the “leading” indicators reflect business expectations, those expectations may themselves turn out to be wrong.

One can think of additional reasons. It is not merely that all statistics reflect merely past events; or that they can never adequately cover the infinite number of economic developments. But business is often tremendously affected by developments from outside the purely “business” world, from government interferences to revolutions and wars.

This does not mean that it is useless to study, refine, or follow business statistics. It does mean that business forecasting is not a science but an art, depending heavily on personal judgment, hunches—and luck.

Conservative Revival
October 12, 1959

Adam Smith’s Wealth of Nations, published in 1776, had tremendous influence on practical policy; but that influence did not reach its peak until 50 or 60 years later. Karl Marx’s Das Kapital, published in 1867, has also, alas, had tremendous influence—yet even that influence did not reach major importance until a half century after publication.

These examples illustrate the truth of Lord Keynes’s observation, in his General Theory, that “the ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the whole world is ruled by little else. . . . Not, indeed, immediately, but after a certain interval. . . . ”

Today conservatives and true liberals are entitled to take some comfort from this reflection. For though in practical politics, especially in America, the assumptions of statism, socialism, paternalism, and inflationism were never more prevalent, there are increasing signs in the academic and intellectual world of a turn in thought. If we confine our attention merely to what has happened so far in 1959, I do not think one could name a year in the last 30 in which so many consciously conservative books of high quality have appeared.

THE 1959 RECORD
Some of these have already been mentioned in this column. They include The Roots of Capitalism by John Chamberlain; Power Unlimited—The Corruption of Union Leadership by Sylvester Petro; The Public Stake in Union Power, a collection of sixteen lectures by leading economists, edited by Philip D. Bradley, and Protracted
Tradition

Though most of the books mentioned above are by East-West Crisis by William Henry Chamberlin; the other Conservative Conflict by Richard LaPiere, Subversion of American Character 1959 587 the Crossroads Chodorov; James Burnham's Congress and the American University.

SEMANTIC PROBLEM

have not had the opportunity to review or discuss. In Strausz-Hupe and associates. writes: "Conservatives should stand strongly for a gov-

ernment of limited and divided powers, kept in equi-

rium by a system of checks and balances." Yet this

was a central tenet of the liberalism of the eighteenth

and nineteenth centuries. Buckley brilliantly excoriates a philosophy he calls Liberalism, yet nearly all the doc-

trines he decries are the opposite of those of traditional liberalism. Notwithstanding the present confusing state of the vocabulary with which we are compelled to deal, a turn of thought away from paternalism, statism, and socialism, and toward conservatism and self-discipline is increasingly perceptible. ♠

Progress vs. ‘Plans’

October 19, 1959

When the present writer went to Europe in 1947, his chief impressions were those of bombed buildings, dis-

repair, half-empty shop windows, scarce, outmoded products, “austerity” programs, price controls, a chaos of inconvertible currencies, and dark, deserted streets at night. A month now in Europe, particularly if the stop-offs are few and somewhat haphazard—Oxford, London, Paris, Vienna, Athens, Delphi, and the Greek Islands—may not provide the most satisfactory basis for a representative economic comparison. But it does impress one anew with the enormous progress that Europe has made in the last dozen years.

Last year I wrote about the incredible amount of new building in Germany and Italy. This year I found the amount of new building around Vienna and in Greece hardly less incredible. In Greece new houses, apartments, hotels, roads are being constructed everywhere; half of Greece looks as if it had been built in the last six years. Vienna and Athens, no less than London, Paris, Frankfurt, and Rome, now have their neon lights and traffic jams.

EFFECT OF PEACE

What has led to this result has not been wise pub-

clic policies but principally peace. It is only four years since the Russians got out of Austria and nine since Greece has been free of war and civil war. The result is a seeming miracle. Once more we have an illustration of Macaulay’s thesis that: “No ordinary misfortune, no ordinary misgovernment, will do so much to make a nation wretched as the constant progress of physical knowledge and the constant effort of every man to better himself will do to make a nation prosperous.”

Where governments have followed free market pol-

icies, as in West Germany, progress has been far more striking. But there has been progress even in highly socialized economies. This was brought out in some of the papers presented at a conference which I attended at Oxford of the Mount Pèlerin Society, made up of economists from a score of different countries. Prof. Bruno Leoni, for example, of the University of Pavia described in detail the extent of government ownership or operation of Italian industry: Eighty percent of the production of cast iron, 45 percent of the production of steel, 80 percent of shipbuilding, 60 percent of natural gas, 99 percent of coal production, 30 percent of electrical energy—and practically 100 percent of the railroad system, the telephone service, and radio and television.
Is Bargaining Free?
October 26, 1959

Twenty-seven years of experience have demonstrated not that our federal labor law is “inadequate” to deal with strikes, but that it encourages and strengthens them. Eventual settlement of nationwide strikes has come not because of the Taft-Hartley Act, but usually in spite of it.

When the President, after holding off thirteen weeks, finally resorted to the emergency provisions of the Taft-Hartley Act, his action was widely criticized. David J. McDonald denounced “injection of Taft-Hartley into this situation” and forcing “free American steelworkers back into the mills.” He professed to favor leaving the decision to “free collective bargaining.” Senator Kennedy accused the Administration of trying to “break the strike.” He urged the “necessity of Congress’s rewriting the national emergency section of the Taft-Hartley law in order to prevent a repetition.”

Those who favor a free economy should sympathize with these objections. It is not desirable that men should be ordered back to work. But it is either uninformed or disingenuous to talk as if this were the first interference by the government in the steel strike. Existing Federal law heavily loads the dice in favor of union bosses and strikers. The Norris-La Guardia Act of 1932 enormously strengthens the power of strikes. It in effect deprives those who want to work of their right peaceably to continue in their jobs and the employer of his right to try to continue his business unmolested. For it denies injunctive relief to persons suffering irreparable injury from unlawful conduct.

COMMON-LAW RIGHTS
The emergency provisions of Taft-Hartley, giving the Federal government the right to seek injunctions, are a fumbling attempt to find a substitute for the common-law rights denied to private persons. But the Taft-Hartley attempt goes too far in the wrong direction and not far enough in the right one. It orders workers back to their jobs against their will—whereas the court injunctions formerly granted to private parties merely ordered strikers to desist from violence, mass-picketing, or vandalism—in short, merely to desist from clearly unlawful interferences with the rights of others. On the other hand, the Taft-Hartley provisions not only allow a strike to be resumed in 80 days, if no agreement is reached; but they also allow the strikers to resume mass-picketing and other forms of intimidation.

In directing his attention at last to the Taft-Hartley Act, Senator Kennedy now concedes by implication that neither the bill he sponsored nor the law he got deals with the central labor problem today. This is the power the law puts in the hands of a single union or a single labor leader to shut down a nationwide industry until his demands, no matter how unreasonable, are met.

NEED FOR REPEAL
The chief cure is not still further government interference in labor relations, as represented by the Landrum-Griffin law, but modification or repeal of existing legislation. What is most urgent is repeal of the pernicious Norris-LaGuardia Act. This alone might have permitted steel companies to continue operations. It would also be desirable either to repeal the Taft-Hartley-Wagner Act completely (a step which union spokesmen sometimes profess to favor) or to amend it drastically—by abolishing, e.g., the government grant...
of exclusive bargaining power to unions which represent a mere majority of employees.

McDonald still professes to favor “free collective bargaining.” But this phrase is a mockery when one party, the employer, is not at all legally free to choose the person or persons with whom he can bargain—to turn to B, say, when he cannot make an acceptable bargain with A. Moreover, what McDonald and others who use this cant phrase have been asking is that the President appoint a “fact-finding” board with power “to make recommendations.” If this is not asking for compulsory arbitration, it is at least trying to get a government board to force more concessions out of the companies than “free collective bargaining” has succeeded in doing.

Why not try restoring genuine freedom of bargaining, collective and individual, to employers and workers? 

It Hasn’t Been Tried
November 2, 1959

Will even the disaster of the 1959 steel strike cause us to ask ourselves whether practically the whole Federal labor legislation of the last 30 years has not been misconceived? Whether it has not gone in the wrong direction, toward one-sided and ever increasing government control? Whether it is not necessary to make an agonizing reappraisal of the whole New Deal approach, and retrace our steps toward freedom? Neither the history of the last dozen years, nor the tenor of current discussion, encourages affirmative answers.

Consider what has happened. The steelworkers, as a result of a smashing series of union victories, were, before the strike broke out, the highest paid major group of workers in the country. This means that they were the highest paid major group of workers in the history of the world. They were averaging $3.10 an hour compared with $2.23 for manufacturing industry as a whole.

David J. McDonald assumed that these smashing victories could go on forever. He ignored the height to which steel wages had already been boosted. He ignored the reduction of employment in the steel industry that had followed his 1956 victory. He ignored the competitive inroads that foreign steel was already making on the American industry’s market. He ignored the further inflationary pressure to which another substantial increase in steel wages was bound to lead. He made extravagant demands and recklessly called a strike.

LOST WAGES
But the longer the strike went on the more difficult it became for McDonald to agree to a compromise of any kind. Even if his full demands were now met it would take years for the steelworkers to earn back their losses from strike idleness—to bring them to where they would have been had they not struck at all. That is why McDonald had to reject every offer by the companies with increasing vehemence as “a mess of nothing,” “infamous demands,” “a black-snake whip on the backs of the workers.”

It is bad Federal laws, government intervention, increasing government controls, that have given this man and his union the power to bring a vital national industry to a halt. But as the paralysis was prolonged there was a rising demand from many politicians and press commentators not for a modification or repeal of these laws, but for still more government intervention and control. What they ask is compulsory arbitration, perhaps thinly disguised as “government machinery for fact-finding and recommendations.” Of course no government body can know what a “correct” wage is any more than it can know what a “correct” price is. Compulsory arbitration would carry us step by step into complete government wage and price control and toward an authoritarian economic system. And all decisions would be necessarily political.

COMPULSORY BARGAINING
As Mr. Eisenhower himself declared on May 5: “I deplore the possibility of putting the government into this field, either as party in negotiations, and certainly in establishing laws to fix the levels of profits and of wages and prices. Once we do that, I believe we have gone to a route that is going to hurt the American system as we know it, especially when we are going to do it in peace time.”

In finally seeking an injunction under the Taft-Hartley Act the President declared that “free collective bargaining has not worked in this dispute.” But free collective bargaining is precisely what was never tried. The essence of free collective bargaining is that neither party is under compulsion. Yet the steel companies are legally compelled to bargain solely with a specified industrywide union. The law gives exclusive bargaining power to that union. The law allows that union to set up mass picket lines which physically prevent the companies from trying to continue their business and individual workers from applying for employment and working peaceably at their jobs.
Why not try a courageous revision of existing law to restore free employee choice, to restore genuinely free, voluntary bargaining, collective or individual, on both sides? The President would be justified in calling a special session of Congress to do that in the 80-day injunction period.

The Real Reform
November 9, 1959

For more than a generation Federal law has assumed that the primary solution of the labor problem was to increase the workers' bargaining power. This took on the form, on the one hand, of putting special compulsions on the employer to "bargain collectively," and, on the other, of granting special privileges and immunities to the labor unions to organize, monopolize, strike, picket, boycott, and intimidate. This legislation notoriously failed of its declared purpose "to diminish the causes of labor disputes." After passage of the Wagner Act the number of strikes tripled.

The mild amendments in the Taft-Hartley Act did little to improve matters. Federal laws still encouraged strikes by making it virtually impossible for an employer to try peaceably to carry on his business with non-striking workers once a strike was called. But the urgent legal reforms have never been made. In quiet times, when there is no major strike, there seems to be no urgency and Congress does nothing. When there is a prolonged nationwide strike, it is "too late" for Congress to act. And most of those who do want to "do something" call for still further government intervention.

TWO PROPOSALS
Two proposals are now being widely put forward. The first is for compulsory arbitration, perhaps thinly disguised as government "fact-finding" and "recommendations." What the optimistic advocates of this fail to recognize is that it would lead us rapidly toward a controlled, authoritarian, economy. The first question is whether it could be enforced. Would an employer accept a wage decision that the thought was going to put him out of business? Would a union accept a decision that its members thought was going to make them worse off than other workers? Would unions and labor leaders generally accept a situation which would cause them to lose their very raison d'être?

Assuming that the government was sufficiently determined and ruthless in enforcing its decisions, its problems would mount. It would doubtless begin by assuming that it could decide each case "on its merits." How would it determine these "merits"? In 1952 automobile wages were higher than steel wages; today the situation is reversed. Which is "correct"? Suppose a government board awarded one union a 5 percent wage increase? Would not every major union immediately demand, or threaten to strike for, a similar increase? On what principle could it be denied? Would the government, in desperation, try to freeze all wages and prices where they were? Wouldn't this freeze all existing inequities? Would it not remove all the flexibility which allocates workers and production among thousands of different products to conform with daily changes in supply and demand, and reduce, distort, and disrupt production?

LIMITING UNION SIZE

The second major proposal is that industrywide unions be prohibited; that the size of the bargaining unit be limited by law—to, say, the workers in each individual firm. Here again the question arises whether this could be enforced, or even whether it would be desirable to try to enforce it. Should we limit the right of freedom of association? It would make sense, of course, to stop putting a legal compulsion on the employer to bargain with an industrywide union, or any unit larger than that consisting of his own employees. But this exemption would probably be meaningless as long as other coercive union privileges—including the exclusive-bargaining-power clause—remained in the law.

Why not simply remove any legal compulsion on the employer to bargain with a specific union? Why not make collective or individual bargaining genuinely free and voluntary on both sides?

Perhaps the best solution, if we were bold enough to consider it, would be to wipe most of the Federal labor legislation of recent years off the books, including the Norris-LaGuardia and Taft-Hartley-Wagner acts, get rid of labor boards, and substitute a simple provision, enforceable in the courts, that an employer substantially engaged in interstate commerce could not discriminate in hiring or firing either against union members or against non-union members.

Where We Are Now
November 16, 1959

On Oct. 19, the U.S. Development Loan Fund announced that in future its loans must normally be used to buy goods in the United States.
I must begin by admitting that I share some of the misgivings expressed by Senator Fulbright concerning the wisdom of this policy. On its face, it doesn’t look like a step toward freer multilateral world trade. It tends to defeat part of the ostensible purpose of the loans by obliging the borrowing nation to pay more for the goods it wants than it otherwise would. Under normal conditions the proceeds of dollar loans would have to be spent, anyhow, directly or indirectly, in this country.

FRUITS OF GIVEAWAY
But Senator Fulbright seems to live in an ivory tower that shuts off part of his view of actual conditions today. Among these are (1) a deficit of about $4 billion this year in our balance of payments; (2) a heavy gold outflow over the last two years which has brought our gold stocks to a nineteen year low; (3) a discount on the dollar in European exchanges; and (4) continuing foreign discriminations against American goods. As the President said at a press conference on Oct. 28, our aid policy has been “merely . . . increasing the gold reserves of somebody else while we have to make good the resulting balance of deficit in our own receipts from abroad. . . .”

The remedy, however, is not to tie our loans to a “Buy American” policy, but to halt our giveaway and most of our government-agency loans.

The Wall Street Journal succinctly recapitulated some of the facts in an editorial of Aug. 19:

“Once upon a time there was established the International Bank for Reconstruction and Development and the International Monetary Fund.

“This was during World War II and the idea, in case you have forgotten, was to provide a capital fund for economic development loans and for currency loans to the war-torn countries and the underdeveloped countries of the world.

“But this did not prove sufficient, and so we had the U.S. loan to Britain, and U.S. loans and grants under the Marshall Plan, and the U.S. loans and grants under the many names of what is now the International Cooperation Administration.

“But this was not sufficient, and so we increased the resources of the U.S. Export-Import Bank.

“But this was not sufficient, and so we set up the U.S. Development Loan Fund to make ‘easy’ loans repayable in local currencies.

“But this was not sufficient, and so the World Bank was broadened to include an International Finance Corp. to invest in special enterprises in underdeveloped countries.

“But this was not sufficient, and so we are now organizing a Latin American Bank and we have proposed a similar Middle Eastern Fund.

“But this was not sufficient, and so this week the U.S. launched a campaign to establish a $1 billion world agency to be called the International Development Association. It will be used to spur economic development in underdeveloped countries on easier terms than those poor countries can get from the World Bank, the Monetary Fund, the Export-Import Bank, the U.S. Development Loan Fund, the Latin American Bank or the Middle Eastern Fund or the International Finance Corp. or from the International Cooperation Administration. . . .”

$69 BILLION
If, now, we tabulate, we find (see A. Wilfred May in The Commercial and Financial Chronicle of Oct. 29) that our postwar overall foreign aid to date totals approximately $57 billion in net grants and $12 billion in net credits. This brings the grand total to $69 billion.

The present $4 billion deficit in our balance of payments can be wholly accounted for by our foreign-aid outflow at an annual rate of $4.4 billion. Therefore the first remedy, as I have already said, is to start drastically tapering off our foreign-aid program, which rests chiefly on dubious socialistic assumptions.

Our global spenders have yet to learn that the most important contribution we can make to international economic stability and growth is to keep our own economy strong and solvent, and to put the integrity of the dollar beyond question.

Revise Our Labor Law
November 23, 1959

There are the strongest reasons why the President should immediately call a special session of Congress to deal with the labor crisis.

“If the [steel] strike is resumed at the end of 80 days,” Secretary Mitchell has declared, “the Administration will have recommendations to Congress as to what to do to settle the strike.” But this is to imply that the President will take no action until more damage has been done, until still more unemployment has been suffered, until there is once again paralysis in industry.

Even if the steel strike is miraculously settled before these words appear, the nation still faces the prospect of resumption of the East Coast longshoremen’s strike, the possibility of a nationwide railroad strike, and the probability of an outbreak of a new nationwide wave of strikes if the steel wage settlement is after all inflationary. If, however, the President utilizes the period of grace allowed by the 80-day injunction, he may not
only forestall future paralysis but encourage a quicker settlement of the steel strike itself.

**COERCIVE PICKETING**

To find the right solution we must first of all recognize the coercion that made the 116-day strike possible. Most press and Washington comments, as well as court decisions, have been curiously oblivious of this coercion. When the strike was called, not a single plant against which it was called tried to continue producing steel. Not a single plant dared to try. If it had tried, any former striker or other worker who had applied for work (on the calculation that $127 a week, say, was at least acceptable until something better turned up) would have been lucky to escape intact. For the union threw picket lines around the plants, and their purpose was to intimidate and coerce. As one reporter put it at the beginning of the strike: “Any ‘back-to-work’ drive under company sponsorship would touch off picket-line violence of a type unknown in the steel industry since the strikes of twenty years ago.”

One looks in vain, either in the Supreme Court decision, or in the lengthy dissent of Justice Douglas, for any acknowledgment that this coercion exists. The Justice decries against injunctions that, “force men back to work” and “bludgeon all workers.” He praises the enactment of the Norris-La Guardia Act as ending the “easy” and “abusive” use of the injunction in labor disputes. He implies (resurrecting a hoary myth) that such injunctions were typically used to force men to work against their will, when they were in fact used to order strikers to desist from intimidatory picketing, violence, or irreparable injury.

**LICENSE TO INTIMIDATE**

The fact is that today unions are in effect licensed to intimidate and coerce anyone who tries to oppose a strike. What they claim is not merely the right to quit their jobs but to prevent others from taking the jobs they have vacated. They have become in effect agencies entitled to use intimidation or violence to enforce their ends. That is why and how they can choke off at will the nation’s supply of steel or of almost anything else.

The first and most important labor reform is to restore the rule of law. Employers who wish peaceably to continue their business, workers (including former strikers) who wish peaceably to apply for the jobs that have been vacated, are entitled to adequate local police protection of life, person, or property. And in order that they may get it, the first thing that must be done is to repeal the Federal legislation that stands in the way—including the Norris-La Guardia Act and either the whole of the Taft-Hartley Act or any provision in it that abridges or clouds the employer’s or the individual worker’s right to freedom of bargaining.

Such a proposal is not “anti-labor” but pro-labor. It is the self-declared champions of labor who advocate or defend laws that bring about industrial paralysis, and then hysterically seek to cure the paralysis by proposals for compulsory arbitration, by Federal seizure (Harry Truman and Senators Morse and Kennedy), or by drafting the strikers into the Army (President Truman). Not until private coercion is prevented can personal liberty be secure.

**Farm Surplus Solution**

November 30, 1959

In *Newsweek* of Dec. 19, 1955, encouraged by an open invitation from Secretary Benson, this department proposed a simple two-point farm program. In a book just published, *The Great Farm Problem* (Regnery. $5), Prof. William H. Peterson of New York University refers to this proposal sympathetically. But as it was not adopted, and as, in consequence, the farm surplus crisis has grown much worse, I venture to repeat my proposal with some additional details.

The first point may sound less startlingly novel than it did four years ago. This is that Congress stop all price guarantees and all promises of support-buying of any kind on any crop not yet planted.

At one stroke this would stop any further accumulation of farm surpluses. These “surpluses” are created by price supports, and by nothing else. When any product whatever is priced above the real market, there is bound to be an unsold surplus. The test of a free market price is precisely that it “clears the market.”

A score of other problems would also be solved by ending price supports. Farmers would cease to be encouraged to overplant, overfertilize, overproduce. Marginal farmers would be forced to turn to occupations where they would be more productive. All need for government acreage controls or marketing quotas, with their huge attendant bureaucracy, would end. We would cease to impair our foreign economic relations.

**SELL AT A BARGAIN**

The one problem that this would not solve is the huge farm surpluses in which the government has already invested $9 billion. This brings us to the second point of my program. The government should sell its existing surpluses back to the farmers themselves.
Each farmer would be allowed to buy, say, an amount proportionate to that of his own relative production of a surplus commodity in preceding years. To assure sale, the government would set a price both below the existing free world price and below the average farm-cost of production. Each farmer would be free to dispose of what he bought as he saw fit. He could immediately sell through the speculative markets, or store at his own expense. The difference between what he paid and what he could sell for would assure him a profit—roughly equal, say, to what he would have made by planting a new crop. His ability to buy the commodity at less than his cost of production would discourage him from planting a new crop and adding to the surplus again.

NO DOWN PAYMENT
The plan could be set up so that the purchasing farmer would not even need cash. The government could give him a negotiable certificate, say, entitling either him or the bearer to buy his allotted quota at the specified price. Suppose the world price of wheat was $1.50, and Farmer Jones was allotted a certificate entitling him to buy from the government 10,000 bushels at $1 a bushel. Jones could simply sell this “right” on the market for, say, $5,000.

It is true that this solution would not instantly bring economic paradise. Individual farmers would for a year or two be paid, in effect, for not raising crops in which surpluses existed. Fertilizer and farm-machinery interests might be temporarily hurt. Some farm labor would have to spend a year or two doing something else. The government would take a big loss (on paper) in selling the surpluses back to the farmers. But most of this loss is inevitable anyway. At least the government would get back, instead of paying out, billions in real cash. If such a proposal had been adopted four or five years ago, some $20 billion might have been saved.

The farm surplus crisis has reached a point where no timid compromise program can avert collapse. Secretary Benson’s new proposal for support payments based on average market prices in the preceding three years is of course not as preposterous as the present “parity” formula based on the years 1910–14. But any support price whatever above the market must simply pile up new surpluses. The government already has $9 billion tied up in surpluses, including a two and a half year supply of wheat. It is costing $1.5 million a day just to store the stuff. How insane can our policy get?

Men, Cars, Cities
December 7, 1959

In New York, already overcrowded, already jammed with traffic that crawls along fitfully or grinds to a halt, 20-, 30-, 40-, and 50-story apartment or office buildings continue to go up at record rates. One of them alone could house the population of an entire town. The problem of getting in and out of them, of moving from one to the other, by foot or car, threatens to become insoluble.

Even if we were to take drastic steps right now to solve the problem, we could not prevent it from growing. Suppose we immediately imposed a height limitation on all future buildings of twelve stories, or some equivalent limitation on cubic footage. The mere building of new structures up to that height or volume, on sites that now have less, could enormously increase crowding. Yet even this much restriction is nowhere seriously suggested. And if it were, it would probably meet the strongest opposition on the double ground (1) that it would be discriminatory against sites on which present buildings were lower, rather than already higher, than the new height limitation, and (2) that it is an abridgment of private property rights to prescribe any maximum building height or limitation whatever.

‘EKISTICS’
This column would be the last, as its readers know, to accept lightly any discriminatory treatment or infringement of property rights. But here is a clear case where each must accept some restraint for the good of all. It may hurt a specific property value in New York to impose a stricter building limitation on it; but it will soon hurt all property values in New York unless stricter building limitations are imposed.

No new principle is involved here. Everyone accepts the necessity of condemnation proceedings to put through a necessary street or road, or to widen an existing one. Everyone accepts sensible building laws against sanitary hazards or hazards of collapse or fire. Nearly all cities, including New York, have some limitations on height or building-area to insure a minimum of light and air and movement. The real question is whether present limitations are adequate or look forward far enough into the future. This problem faces every large city in the world.

In Greece, a month or two ago, I met an extraordinary man, Dr. Constantinos Doxiadis, and talked with him, in an office with a magnificent view of Athens and the Acropolis, in his new building and school. Doxiadis is an architect, engineer, city planner, and more. He is trying to found a new science—Ekistics, “the science
of human settlements”—which would draw upon all these disciplines. He has been called in as consultant or planner by Washington and Philadelphia, by Pakistan and Iraq.

‘SECTORS’
Perhaps some of Doxiadis’s premises go too far in the direction of central planning. But he seems to have recognized, better than anyone else with whose work I am acquainted, the nature and dimensions, economic, technical, and esthetic, of the modern-city problem. These new dimensions have been brought about by the unprecedented increase in world population, the propensity of people to crowd into cities, and the multiplication of automobiles.

Where once our cities were inhabited by men, they are now inhabited by men and machines. Man, Doxiadis points out, has now been displaced as the dominant element by the motor car. Our city plans, once three-dimensional, must now take account of a fourth dimension—time. This is the time wasted or saved in commuting to work or getting from one part of town to another.

The basic element of the city of the future, according to Doxiadis, will be the community neighborhood or “sector.” The size of the sector will be determined by reasonable walking distances. Outside and around the sector cars will be able to move at high speeds. They may enter it at controlled speeds to come to parking lots, dead-end streets, or areas where children play, wives shop, and pedestrians can walk with pleasure and safety. Such sectors can be planned with a fair distribution among property owners of costs and advantages. Cities, after all, are made for man, not man for cities.

The Problems We Face
December 14, 1959

All of us must constantly act on some assumptions regarding the future. But if we are wise enough to recognize that we are merely guessing, we will always be ready to revise our assumptions. Economic forecasting can never be a science. Every forecast depends upon a thousand ifs. The Secretary of Labor, for example, ought to be in a specially favored position to guess how much unemployment there is going to be six months ahead; but because he was too cocksure in April he found himself eating his hat (or a specially baked simulacrum thereof) on the steps of the Labor Department, in November.

Today we make a fetish of “economic growth.” We have already had all sorts of predictions concerning our economic growth in the next ten years. Such predictions can obviously be no better than the assumptions on which they rest. If we project the average percentage “rate of growth” over the Fifties into the Sixties, or if we extrapolate the growth curve, we will get one result. (Or several. One trouble is that our pundits cannot even agree concerning the growth rate of the past—partly because of disputes concerning statistical reliability or method, partly because of disputes concerning what year to start from as a base for calculation.)

GROWTH NOT AUTOMATIC
If we are optimistic we will project a much higher growth rate for the Sixties than in the Fifties. If we are “research foundations” we will point out, with an air of discovery, that an annual growth rate of 4 percent leads to a higher national income at the end of ten years than one of only 3 percent, and one of 5 percent to even more than one of 4 percent. And if we are politicians, we will demand a higher “growth rate”—5 percent, 6 percent, or even more.

But one thing is clear. No rate of growth will take place in the Sixties automatically, regardless of what anyone does. Our economic growth (or shrinkage) will depend on the policies we follow. And the policies best calculated to increase production and living standards are those that encourage the greatest saving and investment, the maximum capital accumulation, the largest addition to and improvement of the tools and equipment that bring the highest increase in the productivity of labor. These are not, unfortunately, the policies favored by those who harp most on “rates of economic growth.” What they propose, rather, are increased government spending, continued deficits, continued inflation, and still more government “planning” and controls.

TO HALT INFLATION
We should look forward to the Sixties, then, not as an era of automatic growth, but as a challenge, as a set of problems to be solved. And the chief domestic problem we have to solve is how to halt the inflation we have experienced over the last 26 years.

The measures necessary to halt that inflation would also solve other major problems. We would have to balance the budget—by reducing both expenditures and burdensome taxes, but reducing expenditures more. We would have to stop subsidizing unsalable farm surpluses at home and socialism abroad. We would have to stop government cheap-money policies, and the continuous expansion of our money supply, and return to the full gold standard. This would also solve the problem of our “deficit in balance of payments.”
The astonishing thing about this proposal is that it is not made by an irresponsible inflationist but by a highly reputable banker and economist who deplores inflation. Its ostensible purpose is to strengthen our present for-foreigners-only gold standard. That it would achieve this declared purpose is improbable. Such an announcement would more likely be interpreted as dropping the last vestige of a domestic gold standard.

What, after all, was the purpose of a legal gold reserve? It was to ensure convertibility at all times of bank notes and deposits into gold. The chief purpose of this, in turn, was to prevent an undue or unsound expansion of credit and currency. The reserve ratio was a sort of thermometer; it was constantly watched, both at home and abroad. When credit expansion or a gold drain brought the reserve ratio dangerously low, the monetary authorities had to raise interest rates and halt further credit expansion to prevent a further gold drain. Reierson’s proposal would destroy the thermometer, smash the pressure gauge, remove the warning signs and traffic signals.

TO RESTORE CONFIDENCE
Consider the history. In 1933 and 1934 we abandoned a real gold standard, devalued the dollar to 1/35 of an ounce, put even this on a “24-hour basis,” and allowed only foreign central banks, not American citizens, to demand gold. In 1945, Congress, at the request of the Federal Reserve, reduced the legal requirement of a 40 percent gold certificate reserve against Federal Reserve notes and 35 percent against deposits to a uniform requirement of only 25 percent. At the end of 1944 total deposits and currency amounted to $151 billion; today they exceed $248 billion. The increase of 64 percent in the total money supply is enough to account for the increase of 64 percent in consumer prices in the same period.

Reierson thinks that: “In the future, as in the past, we shall have to depend upon the integrity and good judgment of the Federal Reserve officials to establish a credit policy appropriate to conditions in the United States economy.” I submit that we need something much more solid to depend on than the arbitrary discretion or caprice of present or future monetary managers.

The immediate need is to halt the inflation, and to restore confidence in the dollar at home as well as abroad. To prevent resumption of inflation, we must ultimately restore the discipline of a full gold standard. Meanwhile our measures should move toward that goal and not remove the last hopes for its attainment.
Wages by Edict?
December 28, 1959

On Dec. 11, the governor of Minnesota threw a brilliant light on the one-sidedness of labor law and law enforcement in this country.

The old labor contract between Wilson & Co. and the United Packinghouse Workers of America expired on Aug. 31. Work continued on a day-to-day basis. On Oct. 29, the company broke off negotiations until “binding assurances be given us that the lawless acts started last May and continuing through the sitdown strikes of the week of Oct. 26 will not be repeated.” On Nov. 3, the union’s workers struck. After a few weeks the company warned them to return to their jobs or be replaced. On Nov. 30, the company tried to continue operating with nonunion labor. Hundreds of pickets surrounded the plant and resorted to violence, overturning and stoning cars of nonunion workers.

Then Governor Freeman called out the National Guard, who used fixed bayonets to restore order. But not order that permitted the company peaceably to operate its plant or the nonunion workers peaceably to process meat. The National Guard shut down the plant. Production workers hired to replace strikers were turned back at the gate. All court orders pertaining to the dispute, including one to limit pickets, were suspended.

SOLDIERS AS PICKETS
Under the guise of maintaining peace and order, in other words, Governor Freeman called out the military not to permit peaceable production but to stop it; not to maintain the right to work but to deny it. He subverted the rule of law and turned the National Guard into an instrument for enforcing the aims and policies of the union.

The governor’s highhanded action merely carried one step farther the legal premises on which our national labor legislation and our local enforcement (or non-enforcement) have rested for the last quarter-century. Unions today are tacitly granted the right not only to strike, but to prevent others from taking the jobs they have vacated. Thanks to mass picketing, with its latent threat of violence, no struck steel plant has attempted to continue production with nonstrikers.

And our statesmen have remained willfully blind to this situation.

But now even “liberal” politicians have suddenly come to see that the labor legislation they did so much to fasten on the country leads to industrial paralysis. In panic, they seek to cure this paralysis by still more government intervention. Governor Rockefeller has come out in favor of compulsory arbitration of labor disputes, and Adlai Stevenson in favor of compulsory arbitration and even seizure of plants.

‘THE END OF AN ERA’

True, Rockefeller opposes “any legislation setting up compulsory arbitration as an automatic and generally accepted remedy for industrial disputes, for it negates the concept of collective bargaining . . . and our economy would tend to be regulated by fiat. But the present situation points up the need for an exception.” What this overlooks is that once a union were led to think it could get more by forcing compulsory arbitration through a sufficiently prolonged nationwide strike, the “exceptions” would become the rule.

McDonald is angling for government arbitration today precisely to get himself off the hook. He knows that no politically appointed board would dare to award him less than the company offer he has rejected. He also knows the history of the Railway Labor Act—how the rail unions have not hesitated to reject the awards of Presidential “fact-finding” boards that they did not wholly like (e.g., 1941), and forced boards to bring in new awards more acceptable to them. Rockefeller and Stevenson talk like men ignorant of this history.

Stevenson now declares that “we cannot tolerate shutdowns which threaten our national safety.” He thinks “the steel strike has dramatized the fact that we are at the end of an era.” But the era which has ended, let us hope, is that in which government has not only tolerated but built up the irresponsible private power of nationwide unions to use mass picketing and the threat of violence to prevent employers who refuse to meet their terms from continuing production peaceably with other workers.
Wage-Price Go-Round
January 4, 1960

Reluctant as this column is to engage in prophecy, it is not taking much risk in predicting that when a settlement of the steel strike does come, it will be inflationary.

Even before the strike began the steelworkers were the highest-paid major group of workers in industry, receiving an average of $3.10 an hour compared with average factory earnings of $2.23. The companies have already offered a three-year contract which they estimate will bring the steelworkers an additional increase of 33 cents an hour over the full period; even the union, which turned down the offer, concedes that it meant at least a 24-cent increase. The final settlement will surely not be lower.

But this means an inflationary increase. Because the steelworkers are already far ahead of the procession, the new gain is certain to let loose a tremendous wave of demands for another round of wage increases.

All this does not necessarily mean that the company managements were foolish to put up a fight. They had every reason to think, at the beginning, that their resistance would have the support of public opinion and of the Administration. They were not merely encouraged, but practically enjoined, not to make an “inflationary” wage settlement. They knew what the opposition would be to another price increase. They knew they would lose further markets to foreign producers.

‘NEUTRAL’ GOVERNMENT
As the strike dragged on, the government remained ostensibly “neutral.” It refused to “interfere.” Certainly it did not, as under Mr. Truman, interfere directly on the side of the strikers. But Mr. Eisenhower began to declare that he was losing patience; he rebuked both sides for not coming to an agreement. As he did this even after the companies had made an inflationary offer, the only logical conclusion was that he expected them to make a still more inflationary offer, if necessary, to persuade McDonald to accept; otherwise he would have expressed his displeasure with the union alone.

And all the time he, his officials, and Congress utterly ignored the fact that the Federal government had been tipping the scales in favor of the strikers from the beginning, through the operation of existing laws. The Taft-Hartley-Wagner Act set up the machinery under which the steelworkers’ union was created, and under which it became the official exclusive bargaining agency for the employees. It set up the requirement that the employers must continue to “bargain” with McDonald no matter how unreasonable his demands or his attitude. It made it in effect impossible for the companies to treat the strikers as having quit their jobs and peaceably to hire other workers to take their place, either on the old terms and conditions or on new ones. And the Norris-LaGuardia Act, plus the absence of local law enforcement, removed from the companies protection against the intimidation of mass picketing and the threat of violence.

IN SPITE OF THEM
Without this intervention by the Federal government (an intervention built in for a quarter-century) it is highly improbable that there would have been a 116-day steel strike for such extravagant demands, or even an industrywide steel union powerful enough to choke off the nation’s steel supply at will.

All this is ignored by the Stevensons and Rockefellers who now call for compulsory arbitration. What they are in effect proposing is that if the unions cannot get what they want even with the legislative scales heavily tipped in their favor, a government body should step in and order the employers to pay more. Theoretically, of course, the workers could be ordered to resume work for less than they could obtain from a continued refusal to work (which would be a violation of their basic liberties), but as the proposal comes from the professional “friends” of labor, it is obvious that they do not seriously expect this result. They merely expect additional pressure on the employer.

So we seem to be in for another round of inflation. But Administration officials and congressmen will all talk as if this had nothing to do with the policies they pursued or advocated, but had come about in spite of everything they had done to stop it. ❄️

Halt Inflation Now
January 11, 1960

Three weeks ago I discussed here the proposal of Roy L. Reierson of the Bankers Trust Co. of New York that we eliminate the present 25 percent gold-reserve requirement against Federal Reserve notes and deposits. Because of limitations of space, I could not do full justice to that proposal. I believe Reierson’s solution is wrong. But he has had the clear-sightedness and courage to call attention to the problem.

The problem, to restate it, is this. Though our gold reserve still stands at about $19.5 billion, more than half of this must be held as a reserve against Federal Reserve notes and deposits. Because of limitations of space, I could not do full justice to that proposal. I believe Reierson’s solution is wrong. But he has had the clear-sightedness and courage to call attention to the problem.

The problem, to restate it, is this. Though our gold reserve still stands at about $19.5 billion, more than half of this must be held as a reserve against Federal Reserve notes and deposits. Because of limitations of space, I could not do full justice to that proposal. I believe Reierson’s solution is wrong. But he has had the clear-sightedness and courage to call attention to the problem.
of “free” gold against some $19 billion short-term dollar balances held by foreigners (including $3 billion held by international institutions).

Foreigners, says Reierson, measure our gold losses not against our total stock of gold but against our very much smaller amount of free gold. This may lead to fears that, if this “free gold” is exhausted, we will be compelled to stop making gold available for international settlement, and thus devalue. His suggested remedy is that we either reduce or eliminate our present 25 percent gold-reserve requirement entirely, to assure foreigners that the whole amount would be available to them.

NO SOLUTION
I do not think this step would provide any real solution. It would drop the last vestige of a domestic gold standard. It would keep the dollar temporarily good for foreigners at the cost of undermining permanently its value for Americans. If foreigners withdrew all their present short-term balances in gold, it would leave Americans with no gold backing for their dollars at all. The proposal turns the perfectly sound principle that gold convertibility ought not to discriminate against foreigners into the untenable proposition that it ought to discriminate against Americans.

And even so it would give only temporary assurance to foreigners unless accompanied by unmistakable evidence of the determination on the part of our government to halt our inflation immediately. With the gold-reserve requirement entirely removed, this assurance would have to take the form of an act of Congress, forbidding any further increase in the supply of money and bank credit. This in turn could only be achieved by not allowing any bank to increase the total of its loans and investments—which means that it could not make any new loan until an equivalent old loan had been repaid.

In the present inflationary mood of Washington, such a proposal would be dismissed as unthinkable.

STRINGENCY NEEDED
But no solution of the problem is possible unless the inflation is halted, by whatever means. Instead of eliminating the gold-reserve requirement entirely, it ought to be restored immediately to the pre-1945 level of 35 to 40 percent—preferably to a flat 40 percent against both notes and deposits. But as the reserve has already been allowed to fall to this level, this too would mean that no further increase could be allowed in money and bank credit until our gold holdings themselves increased.

Even if we hope to remain merely on our present for-foreigners-only gold standard, we must continue to let gold, if demanded, flow out. On this point Reierson is right. But if we hope to keep our foreign creditors from demanding gold, if we mean to protect the integrity of the dollar, if we intend to prevent devaluation, we must stop the further expansion of money and bank credit by one method or another.

If this takes the form of “orthodox” measures, those orthodox measures must be stringent. The budget must be immediately balanced. (Renewed promises of a balance in the sweet by-and-by are no longer enough.) Congress must repeal the legislative ceiling of 4½ percent on long-term government bonds. Interest rates must be raised to the point where they cease to encourage further expansion of credit.

The future of the dollar depends on whether we have the stomach for such decisions.

Inflation Wins Again
January 18, 1960

As this department two weeks ago predicted, and as it took no great clairvoyance to predict, the steel strike has finally been settled by a grossly inflationary wage increase. Continuing its mood of crystal-gazing, this department predicts that the victory for the steel union will let loose a tremendous wave of demands for another round of wage increases throughout industry; that employers for the most part will be compelled to yield to these demands; that the Federal Reserve authorities will be pressured into further expansion of money and credit to make the wage increases supportable, and that neither the Administration nor Congress will do anything in the slightest degree effective to halt the consequent inflation.

Never has this department more ardently wished that its predictions would turn out to be laughably wrong. But let us look at the facts.

If there was any will to resist inflation, the steel strike was the ideal test case. Steel wages even before the strike averaged $3.10 an hour. This was already 87 cents an hour higher than the average wage paid in manufacturing. It was already the highest wage paid to any major group in manufacturing. There was no question of “catching up with the procession.” The steelworkers were already way ahead of the procession.

CARDS WERE STACKED
These were among the reasons, in addition to loss of markets to foreign competitors, that led the steel companies to resist a further substantial wage increase. In addition, they were under ostensible pressure from the
Administration not to grant an “inflationary” wage increase.

But as the strike wore on, it became more and more evident that the companies were engaged in a losing battle. Ostensibly, the government was “neutral”; it refused to “interfere”; it kept “hands off”; it left everything to “free collective bargaining.” But all the time, it was in fact interfering, through the operation of the Norris-LaGuardia and Wagner-Taft-Hartley acts, on the side of the strikers. All the time the union maintained intimidatory picket lines, the constant threat of violence, in case any company should try to resume production and to hire other workers. And all the time the Administration and Congress remained completely oblivious of this situation, and talked as if bargaining were really free on both sides.

It is true that Mr. Eisenhower finally resorted to the strike-injunction provisions of the Taft-Hartley Act, but both before and after he had done so he declared that he was losing patience, and rebuked both sides for not coming to an agreement. As he did this even after the companies had made an inflationary offer, they could only conclude that he expected them to make a still more inflationary offer to buy a settlement. Otherwise they faced a resumption of the strike, with threats in the background of compulsory arbitration or even seizure.

**TOUGH NEXT TIME**

The companies will now no doubt be roundly abused by some for having uselessly and expensively held out, and by others for finally yielding so much. And certainly the package increase of 39 cents an hour that they were forced to yield over a thirty-month period is far more costly than the settlement they might have obtained by offering more last June to avert a strike. But before we condemn the company managements we would do well to weigh the mounting pressures against them.

Only three nights before the steel settlement, New York City, already losing millions of dollars on its city-owned and -operated bus and subway lines, averted a strike only by offering an increase of 40 cents an hour over a two-year period. The private bus lines were forced to settle for an increase of 36 cents an hour. Immediately after the settlement Mayor Wagner announced that the people of the city were “sick and tired of . . . this terrible ordeal every year or every second year . . . I don’t propose to let it happen again.”

The politicians are always going to be terribly tough *next* time, but always capitulate, or force private industry to capitulate, *this* time. They have built up, by their own laws and appeasements, a Frankenstein monster they no longer dare to oppose. ✻

---

**Logic of Do-Nothing**

January 25, 1960

Though the steel companies, as one of their spokesmen admitted, certainly “took a hell of a licking,” it does not follow that labor won. It will take years for the strikers, even with their new gains, to make up their losses during 116 days of idleness. And as the union which forced a thumping increase on top of wage rates already higher than in any other manufacturing industry also refused to permit employers to effect any savings by discarding wasteful work rules, the settlement must adversely affect employment in the long run. As Roger Blough, chairman of United States Steel, pointed out, the settlement “can certainly weaken further their [the workers’] ability to compete in the market place against the workers in steel mills abroad, as the gap between wage costs on opposite sides of the ocean continues to widen.”

As for other workers, the purchasing power of their wages will be cut by a new spiral of inflation. The price at which the Administration bought off the steel strike was a hundred new strikes, unless a new national round of inflationary wage increases is granted. The great problem now is how we can limit the damage done.

**DON’T ACT NOW**

Yet this—the most important domestic problem now before the Administration—was dismissed in the President’s long annual message with a perfunctory mention. The inflationary implications were belittled. We were told that we must depend “primarily upon the common sense of the responsible individuals,” and should “encourage regular discussions between management and labor outside the bargaining table.” In other words, the government should do nothing.

Toward any meaningful reform of our labor laws, this Administration, like its predecessors and its Democratic opponents, has developed a masterly logic of inaction. Don’t legislate during a strike, because then it is too late to affect that strike, and any such legislation would be hasty and ill-considered. Don’t legislate after a strike has been settled, because there is no longer any urgency. Don’t legislate in an election year (i.e., every second year) because such legislation will be “political” and bad. Don’t legislate until we see how the Landrum-Griffin Act (obviously ineffective on nationwide strikes) is going to work out.

We come to the paradox that nobody attempts to solve the problem precisely because it has become so serious. The politician dares not make proposals that might incur the vengeance of the union leaders at the polls. The employer fears to press suggestions.
that would antagonize his union workers or arouse the resentment of their leaders.

**UNION INTIMIDATION**
But the greatest obstacle to reform is the confusion and division even in the ranks of those determined to face the problem. Some ask for compulsory arbitration, failing to see that this must lead into general wage-and-price fixing. Some want to seize the companies and force them to pay what the unions ask, oblivious of the violation of private-property rights and the consequent demoralizing effects on industry and employment. Some demand making the unions subject to “antimonopoly” laws, but fail to specify what these would permit or forbid. Some want to limit the size of unions, but are vague about the limits or how their proposal would be enforced.

And all the time the central evil is ignored. This is union violence, or union intimidation through mass picketing. It was this that made the nationwide steel strike effective. It was this that made it inevitable that McDonald would win. For throughout the strike no steel company dared to try to operate. And this irresponsible union power will continue until a company is in a position to say to strikers: “Unless you are back by Monday morning, you will be considered as having quit your job, and you will be replaced.” Until a company management is in a position to say that without being haled before a labor board, until it can seek immediate relief in the courts from irreparable damage, and until it can depend on local police action to prevent mass picketing and keep the peace, the labor-union bosses will continue to have the economy at their mercy.

---

**Notes on the Budget**
February 1, 1960

**Word Inflation:** The verbal inflation in the budget has increased at an even faster rate than the dollar inflation. The signed part of the President’s message, preceding the hundreds of itemized tables, runs to 78 pages. The Budget Message six years ago ran to only fourteen pages. The increase in wordage is 457 percent, compared with an increase of annual estimated dollar expenditure of 24 percent. The comparison is not frivolous. Good government and good policy depend on the extent of public interest and understanding. Public interest and understanding are encouraged by clarity and brevity, discouraged by prolixity. The significant facts can be buried under mountains of detail. I am not yet ready to put it forward as Hazlitt’s Law, but I suspect that the number of people who read a message varies inversely as the square of its length.

**How Good a Guess?** The President estimates that expenditures in the fiscal year 1961 will be $79.8 billion and receipts $84 billion, leaving a surplus of $4.2 billion. How likely is that surplus? It is not to be achieved by any cut in expenditures, which are estimated at $1.4 billion more than in the current fiscal year, but by an increase, from practically the same taxes, of $5.4 billion in revenues compared with the current fiscal year and of $15.7 billion compared with the fiscal year ended last June 30. Such an increase of 23 percent in two years would be improbable without substantial inflation; but this would mean correspondingly increased costs, which are not allowed for in the expenditure estimates.

Comparisons with the last full fiscal year, 1959, are not encouraging. For that year the President predicted a surplus of nearly half a billion. But expenditures were $6.8 billion more than he estimated and receipts $6.1 billion less, so 1959 ended with a deficit of $12.4 billion. If the same absolute error were now made for 1961, we would end, not with a surplus of $4.2 billion, but with a deficit of $8.7 billion. The 1959 error was abnormally large. But even for the fiscal year 1958 Mr. Eisenhower predicted a budget surplus of $1.8 billion and we ended with a deficit of $2.8 billion—i.e., $4.6 billion worse than the forecast. His present surplus estimate hardly justifies a Democratic spending spree.

**Cost Comparisons:** Even when we take the budget at face value, it is the biggest expenditure Mr. Eisenhower has ever proposed. This is not the result of proposed increased spending on defense. On the contrary, “major national security” expenditures, at $45.6 billion, would be less than in 1959 or in the current fiscal year. The new budget contains the highest nondefense expenditures ever recommended. These total $34.2 billion, compared with $31.2 billion recommended for 1960 and $28.1 billion for 1959 (though both increased in actuality), and with actual non-defense expenditures of $27.8 billion in 1958, $25 billion in 1957, and $20.9 billion in 1954. In brief, non-defense expenditures alone are $13 billion greater than in 1954.

Nor does even this tell the full truth about the 1961 budget. When social security and trust-fund operations are counted in, expenditures for 1961 will not be $79.8 billion but $96.3 billion. Total nondefense and welfare spending, at $50.3 billion, will actually exceed defense spending by $5 billion.

**Debt Management:** Congress will be irresponsible if it does not heed the President’s request for immediate removal of the 42-year-old 4¼ percent limitation on
interest rates on government securities maturing after five years. Such long-term securities can no longer be sold at that rate. The ceiling is highly inflationary, as it forces the government to offer short-term securities acquired by commercial banks. As the government must pay around 5 percent even on these, the ceiling on long-terms actually raises its interest costs.

**Item Veto:** The President is to be congratulated for again asking authority to veto individual items in appropriation bills. He points out that 41 state governors now have such item veto authority. It is a minimum requirement for fiscal responsibility. The only real question is whether it goes far enough.

### Who Makes Inflation?
**February 8, 1960**

The President’s annual Economic Report has come a long way since the days of Leon Keyserling. It is lucid, readable, informative, and conservative in tone. It pays more than lip service to the need for a balanced budget and to the merits of “a free society, free political institutions, and a free economy.” It rightly insists that “we grow only by investing more and producing more, not simply by spending more.” Many of its specific recommendations—such as the removal of the 4½ percent interest-rate ceiling on new long-term Federal bonds—are urgently necessary.

The report is also able to point out that though inflation continued in 1959, the rate of inflation decreased. The money supply (as measured by demand deposits plus currency) grew by only one-half of 1 percent in 1959, compared with 4 percent during 1958. The consumer price index rose from 123.7 at the end of 1958 to only 125.6 at the end of 1959. The wholesale price index actually fell during the year from 119.2 to 118.8.

Yet the latest Economic Report leaves one with the same doubts as have its predecessors concerning the wisdom of the Employment Act of 1946. That act declares (though with elaborate bows to “free competitive enterprise”) that “it is the continuing policy and responsibility of the Federal government . . . to promote maximum employment, production, and purchasing power.”

### DOUBTS ON 1946 LAW
It has not been proved that the act has done any particular good. Thus, though the present report boasts of the great advances made in employment, income, and output in the fourteen years since the passage of the Employment Act, it also concedes that “the annual increase of 3.2 percent in total national output” in this period “is roughly equivalent to the long-term average reached in our previous history.”

But the act, by its emphasis on maximum employment and “purchasing power,” and its silence concerning prices, has given added stimulus to inflation. It is not mere coincidence that since 1946, when the act was passed, the money supply has increased 32 percent and consumer prices have risen 50 percent. This inflation has made the miracle of “economic growth” seem much greater than it is. We boast of our gross national product of 1959 of $479 billion; but if this had been calculated at the 1939 price level, it would have been only $205 billion—not half as impressive.

Moreover, by holding that employment, production, and purchasing power are the “responsibility” of the Federal government, the Employment Act of 1946 has provided an excuse for hundreds of “programs,” handouts, and interventions, and a steady expansion of Federal control. Is it really the province of government to increase employment, output, and purchasing power? Or is not its chief business, rather, to keep out of the way?

**Responsibility**
Its true function is to maintain peace, order, and justice; to protect life and property; to refrain from burdensome and inequitable taxation; to remove the punitive laws and deterrents that previous governments have imposed. Its function is to permit and preserve a sound currency. When it fails to do this, it must bear sole responsibility for the failure.

If it properly fulfills its own responsibilities, it will not need to lecture the people to take “appropriate private actions, especially with respect to profits and wages.” If it did not grant labor unions special monopoly privileges, the power of intimidation and of paralyzing the economy, it would not need to declare piously and futilely that unions should not “threaten to paralyze our entire economy.” And it need not declare that “price reductions warranted by especially rapid productivity gains must be a normal and frequent feature of our economy.” If the government itself will refrain from monetary inflation, these price reductions are precisely what will occur. A fair field for competition will bring down production costs and prices with them.

The greatest profits will go to those who either bring down production costs the most, or improve products the fastest. The free market can settle these relationships better than the most learned government economists.
Sixteen years ago, in a short but very important book, *The Road to Serfdom*, F.A. Hayek sought a modern restatement of the great issue between liberty and authority. Now, pushing his researches further, he has produced a monumental work of 570 pages, *The Constitution of Liberty* (University of Chicago Press. $7.50), exploring the philosophical foundations of freedom with a thoroughness, scholarship, rigor of reasoning, and precision of statement rarely equaled and never surpassed. It is one of the great political works of our time.

It is difficult, within the limits of this space, to convey an adequate idea of the book’s scope and contents. Part I is concerned with the meaning and value of freedom. As Abraham Lincoln pointed out, “The world has never had a good definition of the word ‘liberty.’ We all declare for liberty; but in using the same word, we do not all mean the same thing.” Hayek analyzes the many ambiguities of the word, but uses it to describe “the state in which a man is not subject to coercion by the arbitrary will of another or others.” He examines the goals and methods—legal, political, economic, educational—that restrict or threaten this liberty, as well as the ideals and measures most likely to promote and maximize it. In the course of this examination, the goal of Liberty is compared with that of Equality, Majority Rule, and Democracy to determine to what extent they are compatible and, when not, which must have priority. Democracy, he concludes, though “probably the best method of achieving certain ends,” is “not an end in itself.”

**THE RULE OF LAW**

In Part II, Hayek considers the relation of freedom to the law, and presents an illuminating historical survey of the slow growth of safeguards to individual liberty. Among these he stresses the importance of a written constitution, of federalism, limited government powers, division of powers, and judicial review.

Most of all he stresses the importance of the Rule of Law. By this he means the absence of arbitrariness, privilege, and discrimination. The law must apply to all, and not merely to particular persons or groups. It must be certain. It must consist in the enforcement of known rules. These rules must be general and abstract rather than specific and concrete. They must be prospective in their application and not retrospective. They must be so clear that court decisions are predictable. The case for the ideal of the rule of law, for its certainty, generality, and equality, is presented with unanswerable force. But Hayek is compelled to point out in a final chapter of this section how, under the influence of legal positivism, socialism, and the drive toward a welfare state, the ideal of the rule of law has been declining.

**CREEPING BUREAUCRACY**

The final section consists of eight chapters in which Hayek shows what the effects have been—on labor and employment, social security, taxation, money, housing and town planning, agriculture, and education—of the decline of the rule of law and personal liberty in the pursuit of the goals of socialism, welfare-statism, redistribution, “full employment,” and inflation.

This is a series of masterly discussions which unfortunately cannot be reviewed in detail here. I must confess some disappointment in one or two of them. His chapter on “The Monetary Framework,” for example, though it contains a brilliant analysis of inflation, seems to violate his own declared principles when it suggests that a restoration of the gold standard is neither practicable nor desirable, and even expresses doubt about the wisdom of tying down the monetary managers by “rigid rules” instead of depending on their discretion.

Yet these chapters in general are distinguished as much for their courage as for their intellectual penetration. No one has pointed out more clearly the dangers now facing us from inflation, paralyzing “progressive” taxation, coercive labor unions, the ever-increasing dominance of government in education, and a social-service bureaucracy with far-reaching arbitrary powers. Hayek’s book is the twentieth-century successor to John Stuart Mill’s essay, *On Liberty*, and the contemporary legal-political counterpart of Ludwig von Mises’s economic treatise, *Human Action.*

---

**Great No-Debates**

February 22, 1960

According to Edwin L. Dale, Jr. on the front page of *The New York Times* of Feb. 7, “a new ‘great debate’ is raging” in Washington at the luncheon table and over the after-dinner coffee and brandy, and you’d be surprised to learn what it is about. Its “single idea” is that “the basic trouble with American society is that we devote too much of our resources to increasing an already affluent volume of private consumption, and too little to public services of all kinds.” In sum: “There is something wrong with a country that has bigger and better tailfins at the same time that it has a second-best defense posture, a worsening slum problem, dirty rivers and streams, inadequate health services, and wretched underfinancing of education.”
Before we take up the “single idea” we might go once over lightly a few of these detailed charges. Our defense ought to be as adequate as we can make it; but mere spending is not the whole answer. As for health services, both private and public, we are spending more on them than ever before in human history. The same is true of education. If the education of our children is wretched, it is not because we don’t pay enough for it. The real complaint in the foregoing paragraph is that people choose to spend their own money on automobiles instead of on better housing.

STILL MORE SOCIALISM
The single idea of this so-called great debate, to restate it in plainer words, is that we do not have enough socialism and ought to have still more; that annual Federal expenditures at the rate of $96 billion are not enough and ought to be enormously larger; that the tax burden ought to be still more crushing; that it isn’t enough to confiscate up to 91 percent of man’s income, the government ought to grab what is left; that the enormous Federal bureaucracy ought to be still further expanded; that people should not be allowed to spend the money they earn on the things they want, but on the things that the Lippmanns and Galbraiths think is good for them.

Paradoxically, the same people who are assumed to be incompetent individually to know how to spend their earnings are assumed to be competent collectively, as voters, to decide how the incomes of everybody else should be spent.

What a still greater tax burden will do to incentives and to the productivity of enterprise is a question that the welfare-state zealots do not consider. Production, they assume, increases automatically, regardless of incentives, the right of a man to buy what he wants or to keep what he earns, or the rewards to saving, risk-taking, or capital investment.

If Washington dinner parties are toying with the idea of a still deeper plunge into socialism, welfare-statism, bureaucratic rule, spending and taxing, their attention should be called to a few real problems. I suggest that the following subjects for possible great debates are being neglected:

1—The effects of continuous deficit financing and of continuously expanding government spending—particularly on nondefense items.

2—The effect of progressive income taxes rising to 91 percent, of corporate income taxes of 52 percent, and of the capital-gains tax in its present form, in reducing incentives and production and sometimes even reducing revenues.

3—The effect of our foreign-aid program in subsidizing foreign socialism, making enemies rather than friends, upsetting our balance of payments, and bringing increased taxes or deficits at home.

4—The effect of farm price-support subsidies in increasing taxes or bringing deficits, raising the cost of foodstuffs for city workers and rewarding people for not producing.

5—The constantly growing social-security program and our ability to carry the burden.

6—The growth of a huge bureaucracy with a vested interest in perpetuating foreign aid, expanding social security, etc.

7—The uncontrolled power of nationwide labor unions to paralyze industry and force continuous inflationary settlements.

8—The danger under present conditions of retaining the 4½ percent government-bond-interest ceiling.

9—The threat to our gold reserves.

10—The mounting threat to the integrity of the dollar.

Whose Welfare State?
February 29, 1960

Former President Hoover has pointed out that Marxist thinking infects us and has even “got frozen” into the Eisenhower Administration. Senator Goldwater pleads with his Republican colleagues, in Human Events, to offer the American voter a clear-cut alternative to “the paternalistic superstate with its ever-increasing spending and its ever-increasing taxation and its ever-increasing interference in the life of the individual.” But Arthur Krock points out in the New York Times that the President’s sympathetic “consideration” of proposals for free hospital and nursing care of elderly citizens, to be paid for out of Federal revenues, is another Republican step toward the welfare state. The voters, he concludes, “will find it difficult to detect a basic ideological distinction between the two major parties.”

At present there is hardly a major field in which the voter can detect a significant party difference. Let us run through a list.

Social Security: All the social-security increases of the last seven years have been bipartisan. The President himself has insisted on bigger and longer unemployment benefits. True, there is a small party difference regarding the Senate’s $1.8 billion aid-to-education bill, providing funds for both school construction and teachers’ salaries.
Farm Subsidies: The farm price support fiasco has become a national disgrace. In his message to Congress of Feb. 9, the President pointed out that $3.5 billion of Federal funds are tied up in wheat alone (a crop which provides only 6 percent of cash receipts from sales of farm products). It is costing the government $1.5 million a day, or more than $1,000 a minute, just to store the wheat surpluses created by its own price policies. But the President does not dare to suggest termination of the program. He expresses a mild hope that price supports will be more “realistic” and controls fewer. He advocates an even greater “soil bank”—60 million acres.

Foreign Aid: Though this program was Democratic and Trumanic in origin, Mr. Eisenhower now pleads for more “economic” foreign aid than even Democrats seem willing to give. Most of this will go to subsidize socialistic programs (as in India) which can only slow down rather than accelerate economic progress in the receiving countries.

Spending: Average annual Federal nondefense expenditures, seven Truman years (1947–53), $23.7 billion; average seven Eisenhower years (1954–60), $27.3 billion. The President has asked for repeal of the legislative ceiling of 4¼ percent on long-term bonds, a ceiling which can now have dangerous inflationary consequences. A Democratic Congress has refused to act. But Mr. Eisenhower has certainly been less insistent than the situation warrants.

Labor: The Administration admonished the steel companies not to grant an inflationary wage increase; encouraged them to hold out during a costly 116-day strike; finally intervened in behalf of an inflationary wage settlement; yet did nothing and is doing nothing to revise laws that empower industrywide unions to choke off production until their demands are met.

Hostility to Business: The Administration charged 29 big oil companies with conspiracy to fix prices. A Federal District judge has now acquitted the companies, declaring that the evidence submitted by the government did not “rise above the level of suspicion.”

Communism: To the ideological warfare daily conducted against a free economic and political system by Communistic propaganda, the Administration has made feeble, sporadic, and apologetic replies. Even when, at our doorstep, Cuba expropriates American property and insults us, our government makes only a weak-kneed and perfunctory protest, and continues to subsidize Cuban sugar imports.

True zealots for the welfare state will prefer to have it run by original New Dealers. Unless traditional Republicans are made aware between now and November of a real party difference, they will do what so many did in 1948—sit on their hands.

How to Curb Spending
March 7, 1960

Every January, since the passage of the Budget and Accounting Act of 1921, the President has been required to submit to Congress an estimate of the Federal government’s expenditures and receipts during the next fiscal year. But the results have seldom corresponded with his estimates. In 1959, for example, actual expenditures were $6.8 billion more than his estimate and receipts $6.1 billion less.

The extent of these errors was unusual. What has not been unusual has been the tendency of expenditures to exceed the incumbent President’s estimates year after year for the simple reason that the President in fact lacks the power to control the budget.

SET UP FOR SPENDERS

Today the President, House, and Senate can all compete against each other in recommending or appropriating money to favored projects or groups. It is difficult to fix responsibility for the resulting extravagance or budget deficits. The strongest arguments against the wastes in farm subsidies, veterans pensions, foreign aid, or other programs are impotent against a system that seems precisely set up to favor the spenders.

We urgently need a responsible budget system in which the President and Congress are encouraged to compete with each other in economy rather than extravagance. This is not a utopian dream. Such a responsible budget system has existed for years in Great Britain. It has long prevailed in many of our own states. President Eisenhower, who asked in his Budget Message this year for power to veto individual items in appropriation bills, pointed out that the governors of 41 states now have this power.

But to attain a truly responsible budget system, the President should be granted even more power than this. He should have the power not only to veto any individual item in an appropriation bill, but any increase in any item beyond the amount first proposed by him in his Budget Message or in any special message. If Congress wishes to increase any appropriation beyond his recommendation, or to make any appropriation not recommended by him at all, it should be constitutionally required to do so in a separate bill subject to his veto.

There would be nothing extraordinary or unprecedented in such a grant of power. It is almost precisely
what is required in the constitutions of some of the states.

In New York, for example, the governor’s annual budget must not only give estimated expenditures and revenues for the next fiscal year, but must be accompanied by a bill or bills containing all the proposed appropriations and any proposed new taxes. The legislature (I quote the state constitution) “may not alter an appropriation bill submitted by the governor except to strike out or reduce items therein. . . .” Further: “Neither house of the legislature shall consider any other bill making an appropriation until all the appropriation bills submitted by the governor shall have been finally acted on by both houses. . . .” If the legislature wishes to add any appropriation, it must do so by separate items or bills “each for a single object or purpose” which “shall be subject to the governor’s approval.” And the New York constitution gives the governor explicit power to do what the President cannot do—veto individual items in appropriation bills.

STOP, LOOK, LISTEN

The late Senator Vandenberg, in advocating such power for the President in 1936, wrote in The Saturday Evening Post: “The item veto does not give the President one single additional, affirmative power. He cannot start anything as a result. He can only stop something long enough to focus the attention of the country on it, and long enough to force two-thirds of the House and Senate to agree to it in spite of him and his reasons, if they should persist in their adverse judgments. Its only harm, if any, would lie in the temporary delay while Congress and the country stop, look, and listen.”

The basic principle to be followed to attain a responsible budget system is clear. It is to reduce the power of either Congress or the President to spend without restraint and to increase the power of both Congress and the President to limit the spending of the other.

Arms and the Budget
March 14, 1960

What is the truth about national defense? Are we spending enough on it? Are we spending it on the right things? When the experts contradict each other, whom are we to believe? Shall we dismiss all the criticisms of our defense program as inspired merely by partisan politics? Shall we put our faith implicitly in the President’s judgment?

It is hard to find confident answers to all these questions. Few people can seriously believe that the President would deliberately mislead the American people on a question crucial to our very survival. But the question remains whether he himself correctly estimates all the military possibilities, or whether he has not been misled into unwarranted optimism or placidity. Certainly, even when we have made allowance for the criticism inspired by partisanship or a drive for bigger appropriations for someone’s pet project, we cannot dismiss all the criticism as either interested or uninformed. Too much of it has come from sources that compel respect, both for their motives and for their knowledge.

ERRORS INEVITABLE

Part of the problem arises because no one mind has all the answers. Because of military secrecy, few of us are in a position to know even our own war capabilities; yet military secrecy is indispensable. Even the experts often do not know precisely where they stand. Will their next test missile firing, for example, be a success? And if the difficulties of estimating even our own capabilities are so enormous, what is to be said about our ability to estimate correctly the capabilities of the Russians? As errors are inevitable, they should be on the side of overestimating Russia’s capabilities and underestimating our own.

The testimony of some of the experts is not reassuring. Oskar Morgenstern, in his recent book, The Question of National Defense, comes to the grim conclusion that “the probability of a large thermonuclear war occurring appears to be significantly larger than the probability of its not occurring.” More than a year ago Albert Wohlstetter, in a sobering article in Foreign Affairs (January 1959) on “The Delicate Balance of Terror,” underlined the crucial difference between the capability of striking by surprise and the capability of retaliating after being attacked between a “strike-first” and a “strike-second” capability. Deterrence is extremely difficult. It is not enough, but it is indispensable. “Almost everybody,” Wohlstetter added, “seems concerned with the need to relax tension. However, relaxation of tension, which everyone thinks is good, is not easily distinguished from relaxing one’s guard, which almost everyone thinks is bad. . . . To be tense where there is danger is only rational.”

NONDEFENSE WASTE

None of this means that we must simply surrender to the spenders and the inflationists. Defense is not measured by dollars spent but by weapons and safeguards provided. Suppose we find we ought to spend as much as $3 billion more on certain weapons in 1961. It by no means follows that we must add this to present total spending, or even to total military spending.
New weapons nearly always make old weapons obsolete. Obsolete weapons and ways of spending can be discontinued. In any case, tremendous slashes are possible in nondefense spending, which is $13 billion higher for 1961 than it was in 1954.

It is an easy patriotism that demands higher defense spending financed by budget deficits. This is merely to advocate that defense should be paid for by the invisible but no less real tax known as inflation. It is almost as easy to demand higher total spending financed by higher taxes, and to say with seeming courage that “we” must make greater sacrifices. This glosses over the question of who is to make the sacrifices. Our present tax system rests on the principle that it is precisely the most productive persons in the community who must be penalized the most. This principle obviously slows down economic growth. How about asking those who receive heavy subsidies for not planting crops, say, or others with vested interests in government handouts, to make the sacrifices? Are some of those who loudly demand more spending on armaments courageous enough to slash nondefense waste?

Sugar Can Turn Sour
March 21, 1960

For months Fidel Castro and his so-called government, in addition to waging a reign of terror at home, have been vilifying the United States, ostentatiously making deals with the Russians, seizing American property, and arresting American citizens. Our own government, in return, has not only restricted itself till now to a few perfunctory protests, but has continued to subsidize the Cuban economy.

The manner of this subsidy is complex. The United States assigns quotas to foreign suppliers of sugar. Omitting the special case of the Philippines, Cuba is allotted 96 percent of these foreign imports, and all other foreign countries together only 4 percent. With a quota of 3,120,000 tons this year, Cuba supplies a third of United States consumption, and receives a price of about 2 cents a pound above the world market. The differential is worth about $150 million to Cuba this year.

The actions and slanders of Castro and his lieutenants reveal how little gratitude or good will we have got in return. Major Guevara, president of Cuba’s National Bank, says that the premium the U.S. pays for Cuban sugar amounts to “economic enslavement.” Presumably the highly publicized deal that Cuba made to sell Soviet Russia some sugar at 2.78 cents a pound (about half the more than 5 cents paid by us and even below the world price of 3 cents) was a step toward economic liberation.

EMERGENCY POWERS
Our own next step ought to be clear. Congress should immediately empower the President (whether he asks for the power or not) to reduce or terminate the Cuban sugar quota at his discretion, to stop paying anything above the world price to Cuba, or to raise the (now preferential) duty on sugar imported from Cuba to whatever figure he considered appropriate. These discretionary powers might be granted, say, for a period of a year. They would not necessarily result in any change in the sugar situation. But armed with these discretionary bargaining powers the President and Secretary of State would be able to negotiate with Castro more realistically and flexibly concerning his slanders and his seizures of American property. They would be able promptly to retaliate against hostile actions or promptly to reward more friendly actions. This they cannot do under the present rigid fixed-term quantitative quota system.

Such a grant of temporary discretionary powers vis-à-vis Cuba ought to be kept separate from the question of what the permanent revision should be of the Sugar Act, which expires at the end of this year. So far as that act is concerned, what is required is not a readjustment of quotas but a complete reappraisal of policy. The present complicated quota system goes back to the Jones-Costigan Act of 1934, followed by the Sugar Acts of 1937 and 1948, and the amendments and extensions of 1952 and 1956.

COBWEB OF QUOTAS
There is hardly a pernicious economic or legal principle that is not embodied in these laws. The Secretary of Agriculture must determine each year the quantity of sugar “needed to meet the requirements of consumers.” He must divide the U.S. sugar market among domestic and foreign supplying areas by the use of quotas. He must allot these quotas among individual domestic producers. He must levy a tax on the processing of sugar cane and sugar beets and use the proceeds to make payments to producers to compensate them for adjusting production to marketing quotas. He must prescribe an “equitable” division of sugar returns among processors, growers, and farm workers.

The result is an economic regimentation and complicated nightmare of controls unparalleled even in the rest of our farm program. It involves rigid and discriminatory treatment of all foreign exporting nations, tends to breed resentment in all except the most favored, Cuba and is now treated scornfully in Cuba itself. This
is a heavy price to pay to subsidize a combined domestic beet and cane production equal to only about one fourth, and a domestic cane production equal to only about one-fifteenth, of our total sugar consumption.

It is high time to start extricating ourselves from the whole fantastic sugar quota program.

**Foreign Aid Run Riot**
March 28, 1960

A subcommittee of the House, in reporting on a 40,000 mile study mission around the world has concluded that the U.S. foreign-aid program is attempting to underwrite too many projects, some of them grandiose and too costly, and that money spent on foreign aid is a growing strain on this country. Many previous committees and observers have come to the same conclusions. Yet it is significant that this latest report, like its predecessors, accepts as a matter of course the principle of government-to-government foreign economic aid. This is why such aid not only continues but grows, under ever-different names, with no stopping point in sight. In *Newsweek* of Nov. 16 last I discussed the proliferation of agencies and of postwar foreign loans and grants totaling some $70 billion.

For the next fiscal year the President has asked Congress to provide $4.2 billion in foreign aid, of which $2 billion would be military and the rest “economic” assistance. It is proper that the request should be divided in this way. Military aid can be justified in principle. It is clearly needed in Korea and Taiwan, which have demonstrated their own willingness to resist aggression. But this does not mean that any aid called military should be immune from challenge. Much of it becomes extremely dubious when 50 recipients are involved.

**DO WE GET DEFENSE?**
Moreover, American aid that goes to make up a budget deficit ostensibly caused by military expenditures of the recipient may in fact be paying for larger nondefense expenditures than otherwise. When American taxpayers pay for any category of Ruritania’s expenditures, Ruritanians have that much more of their own resources left to spend on something else. This substitutability of resources (unless we undertake to control every item of a foreign government’s expenditures and taxes!) is ignored by the administrators of foreign aid, “military” or “economic,” when they solemnly approve hundreds of special “projects.”

Though the President’s foreign-aid message of Feb. 16 contained some 5,000 words, he did not find space to specify there how many nations and governments the American taxpayer was aiding or being asked to aid, how much we had already spent on this program, how much it was going to cost in future, and when it was going to stop, if ever. Instead, Congress was told in sweeping generalities that it is somehow the duty of the American taxpayer “to raise the standards of living of millions of human beings” all over the world, and that government economic aid is the way to do it.

**SUPPORTING SOCIALISM**
Both propositions are doubtful. To undertake to lift the living standards in every backward nation, especially with no control over the policies of that nation, is to assume a bottomless and endless responsibility. And government aid retards, instead of promoting, true economic progress.

The situation was bad enough when we gave aid to a score of nations, on the plea of “no strings attached,” regardless of whether or not they dissipated that aid in “directed” economies and in socialization. We now explicitly endorse socialized planning. We apparently even make it a condition of eligibility for aid. In his message of Feb. 16 Mr. Eisenhower spoke approvingly of “an expanded and accelerated program of economic reform and development” for Nationalist China. In a speech in Puerto Rico on March 4 he said that though “the United States alone” should not develop “a so-called master plan for the raising of living standards through the hemisphere . . . each nation of Latin America . . . must analyze its own human and material resources and develop a program of action with priorities assigned. Then national and international credit agencies should stand ready to be of assistance in making the program a reality.”

The dirigistic and socialistic assumptions underlying the foreign-aid program are daily becoming more unmistakable. The sponsors of the program have completely forgotten, if they ever knew, that the soundest economic growth, either at home or abroad, comes when private capital, protected from arbitrary seizure or harassment, is free to flow to the enterprises that best promise to meet consumer demand.

**Backward Step**
April 4, 1960

Because the Landrum-Griffin bill, in the form in which it passed the House, contained some unexpected curbs
on labor-union power, many conservatives hailed its final passage as a great victory. But Sylvester Petro, professor of law at New York University, in the most realistic analysis that I have yet seen, contends in the National Review of March 26 that the new law “fails to remove existing shortcomings in labor relations or to alleviate even the more glaring defects in labor legislation.”

Few persons seem to realize how important the changes were—“all for the worse”—in the bill that emerged from the conference committee of the House and Senate. Those changes were apparently made at the suggestion and insistence primarily of Senator Kennedy and his legal advisers, principally Prof. Archibald Cox of the Harvard Law School. Professor Petro thinks it appropriate to call what emerged “The Kennedy-Landrum-Griffin Law,” a name which he shortens to K-L-G.

BAD LEGISLATION

It is, of course, impossible here to discuss all the details of K-L-G, but Petro finds it, on the whole, bad legislation, both in terms of what it does and what it does not do.

It is legal in most states for unions to force employers to agree to closed shop and union-shop contracts; K-L-G secures the right of unions to exercise these restraints. By a perversion of the majority-rule principle, unions have the privilege of putting themselves forward as exclusive bargaining representatives even for unwilling employees. The minority are denied the right to make their own employment contracts. The exclusive bargaining principle is a special privilege which unions alone enjoy. K-L-G accepts this principle.

In the recent Albert Lea strike of Minnesota, Governor Freeman closed a plant until the courts intervened because a union was resorting to violence against workers who were crossing its pickets in order to go to work. “This kind of privileged crime,” writes Petro, “can only be coped with when we take the honest and courageous step of prohibiting all mass picketing, by applying existing laws against coercive picketing.” K-L-G says nothing about this.

K-L-G does nothing, either, to curb the so-called pre-emption doctrine, contributed by the Supreme Court, which practically holds that, because Congress has “pre-empted” the field, the states no longer have the power to regulate labor relations within their own boundaries. And K-L-G is an ineffectual counter to anti-injunction laws “which make it almost impossible for persons seriously injured by unlawful union conduct to secure the immediate injunctive relief which is in many cases the only relief that is of any use at all.”

PICKETS AND BOYCOTTS

K-L-G devotes a great deal of complicated language to picketing and boycotts. Yet instead of prohibiting “stranger-picketing,” which is generally conceded to be coercive, it explicitly authorizes it under certain conditions for 29 days. K-L-G reverses “one of the healthiest and most significant principles of the Taft-Hartley Act.” This was the declaration that permanently replaced strikers were not eligible to vote in future representation elections in the units in which they were no longer employed. Under K-L-G, replaced strikers can vote for a year after the strike has been called. K-L-G, finally, by dealing in detail with the internal affairs of unions, establishes the dangerous principle of Federal supervision of private associations.

What should have been done instead of passage of the Kennedy-Landrum-Griffin Law is clear. On the one hand, there should have been removal of the special privileges given to trade unions by present law. On the other hand, there should have been enforcement of the basic laws of the land against union violence and coercion.

But because of the new law, the politicians can pretend that at least something has been done toward solving the labor problem, and can ignore that embarrassing issue completely in an election year while busily discussing “civil rights,” subsidies for Federal school construction, and medical aid for elderly voters.

Tying Its Own Hands

April 11, 1960

In the last two or three months there has been a sharp fall in interest rates. As a result it is being frequently said in Washington and in press that the U.S. Treasury’s efforts to get Congress to remove the statutory limit of 4¼ percent on long-term government bonds have become altogether futile; that the proposed legislation is in “indefinite eclipse,” and that the whole dispute has become “pointless.” But before we so hastily bury the issue it might be wise to ask if it is really dead.

It is true that a few months ago some long-term Treasury issues were selling at prices to yield about 5 percent and that within recent weeks some have been selling to yield less than 4¼ percent. It is true that the government’s 91-day bills, which sold at rates to yield 4.75 percent in early January, have recently been put out at yields of only 2.79 percent.

The need for Congressional action looks less urgent than it did a few months ago. But it remains no less
important. It would be, in fact, dangerous for Congress to postpone it. In the recent high interest rates Congress got an unmistakable warning. It will have to bear full responsibility for the consequences if it ignores that warning. President Eisenhower raised the issue in a message as early as last June. It became more urgent after he raised it. If interest rates can fall unexpectedly they can also rise unexpectedly. The latest issue of long-term bonds that the Treasury attempted—the 4 percents of 1969, put out in 1957—rose to 110 to yield about 2.94 within a year of their sale. Less than two years after that they had declined to about 94, at which their yield was 4.71 percent.

WHY KEEP IT?
Instead of asking what need or point there is in removing the statutory interest rate ceiling, we should be asking what need or point there is in keeping it. If the ceiling were repealed, no harm whatever would follow. It would not in the least increase the interest rates the government would have to pay. The Secretary of the Treasury, as now, would not try to borrow at the highest rates possible but at the lowest rates possible, in accordance with his plain duty.

But though the statutory ceiling does no good, it retains great possibilities for harm. Last week the Treasury felt obliged to offer the 4¼ percent ceiling rate for new bonds. When interest rates on government long-term bonds are above 4¼ percent, it forces the Treasury to borrow at short-term (less than five years). This leads to congestion in the market for short-term securities, forces up interest rates on such securities, tends to raise the average rate at which the government can borrow, and prevents the Treasury from achieving a manageable balance in maturities.

PREScribing INFLATION
Two issues are involved here—the administrative and the economic. The administrative issue is whether the terms, maturities, balance, timing, and interest rates of 50 or more different issues of government securities should be determined by Treasury experts, in daily touch with the money market, or whether these decisions should be prescribed blindly and far in advance by a lay Congress concerned with a hundred other matters. The 4¼ percent ceiling on long-term government bonds was written into the law more than 40 years ago. Fortunately for us now, that ceiling was not imposed, as it consistently might have been, on short-term as well as long-term borrowing. Fortunately, also, by historic accident, the statutory ceiling we now have is the 4¼ percent imposed in 1918, and not the 3¼ percent earlier fixed by Congress in 1917.

Administratively, it is folly for the government to tie its own hands. But the economic case against the ceiling is even more serious. The only way interest rates can be arbitrarily held down to the ceiling (even temporarily) is by an increase in the money supply, either directly, or indirectly by forcing the Federal Reserve Banks to return to the pegging of interest rates by buying government bonds and monetizing the national debt. In effect, this is what Senator Douglas and his Congressional committee have been proposing. The failure of Congress to remove the ceiling now can only undermine confidence in the dollar both at home and abroad.

Cheap Money Is Dear
April 18, 1960

The word from Washington is that as a result of the success of the Treasury in selling some long-term government bonds at the legal ceiling rate of 4¼ percent, no action is likely to be taken to repeal or even modify the ceiling in this session. Such a failure to act would be irresponsible. Retention of the old legal ceiling would do no good, and might do incalculable harm.

There is no reason to suppose that the legal interest ceiling in itself saves the government a single dollar in interest costs. It is the plain duty of the Secretary of the Treasury to borrow at the lowest rates possible, in accordance with his plain duty.

But though the statutory ceiling does no good, it retains great possibilities for harm. Last week the Treasury felt obliged to offer the 4¼ percent ceiling rate for new bonds. When interest rates on government long-term bonds are above 4¼ percent, it forces the Treasury to borrow at short-term (less than five years). This leads to congestion in the market for short-term securities, forces up interest rates on such securities, tends to raise the average rate at which the government can borrow, and prevents the Treasury from achieving a manageable balance in maturities.

PREScribing INFLATION
Two issues are involved here—the administrative and the economic. The administrative issue is whether the terms, maturities, balance, timing, and interest rates of 50 or more different issues of government securities should be determined by Treasury experts, in daily touch with the money market, or whether these decisions should be prescribed blindly and far in advance by a lay Congress concerned with a hundred other matters. The 4¼ percent ceiling on long-term government bonds was written into the law more than 40 years ago. Fortunately for us now, that ceiling was not imposed, as it consistently might have been, on short-term as well as long-term borrowing. Fortunately, also, by historic accident, the statutory ceiling we now have is the 4¼ percent imposed in 1918, and not the 3¼ percent earlier fixed by Congress in 1917.

Administratively, it is folly for the government to tie its own hands. But the economic case against the ceiling is even more serious. The only way interest rates can be arbitrarily held down to the ceiling (even temporarily) is by an increase in the money supply, either directly, or indirectly by forcing the Federal Reserve Banks to return to the pegging of interest rates by buying government bonds and monetizing the national debt. In effect, this is what Senator Douglas and his Congressional committee have been proposing. The failure of Congress to remove the ceiling now can only undermine confidence in the dollar both at home and abroad.
by an increase in the money supply. This increase may be achieved by a direct resort to the printing press. It may be achieved by a return to the policy of forcing the Federal Reserve banks to buy at the predetermined low interest rate all the government bonds offered. The Fed would pay for these either by creating deposits or printing notes against them. This is what is known as monetizing the national debt.

Instead of reducing or holding down interest rates by increasing the supply of money and credit, we may increase the supply of money and credit by reducing interest rates. Low interest rates encourage borrowing at the banks. Other conditions being unchanged, more projects will be undertaken and more money will be borrowed at 4 percent than at 5, or at 3 percent than at 4. When the banks lend, they create deposits against the loans; that is, they in effect create new money. Low interest rates are inflationary when they lead to an undue increase in the money supply. Conversely, the only way interest rates can be held down below the “natural” rate at any time is by an increase in the money supply.

WHAT HAS IT COST?
This inflationary cheap-money policy cannot be kept going indefinitely. The consequent increased number of dollars, of course, cheapens the dollar in terms of goods. In other words, there is a rise in prices. As a result, cheap money eventually costs the government far more in total dollar expenses and interest charges than “tight” money would have cost it. Further, if the inflation and the rise in prices is expected to continue, lenders will begin to insist on a higher interest rate as a sort of insurance premium against depreciation in the value of their loaned dollar capital.

The irony is that it is precisely the people in Congress who are now protesting loudest against “high” interest charges whose policies in the past have done most to raise those charges. It is their spending policies and deficit financing policies that have built up a Federal debt of $287 billion and an annual interest charge of $9.4 billion.

Whether or not Congress now votes to repeal the legal 4¼ percent ceiling on long-term government bonds is no mere technical matter, of interest only to experts. It may be a fateful decision. It may crucially affect confidence in the dollar at home and abroad. A failure of Congress to repeal at this session may prove, in effect, a vote for inflation. If the Democratic leaders in Congress make that decision, they must bear full responsibility for it.

Age, ‘Needs,’ and Votes
April 25, 1960

“One of the most intensive and broadly based lobbying operations in recent history has made health insurance for the aged easily the No. 1 issue before Congress this year.” So begins a New York Times news story describing the tremendous campaign to promote the Forand bill. The propaganda and pressure are skillfully organized and timed. They are backed by the Americans for Democratic Action, by Walter Reuther and the Committee on Political Education of the CIO-AFL, by Senator Kennedy, who has introduced a companion in the Senate to the Forand bill in the House, and by a group of columnists who have begun suddenly and as if on signal to wail and weep in chorus about the plight of the aged. Anybody who doesn’t immediately join up is denounced as heartless and cruel. We are back in the revivalist atmosphere of the Townsend Plan of 25 years ago though today $16 billion a year is already being spent on old age and other OASI programs.

THE FORAND BILL
The Forand bill would add hospitalization and surgical insurance to the social-security program. It would profess to pay for this addition out of an increase in the OASI tax of ¼ percent on the employee and ¼ percent on the employer. Actuarial estimates by the insurance industry are that costs under the Forand bill would range from $2 billion to $2.4 billion for the first year, and, by 1980, from nearly $6 billion to more than $7.5 billion a year. This would require a level premium not of ½ percent, but of 2.32 to 2.97 percent of taxable payroll. Social-security taxes are already scheduled to reach 9 percent of payroll by 1969, without any Forand bill, and in later years to soar 11 to 16 percent of payroll.

These and similar facts were brought out in the brilliant speech in the Congressional Record of March 24 by Congressman Thomas B. Curtis of Missouri. At what point, asks Curtis, will the taxpayers rebel? Some of them are now paying more in social-security taxes than they pay in income taxes. The Forand bill has been supported by grossly misleading statistics concerning poverty and need. In any case it would deny benefits to the 4 million aged persons who, through no fault of their own, do not have social-security protection.

There are much deeper criticisms. In 1949, Edna Lonigan, in a pamphlet published by the American Enterprise Association, pointed out how, since 1933, there had been a constant expansion of the concept of the “needy”: “A zealous staff in a public welfare agency can find unlimited opportunities to add to the number of ‘needy’ families . . . and to the number of ‘needs’
which must be met by the public through taxes.” The last decade, with social-security “liberalization” in every election year, has confirmed that thesis.

SOcialized Medicine
The Forand bill is a foot-in-the-door for a complete program of socialized medicine. Walter Reuther testified last July: “It is no secret that the UAW is officially on record as backing a program of national health insurance.” After this new aid to people of 65, people of 62 and 63 would want it. Then it would be argued that the medical needs of families with growing children were no less urgent. Finally everyone would be covered.

Socialized medicine is based on compulsory, not voluntary providence. Social “insurance” is a misnomer; individual benefits bear little relation to the individual tax. It is a program for the redistribution of income. The young will have to accept less than they produce in order that the old can get more than they produce. Pressure will build up for reducing an insupportable burden on the young by an inflation that reduces the real benefits of the aged. It is those who today weep most ostentatiously over the plight of the aged who are mainly responsible for the inflation that has already cut the purchasing power of their pensions in half.

“Security” can come only out of production. The policies of the welfare-statists penalize and discourage production. As Bastiat pointed out more than a century ago: “The state is the great fiction by which everybody wants to enrich himself at the expense of everybody.”

Years of Inflation
May 2, 1960

In this space nearly ten years ago (Newsweek, Sept. 17, 1951) I ran a chart comparing the increase in the cost of living, in wholesale commodity prices, and in the amount of bank deposits and currency, from the end of 1939 to the middle of 1951. This chart was incidental to pointing out that the rise in living costs and prices was the result of the increase in the supply of money and credit, and not of a “shortage of goods” or a so-called “cost push.”

We are now in a position to compare the same three items over a full twenty years, from the end of 1939 to the end of 1959. The accompanying chart gives us a panoramic view of the inflation during that period. It shows that, while consumer prices increased 113 percent between the end of 1939 and 1959, wholesale prices increased 136 percent in the same period and the total supply of bank deposits and currency increased 270 percent.

If we are to adopt the proper measures, the only effective measures, to halt inflation and prevent its resumption, we must clearly recognize that its basic cause is the increase in the supply of money.

Two rival theories still persist. One is that inflation and rising prices are caused by a “shortage of goods.” The figures refute this on their face. The official index of industrial production was 177 percent higher in 1959 than in 1939; in other words, the rate of production of goods was almost three times as great. It was in spite of this enormous increase in productivity that wholesale prices increased 136 percent—i.e., more than doubled—during the period. In other words, the increase in the money supply would have caused an even greater rise in prices if it had not been offset by an increase in the supply of goods. While the production of goods almost tripled, the supply of money and bank credit almost quadrupled.

Money vs. “Cost Push”
The other rival theory is that inflation and the rise of prices are caused by higher wage demands—by a “cost push.” But this theory reverses cause and effect. “Costs” are prices. An increase in wages above marginal productivity, if it were not preceded, accompanied, or quickly followed by an increase in the supply of money, would not cause inflation; it would merely cause unemployment. It is not true, as so often assumed, that a wage increase in a given firm or industry can be simply “added on to the price.” Without an increased money supply, prices cannot be raised without reducing demand and sales, and hence production and employment. We can stop the “cost push” if we halt the increase in the money supply and repeal the labor laws that confer irresponsible private powers on union leaders.

![Chart comparing the increase in the cost of living, in wholesale commodity prices, and in the amount of bank deposits and currency, from the end of 1939 to the middle of 1951.](Newsweek)
Subsidizing Socialism
May 9, 1960

Ever since the advent of the New Deal, socialist assumptions have tended increasingly to supplant capitalist assumptions in our thinking. Nowhere has this change been quite as marked as in foreign economic policy.

The whole foreign-aid program, outside of purely military aid, rests on socialistic assumptions. The quickest and healthiest way to economic growth, which will tend to supply sooner the goods that consumers most need, is the way of free enterprise. The first duty of the government of an undeveloped country (as of a rich and "developed" one) is to make its country as attractive for private investment, domestic or foreign, as it possibly can.

This means that it must assure a sound and stable currency to protect savers against inflation. It must restrict itself to prudent spending, to remove any need for burdensome taxation. It must not discriminate against foreign investors or harass its own businessmen. It must refrain from price-fixing, wage-fixing, and exchange controls, so that foreign investors are free to convert or withdraw their earnings at all times. Above all, it must not socialize or expropriate industry or property or threaten to do so. It must respect property rights at all times.

UNATTRACTIVE FIELD
In the main we followed such policies in our own early history and attracted British capital that greatly increased our rate of expansion. Canada in the main follows such policies today and has attracted billions of U.S. private investment. The great majority of "undeveloped" countries today fail to follow anything like such policies. That is why they are so unattractive a field for private capital, foreign or domestic.

Foreign aid does not cure this situation. It aggravates and prolongs it. As long as foreign governments can get the capital they want from our government without adopting any of the policies or giving any of the assurances that private capital would properly insist on, they will not adopt these policies or give these assurances. So long as we do not insist on these policies (and are even afraid to do so for fear of "dictating" or "attaching strings") our aid subsidizes and prolongs socialism and retards real economic growth.

Today we are actually making state "planning" or socialism a condition for the receipt of our foreign aid. Six weeks ago I called attention to the remarkable endorsement by President Eisenhower of socialized planning for Nationalist China and Latin America.

On April 20 Secretary of State Herter went even further, and declared that the problem of land distribution should have the "urgent attention" of the Organization of American States.

‘LAND REFORM’
Now the Secretary should know that in the last twenty years so-called “land reform” in a score of nations has been commonly an accompaniment of socialization or communization. In most cases it has been a euphemism for expropriation, a fancy name for seizure. A typical procedure has been for the state to take over properties at a fraction of their market value and to pay even this sum in government bonds that would sell for only a fraction of their nominal value. What foreign countries do about their land problem is none of our business except when they expropriate American holdings. Then it is our plain duty to protect the lives and property of our citizens abroad. The Secretary’s statement may indicate why our protests against Castro’s seizures have been so feeble and perfunctory.

Another recent declaration of the State Department was revelatory. It declared that the picketing of the Egyptian ship Cleopatra by seamen in New York was "embarrassing" the conduct of United States foreign relations, but added that it recognized "the special status afforded to labor union picketing in labor disputes." This "special status," unfortunately, does exist under the Norris-La Guardia Act. Under the pretense of protecting "free speech," this makes union members a privileged class, with the right to picket in mass, to intimidate and menace, to block entrance and exit—in short, to use private coercion. It is certainly "embarrassing"—and unconvincing—for our government to explain that it has stripped itself of the power to prevent this.

Inflation vs. Morality
May 16, 1960

Last summer (Newsweek, July 27, 1959) my colleague Raymond Moley wrote a column called "Inflation, a Moral Issue." This ought to be the leading issue in the election.

Inflation never affects everybody simultaneously and equally. It begins at a specific point, with a specific group. When the government puts more money into circulation, it may do so by paying defense contractors, or by increasing subsidies to farmers or social-security benefits to special groups. The incomes of those who receive this money go up first. They begin to buy at the old prices. But their additional buying forces up prices. Those whose money incomes have not been raised are
forced to pay higher prices than before; the purchasing power of their incomes has been reduced. Eventually, through the play of economic forces, their own money-incomes may be increased. But if these incomes are increased either less or later than the average prices of what they buy, they never fully make up the loss they suffered from the inflation.

Inflation, in brief, essentially involves a redistribution of real incomes. Those who benefit by it do so, and must do so, at the expense of others. The total losses through inflation offset the total gains. This creates class or group divisions. The victims of inflation resent the profiteers from inflation. Even the moderate gainers from inflation envy the bigger gainers. There is general recognition that the new distribution of income and wealth that goes on during an inflation is not the result of merit, effort, or productiveness but of luck, speculation, or political favoritism. It was in the tremendous German inflation of 1923 that the seeds of Nazism were sown.

SPECULATION VS. WORK
An inflation tends to demoralize those who gain by it as well as those who lose by it. They become used to “unearned increment.” They want to hold on to their relative gains. Those who have made money from speculation prefer to continue this way of making money to the former method of working for it. I remember once, early in 1929, a conversation between two friends, both of whom held prominent posts as book reviewers but both of whom were heavily in the stock market. They were exchanging stories about their profits. “Today your salary,” they agreed, “is just a tip.” People do not like to work full time just for a tip. The trend in an inflation is toward less work and production, more speculation and gambling.

The profiteers from inflation tend to spend freely, frivolously, and ostentatiously. This increases popular resentment. The incentive for ordinary saving, in the form of savings bank accounts, insurance, bonds, or other fixed-income obligations, tends to disappear. The spectacle of quick and easy returns increases temptation to corruption and crime.

‘A JUGGLING TRICK’
It is not merely that inflation breeds the gambling spirit and corruption and dishonesty in a nation. Inflation is itself an immoral act on the part of government. When modern governments inflate by increasing the paper money supply, directly or indirectly, they do in principle what kings once did when they clipped the coins. Diluting the money supply with paper is the moral equivalent of diluting the milk supply with water. For notwithstanding all the pious pretenses of governments that inflation is some evil visitation from without, inflation is practically always the result of deliberate governmental policy.

This was recognized in 1776 by Adam Smith in *The Wealth of Nations*. Though I have quoted the passage before, it bears repeating: “When national debts have once been accumulated to a certain degree, there is scarce, I believe, a single instance of their having been fairly and completely paid.” There is either “an avowed bankruptcy” or “a pretended payment.”

The pretended payment was inflation. The U.S. Government today is paying off in 47-cent dollars the debts it contracted in 1940. Adam Smith went on: “The honor of a state is surely very poorly provided for, when, in order to cover the disgrace of a real bankruptcy, it has recourse to a juggling trick of this kind, so easily seen through, and at the same time so extremely pernicious.”

---

The Big Brother State
May 23, 1960

More and more cynically, as the years go on, the social-security program is used as a political football. It is assumed that the votes of our older citizens are for sale to the highest bidder. Democrats suddenly push the Forand bill, openly for votes. The Administration, in panic, hastily slaps together a “substitute.”

I discussed the Forand bill in this place in *Newsweek* of April 25. In the same issue there was a special report of three pages on the measure. The report showed that a husband who began paying at the start of collections in 1937, when he was 42, and who retires this year at 65, has paid $1,100 in “premiums” but stands to get back an average of $30,000. Actuaries have figured that a maximum payment from 1937 to the end of 1959—$1,146—would actually finance a pension for a male at age 65 of about $7 a month.

Yet the 10 million people who are getting present windfall payments are treated as if they had somehow been victimized. Though a token increase in taxes would be placed by the Forand bill on people still working, those already receiving old-age pensions, who have not made even nominal contributions for medical care, would be entitled to receive medical benefits immediately.

DISGUISED RELIEF
The Administration bill was thrown together in haste. It is called “insurance,” but it is mere additional relief.
It cheats its supposed beneficiaries by forcing inflation and reducing the purchasing power of their pensions.

A leap into “medicare” may be a leap into socialized medicine; and a leap into socialized medicine may be a leap into the Big Brother State. ✯

Fruits of Appeasement

May 30, 1960

Grave as it is, the present international crisis has compensations. It can teach valuable lessons, if we still have time and wit to learn them.

It was unfortunate that a U-2 was downed 1,200 miles inside Russia. But as a result we now know that these planes have been flying over or deep into Russia for four years, that Russia has not previously had the equipment to detect them and bring them down, and that the piloted bomber is not obsolete. As Hanson Baldwin has put it: “It is safe to conclude that the Soviet air defenses today could not possibly fend off a major assault by SAC.” In short, our striking power is greater and Russian defensive power weaker than had been supposed.

This does not mean that Russia may not still have a substantial lead in long-range missiles. It is still true that our government, and the President, have made practically every diplomatic mistake in the book. It was a mistake to deny that the U-2 was on an espionage mission. It was an even bigger mistake to admit it, particularly after the denial. It was right to stress the need for such reconnaissance, but a mistake to do so without, at the same time, reciting Khrushchev's open threats to bury us, and the whole appalling record of Soviet espionage. It was a mistake to imply that we would continue espionage flights. It was then a greater mistake to promise to stop them. This record of blundering, denial, confession, reversal, and retreat has done incalculable harm to our moral prestige.

THE ROOT ERROR

But beneath all the errors of the last few weeks has been the root error of our whole policy vis-à-vis Russia over the last fifteen years. From the very beginning, when we agreed to accept a militarily untenable position in Berlin, we have followed toward the Russian despots the same policy of appeasement, concession, acquiescence in insults and humiliation that Britain followed so disastrously toward Hitler.

Pressure to follow this policy has come continuously from the political left. Though Khrushchev, like Stalin, has successively broken every promise and treaty the
moment it suited his ends to do so, though he feigned troop withdrawal from Hungary merely to give himself time to bring in more tanks to machine-gun patriots in the streets, we have been urged to negotiate with this monster as if he were a man of good faith, as if his word or his signature were worth something. The slogan of our appeasers has been “relaxation of tensions,” which, as Albert Wohlstetter has pointed out, is hard to distinguish from relaxing one’s guard.

END OF A DREAM
That we are all tense again is, in view of the actual threat we face, not a loss but a gain. We have been saved from a worthless agreement at the summit conference which might have caused us to live in a fool’s paradise while Russia built up for a devastating surprise attack. We should never have agreed to a summit conference. However we may try to disguise the matter, we agreed to that conference under the threat of Khrushchev to kick us out of Berlin. We should simply have told him we were there in accordance with our occupation rights and there was nothing to discuss. We could have told him that if he had any peaceful proposals to make our Ambassador in Moscow had plenipotentiary powers to discuss and convey them. We could have told him that if he wanted to relax tensions he could do so by a few simple deeds or restraints from deeds.

Let us hope that we are through with our summit-conference dreams. Our appeasement has only encouraged Khrushchev to recklessness. Let us at last launch a real propaganda counteroffensive of our own. Let us expose the nonsensical claims of Communist “economic growth” instead of swallowing them whole. Let us have the courage to defend capitalism, to explain the superiority of economic freedom. Instead of trying to call off the cold war, which we can’t, let us recognize at last that it is being relentlessly fought against us, by an enemy determined on world conquest; and that our only hope of peace and security is to accept the ideological challenge and to seek not a truce but a victory.

Growth of What We Owe
June 6, 1960

Our national debt is $289 billion. If there were any serious thought of ever paying this off, even in dollars of today’s buying power, it would present an appalling problem. If we could pay off an average of $2 billion every year, without interruption, and never incur another cent of debt, it would still take nearly a century and a half to wipe the slate clean.

Precisely because there is always danger of another war, it is merely common prudence and common sense to reduce the debt in time of peace or even cold war so that our national credit will be strong enough to meet the incalculable borrowing demands of a shooting war. Yet instead of reducing the debt in the fifteen years since the end of World War II, we have increased it, through deficits, by an average of $2 billion a year, so that it now stands $30 billion higher. And whenever the President talks of balancing the budget, not to speak of reducing the debt, he is accused of putting dollars and mere bookkeeping ahead of national needs.

HEAVY EVEN FOR US
Why is the debt problem treated so lightly? Probably the most frequent argument is that we are the richest country in the world, and can afford it. But the debt of the United States is one of the heaviest in the world even in proportion to our total wealth and resources.

I append below a table comparing the public debt of fifteen leading countries with the latest available figure of their annual tax revenues. The figures for the U.S. are for the current fiscal year. The figures for other countries are from the Statistical Yearbook of the United Nations for 1959. A few are for the 1959 fiscal year, and others earlier. The comparisons are in billions of the respective currencies of each country, except for France, Italy, and Finland, where they are in trillions. The figures in terms of currencies are therefore not comparable as between countries. What is significant and comparable is the percentage of each country’s debt to its own annual income from taxes. This I have calculated in the final column.

It will be seen that the U.S. public debt is not only by far the greatest in absolute terms but one of the heaviest even in relation to revenues.

It should not be assumed that the countries with the heaviest relative national debts are more blameworthy than others. The debts of the three great English-speaking countries are relatively highest not only because they were engaged in a great world war but because they have not reduced their relative debts to the same extent as some others by the swindling device of monetary inflation. But the comparisons do mean that their debt problem is still greater relatively than that of most other countries.

In fact, the relative debt burden of the United States is much greater than these comparisons imply. A year ago Secretary of the Treasury Anderson placed before the Senate Finance Committee a list of the long range commitments and contingent obligations of the Federal government in addition to the direct public debt. This total of contingent obligations alone came to $316 billion, or more than the direct debt itself. As
Politicians are very generous in “doing something for our senior citizens,” but none tells us at whose expense. The only merit of the Forand bill is that it emphasizes how flagrantly “social security” has been turned into a political football. The benefits have been increased in every election year—1950, 1952, 1954, 1956, and 1958. Even in the nonelection year 1959, 173 bills were offered in Congress to liberalize old-age benefits; so far this year 79 more have been introduced.

This political exploitation has been made possible largely by the semantic device of calling the old-age pensions “insurance,” which has been correctly described as “a stroke of promotional genius.” The term was made plausible by levying nominal “contributory” taxes. As Franklin D. Roosevelt once put it: “We put those payroll contributions there so as to give the contributors a legal, moral, and political right to collect their pensions and their unemployment benefits. With those taxes in there, no damn politician can ever scrap my social-security program.”

‘THEY PAID FOR IT’

The result today is that the overwhelming majority of commentators in the press, even conservatives, believe that the present recipients of old-age pensions “insurance,” which has been correctly described as “a stroke of promotional genius.” The term was made plausible by levying nominal “contributory” taxes. As Franklin D. Roosevelt once put it: “We put those payroll contributions there so as to give the contributors a legal, moral, and political right to collect their pensions and their unemployment benefits. With those taxes in there, no damn politician can ever scrap my social-security program.”

To add lightly to this liability now, by hastily passing a “medical care” bill for the aged, would be an act of reckless folly. ✫
now get, measured actuarially, is $10,000 to $22,000 greater than the value of the combined employee-employer social-security taxes paid. This difference is pure gift. Moreover, so far from its being related to need, the higher the recipient’s previous earnings, the greater the subsidy he gets!

**TIME FOR REAPPRAISAL**

As one actuary puts it privately: “Sometimes I think it would be a brilliant educational stroke to shame these advocates of the elimination of the work test by allowing them to get the amount of pension their taxes have financed and let them earn all they can between age 65 and 72, because that pension would really be about $5 a month. Then maybe some of the high-income groups and journalists would quit yelling about eliminating the work test, one of the few features that keeps the Social Security Act from exploding in our face.”

The Social Security Act cries for re-examination. It adds nothing to our national output of goods and services; it is merely a device for redistributing income. It gives heavy benefits to the present aged and loads the cost onto the present young. As Peterson declares: “There is probably no other legislative enactment that commits future generations to greater obligations than our Social Security Act.” Even the official actuaries of the system place its “unfunded liabilities” at some $350 billion. A former actuary, W. Rulon Williamson, places them in excess of $650 billion. The system promotes inflation. Its long-run tendency must be to discourage voluntary saving and self-provision and to increase dependency on government.

The minimum immediate need is to appoint a new advisory council to study the subject in every aspect.

**Inviting Inflation**

June 20, 1960

The reduction of the discount rate by the Federal Reserve Banks (of the twelve banks only Atlanta and Boston have yet to act) from 4 percent to 3½ percent, following the action of the Open Market Committee in easing money by supplying additional reserves to the commercial bank system, is a step of dubious wisdom.

It was not taken to combat a serious recession. The day before the action was announced, the First National City Bank of New York, in its June letter, had pointed out that: “Lagging industrial activity has not prevented the nation from enjoying record overall levels of employment and income. Industry is going ahead with plans for enlarged plant and equipment expenditures.

Construction activity is expanding seasonally. Retail trade, which picked up strongly with the arrival of spring, has been sustained at the higher level.” True, steel-mill operations have been low, but special conditions like this are not to be cured by cheaper money.

On the same day that the Federal Reserve lowering of discount rates was announced, the Federal Bank of West Germany made the opposite decision. It raised its discount rate from 4 to 5 percent, to combat inflation.

**GOLD PROBLEM REMAINS**

This emphasized the international problems raised by our own action. Our gold problem remains serious. Against our gold holdings of $19.4 billion, short-term liabilities to foreigners reported by American banks come to $19.6 billion. The deficit in our balance of payments, which reached $3.7 billion last year, is still running at an annual rate of some $2.5 billion.

The chief cause of the deficit in our balance of payments is domestic inflation, and consequent diminution of confidence in the dollar. This makes it imperative not only that we halt inflation, but that we follow policies calculated to assure both foreigners and our own citizens that it will stay halted. Yet even apart from the latest Federal Reserve action, we have been mainly doing the reverse. Railroad workers have been officially awarded pattern-setting inflationary wage increases. The Administration is pressing for a bigger foreign-aid program—though foreign aid, both directly and indirectly, tends to increase the deficit in our balance of payments. Higher defense expenditures may be unavoidable; but a Democratic Congress, with an eye on the campaign, is pushing increased “welfare” expenditures—more housing and school subsidies, aid to “distressed areas,” old-age medical-care programs.

**THE INTEREST CEILING**

One of the most disturbing developments has been the persistent refusal of Congress to remove the 42-year-old legal interest rate ceiling of 4¼ percent on bonds running for five years or more. Contrary to the professed aim of those who insist on keeping the ceiling, it actually increases the interest charges that the Federal government must pay. It prevents the Treasury experts from floating long term bonds when the going rate of interest is more than 4½ percent, and forces them to glut the market for short-term securities. More serious excessive issue of short-term securities, taken by the banks, tends to increase the supply of money and credit and hence is directly inflationary.

Under policies long followed by the Fed, the main importance of the discount rate has been that of a signal. The lower rate was a deliberate signal that money was going to be made cheaper. The stock market
immediately took the hint. In view of our balance of payments, the wisdom of that signal may be questioned. Banks, moreover, should pay a penalty rate for borrowing from the Federal Reserve—i.e., they should be obliged to pay more for reborrowing than they charge their own best customers. This sound rule has been ignored.

And Federal Reserve discretion has proved sadly wrong in the recent past. The Fed has yielded too easily to inflationary political pressures. It was not wise to have a discount rate of only ½ of 1 percent from 1942 to 1946; to keep the rate at 2 percent or less for the next nine years; to cut it from 3½ to as low as 1¼ percent in 1957 and 1958. We cannot indefinitely leave monetary control to bureaucratic discretion or whim. Ultimately we must return to the discipline of the full gold standard.

**Affluent Government**

June 27, 1960

In *Newsweek* of Feb. 22, I discussed the Galbraith-Lippmann-Dale thesis that though “private affluence grows . . . there is poverty in the public sector of the economy”; that people really don’t need all the money they bother to earn, that they spend it foolishly, and that therefore still more of it should be seized from them in taxes to be spent wisely by the politicians.

Now the First National City Bank of New York, in its June letter, looks for the statistical evidence on which this thesis rests. It finds it hard to come by. In the past generation (since 1927) the cash intake of the Federal government has multiplied twenty times, though disposable personal income (what people have left after taxes) has multiplied only four times. The Federal government today enjoys a bigger cash income than any other government on earth—a cool $100 billion a year. Whereas Federal, state and local governments together were spending less than 11 percent of our gross national product in the mid-1920s, and less than 21 percent in 1940, they were spending 31 percent in the mid-1950s.

**TAILFIN VS. WHEAT BIN**

The bank presents a table of government revenues and expenditures in the mid-1920s, 1940, and the late 1950s. I append comparisons of some of the leading items for the late 1950s and 1940 alone. The comparisons emphasize the absurdity of the charge that we are “starving” health or hospitals or education or social security. No country approaches our spending on education. Total public and private expenditures for education in the U.S. reached $22 billion in 1959, almost triple their level in 1949.

“The preachers of the affluent society doctrine,” says the bank, “are fond of using tailfins on automobiles as the ultimate symbol of unnecessary private extravagance. They are not so apt to mention the wheat bins holding surplus grain for which taxpayers have put up more than $3 billion . . . They say nothing about misconceived public-works products and the common abuses of social-welfare programs . . . ”

Despite the unparalleled extravagance of our Federal and local governments, it may be true that we sometimes spend too little for public purposes in some directions. More small parks and plazas in our cities, for example, as in the cities of Europe and Latin America, would not only make our cities pleasanter places to live in but would probably pay for themselves in higher property values. But it is precisely here that our government expenditures are comparatively modest and have increased least. Perhaps the answer is that a park is not a handout to any specific person or group. It is, bluntly, not a good vote-buying device, like farm subsidies or old-age benefits.

**PEOPLE UNFIT TO SPEND**

The Galbraith thesis may be reduced to this: That people are individually unfit to spend the money they themselves have earned, but somehow able to choose wisely the officeholders who will seize the money and spend it for them. This doctrine would deprive us, on the ground of our incompetence, of the freedom to spend our own incomes as we see fit. It assumes that people will continue to work to earn the same amounts or more, no matter how much their freedom to keep or spend their earnings is curtailed. It assumes that corporate income taxes of 52 percent, and personal income taxes rising to 91 percent, are not onerous enough, and that socialized spending will not in the least discourage individual earning and production.

The Galbraithians have belatedly discovered that free enterprise produces unparalleled affluence, but they still haven’t found out why.

WILSON’S SOLUTION

It would be his duty, he concluded, “to relieve the country of the perils of such a situation at once,” and if he could gain the consent of the persons involved, to “join the Vice President in resigning and thus open to Mr. Hughes the immediate succession to the Presidency. . . .

The whole country has long perceived, without knowing how to remedy, the extreme disadvantage of having to live for four months after an election under a party whose guidance has been rejected at the polls.”

Though the interregnum period has been shortened by the Twentieth Amendment, it has not been eliminated. The succession act of 1947 prevents the solution proposed by Wilson in 1916. Yet the dangers of that period have been incalculably increased both by the potentialities of nuclear-missile blackmail and warfare and by the propensity of the Communists—Russian, Chinese, Cuban, or what not—to exploit any interval of weakness, uncertainty, or indecision.

There is still time, in the remaining days of the present session, for Congress to eliminate these needless risks and dangers. No further tampering with the Constitution is necessary. All that is needed is the appropriate changes in the Presidential succession law. Congress could simply add a provision permitting an outgoing President to resign in favor of the President-elect.

NONPARTISAN REFORM

It need hardly be added that such a revised law should impose no economic penalties on resignation. It should provide that the salary of any President who resigned for this purpose would be continued until Jan. 20, just as if he had remained in office. The new law should also, preferably, give the Vice President and each outgoing congressman or senator the same right of immediate resignation in favor of his elected successor, under similar salary provisions.

There would be nothing obligatory about such resignations. But once legal provision were made for them, and the precedent set, both outgoing congressmen and outgoing Presidents would probably be eager to take advantage of it. Nobody likes the label or the status of a lame duck.

I made a similar proposal in Newsweek of Nov. 17 and Dec. 1, 1952, following the election of Mr. Eisenhower. But proposals of this sort are too often judged by the way in which they will immediately affect specific persons. These few weeks before the nominations, and when nobody is sure whether our next President will be a Republican or a Democrat, would seem to be an ideal time for Congress to make this

---

End the Interregnum

July 4, 1960

On Nov. 8 a new President will be elected; but he will not take office until Jan. 20. In this period of ten weeks, President Eisenhower, under the Twentieth Amendment to the Constitution (adopted in 1933) and the Presidential succession act of 1947, will retain the office and legal powers of the Presidency but will lose much of its authority and prestige.

This interregnum, which once lasted four months and still lasts two and a half, has always been potentially dangerous. On several occasions it has done incalculable harm. It was in the four months between the election and inauguration of Lincoln that seven states seceded from the Union and set up the Confederacy. In the interregnum after Franklin D. Roosevelt defeated Herbert Hoover in 1932 business confidence deteriorated rapidly; insolvencies, bank closings, and unemployment mounted. Roosevelt still lacked power to act; Hoover then lacked the public support to lead.

The problem was posed also in 1916. “Again and again,” wrote President Wilson to Secretary Lansing in that year, “the question has arisen in my mind, what would it be my duty to do were Mr. Hughes to be elected? Four months would elapse before he could take charge of the affairs of the government, and during those four months I would be without such moral backing from the nation as would be necessary to steady and control our relations with other governments. . . . Such a situation would be fraught with the gravest dangers.”

*End the Interregnum*
Why Our Debt Grows
July 11, 1960

We ended the fiscal year 1960 with a national debt of $286 billion. In addition to this direct and avowed debt, our government has contingent obligations of some $316 billion, not including unfunded social-security liabilities of $350 billion or perhaps $650 billion, depending on the assumptions on which they are calculated. Our national debt, including contingent liabilities, is not only the highest in the world in absolute amount but the highest in relation to annual government revenues.

What would we think of the prudence of a man with a yearly income of $7,900 who owed $29,000 and had endorsed, in addition, IOU’s of relatives totaling $31,600 or even $76,000 more? Multiply these figures by 10 million and you get the position of our government.

It has long been fashionable to say that the maxims of fiscal conduct that apply to an individual do not apply to a nation. One facile argument, brought forward in the early days of the New Deal, is that the size of the national debt does not matter because “we owe it to ourselves.” Though this argument was put forward as a new discovery, it was really very ancient. In 1740, a generation even before the publication of Adam Smith’s Wealth of Nations, Smith’s countryman, the philosopher David Hume, in a remarkable essay, “Of Public Credit,” dealt with it specifically:

“We have indeed been told that the public is no weaker upon account of its debts, since they are mostly due among ourselves and bring as much property to one as they take from another. It is like transferring money from the right hand to the left; which leaves the person neither richer nor poorer than before. Such loose reasoning and specious comparisons will always pass where we judge not upon principles.”

DESTRUCTIVE TAXES
Hume went on to point out that the people who pay the taxes are not necessarily the same as those who receive the interest, and certainly never in the same proportion. Taxes always fall upon the most productive people in the community. “If all our present taxes be mortgaged, must we not invent new ones? And may not this matter be carried to a length that is ruinous and destructive?”

This was not the only “modern” fallacy that Hume answered. It was only last August that Britain’s official Radcliffe report announced that a big public debt “gives strength” to a nation. Yet more than two centuries ago Hume was writing: “What, then, shall we say to the new paradox, that public incumbrances are of themselves advantageous, independent of the necessity of contracting them; and that any state, even though it were not pressed by a foreign enemy, could not possibly have embraced a wiser expedient for promoting commerce and riches, than to create funds and debts and taxes without limitation? Reasonings such as these might naturally have passed for trials of wit among rhetoricians, like the panegyrics on folly and a fever, on Busiris and Nero, had we not seen such absurd maxims patronized by great ministers, and by a whole party among us.”

A CAUSE OF INFLATION
Hume proceeded to point out not only that interest payments on the debt must raise taxes, but that “public securities are with us become a kind of money . . . a kind of paper credit,” with “all the disadvantages attending that species of money.” In brief, he saw that debt led to inflation.

And Hume also recognized clearly that the persistent political pressures were all on the side of incurring debt rather than repaying it. “It is very tempting to a minister to employ such an expedient as enables him to make a great figure during his administration, without overburdening the people with taxes, or exciting any immediate clamors against himself. The practice, therefore, of contracting debt, will almost infallibly be abused in every government. It would scarcely be more imprudent to give a prodigal son a credit in every bank-er’s shop in London, than to empower a statesman to draw bills, in this manner, upon posterity.”

Hume was not too hopeful regarding the future. “I must confess that there is a strange supineness, from long custom, creeped into all ranks of men, with regard to public debts.”

The New Collectivism
July 18, 1960

Though the old doctrinaire socialism “public ownership and operation of the means of production” is in dispute in the Western world, a new brand of socialism is now on sale. It does not insist on the socialization of production but on the socialization of consumption.

The New Socialists—or perhaps they should be called the New Collectivists—are at last willing to admit that capitalism, private enterprise, is incomparably more
productive than socialism. But they don’t like what it produces. For under capitalism, it seems, people spend the money they earn in foolish and trivial ways and show dreadful taste. The government, therefore, the bureaucrats, the “public servants,” should step in and seize this money from them by imposing far more drastic taxes than the piddling sums people pay today, and spend the money not on the things that people individually want, but on what they would want if they were competent to know their own interest.

The chief spokesman for this New Collectivism is J. Kenneth Galbraith, but he has been rapidly acquiring disciples, of whom Charles F. Darlington, author of a piece in The New York Times Magazine of Sunday, July 3, seems to be typical. His thesis is stated in his second paragraph: “Nations, like individuals, can make vices of their virtues. Private enterprise is a virtue as a successful method of organizing society for production, but it takes on the color of a vice when, as today in the United States, it is widely regarded as the ideal of society. It is a means to a good society, but we are making it society’s goal.”

MEANS AND ENDS
The title of Darlington’s piece is “Not the Goal, Only the Means.” This is a false antithesis. Many things may be both means and ends. An outstanding example is liberty. Liberty is an indispensable means of accomplishing all our other purposes; but it is also an end in itself. Lord Acton went so far as to say that liberty “is itself the highest political end.”

Now capitalism, or private enterprise, is simply another name for liberty in the economic sphere. It leaves the Individual free to produce what he wants and free to consume what he wants. It allows him to keep the fruits of his labor. It protects him in that right by the institution of private property. Private enterprise is not merely a means; it is not simply a remarkable gadget for production; it is also an end in itself. It is the system of economic liberty. Once economic liberty is abridged or destroyed all other liberty is abridged or destroyed with it. “Power over a man’s subsistence,” said Alexander Hamilton, “is power over his will.” The freedom to spend is only a little less important than the freedom to earn.

FREEDOM REDEFINED
Darlington wishes to deprive the individual of this freedom. To make his argument seem plausible he has to redefine freedom, individualism, private enterprise, and government. “Freedom, above all for a great people, is found in doing what is morally right.” Who is to decide what is morally right? Darlington replies that “we” (presumably he and Galbraith) “know what is right . . . We know that it is right for the rich to succor the poor . . . at home and abroad.” And this can be interpreted to mean that the industrious and efficient must be drastically taxed to compel them to support the shiftless and inefficient at home and socialist experiments abroad.

The “mainspring” of private enterprise is “self-interest, which is highly useful in getting things done, but self-interest idealized approaches selfishness.” Here is another basic confusion. Private enterprise does leave people free to pursue their own purposes. But are these necessarily selfish purposes? Is a man who works to support a large family and send his children to college acting selfishly? Are people selfish just because they are free? And if we compel them, through the government apparatus of coercion, to support the purposes of the politicians in power, does this make them unselfish?

The essence of collectivism is to belittle the purposes of the individual in favor of those of some mystic collectivity. The “national purpose” is no different from the purposes of the individuals who compose the nation.

Evil of Import Quotas
July 25, 1960

So far as immediate policy is concerned, Congress was justified in granting and the President in using discretionary power to slash the Cuban sugar quota. The President, in fact, should have asked and Congress should have granted even wider discretionary powers many months ago, when Castro first started seizing American property and vilifying us.

As it is, our timidity, our declared fear of doing anything to injure “the Cuban people,” our failure even to stop subsidizing the Cuban economy, led Castro to conclude that he could go further and further with impunity. Our action came only after 2,380,000 of Cuba’s 3,120,000 quota of short tons for 1960 had already been certified for entry. The President had to cut 95 percent, or all but 40,000 tons of the 740,000 ton remainder. By that time Castro had burnt too many bridges behind him. Face-saving forced him to go further.

It is gratifying that when the President did act he acted firmly, and refused to allow himself to be bluffed by the Khrushchev threats. It is the duty of every nation to protect the lives, persons, and property of its citizens abroad. We should take whatever economic or diplomatic countermeasures our own interests require.

EXORBITANT COST
It is disheartening, however, to find that the only way the Administration can think of to protect our rights
and to “counter Communism” in Latin America is to plan a still bigger “economic assistance” program there. This is getting to be hard to distinguish from an uneasy payment of tribute. The billions we have already given away globally have failed either to halt Communism or to win us reliable allies.

As for our long-run policy concerning sugar, what is required is not a readjustment of quotas but abolition of the quota system. That system goes back to the depression-inspired Jones-Costigan Act of 1934. The purpose of this legislation has been to “stabilize” the price of sugar and to protect our domestic producers. It has done so at an exorbitant cost.

An import-quota system must be discriminatory as between exporting nations. It breeds resentment in all but the most favored. Ironically, our sugar-quota system was set up especially to favor Cuba which, in addition to being allotted 96 percent of all foreign imports (apart from the special case of the Philippines), was granted a tariff preference and got from us a premium of 2 cents a pound above the world market. Now that we have cut that quota, Castro can plausibly claim that we are discriminating against Cuba.

We pay a heavy price to subsidize a domestic sugar production equal to only about a fourth of our total sugar consumption. In order to make our import-quota system work we also enforce a quota for every individual domestic producer.

**TARIFF LESS HARMFUL**

I have no wish to advocate tariffs. But if we want to continue to protect our domestic sugar producers, we can do it just as effectively through a higher tariff as through a quota system, without discrimination between foreign countries, with infinitely less red tape, and without authoritarian production controls at home. A uniform tariff would allow foreign countries to sell to us in proportion to their efficiency and costs. It would also allow our domestic producers to compete with each other on the basis of their individual efficiency and costs. Though our consumers would have to pay the duty in the price, most of it would go to the government in revenues, and (unless its total expenditures were increased) come off their taxes somewhere else.

A tariff is at least compatible with the continuance of an otherwise free economy; a quota system is not. Our regimentation of the sugar market has set an evil precedent. Practically everything that is wrong with our import-quota system in sugar is equally wrong with our recent import-quota system in oil. Here again, everything that a quota system accomplishes in holding up the price or holding down supply (assuming either aim to be desirable) could be accomplished much more flexibly and efficiently by a tariff, which would at least permit volume and cost competition within the domestic market.

---

**The Total Welfare State**

August 1, 1960

The Democratic platform reads, at times, more like a parody than a serious document. It states mere wishes or problems as if it were stating solutions. It favors “an enduring peace . . . ending nuclear tests under workable safeguards . . . preventing surprise attack.” If you ask how it proposes to achieve these goals, why, it will set up “a national peace agency”!

When it comes to economic policy the platform drops all pretense to consistency or responsibility. It promises to “unshackle” American enterprise apparently by imposing new controls in every direction. We are told that “our economy can and must grow at an average rate of 5 percent annually.” Why stop at 5 percent? Why not 6 percent? Or if we are only talking about “goals” why not 50 percent? The platform framers should recall Shakespeare: “If to do were easy as to know what were good to do, chapels had been churches, and poor men’s cottages princes’ palaces.”

The Democrats “pledge” themselves “to policies that will achieve this goal without inflation.” However, “as the first step in speeding economic growth,” they demand an inflationary cheap-money policy. They would try to offset their own monetary inflation, they strongly imply, by the reimposition of price controls.

**‘THE RIGHT TO A JOB’**

The platform presents an “economic bill of rights.” This includes the “right” not only to a job but to a “remunerative” job. Nothing whatever is said about the diligence or qualifications of the worker, or about who is to be forced to supply the job, if it doesn’t exist. A new WPA?

“Full employment,” which has become a synonym for a policy of inflation, is made “a paramount objective.” “The right to a job,” we are told, “requires the restoration of full support for collective bargaining.” But it does not require state right-to-work laws. These are to be forbidden.

“Every farmer” (Why just the farmer? Why not everybody in every line?) is guaranteed “the right . . . to raise and sell his products at a return which will give him and his family a decent living.” Nothing is said about the need for his particular crop. Nor are we told who is to be forced to buy his crop at a profit above his
cost, however high that happens to be. There is to be “positive action to raise farm income to full parity levels.” As more surpluses pile up in our warehouses they are to be treated “not as a liability but as a national asset.”

Everyone has the “right” not only to a home but to a “decent” home, even to “recreation”; and, of course, “the right to adequate medical care.” For the cities, a new Democratic Administration will help “clear their slums, dispose of their sewage, educate their children, transport suburban commuters . . . and combat juvenile delinquency.” No family or city will need to do anything for itself. As the French economist Bastiat put it more than a century ago: “The state is the great fiction by which everybody tries to live at the expense of everybody.”

ALL SUBSIDIZE ALL
After the Democratic platform pledges new and bigger expenditures in every direction, it declares with bland effrontery that “these needs can be met with a balanced budget, with no increase in present tax rates, and with some surplus for the gradual reduction of our national debt.” However, “if . . . the unfolding demands of the new decade . . . cannot be fulfilled without higher taxes,” the Democrats promise to impose them.

What we have, in sum, is a pledge to impose a total welfare state.

The Democratic Presidential candidate, after ordering and accepting all these sweeping promises of security, with no mention of any return by the individual in effort or obligation, then declared, in baffling contradiction, that he was appealing to the American people’s “pride, not their pocketbook,” and promising “more sacrifice, instead of more security.” More sacrifice just for taxpayers?

But he has yet to reveal the details of his personal platform. So far, its chief plank might be summed up by paraphrasing the Lord Chancellor in “Iolanthe”:

Youth is the sole embodiment
Of everything that’s excellent.
It alone discerns the truth,
And I, my friends, embody Youth. ⚫

A Circus or a Session?
August 8, 1960

The country can look forward to the forthcoming session of Congress only with profound misgiving. Its temper was foreshadowed by the action of Congress on July 1 in passing over the President’s veto a Federal pay increase of $764 million a year, correctly described by Mr. Eisenhower as “indefensible by any light.” A few routine appropriation bills may need to be passed. But the session was planned mainly to push big-spending or statist measures as part of the Democratic campaign.

There are five of these measures: A school-construction bill, a housing bill, the $1.25 minimum wage, a farm bill, and medical care for the aged. Not one of these is urgent. All would do harm. The school-construction bill would pour Federal funds and spread Federal power into an area which has been and ought to be the sole responsibility of the localities. Socialized housing, invading the field of private enterprise, leads directly toward the total welfare state.

As for the minimum wage, if money wages could be raised by government fiat, without loss of real purchasing power and without causing unemployment, there would be no point in stopping at $1.25 an hour. The higher minimum may raise some persons, hitherto receiving less, to that figure. But it is certain to throw others out of employment altogether unless the purchasing power of the dollar is further diluted.

INVERTED PYRAMID
The proposed farm bill will merely make the farm fiasco worse. It will increase the unmanageable farm surpluses that already cost us more than $1,000 a minute just to store. The medical care proposals are being hastily piled on top of a tremendous inverted pyramid of claims with a contemptuous disregard for ultimate costs or a cynical pretense that a nominal increase in tax contributions will “pay for” them. What the Social Security Act desperately needs, before still more unmeasured obligations are blindly assumed, is reexamination by a new advisory council.

The new session will be supercharged with partisan emotion, and create opportunities for infinite political mischief. The Democratic strategy will be to pass measures offering huge handouts to pressure groups. If these are vetoed by the President, the Republicans will be blamed for their defeat. If the measures become law, the Democrats hope to grab the credit. And in the Republican me-too mood, the prospects of defeating the measures are not bright. The country seems likely to take a further plunge into welfare socialism, big spending, and inflation.

And yet, if either party cared to seize it, the new session also provides an opportunity for responsible statesmanship and constructive achievement. I will mention only two items.

TO AVOID PARALYSIS
The President ought to renew his plea for a removal of the 42-year-old legal interest-rate ceiling of 4 percent on bonds running for five years or more. The effect of this ceiling is to compel excessive issues of short term
Would more massive payments do anything but pile up more massive surpluses?

The best farm program would be one to end “farm programs.” The major farm problem today is that created by the government itself.

SUPPORTS CAUSE SURPLUS
The constantly repeated contention that present crop surpluses are the result of a “technological revolution” on the farms is untrue. These chronic surpluses have occurred only in the crops under which the government has struck price supports. The crop surpluses were built up by setting government price floors higher than the prices farmers could obtain in a free market. This caused the farmers to plant more than otherwise or to pour in more fertilizer to get more per acre. The higher prices also cut down the market demand. If support prices were stopped, farmers would raise less and consumers would buy more. Surpluses would cease to pile up.

What about the surpluses that already exist? That problem too could be solved in a single growing season. The government need merely sell back to the farmers themselves the surpluses it acquired from them. Before the new planting season for each crop of which the government holds a surplus, it could offer each grower his prorated share (figured on his previous acreage allotment) at a price set below the expected world market price and below the farmers’ own average cost of production. The government might issue to each farmer transferable certificates entitling the bearer to buy so many pounds of cotton or bushels of wheat at this bargain price. The farmer could then either turn in the certificates with the required amount of cash if he wanted to buy the crop to hold for later resale, or he could sell the certificates themselves in the open market. They would naturally sell at a price equal to the amount by which the free market price exceeded the low purchase price set on government holdings.

OPERATION DISPOSAL
Few farmers, except those with unusually low costs, would be foolish enough to plant more of that crop that year. They would know in advance that it would not pay them. From their sale of certificates they would get an average of cotton or bushels of wheat at this bargain price. The farmer could then either turn in the certificates with the required amount of cash if he wanted to buy the crop to hold for later resale, or he could sell the certificates themselves in the open market. They would naturally sell at a price equal to the amount by which the free market price exceeded the low purchase price set on government holdings.

To End Farm Surpluses
August 15, 1960
The details of Nixon’s farm program have not yet been revealed, but his announcement of July 31 did not sound promising. He repudiated Secretary Benson, who has tried to move toward sense and sanity. “We must develop a massive program,” said Nixon, “which is not concerned with budgetary costs year by year.” As the government had put the farmer in his present fix by its wartime policies, “obviously the government must pay the cost of getting him out.”

This “new” farm program may turn out to be a serious political blunder, of which Kennedy has already taken advantage. Nixon cannot repudiate the record of the Eisenhower Administration in a major field. And an airy dismissal of “budgetary costs” would undermine his own main case against this year’s Democratic platform.

In any event the foreshadowed program sounds like a major economic error. What does Nixon mean by a “massive” program? Isn’t a cost to the Federal government of $5.5 billion a year, mainly to pile up unsalable crop surpluses, massive enough to suit any taxpayer?
current rate for prime commercial loans in this country is among the lowest in the world.

Though the President spoke against “reckless spending schemes,” he came out, on every specific issue, on the side of more spending. This applied to foreign aid, “food for the hungry,” medical aid for the aged, and assistance to depressed areas.

Suppose we test one or two of these programs by the principles of fiscal responsibility or free enterprise. The long-run effect of the ever-expanding program for foreign economic aid must be to slow up national and world economic growth, not to accelerate it. An “underdeveloped” country grows more soundly and rapidly when it seeks to attract foreign and domestic private capital by assuring protection of person and property, permitting withdrawal of earnings at all times, and giving assurances against vexatious restrictions or harassment, burdensome or uncertain taxation, expropriation, and making or keeping its currency inconvertible.

**SUBSIDIZED SOCIALISM**

But when a foreign country can get loans or gifts from our government without giving such assurances, it will not bother to give them. It will launch instead upon grandiose socialistic projects more calculated to sound good in speeches or to appeal to national vanity than to repay costs. Our “economic” foreign-aid program subsidizes and expands world socialism, and tends to deflect capital from constructive to wasteful use.

In special cases, when hunger follows some calamity outside the control of the country affected, aid from outside is more than justified. But as a regular established giveaway program it is shortsighted. It becomes an excuse to make uneconomic crop surpluses permanent. A country like the United States, which raises only an eighth of the world’s food supply, cannot hope to feed the world. When we dump food on another nation at less than world prices we merely discourage growers in that nation, or in still other nations, from raising the food they are physically and economically capable of raising. Such a program will not in the long run encourage either self-help or a net increase in the world’s food supply.

Apart from a strong military posture, the most important contribution the United States can make to the world’s economic strength and stability is to maintain confidence in the dollar. Yet, broadly speaking, the Republicans are giving only perfunctory attention to that goal, while the Democrats are ignoring it altogether.
How to Beat Inflation
August 29, 1960

Between them, the present session of Congress and the Federal Reserve seem to be working toward cheaper money and more inflation.

From time to time I get letters from readers asking how they can protect themselves from the eroding effects of inflation on their savings. It is possible to answer this question in a way that is helpful to a particular individual; it is not possible to answer it in a way helpful to everyone. What is still not widely understood is that inflation can benefit one man only at the expense of another. The price of what you have to sell can go up more or faster than the average price of what you have to buy only if the price of what other people have to sell to you goes up less or slower than the price of what they have to buy from you. Roughly speaking, one-half of the population can gain from inflation only at the expense of the other half. The political appeal of inflation comes from fostering the illusion in the great majority of voters that they will somehow get the better of the swindle, and profit at the expense of a few unidentified victims.

The pressure groups for inflation do vaguely or explicitly understand this. An inflation is initiated or continued in the belief that it will benefit debtors at the expense of creditors, or exporters at the expense of importers, or workers at the expense of employers, or farmers at the expense of city dwellers, or the old at the expense of the young, or this generation at the expense of the next. But what is certain is that everybody cannot get rich at the expense of everybody else. There is no magic in paper money.

HE WHO ACTS FIRST
It is true that an alert individual can do certain things to protect himself from the eroding effects of inflation on the value of his dollars but only if he acts both sooner and more wisely than the majority.

Even this used to be easier than it is today. In the German hyperinflation which culminated in 1923, a German could always buy American dollars, at the current rate in marks, as soon as his monthly, weekly, or daily income above current needs became available to him. But Americans today have no completely safe major foreign currency to turn to. They are prohibited by law from buying and holding gold at home. If they buy gold abroad, they face the risk that our government (following the domestic precedent of 1933) may force them to turn in their holdings at an arbitrary value in paper dollars.

They are left, then, in practice, with the choice of buying real estate, common stocks, cars, TV sets, paintings, Oriental rugs, jewelry—any equity or luxury that is not dollars or a fixed obligation payable in dollars. They are forced, in short, into extravagance and speculation.

MUTUAL FUNDS
An inexpert speculator may, of course, turn to investment trusts or mutual funds which diversify his investment for him and protect him to some extent against his own lack of expert knowledge. But always, the people who buy first, or at lower prices, can profit or protect themselves only at the expense of those who buy later or at the top.

It is impossible, in short, for everybody to protect himself against inflation. The early minority can do so only at the expense of the late-comers. And a scramble to get out of money and into things only intensifies the inflation, only increases and accelerates the rise of prices or the fall of the dollar.

This last result must follow whether individuals try to protect themselves against inflation by individual action or through such group devices as escalator wage clauses or escalator bond clauses. Such schemes accelerate inflation. Neither prices nor wages go up uniformly. Suppose some wages and prices have gone up 100 percent, and other wages and prices not at all. The average increase may be 50 percent. If cost-of-living escalator clauses are prevalent, and the wages or prices that have not gone up are raised 50 percent, the average wage or price level may be raised by that act itself to 75 percent. And so on.

There is only one solution only one sure hedge against inflation that can protect everybody: Don't have the inflation. If you have it, halt it as soon as possible. ✽

Is ‘Deflation’ Likely?
September 5, 1960

“Not inflation, but deflation is the new official worry.”

Such is the explanation now offered in some Washington reports for the action of the Federal Reserve authorities in lowering reserve requirements to add $3.6 billion to the money–and–credit–creating powers of the nation's banks, in twice reducing the discount rate within three months, and in forcing down the prime lending rate. It is also put forward as the explanation of the increased spending programs in Congress, and pressure for medical care for the aged, higher farm price supports, and a higher minimum wage.
The slump in steel output, in construction, in appliance sales, the squeeze on profit margins, the relatively high levels of inventories and unemployment, are among evidences cited for the “deflation” that is feared.

There is nothing new in this fear. If one looks back over the record of the last twenty years, one finds a steady progress of inflation, with the total supply of bank deposits and currency up 270 percent between 1939 and 1959, and consequently with wholesale prices up 136 percent, and consumer prices up 113 percent, for the same period (see this column May 2).

Yet all during this twenty-year period it may be doubted whether a single week went by without at least somebody in Congress or the press expressing the fear that “deflation” might be just around the corner unless the economy were given a fresh inflationary shot in the arm.

MISUSE OF TERMS
These fears, to the extent that they are real, rest upon a misuse of terms and a confusion of thought. There has never been the slightest danger of “deflation” since 1933 in the true sense of a major contraction in the supply of money and bank deposits. Inflation means an increase in the supply of money and bank credit. The rise of commodity prices and living costs which almost inevitably follows is not the inflation but the consequence of the inflation. But by a still further extension of the two terms, any prosperity is called “inflation” and any recession or unemployment is identified with “deflation.”

This can lead to endless confusion. For, as illustrated in Germany and elsewhere since World War I, a sharp business recession and heavy unemployment can occur in the very midst even of a hyper-inflation.

Inflation works its apparent magic only in the short run, and only as long as final prices are rising faster than wage rates and other costs, so that employment and activity are stimulated by attractive profit margins or prospective profit margins. But if wage rates, taxes, or other costs rise as fast as or faster than selling prices, and start squeezing profit margins or inflicting losses on marginal firms, activity will fall and unemployment rise.

MONETARY MANAGERS
A new hike in minimum wage rates, and an extension of coverage, with 4 million already unemployed, would not be very intelligent. Its tendency would be to increase unemployment among the very groups it is ostensibly designed to help unless, of course, the purchasing power of the higher money wage rates were reduced by another dose of inflation.

What Congress and the Federal Reserve are in effect saying is that no recession is ever to be corrected by individual wage or price adjustments, but only by further doses of inflation to boost the whole price level. In fact, instead of there being any correction of uneco-nomically high wage rates in a recession, wage rates are to be hiked still higher.

It remains to be seen whether present inflationary policies will have their intended economic and political effects. They will surely do nothing to restore our export markets, to correct our adverse balance of payments, or to increase foreign confidence in the dollar. They are more likely to induce a further drain on gold stocks already slightly exceeded by our short-term liabilities to foreigners.

The recent actions by the Federal Reserve authorities not only seem unwise, they raise once more the whole question of whether monetary managers can be trusted, in the long run, to use wide discretionary powers wisely or whether restoration of a full gold standard, governed by strict and quasi-automatic rules, would not be preferable after all.

Sugar, Fares, Picketing
September 12, 1960

Import quotas: Our foreign policy becomes more and more incomprehensible. Castro seizes more than $800 million of American property in Cuba, arrests our citizens, engages daily in a calculated hate America campaign, and we dare not break off relations with him. Then we break off relations with Trujillo, who had not seized American property, arrested our citizens, whipped-up a hate American campaign, or invited the Russians in.

We explain that Trujillo is a “dictator” as if Castro were not a far more dangerous one, so far as our interests are concerned, and as if we were not recognizing scores of dictators all over the world, including Khrushchev himself. We continue to recognize Khrushchev though he shoots down our planes and murders our aviators above neutral waters.

No one in the Administration has seemed to consider what the long-run consequences are going to be of our strange sugar policy. Who is to be allowed to send sugar to us, and exactly how much, and whether those who sell to us are to be paid a bounty over the world price, is to be decided by Congressional fiat or the day-to-day whim of the Administration. The U.S. is still committed to pay the Castro government a subsidy of about $96 million a year above the world price for the 2.4 million tons of sugar remaining in the Cuban quota.
The resentment and economic disruption we are going to cause by this discrimination can easily be foreseen. The first step toward economic sanity and freedom would be to abolish entirely the whole sugar import-quota system and to substitute a uniform tariff. This would also allow us to abolish domestic quotas.

**Socialist ‘Profit’**

“City Transit Nets $5 Million Profit” ran the headline. What a triumph for municipal ownership and operation! At last an answer to the critics of local socialism. For though the New York City subways had tripled their fares since the city took them over, they could not seem to show anything but an operating deficit. The 1958–59 operations, for example, had shown a deficit of $10,184,316.

How has the new miracle happened? Well, the Transit Authority concedes that it did receive a little help. There were subsidies from the city totaling $18,604,499. Without them the city’s transit lines would have shown a deficit in the fiscal year ended June 30 last of $13,391,570. But such a detail ought not to be allowed to obscure the great fact that the Transit Authority’s books did show a “profit” of $5,212,928. Could private enterprise, paying heavy taxes instead of getting them, have done as well?

**Why Labor Chaos**

If you want to know why we have labor violence, if you want to know why an employer has no way of settling a strike except by giving in to the demands of the union, if you want to know why the government itself is impotent to halt what it calls “cost-push” inflation, you have merely to read the decision of the National Labor Relations Board holding the Kohler Co. guilty of prolonging by unfair labor practices the six-year-old strike by the United Auto Workers Union.

The board admits that the union engaged in illegal “belly-to-back” mass picketing and violence after the walkout began on April 5, 1954. But the board apparently regarded this violence as trivial compared with the unfair labor practice engaged in by Kohler. And what was this unfair labor practice? Why, the company granted a wage increase of 3 cents an hour to nonstrikers “without bargaining with the union.”

So the board ordered Kohler to rehire all the strikers (except 77) who had not been permanently replaced prior to June 1, 1954, the day of the wicked wage increase, provided they applied for reinstatement. The union estimates that this might mean replacing 1,700 to 2,000 of the total 2,500 that the company employs. And the board specifically ordered that this should be done even if it required discharge of the replacements, some of whom have now acquired six years seniority with Kohler.

Whatever “collective bargaining” is now interpreted to mean, it obviously does not mean free bargaining. The employer, or the non-union worker, has no bargaining freedom that any one is bound to respect.

**Legal Strike Incentives**

September 19, 1960

It can be hazardous to write in a weekly magazine about a strike that could be settled at any hour of any day. But it seems reasonably safe to predict that the Pennsylvania Railroad strike settlement, when it comes, will be in favor of the strikers and distinctly not in favor of either the railroad or the traveling public. This will happen for the same reason that the 1959 steel strike and the recent Long Island Rail Road strike were settled in favor of the strikers and not in favor of the consumers or commuters. That reason is the existence of a set of Federal labor laws that make it all but impossible to settle a strike except by giving in to the demands of the union.

All during the long steel strike the Administration kept repeating that it was not “interfering” and would not “interfere.” Its protestations were made sincerely. They were accepted at face value by most of the press. Yet both before and during that strike the Federal government was in fact interfering every day through laws laying down one-sided rules of the game that it had enacted over the past 30 years notably the Norris-LaGuardia and Wagner-Taft-Hartley acts.

**ONE-SIDED LAWS**

These set up a situation in which the employers were forced to negotiate with the strike leaders, no matter how unreasonable the latter’s demands might be, for the simple reason that the law in effect compelled this and forbade the employers to negotiate with anybody else. And the strikers could throw mass picket lines around the steel mills with impunity, and physically prevent anybody else from applying for the jobs that they had voluntarily vacated, while the Norris-LaGuardia Act effectively denied the employers injunctive relief.

True, the railroad labor situation is somewhat different, owing to the fact that Congress (never troubled about consistency) has written and retained a different law for railroad labor than for other labor. Under the Railway Labor Act of 1926, elaborate machinery is set up by which no strike can take place until the President
Democratic orators both implied and stated that to vote for a Republican President would be to vote for a return to depression, mass unemployment, bank runs, mortgage foreclosures, apple selling, and bread lines. A Republican President was eventually elected, and none of these things happened. On the contrary, our present economic fetish, the gross national product, is now at the highest level on record.

This would be embarrassing for Democratic orators today had not a new slogan, Economic Growth, come to their rescue. Sure, the economy grows; sure, everybody’s income gets higher every year, automatically; you can hardly prevent it. But our economic “rate of growth” just isn’t what it ought to be. The Republicans are holding it down, because they lack vision and are cold-blooded. Elect us to office, and watch things hum!

Anybody who thinks this is a caricature need merely read the full text of Senator Kennedy’s Labor Day speech in Detroit. He was very specific: “With an average rate of growth in this country every workingman in the last eight years would have received $7,000 more than he has received for an education, or a new house, or a rainy day, or his old age. With a really healthy rate of growth this country can have full employment for all who want a job.” How to get this $7,000 and this rate of growth? Simple: “Elect an administration that will do something about it.”

**How to Retard Growth**

The senator didn’t bother to explain just what this “something” would be. The only specific hint he threw out is that he would halt “this high-interest-rate policy.” But American interest rates today are among the lowest in the world. And the chief effect of the cheap-money policy under the New and Fair Deals was to produce or aggravate an inflation that cut the purchasing power of the dollar in half.

Kennedy never mentioned any policy that really might increase our rate of growth such as less drastic graduated income taxes to give more incentive to production, or sensible tax allowances for depreciation to encourage more new capital investment by corporations. Perhaps the crowning irony of the whole “rate of growth” agitation is that the people who insist most on faster growth demand policies least likely to promote it.

**Vote for Me and $7,000**

September 26, 1960

All through the twenty years of the Roosevelt and Truman Administrations, from 1933 to 1952, Democratic orators both implied and stated that to vote for a Republican President would be to vote for a return to depression, mass unemployment, bank runs, mortgage foreclosures, apple selling, and bread lines. A Republican President was eventually elected, and none of these things happened. On the contrary, our present economic fetish, the gross national product, is now at the highest level on record.

This would be embarrassing for Democratic orators today had not a new slogan, Economic Growth, come to their rescue. Sure, the economy grows; sure, everybody’s income gets higher every year, automatically; you can hardly prevent it. But our economic “rate of growth” just isn’t what it ought to be. The Republicans are holding it down, because they lack vision and are cold-blooded. Elect us to office, and watch things hum!

Anybody who thinks this is a caricature need merely read the full text of Senator Kennedy’s Labor Day speech in Detroit. He was very specific: “With an average rate of growth in this country every workingman in the last eight years would have received $7,000 more than he has received for an education, or a new house, or a rainy day, or his old age. With a really healthy rate of growth this country can have full employment for all who want a job.” How to get this $7,000 and this rate of growth? Simple: “Elect an administration that will do something about it.”

**How to Retard Growth**

The senator didn’t bother to explain just what this “something” would be. The only specific hint he threw out is that he would halt “this high-interest-rate policy.” But American interest rates today are among the lowest in the world. And the chief effect of the cheap-money policy under the New and Fair Deals was to produce or aggravate an inflation that cut the purchasing power of the dollar in half.

Kennedy never mentioned any policy that really might increase our rate of growth such as less drastic graduated income taxes to give more incentive to production, or sensible tax allowances for depreciation to encourage more new capital investment by corporations. Perhaps the crowning irony of the whole “rate of growth” agitation is that the people who insist most on faster growth demand policies least likely to promote it.

Kennedy’s Labor Day speech was no more convincing in its “facts” than in its theories. Take “Fact No. 1”: “Our economy, under the first six years of the Republican Administration, grew one-half as much as under the last six years of the Truman Administration.”

**That Tricky GNP**

Why the last six years of the Truman Administration? Why not the first six? In 1944, the year before Mr.
Communist states were members would be allowed on net balance to promote world peace and justice.

**TIME TO REEXAMINE**

Whether our proper course now with respect to the United Nations is to try to expel the Communist countries from it, or to withdraw ourselves and form a union of non-Communist democracies, or merely to cease to be the U.N. host country, does not come within the purview of this column. But our attitude to the world economic bureaucratic machinery we helped to set up is directly relevant to our economic future. It is time to reexamine our premises.

It is time to ask whether we should continue to pour out billions of aid to subsidize foreign governments and their socialist planning. It is time to ask whether this aid in fact accelerates world economic growth or retards it. It is time to ask whether there is any real need for the International Monetary Fund, or whether this institution has not merely prolonged worldwide inflation and fiscal irresponsibility. By sanctioning arbitrary official valuations of irredeemable paper currency and automatic borrowing rights, and conniving at devaluations of scores of currencies, it has reduced the pressure within each country for monetary discipline, for free and full convertibility, and for making that country credit worthy.

The World Bank is the best of all these postwar official international institutions, but because it is an intergovernmental institution it inevitably subordinates economic to political considerations in its decisions concerning which countries and which projects shall have credit.

**False Internationalism**

October 3, 1960

The irresolution of our own spokesmen and officials, in the face of increasingly brazen Communist aggression and insults, has caused a deep uneasiness in the American people. This uneasiness is now reflected even in the trend of business and the security markets. Neither Presidential candidate has come to grips with the issue. Nixon seems to be the prisoner of his position, bound to defend the Eisenhower Administration’s every act or failure to act. Kennedy seems to suffer even more than the Administration from an appeasement ideology, typified by his remark that the President should have “expressed regrets” to Khrushchev for the U-2 flight, and promised not to do it again.

The truth is that the so-called internationalism that not only we but politicians of the whole West have been preaching and practicing for the last fifteen years is a false internationalism. It has put mere organization above principle. It should have been obvious from the beginning that no organization of which the

Truman came into office in April 1945, the official figure of the gross national product (as measured in “constant” 1959 dollars to eliminate the effects of more price inflation) was $366 billion. In 1945 it fell to $360 billion. In 1946 and 1947 it was down to $316 billion each year. In 1950 it was still only $356 billion.

In other words, in the first six years of the Truman Administration, the GNP actually fell in real terms. In 1952, the year before Mr. Eisenhower took office, the GNP was $399 billion. This rose to $451 billion in 1958, to $482 billion in 1959, and is currently running close to $500 billion.

The trick of Kennedy’s “rate of growth” comparison is that it was measured from the low point to which GNP fell in 1947. The rise to 1952, incidentally, was caused in large part by Korean-war expenditures. In fairness to Mr. Truman, the decline in GNP after 1945 was also largely the result of the decline from Federal World War II expenditures. Consumers were not less well off in 1947 than in 1944; the contrary was true. But all this only shows how artificial and tricky these GNP “rate of growth” comparisons can be.

The broader question raised by Senator Kennedy’s Labor Day speech, and its crude lure of “$7,000 for every working man,” is whether he himself understands the facts as little as his remarks indicate, or whether he merely has a low opinion of the voter’s intelligence.

**FREEDOM ABRIDGED**

It is no accident that all the international commodity agreements, whether in wheat or metals or sugar, resort to a complicated set of rigid import or export or production quotas that try to freeze the situation and prevent the natural competitive forces from operating. These agreements clearly cause more economic disruption than they cure.

Finally, such regional institutions as the European Common Market, though they reduce tariff barriers and increase trade among their own members, tend to increase tariff barriers and to disrupt trade with non-members. Everything valid that the Common Market or the Free Trade Area seeks to accomplish could be accomplished better if each nation simply reduced its own tariff and restored the most-favored-nation principle.
What the world today calls “internationalism” is really interstatism, intergovernmentalism. It is a set of barriers, compulsions, prohibitions, and controls administered by an international bureaucracy. True economic internationalism is the internationalism that came close to realization before World War I. It is the freedom of individuals in all lands to deal freely with each other, to buy from and sell to each other, to lend to and borrow from each other, to exchange each other’s currencies at whatever rates they can mutually agree upon, and to do all this without having to run to some nationalistic-minded government bureaucrat for a special license for every transaction.

Is it utopian to think that we can begin once more to move toward this international freedom.

**American Abdication?**

October 10, 1960

In his speech before the U.N., President Eisenhower came close to abdicating American responsibility and power and putting our consciences in the hands of other nations. “Only through the United Nations organization and its truly democratic processes,” he declared, “can humanity make real and universal progress toward the goal of peace with justice. . . . The United States stands squarely and unequivocally in support of the United Nations and those acting under its mandate.” This seems to pledge ourselves in advance to support every U.N. decision and action, wise or unwise, moral or immoral.

On Jan. 10, 1957, former Secretary of State Dean Acheson, not commonly regarded as an “isolationist,” observed to Congress, concerning what he even then considered an Administration tendency to pass the buck to the United Nations, that the U.N. is only “a forum. And if a great nation like the United States looks to the United Nations to form American policy, instead of fighting in [and outside?] the United Nations for what the American Government believes should be done, then we have committed an unprecedented abdication of responsibility and power.”

**‘A FOOl’S Paradise’**

About a month before that, Viscount Cherwell, a nuclear scientist, declared in the House of Lords: “I hate living in a fool’s paradise, and though, like everyone else, I wish the U.N. could work, I have come reluctantly to the view that in its present form it cannot.” He went on to point out that in the Assembly, “the ultimate governing body of the U.N. . . . 5 percent of the world’s population can carry the day against the other 95 percent; and 10 percent could claim a two-thirds majority. . . . Half the population of the world is represented by four delegates, the other half by 75.” It is “nonsense,” he concluded, for nations to submit their “vital interests to a body so absurdly constituted.”

That the situation has been improved by the additions since that time may be doubted. Among the seventeen new nations just admitted to the U.N. are Cameroon, Niger, Gabon, and Chad. Those four can now outvote the United States, Britain, and France.

We do not need to ask, as a purely hypothetical question, what will come of putting our conscience in the hands of other nations. We already know. Going along with the Organization of American States, we have just broken off diplomatic relations with the Dominican Republic, because it is ruled by a “dictator,” but have not dared to break off relations with either Castro, who daily seizes American property, arrests our citizens, and vilifies us, or with Khrushchev, the butcher of Hungary, who sanctioned, in the President’s words, “the shooting down of American aircraft last July 1 over international waters, the apparent killing of four of its crew members, and the imprisonment of two others on trumped-up spy charges.”

**WHY WE LOSE FACE**

Because we lack courage even to break off relations with our sworn enemies, and because they are all in the U.N., we are obliged to admit them here, give them police protection, give them use of our own unparalleled communications channels to broadcast their hate campaigns against us, and treat them with all the punctilio that protocol demands. Of course we continue to lose face in the world. Have we also lost our national self-respect? Or are we sleepwalking in some utopian dream, wandering around in a moral fog?

The only solution the Administration can seem to think of for every problem in South America, Asia, Africa, or wherever is to give away more of the American taxpayers’ money in “aid.” Now we are to give it away through the United Nations, at the behest of the Secretary-General. Meanwhile we ignore the heavy deficit in our balance of international payments as a result of our foreign aid, or the renewed outflow of our gold as a result of this and our cheap-money policies. We have forgotten that the greatest service we can perform for world economic stability is to keep ourselves strong, and to keep the American dollar above suspicion. It is a disservice to the free world to allow confidence in the dollar to be undermined.
How to Lose an Election
October 17, 1960

Those who followed the election of 1948 must be struck by the parallel between the campaign conducted by Governor Dewey then and that conducted by Vice President Nixon this year. The present commentator, turning back to his own record of events, finds the parallel even closer than he had remembered.

Let us begin with the overall strategy. Commenting in Newsweek of Nov. 15, 1948, on the reasons for Dewey’s defeat, I wrote: “He assumed that he already had a comfortable . . . lead, that the way to hold it was simply not to make any mistakes, and that the way not to make any mistakes was not to take any stand that would cost him any of his supporters. The result was that he repeated tediously high-sounding truisms about national unity and that he failed to debate the merits of a single major issue. He avoided all the little errors only by making the one tremendous error that defeated him.”

I went on to point out how he had thrown away all his real issues: “He never hinted, except in the vaguest generalities, how he would halt inflation. On New Deal policies such as farm parity payments, social security, public housing, and Federal minimum wages, he adopted a me-too attitude that many of his opponents thought was insincere and that many of his supporters hoped was insincere.”

ROAD TO NOWHERE
Dewey never seemed able to analyze his own mistake. He implied he had lost because the Republican record had been too conservative. I commented on this in Newsweek of Feb. 21, 1949: “What he fails to see is that the most fatal course of all is precisely the sort of ‘middle road’ he recommends one in which the Republicans accept the basic premises of the New Deal but allow themselves to be outbid in their application.”

It is astonishing how even the detailed issues and positions of 1948 parallel those of today. Dewey accepted the New Deal thesis that the country owed the farmers a living. But “his belated and halfhearted acceptance of the ‘parity’ nonsense made them suspect that he and the Republicans would offer them less of the taxpayer’s money than Mr. Truman.” Today Nixon repudiates the Benson farm program for one that he admits would be more expensive at the start but he offers smaller handouts than Kennedy does.

Next (in 1949): “Can the Republicans hope to win if they endorse the principle of Federal minimum-wage laws but offer only 65 cents an hour instead of 75 or only 75 instead of $1?” Or, in today’s terms, only $1.15 instead of $1.25?

Next (in 1949): “Can the Republicans hope to win if they come out belatedly for building private housing at public expense but offer only 500,000 units instead of Mr. Truman’s 1 million? Why so little of a wonderful thing?” The parallel today applies not merely to housing but to Federal aid to local public schools, and a score of other spending projects.

ME TOO, BUT—
Finally I came to social security, which Dewey had accepted in principle though drawing back from too much of it. Here again his attitude versus the Truman proposals of that time has been closely paralleled by Nixon’s attitude toward Kennedy’s old-age medical-care program today.

What is truly amazing is that Nixon, with the record of the Dewey campaign before him, should seem so bent on repeating it. He has yet to point out why any major Kennedy proposal is wrong in principle.

Nixon’s program so far, in brief, seems strangely like Dewey’s in 1948.

“Me too—but not as much.” It is the perfect formula for defeat. It throws away the principle, but reduces the size of the bribe. It loses votes at both ends of the political spectrum. The pressure groups vote against it because the other side offers them more. The conservatives, the taxpayers, those who fear inflation or have faith in the free market, become apathetic or indifferent. It is not true that they have “nowhere else to go.” As the 1948 election proved, they can stay home in droves. If they are to be aroused and got to the polls, the must be convinced that they have a clear-cut alternative worth voting for. There is still time for Nixon to offer it to them.

What Are We Deciding?
October 24, 1960

What are the central issues that will be decided in this election? The best way to find the answer is not through the TV “debates”—which seem mainly designed to show how quick each candidate is on his feet, and how he can handle, in two or three minutes, the particular curve thrown to him by a reporter—but by imagining the victory of either candidate, and asking ourselves what its probable sequel would be.

A victory for Kennedy would first of all be interpreted as a repudiation of the record of President Eisenhower, both in foreign and domestic policy. It would above all be interpreted as a repudiation of practically every element in his domestic policy that
is conservative, noninflationary, or in the direction of fiscal prudence.

For the Democratic platform is an out-and-out left-wing document. It was drafted to reflect Kennedy’s ideas. He supports all its extreme proposals. He starts from the premise that the taxpayers and food consumers owe the farmers a living, at “full parity levels,” regardless of the conditions of supply and demand. This parity income is to be achieved even if it involves not only permanent subsidies but permanent controls over what the farmer plants and sells.

STRIKE VIOLENCE

Kennedy has not dared to differ on any important point from the country’s big labor bosses, especially Walter Reuther. They, in effect, dictated the labor planks of the Democratic platform. What this will mean in practice can be seen from a glance at the current General Electric strike. The International Union of Electrical Workers, AFL-CIO, has thrown picket lines around 55 plants. Around GE’s biggest plant, at Schenectady, the union threw a mass picket line of 3,500 strikers, “shoulder to shoulder and belly to back,” to prevent those who wanted peacefully to continue to work from doing so. If Kennedy sees anything wrong with such lawless violence he has neglected to make his view known.

The Democratic platform is a pledge to impose the total welfare state. It promises bigger spending in every direction—housing, education, farm subsidies, old-age medical care, public power. Vice President Nixon has estimated that it would increase total Federal spending by $13.2 billion to $18 billion a year. Kennedy has denied this, but on the Oct. 13 TV debate failed in answer to a direct question to supply his own total. Instead, he professed to believe, like the Democratic platform, that his huge new spending program could be financed with a balanced budget and without inflation. But as his spending promises can hardly add up to less than $10 billion more a year, he owes it to the voters to tell them what additional taxes he proposes to impose to raise it.

TENDENCY TO RETREAT

As to foreign policy, we find that, wherever Kennedy has turned from vague generalities to specific proposals, he has shown a tendency toward retreat and appeasement. His preference for advisers like Stevenson and Bowles, his suggestion that the President should have halted the U-2 flights earlier and expressed regrets to Khrushchev, his opposition to United States resumption of underground nuclear tests, his suggestion that we should publicly declare in advance that we have no intention of defending Quemoy or Matsu—all point in the same direction. If we were to surrender Quemoy and Matsu chiefly because they were “militarily indefensible,” what would become of the case for standing firm on Berlin?

If the implications of Kennedy’s election were more widely understood, that election would be improbable. Why is it, then, that his chances today seem at least even? The reason is that Nixon has failed to make the issues clear. He has not supplied a sufficiently clear-cut alternative. True, on a few questions—the U-2, Quemoy and Matsu, the error of attempts to force “economic growth” by cheap money and inflation—Nixon has spoken out. But he will have to speak out much more clearly for a firm and unequivocal foreign policy, for encouragement of private enterprise, and against big government, big spending, inflation, labor violence, and the total welfare state, if he hopes to win.

The Dollar Crisis

October 31, 1960

The present dollar crisis was immediately precipitated by the irresponsible spending and soft-money promises in the Democratic platform and in the speeches of Senator Kennedy, combined with an increasing fear that he may be elected.

But the dollar has been in an increasingly precarious position for the last two years. We have had a heavy deficit in our balance of payments and a heavy gold loss. As a result of unbalanced budgets, huge foreign-aid programs, inflation, and cheap-money policies, our gold holdings have dropped from $24 billion in 1949 to $18 billion. Our short-term liabilities to foreigners (payable in gold if their central banks demand it) exceed our entire gold reserve. They have risen from less than $8 billion in 1949 to more than $20 billion today.

The Democrats in Congress have done everything to undermine confidence in the dollar still further. They refused the President’s request to repeal the legal interest rate ceiling of 4 percent on long-term bonds, thus forcing more inflationary short-term financing. The Democratic platform, instead of giving assurance of economy, has proposed huge new expenditures in every direction—housing, education, farm subsidies, old-age medical care, public power. Vice President Nixon has estimated that it would increase total Federal spending by $13.2 billion to $18 billion a year. Kennedy has denied this, but on the Oct. 13 TV debate failed in answer to a direct question to supply his own total. Instead, he professed to believe, like the Democratic platform, that his huge new spending program could be financed with a balanced budget and without inflation. But as his spending promises can hardly add up to less than $10 billion more a year, he owes it to the voters to tell them what additional taxes he proposes to impose to raise it.
PARALLEL WITH 1932
The integrity of the dollar can be protected, it can be kept on a gold basis at $35 an ounce, only if Kennedy immediately gives the strongest assurances that, instead of increasing nondefense expenditures, he will strive to cut them; that he will never seek either to overrule the Federal Reserve Board or to force it to follow cheap-money policies; and that, instead of agitating for still cheaper money, he will support monetary discipline firm enough to assure the outside world that we mean to maintain the dollar. Such assurances would require a complete reversal of the policies he has hitherto espoused.

There is an ominous parallel between our inflation crisis today and the deflation crisis between the defeat of President Hoover in November 1932 and the inauguration of President Roosevelt in March 1933. It was in this four-month interregnum that the great bank runs developed.

HOOVER AND F.D.R.
Hoover, in his memoirs, has given a detailed account of his persistent but futile efforts to get the cooperation of Roosevelt in halting the degeneration of confidence. Despite Roosevelt’s specific assurances prior to the election, there were spreading fears that he was determined to abandon the convertible gold standard for a managed currency or devaluation. There was a foreign run on our gold. In February, Hoover sent a confidential letter to Roosevelt declaring that it “would serve greatly to restore confidence” if “a very early statement by you” would give “prompt assurance that there will be no tampering or inflation of the currency; that the budget will be unquestionably balanced; . . . that the government credit will be maintained. . . .” No such reassurance was given.

The present crisis, of course, cannot be blamed on the proposed policies of Senator Kennedy alone. Behind the dollar crisis today lie years of wrong policies and irresponsibility on the part of both political parties and of the Federal Reserve System. The World Monetary Fund was set up without understanding of the terrific load it put upon us. It made the American dollar, in effect, support all other currencies. Our foreign-aid program was launched and expanded with no thought of the great pressure it would put upon the dollar. Federal “welfare” expenditures have been steadily increased. Our Federal Reserve authorities have pushed interest rates below the level necessary to prevent inflation, gold loss, and loss of confidence in the dollar.

If the dollar is to be saved, it can only be by courageous monetary policies and the united determination of the leaders of both parties. ♦

How to Restore Poverty
November 7, 1960

Senator Kennedy’s choice of John Kenneth Galbraith as his chief economic adviser provides a clear warning of what Kennedy’s economic policies, if he became President, would be like.

The professor once exercised power. He was duty price administrator in the OPA under Roosevelt in 1942 and 1943. Leading members of the food industry protested that he was primarily responsible for pricing regulations that had “strangled” their operations and produced “utter confusion and chaos in the production and distribution of the nation’s food supplies.” Leading members of Congress joined in demanding his resignation, which they finally forced in May of 1943. The professor still believes in price controls. He still believes he knows better than the free market just what prices ought to be.

The flavor of Galbraith is best conveyed in an often-quoted paragraph from his book The Affluent Society:

“The family which takes its mauve and cerise, air-conditioned, power-steered, and power-braked automobile out for a tour passes through cities that are badly paved, made hideous by litter, blighted buildings, billboards, and posts for wires that should long since have been put underground. . . . They picnic on exquisitely packaged food from a portable icebox by a polluted stream and go to spend the night at a park which is a menace to public health and morals.”

ARE WE TOO RICH?
If we accepted this extravagant caricature as accurate, what would it prove? According to Galbraith it proves that the problem of production is not only solved but oversolved. Capitalism is so productive that production is running wild. The American people have become too rich and affluent for their own good. The people who earn the money spend too much of it on themselves (the “private sector”), whereas it should be seized from them in taxes and spent by the politicians and bureaucrats (the “public sector”).

Actually the picture that Galbraith paints of American life seems a damning indictment of his own proposals. It would mean that for the money they spend on the private sector the American consumers get marvelous products and amenities never dreamed of before
in human history. But though they are forced to spend more both absolutely and proportionately on the “public sector” than ever before in history, they are wretchedly served, because political spending is inherently improvident, inefficient, and wasteful. Yet Galbraith, in the face of the statistics, blandly blames it all on insufficient funds.

**CONSUMERS AS DUPES**

His whole program rests on an inner contradiction. It assumes that people are individually unfit to spend the money they themselves have earned, but somehow collectively competent to choose wisely the officeholders who will seize their money in still more onerous taxes and spend it for them. People as voters are supposed to have sense and wisdom; the same people, as consumers, are boobs, gulls, suckers who can be pushed into buying whatever Madison Avenue wants them to buy. Galbraith laughs at the idea of thinking such people worthy to retain the liberty to spend their earnings as they see fit. His conclusions remind me of de Tocqueville’s remark that “the taste a man shows for absolute government bears an exact ratio to the contempt he professes for his countrymen.”

I have discussed only Galbraith’s central contradiction. There is no room to discuss his lack of originality. Or his completely inverted ideas on inflation. Or his strange assumption that “goods” and “income” are two entirely separate things instead of two names for the same thing. Or his scheme for making unemployment perpetual and universal by paying everybody seven-eighths as much for not working as for working.

One thing, however, must be conceded. According to Galbraith, the great evil today is too much unneeded production. His schemes are certainly calculated to cure this. He would reduce or destroy every incentive to production and pay extravagant bonuses for malingering and idleness. His program would halt this demoralizing affluence and restore a noble and uncorrupted poverty.

**Conventional Heretic**

November 14, 1960

In the last issue, space did not permit me to discuss certain aspects of the doctrine of J.K. Galbraith, present idol of the left. Further examination seems warranted.

The professor is nothing if not ironical; he is a fountain of perpetual paradox; and I do not get the impression that he cares very much whether or not a given proposition is true. He is out to épater le bourgeois, to demonstrate his iconoclasm, his superiority to what he disdainfully calls “the conventional wisdom.” But his claims to originality have been shown to be groundless. David McCord Wright has pointed out that Galbraith’s basic argument is simply an expanded rehash of one of Keynes’s essays, “Economic Possibilities for Our Grandchildren.” George Schwartz of The London Sunday Times has pointed out that 130 years ago, Southey, in his “Colloquies on Society,” was proclaiming that a people may be too rich but a government cannot be:

“A state cannot have more wealth at its command than may be employed for the general good, a liberal expenditure in national works being one of the surest means for promoting national prosperity; and the benefit being still more obvious of an expenditure directed to the purposes of national improvement. But a people can be too rich.”

**BACK TO MERCANTILISM**

I myself am tempted to trace the “Galbraith” thesis as far back as 1705, two generations before the appearance of Adam Smith’s The Wealth of Nations, to Mandeville’s “Fable of the Bees,” in which that satirist argued that jobs depended on the production of needless luxuries for the rich. The heretical Galbraith, like the heretical Keynes, ends by sliding back into seventeenth-century mercantilism.

It is interesting to notice one reason why he does so. Adam Smith considered it “too ridiculous to go about seriously to prove, that wealth does not consist in money... but in what money purchases.” Say and Mill pointed out that, when we remove “the monetary veil,” we find that we buy goods with other goods; each buys the production of others with his own. But Galbraith, whose disdain of the classical economists apparently caused him to skip the beginners course, never learned this elementary lesson. He treats “goods” and “income” as two entirely separate things. The “income” that men get from the production of “goods” he insists, is vital; but the “goods” themselves are excessive and unimportant.

What on earth is his concept of “income”? Is it paper dollars, which we could turn out on the printing press to any desired amount? Or is it not precisely the output of goods and services?

**PLANNED IDLENESSE**

Galbraith praises unemployment compensation because “it provides income apart from production.” (My italics.) Hence his preposterous scheme to pay workers, as soon as unemployment gets beyond 4 million, seven-eighths as much for staying idle as for working at a job. How
this enormous handout would be paid for, who would work under such conditions, how much goods would be produced for anybody to consume, and what the purchasing power would finally be of dollars handed out to promote nonproduction, seem to him problems hardly worth considering.

The old socialist contention was that the poor were getting poorer and that capitalism could not get optimum production, could not deliver the goods. Galbraith abandons this argument. He admits that production in the United States today far exceeds the most utopian dreams of the past. But instead of asking himself what has wrought this miracle—instead of examining the role of free markets and free enterprise, of competition for the consumer’s dollar, of incentives to production, of capital accumulation—takes it all for granted, as if it happened automatically, and would automatically continue, notwithstanding his own plans for drastic taxation, socialized spending, redistribution of income, and planned idleness.

Galbraith has overlooked one of the oldest discoveries of the conventional wisdom: That the workers of the world have enormously more to gain from continuous increase in per capita production than from any conceivable redistribution.

**To Maintain the Dollar**

November 21, 1960

The most urgent problem that confronts the President-elect is to remove any suspicion or misgiving concerning the future of the American dollar. This issue cannot be postponed until he takes office on Jan. 20. It must be met now. For the dollar and gold are being traded in on every business day in the markets of the world. Their movements between countries, and the quotations on them, will be governed in the next nine weeks not only by what “speculators,” but investors, importers, exporters, and the great central banks think is going to be done about the dollar by the new Administration.

The first need, therefore, is for Mr. Kennedy to reaffirm the pledge he gave during the campaign not to “devalue the dollar from the present rate.” There are several reasons why this reaffirmation is necessary.

The first is to reassure all foreign governments and banks and holders of dollar assets everywhere that the pledge of Oct. 30 was not merely something said to win an election, but a deep determination that can be reasserted now that Mr. Kennedy has nothing to gain from doing so but his country’s honor and prestige.

**NO REPETITION OF ’33**

What must be at all costs averted is a repetition of what happened between the election of 1932 and the transfer of power on March 4, 1933. On Nov. 4, 1932, four days before the election, Franklin Roosevelt declared in a major campaign speech at the Brooklyn Academy of Music:

“One of the most commonly repeated misrepresentations of Republican speakers, including the President [Hoover], has been the claim that the Democratic position with regard to money has not been made clear. . . . The businessmen of the country, battling hard to maintain their solvency, were told in blunt language in Des Moines how close an escape the country had some months ago from going off the gold standard. But that, as has been clearly shown since, was a libel on the credit of the United States. . . . No responsible government would have sold to the country securities payable in gold if it knew that the promise, yes the covenant, was as dubious as the President of the United States claims it was.”

Yet when President Hoover after the election tried in a confidential letter to get President-elect Roosevelt to give “prompt assurance that there will be no tampering or inflation of the currency” the President-elect refused to give it. Indeed, he refused all cooperation in the interregnum period on the ground that “it would be unwise for me to accept an apparent joint responsibility with you when, as a matter of constitutional fact, I would be wholly lacking in an attendant authority.”

**ROLE OF THE FED**

Notwithstanding his pre-election pledge, Roosevelt, a few days after his inauguration, asked for and got emergency powers not merely to go off the gold standard, but to make it unlawful for any American to own gold or gold coins, gold bullion, or gold certificates.

That is why a reassertion of the pre-election gold pledge of Mr. Kennedy is so essential now to maintain confidence in the dollar. But while such a reassertion is necessary, it is not enough. Mr. Kennedy must also give assurance that the policies he intends to follow on government spending, taxes, avoidance of deficits, non-interference with efforts of the Federal Reserve to maintain monetary discipline and anti-inflationary interest policy will be such as to make the pledge meaningful.

Responsibility is not, of course, wholly upon Mr. Kennedy to maintain confidence in the dollar. The Eisenhower Administration must co-operate to the full. Above all, the Federal Reserve authorities must cooperate. It was highly unwise of them to reduce the discount rates from 4 to 3½ percent in June, and still more
unwise of them to reduce it from 3½ to 3 percent in August. These reductions did not stimulate American business; they chiefly caused further loss of gold, further loss of foreign confidence in our determination to maintain the integrity of the dollar. The discount rate should be restored to 4 percent, both as a practical measure and as a symbol of that determination.

A Meaningful Opposition
November 28, 1960

Associates of Senator Kennedy contend that in view of his religion and youth, and the fact that he was running at a time of peace and relative prosperity, his triumph was "miraculous." When we add other handicaps that they do not mention, above all the extreme leftism of the Democratic platform, the Kennedy triumph seems indeed a miracle.

But the chief architect of that miracle was not Kennedy but Nixon himself. He lost the campaign because he lost the debate. Did he lose it because he was not, after all, a first-rate debater? Or because he did not basically understand the chief political and economic issues? Or because he lacked the courage to state his convictions because he was timid and opportunistic? I do not pretend to know the answers.

But for whatever reasons, he never stated the real case against Senator Kennedy. And when a candidate for the Presidency fails to make the case, nobody else can make it for him. The real issues were clear enough. They included the apparent Kennedy softness toward Soviet Russia and Communist aggression (as reflected both in his stand on Quemoy and Matsu and on expressing regrets to Khrushchev for the U-2); Democratic platform extremism on civil rights, and such economic issues as the Kennedy farm program and his big spending and soft-money policies.

BLUNTED ISSUES
Nixon seemed more anxious to blunt these issues than to drive them home. He kept trying to reduce the issue to a purely personal one. Choose between the two men. Which has the "experience"? Perhaps, as many think, the campaign was decided on the first television debate, when Nixon declared that he and Senator Kennedy had the same "goals," and differed only as to "means." And Nixon, for the most part, stood by this error. He treated his opponent with deferential politeness. He seemed to be intimidated by his implacable enemies; and afraid of being called "the old Nixon."

So the campaign he followed remained to the last curiously like the Dewey campaign that had failed so disastrously against Truman. I described this parallel (Newsweek, Oct. 17: "How to Lose an Election") as it had already been drawn early in October. Its basic formula on all leading economic issues was "Me too—but not as much." Even when fears of a Kennedy victory led to a discount on the dollar in the London gold market, Nixon appeared to have no realization of its full significance, and made only a few perfunctory references to it. It was Kennedy who set the "issues"—economic growth, military strength, American "prestige." He succeeded in keeping Nixon on the defensive.

NOT THE SPOKESMAN
It is only natural that many of us should feel sorry for Nixon on personal grounds. He conducted a campaign on a high level of courtesy and absence of personal abuse. He gave himself without stint to an incredible expenditure of physical energy. He fought against the handicaps of the laxness and ineptitude of the Eisenhower Administration in dealing with Khrushchev and Castro, and the gratuitous campaign blunders of Henry Cabot Lodge.

But when all this has been conceded, it is still clear that Nixon cannot be the spokesman of the opposition in the next four years, nor the formulator of Republican doctrine and policy, nor its next prospective candidate for the Presidency. If he could not win as the Vice President, backed by an Administration in power, how could he hope, as a man out of office, to win against a Kennedy Administration in power? More important, if he did not know how, or did not want, to state the case during the campaign against big spending, higher taxes, budget deficits, cheap money, and the total welfare state, how can he be expected to do so in the next four years?

It is the Republicans in office, and specifically the Republicans in Congress, who must now choose their leaders and formulate a positive policy. This policy must be what is now called conservative—that is, it must be a policy of limited government and sound money. We do not need two parties to enforce inflation and the welfare state.

Wrong Dollar Solution
December 5, 1960

It is the view of the Administration that the recent gold and dollar outflow has been caused by "a deficit in the American balance of payments." Consequently the remedies that the Administration is proposing—such
as reducing the expenditures of our troops and their families abroad, or getting other nations to assume a greater share of the foreign-aid burden—are directly designed to reduce this “deficit.” But the diagnosis is mistaken and the proposed cure does not go to the heart of the problem.

“A deficit in the balance of payments” means the excess of our total payments to foreigners (for imports, tourism, long-term investments, etc.) over total receipts from foreigners (from exports, etc.). This excess is defined as and measured by our loss of gold and liquid dollar assets.

A fallacy occurs when it is tacitly assumed, as in most current discussion, that everything else in the “balance” (commercial imports, exports, etc.) is the result of intentional decisions by Americans or foreigners, while only the movement of gold and dollars is not intentional but merely the passive and unavoidable result of the other decisions. This is not true. The decision of foreigners to use their dollar credits (whether they got them from exports to us or from foreign aid) to buy goods from us, or to leave them here as dollar deposits, or to demand gold for them, is just as intentional as any other decision.

**WHICH IS ‘CAUSE’?**

It is not correct, therefore, to call the “deficit in our balance of payments” the cause of the gold or dollar outflow. The causation may be the other way round. A run on our gold would “cause” an increase in the balance-of-payments “deficit.” In fact, our loss of gold and dollars, and a deficit in the balance of payments, turn out to be simply two names for the same thing.

Our problem is only partly the result of our foreign-aid program. If our payments were otherwise in balance, and we gave away some $4 billion a year in foreign aid, then, if foreigners elected to take all this in the form of gold and dollars, we would have a deficit of $4 billion a year in our balance of payments. But this is unlikely to happen. If the rest of the world uses $3 billion of this to buy more goods from us, our resulting deficit is only $1 billion. Similarly, even if we pay $2 billion a year for our troops to spend abroad, some of the dollars they spend are likely to be used by foreigners to buy American goods, so reducing our net deficit.

**TO RESTORE CONFIDENCE**

Even if we were to cut down on our foreign troops or cut our foreign aid entirely, therefore, it does not follow that we would reduce our balance-of-payments deficit by the same amount. For we would not then be giving the rest of the world the added dollars to buy our goods. Of course our foreign-aid program does intensify our dollar problem. If our prices are not kept competitive, foreigners will use their dollar aid to drain our gold rather than to buy our goods. And if our foreign-aid program increases inflation here (by adding to budget deficits, for example), it works to undermine faith in the dollar.

The determining factor is, at bottom, the world’s faith in the dollar—faith that we do not intend to inflate or devalue, faith that our gold supply is great enough in comparison with the foreign claims on it to meet all demands. It is precisely this faith that we have been shaking. While the Eisenhower Administration busies itself belatedly with a fringe problem, the Federal Reserve has failed to take the measures necessary to assure foreigners that we have set our face against cheap money and inflation. And the President-elect, according to a report in *The Wall Street Journal*, “is preparing a series of possible moves to counter” feared unemployment in January, including “increased and faster Federal spending, more loans to small businesses at lower interest rates, and lower interest-rate ceilings on government-guaranteed housing loans. . . . Mr. Kennedy is fully prepared to set aside hopes for a balanced budget in favor of Federal stimulation of the economy.”

These plans to spend and inflate are the exact opposite of the assurance the world needs regarding the integrity of the dollar.

**In the Wrong Direction**

December 12, 1960

Within the next few weeks or months we may be forced into major decisions regarding gold and the dollar. It is vital that whatever decisions we make should at least be in the right direction.

That is why the proposals made by Henry C. Alexander, chairman of the board of the Morgan Guaranty Trust Co. of New York, in a speech before the Investment Bankers Association on Nov. 28, are a cause of concern. Alexander’s position and standing may give these proposals great influence, and yet they would take us, I believe, in the wrong direction. They would tend to encourage further inflation.

Two in particular call for discussion. The first is that we repeal even the present requirement that the Federal Reserve Banks keep a 25-percent reserve in gold against their note and deposit liabilities. (Until 1945 the required reserve ratios were 35 percent against deposits and 40 percent against notes.) The second is
that we continue to forbid American citizens to own gold at home and even forbid them to own it abroad.

THE LAST VESTIGE
The proposal that we abandon even the 25-percent gold reserve requirement was made a year ago by Roy L. Reierson, vice president and chief economist of the Bankers Trust Co. of New York. I discussed it in Newsweek of Dec. 21, 1959, and Jan. 11, 1960. As Alexander makes substantially the same arguments for it, we may repeat the same answer. By taking this step, we would drop the last vestige of a domestic gold standard. We would, at best, keep the dollar good for foreigners for a while longer at the cost of permanently undermining its value for Americans. We would remove even the feeble restraint against inflation that a 25 percent gold requirement has exercised on our monetary managers.

When those monetary managers asked Congress in 1945 to lower the gold reserve requirements from 35 and 40 percent to 25 percent, they did so under the plea of war emergency. But though the war ended a few months later, they continued to permit and promote inflation. At the end of 1944, total bank deposits and currency amounted to $151 billion; today they amount to $252 billion. The increase of 67 percent in total money supply accounts for the increase of 69 percent in consumer prices in the same period. Monetary managers, under constant political pressure, tend to inflate to the extent that the law permits them to inflate.

Alexander contends that the pseudo gold standard that we improvised in the '30s and formalized with the International Monetary Fund in the '40s “has proved workable.” In whose favor? Hardly in that of the pensioners, bondholders, policyholders, and savings-bank depositors who have seen half the value of their savings wiped out.

WHY HOARDERS?
It is a sign of the extent to which the system has not worked that we are now in a gold and dollar crisis. Alexander thinks this can be cured only by removing all gold reserve requirements, and prohibiting Americans even from owning gold abroad. His argument for these measures is that gold “hoarding” by “speculators” or “eccentrics” undermines confidence in the paper dollar and reduces the amount of gold for “legitimate” monetary purposes. But these “speculators” are people who dislike being forced to speculate in a constantly rotting paper dollar. These “hoarders” and “eccentrics” are people trying to protect themselves against further expropriation of their savings by the monetary managers, whose idea of “legitimate” monetary purposes includes constant inflation.

Alexander rightly insists that “sound money” can only be achieved by “sound, honest, wise fiscal and economic policies.” He deprecates “submitting to the automatic, unreasoning operation of a gold coin standard with full convertibility here at home.” But he seems to forget that it was precisely the function and merit of the full gold standard that it enforced strict limits on the inflationary schemes of the politicians.

What this country faces today is only secondarily a crisis in the “balance of payments.” It is primarily a crisis of inflation. Until we halt inflation, our problem is insoluble.

To Encourage Growth
December 19, 1960

The need to increase America’s economic growth is urgent. We must expand our capacity to produce more and better goods in order to raise still further the American standard of living, to provide jobs at rising wages for our growing population, and to retain our economic leadership in an increasingly competitive world.

Yet the most important measure we can take to increase our rate of economic growth has been neglected. America leads the world today in production per man-hour because it has provided each worker with more and better tools than any other nation. The National Industrial Conference Board estimates that the average capital invested for each worker in manufacturing industries in the United States amounts to $19,300. But today our growth is retarded because we are not replacing our tools of production fast enough to keep pace with the world’s rapidly advancing technology and our own economic potential. If we are to increase our productivity and maintain our lead over foreign competitors, American industry must invest substantially more than $19,300 for each new job. In addition, industry must of course put ever new capital, in the form of new and better plant and equipment, behind the present workers.

NEED TO MODERNIZE
In brief, we must give every possible encouragement to new investment by American business. Our rate of economic growth, and even the ability of our industry to hold its own against foreign competition, depend primarily on the volume of new investment—on the replacement of obsolete tools of production with the most modern and efficient equipment.
The main source of capital for new plant and equipment has not been savings of individuals but the savings of corporations themselves out of their profits. And of these by far the largest amount is what the corporations are allowed to set aside each year, free of taxes, for depreciation—the wear and tear and obsolescence of existing plant and equipment.

What are needed are tax laws and rulings that will encourage the maximum amount of modernization and new investment. Instead, our tax laws and rulings in this respect are the most restrictive and discouraging of any leading industrial nation. In adequate depreciation allowances and new investment incentives we are far behind Canada, Britain, France, Germany, Sweden, Belgium, the Netherlands, and even Uruguay.

In Germany, for example, tax reform played a central role in the miraculous recovery which began in 1948. Basic industries that replaced equipment were allowed a tax write-off of 50 percent of their whole investment in the first year. This has since been modified slightly because expansion was so rapid, but the allowances are still incomparably more liberal than our own. Write-offs of 25 percent of cost in the first year, and of 58 percent in the initial three years, are common.

HOPE OF REFORM

In U.S. industry, however, leading economists and accountants have estimated the costs of replacement are outrunning depreciation allowances by $5 billion to $8 billion a year.

But there are grounds for hope of reform. In January of 1960, the Senate Select Committee on Small Business reached the conclusion that: “Present depreciation policies do not sufficiently encourage the expansion of the national economy. Indeed, those policies have, in all probability, stifled economic growth. The twin problems of inflation and technological obsolescence . . . have made our depreciation policies completely out of date.”

Even more significant, in a statement on Oct. 30, during the campaign, Senator Kennedy declared: “We must stimulate plant modernization programs which are vital both to increased production and to building industrial facilities which can compete successfully with the modern plants of Europe and the Soviet Union. Wherever we are certain that tax revision—including accelerated depreciation—will stimulate investment in new plant and equipment, without damage to our principles of equity, we will proceed with such revision.”

There is no more urgent task before the new Congress than to make this reform in our tax laws.

To Promote Growth

December 26, 1960

Last week I discussed here the need of tax reform to encourage increased corporate investment in the most modern plant and equipment in order to promote more rapid economic growth and to enable American industry to meet increasingly serious European competition. The most important tax reform in this connection would be to permit more rapid write-offs for depreciation of old equipment.

Suppose you are in the laundry business, and have invested $5,000 in machinery which has worn out or become obsolete in five years. If you have been allowed to deduct $1,000 a year for depreciation, and at the end of five years the new machines available to replace the old cost you no more, then you can have both the funds and the incentive to replace your old machinery with new. But suppose the government refuses to allow you to write off your old machines over five years, and says you can only do so over ten, fifteen, or even twenty years? Then you may not have the funds to reinvest at the end of five years, and you will certainly have less incentive to do so.

REPLACEMENT COSTS

Even if you are allowed to depreciate your old equipment over five years, or some similar short time, it is improbable, in a period of inflation, that you will be able to replace your worn-out or obsolete equipment at the same dollar cost. It will probably cost you more. That is why, in France today, the government not only allows rapid depreciation deductions against original cost, but revaluations of property to take into account higher costs of replacement as a result of inflation. A like reform here would certainly be desirable, but accelerated depreciation allowances would at least make it less urgent. In a “creeping” inflation, prices of equipment rise less over a short period than over a long one.

If accelerated depreciation has such obvious advantages, if it encourages greater production, lower costs, faster economic growth, why did our government adopt it only for defense industries in wartime? Why does it refuse to permit all industry to make regular use of it?

The stock argument against this has always been that the government would lose revenue. The objection is shortsighted. Perhaps there would be some loss of revenue in the first year or two, but it is difficult to see how there would be any over the long run. A corporation is allowed to deduct, in any case, no more than 100 percent of the amount it has invested in plant or equipment. If it has invested $1,000 in a given machine, and the government does not change the corporate income
tax rate over the years, what difference does it make to its revenues whether the corporation deducts $50 a year depreciation over twenty years, or $200 a year over five years, or $500 the first year and diminishing amounts in succeeding years? Whatever the government loses in tax revenues in the early years it makes up in later years.

**INVESTMENT STIMULATED**

Of course if the corporation tax rate is lowered in later years, the corporations “gain” and the government “loses” by accelerated depreciation. But if (as has, alas, been more usual) the tax rate is raised rather than lowered in later years, the corporations lose and the government gains by accelerated depreciation.

The foregoing calculations ignore, however, an even more important factor. Accelerated depreciation stimulates investment in modernization and new plants. This modernization increases production, payrolls, and corporate earnings, and so increases tax revenues over the long run.

This has been dramatically shown in Canada, which has far more liberal depreciation allowances than we have. A study by Maurice E. Peloubet, a prominent accountant, has shown that whereas depreciation allowances taken by Canadian corporations in 1959 were more than five times what they were in 1946, corporate profits before deducting either depreciation or taxes had increased three times in the same period. As a result corporate income tax revenues increased nearly two and a half times.

A recent poll by the American Economic Foundation shows that seven out of every ten business and labor economists favor liberalized depreciation. The reform is long overdue. ✨
1961
A World Super-Bank?
January 2, 1961

As the gold-and-dollar problem increases, and no one in authority wants to take the agonizing corrective steps, everyone tries hopefully to find some painless and easy way out. This accounts for the sudden popularity of two proposals. One is to abandon even the legal 25 percent gold reserve requirement in our Federal Reserve System. The other is the proposal of Robert Triffin of Yale to set up a world super-bank.

The first proposal, already put forward by a few American bankers, has now been blandly endorsed by no less a figure than Per Jacobsson, the managing director of the International Monetary Fund. I have already devoted several articles to trying to show what is wrong with it. It would destroy the last meaningful restraint on credit expansion. Against its paper liabilities our banking system would be required to hold nothing but paper reserves. There would be no further brake on inflation except the arbitrary discretion of our monetary managers. And these would have politicians and labor leaders constantly breathing down their necks demanding more inflation to maintain “full employment.”

KEYNES PLAN REVIVED

The Triffin plan would turn the International Monetary Fund (IMF) into an international central bank for national central banks. These central banks would be required to keep on deposit at the IMF a minimum of 20 percent of their total reserves of gold and foreign currencies. Against these reserves the IMF could make loans and create deposits, or conduct “open market operations”—in other words, manufacture more money or more “reserves” against which more money could be issued.

In broad outline, this is a revival of the Clearing Union scheme originally proposed by Lord Keynes at Bretton Woods. The Keynes plan was rejected on the sound argument that it would have led to continuous world inflation. Triffin tries to meet this by proposing that his world super-bank should not be allowed to inflate at a rate of more than 3 to 5 percent a year. He does not say what assurance we have that most member governments would not vote, as soon as they got into difficulties, for a much faster rate.

Another objection to the Keynes plan was that it would have meant a surrender of national sovereignty to an international institution. To keep its currency at parity with the world central bank’s, every nation regardless of its internal economic or political situation, would have had to inflate as fast as, but no faster than, all the rest. Triffin would apparently meet this by allowing considerable monetary “independence” to each nation. They could of course have all they want of this now, with no international central bank at all. But if they had this “independence” with a world central bank, then the countries that inflated the most would be exploiting the countries that inflated less.

WHO GETS WHAT?

This calls attention to the central fallacy of the world central bank scheme. It would be a bank in which the U.S. would make the lion’s share of the deposits while the “underdeveloped” countries would get the lion’s share of the loans. This would mean more foreign aid, though disguised. Even under the IMF, as Triffin admits, the U.S. has been practically “the sole net lender.”

In a world super-bank, there would be endless disputes concerning the distribution of the newly created fiat money among the member nations. These conflicts would probably lead to the breakdown of the whole scheme.

The reason proposals like this are now being seriously discussed is that no one likes to face the alternatives. An embargo on the outflow of gold, or a unilateral devaluation of the dollar, in the sense of a marking up of the dollar-price of gold, would be regarded as a breach of faith by the central banks that hold reserves in dollars. The mere discussion of such plans would precipitate massive anticipatory speculation and a crisis.

An indispensable part of any real cure would be a complete halt to our inflation. As prevailing opinion thinks that inflation is necessary to maintain employment, nobody likes to face this. That is why we listen to siren voices assuring us that the cure for the evils of past national inflation is more world inflation.

Are We Going Left?
January 9, 1961

The new Administration is already laying plans for a program of Federal medical care for the aged, tied to the social-security program, for Federal aid to education, a Federal housing program, a rise in Federal minimum-wage standards, and “redevelopment” of “economically depressed areas.” All these proposals mean more Federal intervention, more concentration of power, more spending, more taxing, more paternalism, more statism.

Yet all this was determined by the thinnest of margins—a plurality of 112,801 in a total vote of 68,832,670. Kennedy’s percentage of the major party vote was 50.1
The unions threatened to purge everyone who voted for the Landrum-Griffin Act. Actual result: Of 229 members of the House who voted for passage, only four were defeated; of 201 who voted against passage, 22 were defeated.

Five New Deal Democratic governors—Loveless of Iowa, Freeman of Minnesota, Docking of Kansas, Furcolo of Massachusetts, and Herseth of South Dakota—were replaced by more conservative Republicans. The Republicans gained control of ten State Legislatures and lost two, a net gain of eight.

So much for the temper of the electorate. In addition, the effort to push through a huge paternalistic spending program will now find itself up against a hard (or should one call it soft?) economic reality: The loss of gold, the weakness of the dollar.

If We Demonetize Gold
January 16, 1961

It was in the early 1960s, writes the Chinese historian Hi-Ho-Hum,* that the United States “demonetized” gold, with consequences that astonished the advocates of the plan.

In 1958, 1959, and 1960, continues Hi-Ho-Hum, the United States suffered a heavy loss of gold. The monetary authorities became worried. But an article in The London Economist of Dec. 24, 1960, suggested what seemed an easy way out of their difficulties. The article was in the form of a fable, set in an imaginary future. But its proposals were made in earnest, and so were its predictions of the economic consequences of adopting them.

What the article advocated, in short, was that the American Federal Reserve authorities put an embargo on gold, and discontinue either buying or selling it at $35 an ounce or any other figure. The International Monetary Fund was to take over this obligation for six months longer, but announced that at the end of that time gold would be demonetized entirely. It would become “just a commodity.”

WHAT WENT WRONG
The Economist predicted that everybody would rush to get rid of his gold at $35 an ounce while there was time; and that gold would finally fall to $2.50 an ounce.

In disparaging gold (adds the historian in a footnote) the Economist talked as if it were being wonderfully clever and original. It forgot that sixteen years earlier, Keynes had denounced gold as “a barbarous relic”; that Bryan in 1896 railed against “crucifying mankind upon a cross of gold”; and that Sir Thomas
A Needless Risk
January 23, 1961

Once more we have had an interregnum (of two and a half months) between the election of one President and the retirement of a predecessor of the opposite party. Once more needlessly risks were taken, uncertainty created, urgent decisions postponed, and serious harm done by the long delay in actual transfer of office and power.

The Communists did not miss their opportunity to exploit this interregnum. Castro launched on more seizures, charges, insults, and humiliations. When Mr. Eisenhower at last took the only step possible in breaking off relations, Mr. Kennedy disassociated himself from it on the excuse that he did not know the facts. There was even Democratic criticism of Mr. Eisenhower for “limiting the freedom of action” of the new Administration—though any decision or action whatever by the outgoing Administration in any field would necessarily do that.

Then Khrushchev sent a New Year’s message, not to the legal President but to the President-elect, expressing hope that relations between the U.S. and Soviet Russia would “develop in the new year on a new and reasonable basis”—in other words, that we would make more retreats and concessions. Nothing was said in reply to disabuse him of this hope.

HI-HO-HUM GOES ON

Yet a little thought, taken in time, might have saved them. They themselves had recommended that gold be treated just like any other commodity. The American Government took this literally. It ceased to make it a criminal offense to hold, own, or buy gold. Removing this prohibition enormously increased the demand for gold on the part of the people. Further, the gold was now being bought with, and priced in, paper dollars of unknown future value. People rightly interpreted the demonetization of gold as a mere first step to an acceleration of fiat money inflation everywhere. They sought to spend their paper dollars while the dollars still had any value.

Moreover, the “demonetization” of gold, paradoxically, led to resumption of its use as money, something not widely seen since 1914. New long-term contracts, debts, and bonds were made payable in ounces of gold, at the insistence of lenders who did not trust the future value of paper currency units. Exporters everywhere increasingly refused to sell except in terms of gold. Stores priced goods both in paper money and in grains of gold. Gold coins, privately minted and stamped with their weights, came into circulation.

After ten years, concludes Hi-Ho–Hum, the world’s governments finally recognized that for the wrong reasons they had stumbled on the right thing. They were forced, in order to give them any value, to make their paper currencies convertible into gold again.

*One of the most learned writers of the 21st century, frequently quoted by the late Simeon Strunsky.
the fiscal year, or to postpone the required date of the annual Budget Message.

**DANGER TO THE DOLLAR**

But perhaps the most serious damage of the interregnum just ended has been in the monetary field. On Nov. 28 President Eisenhower served notice that he was “determined to take whatever decisions are necessary . . . to protect the integrity of the dollar.” From an Administration with only seven weeks to live, this pledge was practically meaningless. The attempt, wise or unwise, to negotiate with Germany on troop support was doomed to fail. What the world wanted to know was what the new President would do. But Mr. Kennedy was silent. He refused to repeat his pre-election pledge (of Oct. 30) not to “devalue the dollar from its present rate.”

His excuse for his silence and disassociation was substantially the same as Roosevelt’s to Hoover 28 years ago: “It would be unwise for me to accept an apparent joint responsibility with you when, as a matter of constitutional fact, I would be wholly lacking in an attendant authority.” Yet all during the interregnum period Mr. Kennedy was receiving and publishing “task force” reports recommending immense increased spending and deficit-creating measures. All these were undermining confidence in the dollar and increasing the run on gold.

The risks and evils of the interregnum period could be removed by a simple amendment of the Presidential Succession Act permitting any outgoing and incoming President to agree, if both wished it, to an earlier transfer of office and power than Jan. 20. This earlier date could be set in each case in accordance with circumstances and mutual convenience. Responsibility would then no longer be blurred, decisions no longer paralyzed.

**A Crime to Own Gold**

January 30, 1961

When this country went off gold in 1933 its bonds and currency contained the most solemn pledges that they would be redeemed in gold on demand, at their face value in dollars, at the rate of $20.67 an ounce. This pledge was dishonored. Holders who asked for the gold they assumed was theirs were denounced as enemies of the country. They were ordered to turn over all their holdings of gold to the government. Further possession of the metal was made a criminal offense.

But in this act of bad faith there was one oversight. The government had neglected to make it a crime for American citizens to buy or own gold abroad. Discovering this 28 years later, the Eisenhower Administration, though it had only one week to go, could not wait for the Kennedy Administration to assume office before plugging the awful loophole.

Let us pass over such trivial questions as the abridgment of personal liberty or private property rights. Will the new prohibition accomplish its ostensible aim of “protecting the integrity of the dollar” and halting or reducing the outflow of gold? Obviously it will do nothing to bring gold back. The amount of gold Americans hold abroad is not known. Estimates range from a top of $1 billion to less than $50 million—trivial sums against a world monetary gold stock of more than $40 billion or even our shrunken holdings as of Jan. 11 (the lowest since 1939) of $17.6 billion.

**FLOW-BACK UNLIKELY**

But there is no reason to suppose that any substantial part of this American-held gold will flow back. Putting aside probable evasions of the new ruling, even the Americans who comply are unlikely to sell their foreign-held gold for dollars. They bought the gold precisely because they did not trust dollars. Therefore they will in all likelihood sell it for foreign currencies or investments—anything but dollars. Moreover, as they have until June 1 to sell, and cannot get less than $35 an ounce for it, they may hold until then against possible dollar devaluation in the meantime.

True, the new regulation may prevent Americans from buying more gold abroad. But it will probably tempt foreigners to buy more gold at $35 an ounce while they still have the chance. These foreigners, as pointed out by S.J. Rundt, a consultant on international business, include residents of Germany, Switzerland, Lebanon, Argentina, Belgium, Canada, Costa Rica, Ecuador, Jordan, Kuwait, Panama, Paraguay, Peru, Saudi Arabia, Uruguay, and Yemen. These people, unlike those in the Land of Liberty, are allowed to own, buy, or sell gold in any form.

**REDUCING CONFIDENCE**

In brief, the Eisenhower Administration’s expiring act will further reduce confidence in the dollar. It will lead foreigners to conclude that our currency situation must be more desperate than they had supposed. Otherwise, why would a government with only one more week in office feel that action could not wait that long? They will also assume that this new prohibition is a prelude to further restrictions on the convertibility or transferability of the dollar, or on the movement of American capital.

The new prohibition attacks symptoms and neglects causes. It blames the “speculators.” It blames the people who have lost confidence in the dollar instead of
re-examining or correcting the policies that have caused them to lose confidence.

What the United States faces today is only derivatively a “balance of payments” crisis; it is primarily a crisis of inflation. If for a moment we neglect the goods and dollars that we deliberately give away in foreign aid, payments always balance—for the simple reason that people insist on being paid for what they sell. If, in return for the goods they sell to us, foreigners buy gold instead of other goods, it is because they think gold is the better bargain. They will think this as long as our commodity prices, as a result of domestic inflation, are too high as compared with the price at which we sell gold.

The real and only permanent cure for the gold outflow and the “deficit” in our balance of payments would be to halt our inflation. But this is the one course that nobody in office is seriously discussing.

What Is to Be Done?
February 6, 1961

President Kennedy’s assurance that “the dollar must be protected, the dollar can be protected in its present value” is gratifying as far as it goes, but will require courageous measures to make it effective.

The first thing we must do is to make the correct diagnosis of the disease. The prevailing diagnosis is not correct. What we are primarily suffering from is not a “balance of payments” crisis but an inflation crisis. Confidence in the dollar has not fallen because of a “deficit” in the balance of payments, but there is a “deficit” in the balance of payments because of our inflation. The cure, therefore, is not to try to tinker directly with the balance of payments but to halt the inflation. If we do this, the balance of payments will correct itself.

What would we have to do to halt the inflation?
1—We would have to raise short-term interest rates. Last June and August, the Federal Reserve did exactly the opposite of what was required when it lowered the discount rate from 4 to 3 percent. The direct effect was to cause short-term balances to go abroad for higher interest rates. The indirect effect was to cause loss of confidence in our determination to defend the dollar. We have encouraged monetary inflation to go on so uninterruptedly for 27 years that perhaps the only way we could convince the world we meant to halt inflation now would be temporarily to forbid any further increase in the total loans and investments of the banks.

2—We would have to balance the budget, convincingly and dramatically, not by another burdensome and strangling increase in tax rates but by slashing nondefense expenditures—particularly such items as foreign aid, farm price supports, public roads and housing—and by halting further increases in welfare and social-security commitments. In brief, we must do exactly the opposite of what all the Kennedy task forces have recommended. It may be sobering to recall that of our enormous Eisenhower-planned budget expenditures of $101.8 billion for the fiscal year 1962, $54.4 billion, or more than half, are for nondefense items.

3—Finally, we would have to repeal all Federal labor legislation which compels men to join unions, compels employers to bargain exclusively with specified unions, permits mass picketing or labor violence—in other words, makes it next to impossible for employers to resist unreasonable, uneconomic, and inflationary wage demands.

Merely to list these essentials shows how tremendously difficult is the political problem of getting the only real economic solution accepted. The politicians wish to take precisely the opposite measures. The assumption behind all the task-force reports is that the correct solution of the dollar problem is more inflation, not less; that the way to cure unemployment is not to restrain or correct excessive wage rates but to increase government spending, to lower interest rates, to increase the supply of paper dollars still further, to raise prices—in short, to inflate and inflate.

TRANSITIONAL STEP
In this unhealthy ideological climate, in which the real solution is so unlikely to be adopted (at least at present), one must face the question of the least harmful alternative. In fact, one must face the question of what must be done even if, after an inflation of 27 years, the real solution is now belatedly adopted. There are writers who believe that even today we could establish a full gold standard at $35 an ounce. The result of any such attempt, however, would be to drain the Federal Reserve System of gold in a few weeks, and force an intolerable deflation.

Probably the least harmful transitional measure, pending re-establishment of a full international gold standard, would be for our government to stop buying or selling gold, permit a free gold market, and compensate foreign banks for any loss of value of their present dollar reserves in terms of their own currencies. Whatever drawbacks such a course may have, they seem less than those of the alternatives being seriously considered. The real danger foreshadowed by the Allan Sproul staff report is that we will plunge into still more inflation and attempt to “repress” its consequences by exchange controls and price controls.
Pledges vs. Policies
February 13, 1961

The President and his economic advisers seem to think that the integrity of the dollar can be defended chiefly by uttering the right phrases. So Mr. Kennedy “pledged” himself once more to take no action “to increase the dollar price of gold from $35 an ounce” or “to impose exchange controls” or “to distort the value of the dollar in any fashion.” And then he proposed a gigantic spending program that would unbalance the budget, accelerate inflation, and precipitate a crisis that would lead either to a complete drain of our free gold reserves or the very exchange controls or rise in the dollar price of gold against which he was pledged. It is as if a debtor, whose current liabilities already exceeded his quick assets, were to pledge himself to repay on demand 100 cents on the dollar and then go off on a spending spree.

What ails the dollar today is not a “deficit” in the balance of payments or the loss of gold. This is merely a consequence of our past and future-feared inflation. The dollar can be saved only by abstaining from further inflation. Mr. Kennedy’s cure is to step up the inflation.

His remedy is the result of a wrong diagnosis. This is not merely his personal diagnosis. It is that of all his advisers—of the Galbraiths, Samuelsons, Sprouls, the authors of practically all his task-force reports. It is, in fact, simply the Keynesian diagnosis that has bewitched the New Dealers of the last quarter century.

MORE INFLATION

To these people the greatest economic disaster that can befall a nation is unemployment. But it never for a moment crosses their minds that this unemployment may be the result of excessive wage rates or excessive labor costs that endanger or wipe out profit margins, that raise prices in the domestic market to a level that reduces demand, or costs to a level where we can no longer meet foreign competition. Never do their remedies for unemployment contemplate the slightest downward adjustment in any wage rate, no matter how out of line it may be. On the contrary, they insist on labor-relations laws and minimum-wage laws calculated to push money wage rates still higher.

And then they proposed to make these high wage rates payable by further inflation, which is to raise prices and “increase purchasing power.” This purchasing power is always to be increased by increased government spending, by bigger government deficits. And though they are always demanding “faster economic growth,” their concern for increased purchasing power or increased incentives for job-creating investment, for enlargement or improvement of our productive plant, is at best secondary. Their primary demand is increased purchasing power for consumption. “The fairest and most effective step the Federal government can take to help fight the recession [the words are from the Samuelson report] would be to expand unemployment compensation benefits. Such expenditures go to those who need them and will spend the money promptly.”

BUILT-IN UNSTABILIZER

So item No. 1 on the economic agenda is to increase and prolong these benefits—to “provide unemployment benefits of at least one-half of the employee’s earnings,” and to “extend the term of benefits to a minimum of 26 weeks in all states, supplemented by an additional thirteen weeks during periods of high national unemployment.”

But will bigger and longer unemployment benefits tend to reduce unemployment—or to increase and prolong it? May not this so-called “built-in stabilizer” be in fact a built-in unstabilizer? When we make bigger and longer payments to the unemployed we reduce the spur on the individual to seek a job promptly and the pressure on union leaders to accept more workable wage rates. We increase the rigidity of wage rates in the downward direction. In brief, we tend to increase and prolong unemployment as we increase and prolong the subsidies we pay for it.

Mr. Kennedy’s spending program will endanger the dollar still further. This is the most harmful thing he could do. It would not only undermine American prestige but disrupt international trade, confidence, and monetary stability.

Kennedian Economics
February 20, 1961

Mr. Kennedy’s economic program raises so many questions simultaneously that it seems best to discuss some of them in a series of brief notes.

Campaign Document: The President’s economic message of Feb. 2 is a partisan document. It professes to be dealing with a crisis brought on by the apathy of his predecessor. “In the past seven [i.e., Eisenhower] years, our rate of growth has slowed down disturbingly.” Slowed down from what? In the eight Eisenhower years our gross national product grew, in real terms, by 23.7 percent, or about 3 percent a year. Over the preceding eight Truman years it grew 8.1 percent, or 1 percent a year.
The Growth Game: The fact that the American economy reached the highest production on record in 1960, at $503 billion, is treated not as an achievement but as a disgrace. This was nothing compared with what it ought to have done: “It was capable of producing at least $535 billion.” If it had done what it ought, then “$20 billion more personal income could have been earned. . . . Corporate profits could have been $5 billion higher” and everyone could have had a job. The growth slogans may be economic hocus-pocus, but they are a wonderful political device. No matter what the economy has done, it can always be argued that it ought to have done better, and that your own remedies would have done it.

Spending Cure-All: Mr. Kennedy’s own chief remedy is spending, spending in every direction, more and faster spending on agriculture, on housing, on highways, on “urban renewal,” on unemployment compensation, on depressed areas, on distribution of “surplus” food, on school lunches, on veterans, on defense contracts, on education, on flood control, on irrigation, on forests, on “long-range energy resource development,” and on a beefed-up and expanded social-security program.

No Budget at All: How much would all this increased spending come to? Mr. Kennedy does not say. His message not only fails to give any total, but even the cost of the chief individual items. He is content to say that “the programs I am now proposing will not unbalance the budget which was earlier submitted”—apparently for the reason that he expects a deficit anyway, so what difference can a few more billion make? We are to operate, apparently, with no budget at all.

To be sure: “This Administration is pledged to a Federal revenue system that balances the budget over the years of the economic cycle—yielding surpluses for debt retirement in times of high employment that more than offset the deficits which accompany—and indeed help overcome—low levels of economic activity in poor years.” The political advantage of this system is that no one can ever hold you to account, because no one knows when an “economic cycle” has begun or ended, or just where we are in it, or when employment is ever high enough to take the terrible risk of balancing or overbalancing the budget. We have already had 24 budget deficits in the last 30 years. The record will become even worse if we adopt the indeterminate “cyclical-balance” theory as official doctrine.

Social Security: The most reckless spending proposal of all is that increasing social-security commitments in all directions. The OASDI program has long cried for expert reappraisal and study. Its “unfunded liabilities” have been estimated by actuaries as already from $350 billion to $650 billion. The month-long strikes, riots and violence in Belgium, when the government proposed very moderate reductions in the social-security benefits which some groups had got used to, were an ominous warning to other nations of the political as well as economic dangers of overcommitment. Social-security benefits are easy to raise, enormously difficult to reduce.

Inflation: In brief, the Kennedy economic program accepts lock, stock, and barrel the Keynesian economic philosophy, which never sees the cure for unemployment in any adjustment of wages, prices, or costs, but only in more and more spending and inflation.

Saving the Dollar
February 27, 1961

Once more, in his message to Congress on the balance of payments, the President pledged that: “The U.S. official dollar price of gold can and will be maintained at $35 an ounce. Exchange controls over trade and investment will not be invoked. . . . A return to protectionism is not a solution.” Once more the actual policies he proposed would make it impossible to keep all these pledges.

Solutions must deal with causes. The “deficit” in our balance of payments is not the basic cause of our gold and dollar problem. The basic cause is inflation. This includes both the inflation that has been built up for the last quarter century and the future inflation that is now feared. The “deficit” in our balance of payments is itself one of the consequences of this inflation. Yet ninetieths of the economic proposals that Mr. Kennedy has made in his first weeks of office would increase the inflation.

The assumption that the basic cause of our gold and dollar problem is the “deficit” in our balance of payments is a relic of seventeenth-century mercantilism. And most of the immediate measures that Mr. Kennedy proposed, seeking to eliminate this “deficit” directly, move in fact toward protectionism and exchange control.

RESTRICTIONISM

This is true, for example, of his proposal to reduce the duty-free allowance for returning travelers from $500 to $100. This might have been urged on the ground that the larger allowance discriminates in favor of people who can afford to travel; but it was actually urged on a
“balance of payments” argument that would be just as
good or bad for any other measure to restrict imports.

His other measures lead toward exchange controls
and further restrictions on the freedom to trade and
invest, to buy and sell, to lend and borrow. This applies
to his endorsement of the prohibitions on Americans
against buying or owning gold at home or abroad. It
applies to his proposals for laws “to prevent the abuse
of foreign ‘tax havens’ by American capital abroad as
a means of tax avoidance”—leaving it to bureaucrats
to decide just what is “legitimate” private investment
abroad. It applies to his proposals to control and com-
partmentalize interest rates, discriminating in favor of
foreign lenders, and keeping up short-term rates while
pushing down long-term rates. Such schemes could not
be made to work at all without exchange controls, gov-
ernment discrimination as between both borrowers and
lenders, and detailed government intervention in the
money market.

Finally, it is disturbing to have Mr. Kennedy decry
as “speculation” every effort of Americans to protect
themselves against further devaluation or debasement
of the dollar. This view must lead to exchange control.

HALT THE INFLATION

Mr. Kennedy’s statistical pictures seems unduly opti-
mistic. The fact is that against $17.4 billion of gold
reserves we have short-term liabilities to foreigners of
$20.9 billion. Nearly two-thirds of these are official
holdings for which gold could be demanded; most of
the rest could easily be turned into official holdings. Of
our $17.4 billion gold reserves less than $6 billion are
“free.” The remaining $11.4 billion are held as a required
25 percent reserve against Federal Reserve notes and
deposits. Mr. Kennedy hints that we could abolish the
reserve requirement. This would merely protect foreign-
ers a little longer at the permanent expense of our own
citizens. One can imagine what the effect of such an
announcement would have been if Americans as well
as foreigners were free to convert their dollars into gold.

The first and only cure of the dollar problem, and
the so-called balance-of-payments problem, is to halt
the inflation. Nearly all of Mr. Kennedy’s proposals
would increase the inflation. He is right in saying that
“our costs and prices must be kept low.” But one does
not keep them low by increasing the minimum wage.
To pour more inflationary funds into the economy, and
raise money-wages and prices, will only encourage and
discourage exports still further, and increase the “defi-
cit” in the balance of payments. We cannot cure the
evils of inflation with more inflation. ✹

Jobs by Inflation?
March 6, 1961

We are in a recession. Unemployment is alarmingly
high. We must act. “I hope we can get action as soon
as possible.”

Thus the Kennedy Administration. And what is
this action we must take so precipitously? It is more
government spending in all directions—on unemploy-
ment compensation, crop price supports, housing, high-
ways, depressed areas, veterans, social security, Federal
aid to education, and scores of other projects. It is low-
ering interest rates and increasing loans. It is, in a word,
inflation.

Behind this proposed remedy is the same the-
ory that has dominated the economic policy of most
Western governments, especially our own, for the last
quarter century. It is the theory made popular by union
propaganda and the late Lord Keynes.

Keynes himself recognized that raising wage rates
would only increase unemployment. He left-handedly
conceded that unemployment might exist because real
wage rates were already too high in comparison with
prices and demand, so that the outlook for profits was
too bleak to encourage full employment. But he argued
that a direct lowering of money wage rates would be so
strongly resisted by the unions as to politically impos-
sible. Therefore the only way to lower wage rates to a
workable level was to lower the value of money. The way
to do this was to inflate, to print more money, and so to
raise prices and monetary demand to a level at which
full employment would be possible again.

WHY NOT FOREVER?

This is the process to which we have resorted again and
again in the last 28 years. Economically, it has seemed
to work. We have had continuous inflation, but we have
also (at least since 1942) had fairly continuous employ-
ment. Politically, it has kept whatever Administration
was in power from having to face up to the problem of
how to halt constant union wage demands and increases
that exceeded the gains in labor’s marginal productivity
at the existing level of prices. We have floated ourselves
out by ever new doses of inflation.

Well, why can’t we do it again? Why can’t we keep
it up forever?

One reason it is especially dangerous to try it again
now is that we have done it so much in the past that we
have undermined international confidence in the dol-
lar. Our labor costs of production on some items have
been raised to a point that is pricing them out of the
world market. American capital is being invested in
new plants abroad rather than at home. Our existing
inflation has already caused a deficit in our balance of payments. We have been losing gold at a dangerous rate. Further inflation will only intensify the problem.

**DESPERATE RACE**

And we can’t keep inflating forever because the process inevitably becomes accelerative. With every dose of monetary inflation and increase of prices, the unions make demands for still further wage increases to keep up with or get ahead of the latest price increase. Each round of wage increases leads to another dose of inflation to pay the new wage level. There is a perpetual and increasingly desperate race between the printing press and the union demands.

Yet the whole race is needless. What is necessary for full employment is the coordination of wages and prices, at whatever average level. If this coordination does not exist, if a new dose of inflation simply touches off a new round of wage hikes, then the inflation is futile, even as a short-term expedient.

What labor is chiefly suffering from today is too many victories. It is no mere coincidence that unemployment now is highest in lines in which wage rates are highest. As compared with average wages of $2.30 an hour in all manufacturing industries, wages in automobile plants are $2.87 an hour, in steel mills $3.02, in bituminous coal mines $3.27. But in the excited calls of the Kennedy Administration for “action,” there is complete silence regarding wage rates. They are treated as irrelevant.

Yet not quite. Among the proposed remedies for unemployment are higher and longer unemployment benefits and higher minimum wages to keep wage rates up or to force them still higher.

---

**Protectionism**

March 13, 1961

In his Feb. 6 message to Congress the President pledged that, “Exchange controls over trade and investment will not be invoked. . . . A return to protectionism is not a solution.” Within a few weeks he not only approved the equivalent of exchange controls over trade and investment, but new protectionist measures.

On the exchange-control side, he not only endorsed the prohibitions on Americans’ buying or owning gold at home or abroad, but he proposed discriminations against American and in favor of foreign lenders by offering the latter higher interest rates. He also proposed a scrutiny of American investment abroad to find what part of it was “legitimate.” All this foreshadows increasing government intervention and control of foreign lending and investment.

On the protectionist side, he has advocated a reduction from $500 to $100 of the amount of duty-free goods that American travelers can bring from abroad. This is made on the assumption that it will help the balance of trade by reducing imports. Then on Feb. 25 the President raised the tariff on foreign-made bicycles by 50 percent.

On the same day, the AFL-CIO, which is itself built on protectionist principles, but has hitherto given lip service to free trade, adopted a new formula which continued to pay lip service to free trade but, as one report summarized its conclusions, “with additional safeguards for domestic jobs and wage standards.”

**FALSE ASSUMPTIONS**

Individual unions announce their own protectionist policies. The Amalgamated Clothing Workers will boycott Japanese imports unless Japan puts a “voluntary” quota on shipments of men’s suits. The Chicago local of the International Brotherhood of Electrical Workers will refuse to handle any Japanese-made electronic parts after May 1.

Behind all these protectionist measures, official and unofficial, there is not only the desire to protect special interests (at the expense of consumers), but false assumptions concerning the cause and cure of the dollar crisis. The outflow of gold and dollars is generally attributed to a “deficit” in the balance of payments. (It is, in fact, just another name for the same thing.) From this it seems an easy step to the assumption that if we cannot induce foreigners to buy more American goods, we can cure the “deficit” by penalizing Americans for buying foreign goods.

This is the protectionist theory. It goes back to the mercantilism of the seventeenth century. What it overlooks is the essentially two-sided nature of all trade. In the long run we can buy only as much as we sell, and sell only as much as we buy. To the extent that we refuse to buy foreign goods, we deprive foreigners of the dollars with which to buy our goods. When we buy their goods, and “lose” dollars, foreigners in the long run have no way of using these dollars except by buying American goods, services, or investments with them.

**GOLD AS A BARGAIN**

It makes no difference how indirect these transactions are. If our troops spend dollars in Germany, the dollars do not disappear down a well. Even if the Germans use all the dollars to buy goods in Japan, the Japanese (or whoever) must eventually use the dollars to buy American goods. Trade (in the widest sense) must
average factory wage is about $2.30 an hour, the proposal is to raise the minimum to $1.15 in 1961 and to $1.25 in 1963.

**ROAD TO INFLATION**

Thus, as increased capital investment and new and better tools of production keep raising marginal labor productivity, and as the general level of wages is raised by competition of employers, the ideas of reformers as to what the minimum wage ought to be keep rising always a little ahead of actualities. Among the simple, this creates the optical illusion that it is the successive increases in the minimum-wage law that have pushed up the actual average of real wages. If that were really so, the most underdeveloped nation would have no problem. It could set wages wherever it wished, by passing a law.

No doubt minimum-wage laws have played a role in raising money wages. When unemployment has been brought about by higher minimum money wages (which tend to push up all other wages by persistence of existing differentials) increased political pressure has been built up for further monetary inflation to make the higher wages payable. Thus successive minimum-wage boosts have exercised continuous political pressure for more inflation.

**FORCING UNEMPLOYMENT**

Minimum-wage laws tend to hurt most precisely the workers they are ostensibly meant to help. They increase unemployment especially among low-paid workers. For the first thing that happens when a law is passed that no one shall be paid less than $1.25 an hour is that no one whose work is not deemed worth $1.25 an hour will be employed at all. You cannot make a man worth a given wage by making it illegal for anyone to offer him less. You merely deprive him of the right to earn the amount that his ability permits him to earn.

President George Meany of the AFL-CIO has said: "If an enterprise cannot survive except by paying wages of 75 cents or $1 an hour, I am perfectly willing for it to go out of business." This could be reworded as follows: "If workers are only getting $1 an hour, I am perfectly willing to see them forced into total unemployment." How does this make them better off? Meany forgets that low as are the wages in the enterprise he is willing to destroy, the workers in those enterprises have presumably found them to be the best among the alternatives open; otherwise they would have taken jobs elsewhere. Workers are not benefited by being forced into unemployment or onto relief. Nor are the taxpayers. Nor are the former customers of the enterprises.
forced to shut down. The nation is not benefited when its marginal production and industries are deliberately destroyed.

An International Money
March 27, 1961

Since West Germany revalued the mark on March 4, there has been a great deal of discussion concerning the probable effect of the change on its export and import trade, on its internal price level, and on the dollar. But one aspect of the change has attracted less attention than it deserves. The value of the mark was changed from 4.20 to the dollar to four to the dollar. In other words, the mark has been so revalued as to make it very simple mentally to translate one currency into the other. This is a step nearer to an international money.

Monetary reformers have long dreamed of a uniform international money. They have seen this as not merely a benefit to travelers but as a means of simplifying and facilitating all international trade, and comparisons of prices and statistics. This aim inspired the Latin Monetary Union in 1865, which embraced France, Belgium, Switzerland, Italy, and later Greece. While each country kept its own name for its currency unit, they established a one-to-one exchange ratio. Later Spain, Serbia, Bulgaria, and Rumania adopted the same currency unit. Sweden, Norway, and Denmark formed a monetary union of their own.

FRENCH PLAN OF 1872
In 1872 a French Imperial Commission proposed a scheme by which the leading world currencies would establish very simple ratios between each other and the franc:

<table>
<thead>
<tr>
<th>Currency</th>
<th>Then existing value</th>
<th>Proposed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Franc</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Florin (Austrian, silver)</td>
<td>2.47</td>
<td>2.5</td>
</tr>
<tr>
<td>Dollar (American, gold)</td>
<td>5.18</td>
<td>5</td>
</tr>
<tr>
<td>Pound sterling</td>
<td>25.22</td>
<td>25</td>
</tr>
</tbody>
</table>

Nothing came of the proposal. The first world war finally broke up both the Latin and Scandinavian monetary unions, because individual members resorted to inflation and exchange restrictions. But the breakup called attention to something that had been taken for granted. Most of the world had been on a common gold standard. And on that standard it was far closer to an international currency system than it has ever come since.

Let us see just how the full gold standard unified the currency systems of the world. When the currency unit of nearly every major country was defined as a specified weight of gold (previous to 1934 the American dollar, for example, was defined as 23.22 grains of pure gold), every such currency unit bore a fixed relation to every other currency unit of the same kind. It was convertible at that fixed ratio, on demand, to any amount and by anybody who held it, into any other gold currency unit. The result was in effect an international currency system. Gold was the medium of exchange.

THE GOLD STANDARD
The international gold standard enforced strict monetary discipline within each country. When one country began to inflate, its domestic prices rose, its imports increased, its exports fell, its balance of trade or payments became “unfavorable,” its currency unit in the world’s exchange markets dropped “below the gold point.” Gold started to flow out. To stop or reverse the gold flow, it had to stop inflating, and to allow its interest rates to rise. The international gold standard coordinated prices, interest rates, markets, demand, supply, trade, and production all over the world. It did not “break down.” It was abandoned precisely because politicians wanted to get rid of the discipline it enforced against domestic inflation and internal tampering with money.

The great present need is to restore and perfect this system. We should never go back to a relationship of incommensurable values, typified when the pound at par was $4.866,563. . . . This made calculations and conversions absurdly complicated. It often forced needless melting down of coins and recoining. While other currency units should today be aligned with the dollar, we on our side should offer to set a new gold weight for the dollar in terms of the metric system—say a gram or a round number of decigrams. Then every country would be responsible for maintaining its own currency at par—without constant rescue operations by an International Monetary Fund—by maintaining confidence, by refraining from reckless budget deficits and inflationary credit expansion. This would be a true internationalism.
Aid with What Strings?
April 3, 1961

Our foreign-aid program, now fourteen years old, is the product of sentimental confusions. Its basic assumptions are wrong politically, diplomatically, and above all economically. Yet just at the moment when our balance-of-payments crisis makes it most necessary to re-examine them, and to consider how we can most gracefully taper off the program, we are planning to expand it to “towering dimensions,” and to commit ourselves for years ahead.

Consider the dimensions the program has already assumed. Since the end of World War II the United States has spent the staggering sum of $90 billion in foreign aid—more than $60.4 billion of it for economic aid—to more than 70 nations.

In a book written in 1947, I pointed out that intergovernmental loans (they were first proposed as loans, not gifts) were on the horns of a dilemma. “If on the one hand they are made without conditions, the funds are squandered and dissipated and fail to accomplish their purpose. . . . But if the lending government attempts to impose conditions, its attempt causes immediate resentment. It is called. . . . ‘American imperialism’; or ‘interfering in the internal affairs of the borrowing nation.’

THE DILEMMA
This dilemma has never been acknowledged by the successive administrators of foreign aid. In practice, however, they have grabbed first one horn, then the other. Faced with waste, corruption, fantastically impracticable schemes, they tried to impose a few modest conditions. Faced with resentment of these conditions, they hastened to assure recipient governments that the aid would be given “without strings.”

Now, in the new Kennedy foreign-aid program, particularly as outlined in the March 13 speech to Latin American diplomats, we are to impose conditions again. But unless I gravely misinterpret that speech, they are to be precisely the wrong conditions. We are to give aid, not if the recipients will adopt the only principle that can make the aid effective—the principles of capitalism, free markets, private property, private enterprise—but if they will adopt grandiose statist or socialist programs:

“Each Latin nation must formulate long-range plans for its own development—plans which establish targets and priorities.” Was it by formulating long-range government plans and establishing governmental targets that the United States itself became the richest and most productive nation on earth? Or was it not, rather, by permitting free individuals each to make his own long-range plan or establish his own targets and priorities?

PRICE ‘STABILIZATION’
Mr. Kennedy seems to call for more of the very programs that have brought many Latin American countries to their present distress. “The United States is ready to cooperate in serious case-by-case examinations of commodity market problems. Frequent violent changes in commodity prices seriously injure the economies of many Latin nations. . . . Together we must find practical methods of bringing an end to this pattern.”

It is precisely changes in prices that guide producers as to what to plant or make, and how much of it. It is precisely changes of prices in free markets that guide allocation of production among thousands of commodities, tending to optimum balanced production in the long run. It is precisely government attempts to “stabilize” such prices—Brazil’s with coffee, ours with our own farm commodities—that lead to waste, imbalance, unsalable “surpluses,” contrived scarcity, increased taxes, and final disillusion for the very producers being “aided.”

It is true that the President makes some points in the other direction. He wants Latin American nations to “insure monetary stability.” But it is precisely the “massive planning efforts” they have already made (of which he calls for more) that have led the great majority of them into appalling and inexcusable inflations. And our own present contemplated expansion and perpetuation of our foreign-aid program is one of the major threats to renewed inflation at home.

How long will it take us to learn that the most important thing we can do for world stability is to keep the dollar strong? ✫

Handout or Investment
April 10, 1961

Near the beginning of his foreign-aid message to Congress of March 22, President Kennedy posed “a fundamental question: Is a foreign-aid program really necessary?” It is a question we ought to have asked ourselves a dozen years ago. Many of us will answer that continuance of a so-called economic (as opposed to military) aid program is not only unnecessary but harmful to the United States, and in the long run harmful to the recipient nations themselves.

The President’s own answer to his question is that “there is no escaping . . . our moral obligations . . . our
economic obligations as the wealthiest people in a world of largely poor people.” But when did this obligation, historically, begin? When will we be able to consider it discharged? Has it any limits? What are they? Do we keep pouring out money until every country in the world is as rich as ourselves—or as poor as the poorest? If we, by establishing a free economy, have made ourselves the richest nation in the world, shouldn’t we be proud of that achievement? Why should we have a guilt complex because others, with repressive systems, haven’t done as well?

The most specific sign of how the President measures the extent of our obligation is the proposal that each industrialized country provide annual aid to backward countries amounting to 1 percent of its gross national product. But this is a token figure, unrelated to the special “needs” of Chile or Chad. It may sound small, but it would mean more than $5 billion a year for the United States. That is greater than the $3.8 billion deficit in our balance of payments last year.

AID AND INFLATION

The President seems to take this problem lightly. He estimates that “not more than 20 percent of foreign economic-aid expenditures will affect our balance of payments” because 80 percent “will be spent directly” for our goods and services. But this overlooks that when we give away the dollars to buy part of our exports, we give away those exports. We cannot use the proceeds from those exports to buy our needed imports.

Our foreign-aid program, moreover, causes the budget deficit that causes the inflation that causes the deficit in the balance of payments. The President forecasts a budget deficit of $2.2 billion for the fiscal year 1961 and of $2.8 billion in 1962. But, other things unchanged, both deficits would be surpluses without the foreign-aid program.

Instead of “a series of one-year programs,” the President recommends “long-term development loans at low or no rates of interest” running for “as long as 50 years.” This proposal calls for careful scrutiny. Our own government is now paying more than 3½ percent a year for long-term borrowing at home. On every dollar borrowed now at that rate our taxpayers will have to pay $4.58 at compound interest over 50 years. To charge no interest on such loans would be equivalent to giving away four-fifths of the amount even if the principal were repaid at the end of the period.

SOCIALIZED SOCIALISM

But the most serious aspect of the new foreign-aid proposals is that the money is to be given or lent only if the recipient countries promise to “engage in long-range planning,” to “mobilize their own resources,” to set “targets,” to embark on “land reform” and “social justice.” This clearly means state planning. What we are offering to do is to subsidize other people’s socialism. We are insisting on more of the very planned economies that have brought a tangle of government controls and chronic inflations.

It is because this is what we have been doing in the past that the President is correct when he points out that “many of the nations we are helping are not much nearer sustained economic growth than they were when our aid operation began.” If we stopped our foreign economic-aid program these nations would have to turn to private investors. These investors would insist on the reforms really calculated to bring sustained economic growth. They would insist on assurances against seizures or stifling controls. The plan they would ask for is capitalism—the system of private property and free markets—to release the initiative and energies of millions of individuals everywhere.

Budgetary Chaos

April 17, 1961

The budget message that President Kennedy sent to Congress on March 25 was a baffling document. Here is both sample and summary: “This, then, is the revised budget—apart from defense additions—that I now present to the Congress: A budget that is in balance in terms of my pledge of Jan. 30. A budget that is likely to be in deficit unless economic conditions rapidly improve to meet the levels predicted in the Jan. 16 budget. A budget that would be in surplus if the economy were operating at or near its full potential.” How does one get a budget that is at the same time in balance, likely to be in deficit, and would be in surplus?

Mr. Kennedy’s pledge of Jan. 30 was that he would submit a program of expenditures that “will not of and by themselves unbalance the earlier [Eisenhower] budget.” He felt safe in making this pledge, it now becomes clear, because he expected a deficit even without new spending.

Mr. Eisenhower forecast a thin surplus of $79 million at the end of this fiscal year and a substantial one of $1.5 billion at the end of fiscal 1962. Whether or not he overestimated revenues and underestimated expenditures even on the basis of his own proposals, as Mr. Kennedy charges, Mr. Kennedy’s own proposals obviously add billions to the expenditure side of the budget. Hence his estimate that instead of a thin surplus there will be a $2.2 billion deficit in the current fiscal year, and instead of $1.5 billion a deficit of $2.8 billion
in fiscal 1962. The expenditure estimate for fiscal 1962 is raised from Mr. Eisenhower’s $81.5 billion to $84.3 billion. The increase in requests for new obligational authority is even more striking. Mr. Eisenhower recommended $80.9 billion; Mr. Kennedy $86 billion.

**COST OF NON-DEFENSE**

“The point I wish to stress,” says Mr. Kennedy, “is that any budgetary unbalance at the close of fiscal 1962 will not be the result of any nondefense programs I have submitted.” This implies that it is defense spending that will cause a budgetary unbalance. Yet Mr. Kennedy’s defense spending proposals for 1962 are only $890 million higher than his predecessor’s; his non-defense spending proposals are $2.6 billion higher—almost equal to the total expected deficit.

Mr. Kennedy seems anxious to prove that whatever deficit occurs in 1962 will not be his fault. But in view of his own contention that a deficit in any one year isn’t important anyway—that the only thing that counts is that the budget be “in balance over the years of the business cycle”—this anxiety is hard to understand.

**IRRESPONSIBLE SYSTEM**

But the present budgetary chaos is not wholly the fault of Mr. Kennedy. It is even more the fault of our lack of any responsible budget system. “It is a legal absurdity [I quote my own *Newsweek* column for Jan. 26, 1953, on the Truman budget for fiscal 1954] that an outgoing President should be required to frame and present a budget for a year in which he will not be in office and for which he cannot and should not assume any responsibility.” The result is mainly to obscure the fiscal responsibility of a new President for his first year and a half in office. This absurdity is imposed by the Budget and Accounting Act of 1921. That act should be drastically amended, now. Each President should be made unmistakably responsible for his full period in office.

This is a minimum reform, but it is far from enough. There can be no executive responsibility for the budget until the President, like the governors of 43 states, has the power to veto individual items in appropriation bills. Even this would not be enough to give us a truly responsible budget. In New York, the governor’s annual budget must not only give estimated expenditures and revenues for the next fiscal year, but must be accompanied by bills containing all the proposed appropriations and any proposed new taxes. The legislature (I quote the state constitution) “may not alter an appropriation bill submitted by the governor except to strike out or reduce items therein.” Here is a guide for the Federal system. Congress will not be a resolute watchman of the public purse as long as it is permitted to put its own hands into the purse.

### Inflation Without Jobs

**April 24, 1961**

I have just received the English text of a speech delivered in Stockholm by the European economist L. Albert Hahn. It covers economic growth, saving, unemployment and inflation, and it applies with remarkable pertinency to our immediate problems.

On economic growth: “In every decade economists seem to be beset by some new panicky fear. In the ‘30s it was the fear of secular stagnation through oversaving and lack of investment opportunities. Nowadays it is the fear of insufficient growth. This fear develops sometimes into a desire to foster growth at almost any price, and leads, in fact, to real growth fanaticism. Most people, of course, favor the growth of the national product; but only few seem to realize that in order to achieve a bigger national product people have to work harder, and to save more; the latter in order to increase the worker’s productivity by equipping him with more capital. The impression seems to prevail that an economy can, like Munchausen, pull itself by its own hair out of the mud of insufficient growth; in other words, that growth can be commanded at will. And the increase of the money supply is recommended as an appropriate means of such commanding. . . . [Yet] growth does not . . . depend on the amount of money in circulation, but on how much the people decide to work and save. It is, therefore, probable that the urge for growth will have inflationary effects.”

**BIGGER MONEY SUPPLY**

Defining inflation simply as an increase of money—bank notes plus demand deposits—Hahn points out that since 1939 the money supply in the U.S. has increased about fourfold while prices have about doubled. In the seven-year peacetime period from 1953 until today wholesale and consumer prices have risen by about 10 percent. What is alarming is not the extent of this depreciation, “but its happening during a period which included two recessions, 1953–54 and 1957–58. According to rule, prices should have declined during the recessions; but they refused to do so. During the last of the two recessions they even continued to move up with the result that the next upswing started from an even higher price level.”

Suppose, now, looking at our own statistical picture a little more closely than Hahn does, we try to see why prices continued to rise. For one thing, the money supply continued to rise. Between the end of 1953 and 1954 it went up $3.7 billion; between the end of 1957 and 1958 it went up $5.3 billion. If we include time deposits,
the increase in monetary media throughout the period has been uninterrupted and much larger.

**HOURLY WAGE RATES**

Now let us look at average hourly wage rates. Since the end of 1953 they have risen from $1.77 to $2.32—not 10 percent, like prices, but 30 percent. It is particularly instructive to notice that they went up from $2.29 in February 1960, to $2.32 in February this year. This happened in a recession, when unemployment rose from 3.9 million to 5.7 million.

Classical economists would agree that the increased wage rates increased the unemployment. By raising wages sufficiently high one can create any amount of unemployment. This is because wage-rate increases are cost increases. They destroy the profitableness of marginal enteraine and so reduce production. But under the sway of Keynesian doctrines, not only is it taboo to mention the wage level in connection with the extent of employment, but a discredited “purchasing power” theory creates political demands for boosting wage rates further. Hence the minimum-wage law agitation.

As nobody dares to suggest that our unemployment be corrected by a realistic wage-rate adjustment in the industries in which the main unemployment exists, Washington is seeking to cure it by another giant dose of spending and inflation, even though this must imperil the dollar.

And the economic and moral evils of that course (which I tried to point out myself last fall in a book called *What You Should Know about Inflation*) are explained with great cogency in an excellent little volume just published—*An Inflation Primer*, by Melchior Palyi (150 pages, Regnery, $4).

**Propaganda in Orbit**

May 1, 1961

In spite of all the discrepancies in their story (see page 87), the Russians may finally prove that they shot a man into space on April 12 and brought him safely back. Yet we know that the Russian Communists lie on principle, and there was nothing in the crude propaganda with which they handled this case to remove any scientific doubts.

Gagarin’s statement to the press told nothing about weightlessness or how the earth looks from high up that was not already familiar to the American magazine or newspaper reader or could not have been supplied by any hack science-fiction writer. If the scientific content of his statement was thin, the political propaganda was so thick that it read like a travesty: “I should like to note especially that loving human care which is being shown in our Soviet Union toward the ordinary people from the Central Committee of the [Leninist Communist] party, the Soviet Government and our dear Nikita Sergeyevich Khrushchev.” There was one piece of real news in the statement—“the first airplane” was invented by the Russians.

But suppose the Russians finally straighten out their discrepancies and prove that in this case, at least, they were telling the truth? With millions of human beings in Russia living six to a room in slums and hovels, and millions in slave camps, should we applaud the diversion of billions of dollars (as David Lawrence has asked) for a spectacular propaganda stunt that does nothing to advance the conditions of life? “A dictatorship,” as President Kennedy pointed out, “enjoys advantages in this kind of competition over a short period, by its ability to mobilize its resources for a specific purpose.”

**FIGURE JUGGLING**

Hardly less remarkable than the Russians’ propaganda about the flight was the instant and unquestioning acceptance of their claim by our own officials. We have made a habit of accepting all the Russian claims on the general principle that it is safer to overestimate the strength of one’s enemy than to underestimate it. But we are in grave danger of downgrading our own system. We have long given credence to Russian economic statistics, for example, that even Khrushchev recently repudiated as “figure juggling.”

The eminent economist Colin Clark recently pointed out in testimony before a Senate subcommittee: “A statement which has now circulated so extensively that nobody ever questions it is the proposition that the real product of the Soviet Union is growing” at the rate of 6 percent per year... and that therefore it is mathematically inevitable that it must, within quite a few years, overtake and then surpass the real product of the United States. . . . Like so many other things which everybody knows, this supposed 6 percent per annum growth trend of the Soviet economy is an illusion.”

**RUSSIAN OUTPUT MYTH**

Over the whole period 1913–56 Dr. Clark pointed out, the long period rate of growth in Russia averaged only 1.2 percent per year. Even if we reckon Russian productivity trends from 1928 or from 1939 we get figures of only 1.7 or 1.6 percent per year. The United States, on the other hand, Dr. Clark figures, has ever since the 1890s, subject only to minor fluctuations, maintained a steady rate of growth of real product per man-hour of 2.3 percent per year.

When we drop tricky projections of percentage rates of growth into the future and turn to actual present
That ‘Cyclical’ Budget
May 8, 1961

In his Budget Message of March 24, President Kennedy took over a doctrine that has been preached for the last 30 years by spenders and Keynesian economists and declared it to be official policy:

“Federal revenues and expenditures—the Federal budget—should, apart from any threat to national security, be in balance over the years of the business cycle—running a deficit in years of recession when revenues decline and the economy needs the stimulus of additional expenditures—and running a surplus in years of prosperity.”

A “cyclical” budget of this sort would be, in fact, an abandonment of all fiscal responsibility.

No one can predict the business cycle in advance. No one knows just when an upturn will begin, how fast or how far it will go, when it will reach its peak, when it will crack, how far it will drop. There are, of course, hundreds of statisticians and forecasters, in and out of the government, who offer to tell us or sell us this information. Some of them will make better guesses than others. But in the nature of things, at any given time only a minority of them can be right. As the European economist L. Albert Hahn recently summed up the case: “If the business cycle were predictable, there would be no cycle, as everybody would hedge against it.”

WHERE ARE WE?

No one even knows at any given time precisely where we are in a cycle. If we are in a recession, are we scraping bottom, or are we due to drop lower? If a recovery has started, will it peter out? Will it be mild? Will it be strong? If things are good, are we in a short-lived boom? Or has the country taken off on a higher rate of longtime economic growth?

Economists may, in the main, agree that a past business cycle ran so-and-so-many months or years. A present or a future business cycle, however, has no predeterminable length and no known end. Consequently, at no point can anyone charge that an Administration has definitely failed to balance the budget even over the cyclical period. The Administration in power can always argue that things are so unsatisfactory that a continuation or increase of huge spending or deficits is necessary. No matter how high an existing boom, the Administration will always be able to point to “pockets of unemployment” here and there, or to some groups that have not done as well as others. It will still argue that this is no time to endanger everything, and bring on unemployment and deflation, by overbalancing the budget and paying off debt.

IRRESPONSIBLE PLAN

The cyclical budgeteers do not accept the logic of their own proposal. If, as they argue, it is unreasonable to expect a budget balance every year, because we cannot, say, foresee depressions and wars, then the corollary is that we should normally plan for a substantial annual surplus. If thumping deficits are necessary in the low years of the cycle, then equally thumping [surpluses] are required in the good years. But I have not heard any of those who advocated or helped bring on the $12.4 billion deficit in 1959 demanding a $12.4 billion surplus in 1962. They are urging or planning still more deficits. So, to repeat, official adoption of the cyclical-budget doctrine would mean the complete abandonment of fiscal responsibility. No Administration could be held to account. It could always leave the balancing to its successors. Après nous le déluge!

Even without making it official, we have already had irresponsibility enough. We have had 25 budget deficits in the last 31 years.

The cyclical-budget doctrine, finally, not only promotes political irresponsibility; it is economically unsound. It got a massive tryout in the ten-year period 1931–40, and proved a massive failure. The average deficit in those ten years was 3.6 percent of the then gross national product (which would mean average annual deficits today of $18 billion). The consequence was average unemployment of 18.6 percent of the working force.

Perpetual full employment is not assured by perpetual inflation. Full employment is the result of a proper coordination of wages, costs, and prices. But this is something the Keynesians have not yet learned.
The First 100 Days
May 15, 1961

At noon on April 29, President Kennedy completed his first 100 days in the White House. During the election campaign, he announced that these would be “the crucial days” of a new Administration, and drew a parallel with the famous first 100 days of Franklin Roosevelt’s Presidency.

In view of the hairline margin of his victory, Mr. Kennedy has so far been astonishingly successful in getting his domestic program through. Of the sixteen measures called for in his “must” list of February, seven have already been enacted, and some action is under way on all but two. The President can surely not be accused of inactivity. During the period he sent no fewer than nineteen messages to Congress—an unparalleled record.

But is this a record of “success”? That depends on what the practical effect of these measures will be (or will be judged to be) at the election three and a half years from now.

The President’s Cuban venture was a disastrous failure. It was seen to be such a failure by practically everybody within 72 hours after it was launched. The consequences of economic policies are more difficult to judge. Their long-run effects are often quite different from their immediate effects. The innumerable factors always at work in the economic realm lead to wide differences of interpretation. Bad consequences of bad policies are often blamed on something else—especially by those who originally recommended the policies. But the longer a bad policy is continued the worse its consequences tend to become, and the more obvious becomes the connection between the consequences and the policy.

SPENDING PROGRAM
Let us now look at some of the major Kennedy measures, both enacted and proposed. They include a higher minimum wage with broader coverage; aid to depressed areas; higher and longer unemployment benefits; aid to dependent children of the unemployed; increased social-security benefits; with a lowering of the eligibility age; medical care for the aged; large Federal school aid; expanded foreign aid; an omnibus farm bill with higher price supports; lower interest rates through government intervention; withholding of taxes on dividends and interest (though with some limited incentives for business investment), and a “cyclical” rather than an annual balance—beginning with a planned deficit.

Space does not permit an analysis here of any one of these proposals. But they add up, individually and collectively, to a huge spending program. And all this is on top of the tremendous annual spending program in excess of $100 billion (including social security) that had already been planned by President Eisenhower. This spending, and the deficits it would entail, are being taken very lightly. “Such a deficit [$2 billion],” now says Secretary of the Treasury Dillon, “is not a cause for alarm in times like these. . . . Another deficit is in prospect for fiscal ’62, one of about $3 billion. This, too, will be entirely appropriate.”

INFLATION AHEAD
What this spending and these deficits mount up to, however, is inflation. This inflation may seem at the beginning to be beneficent. The upturn in business that has already started may continue. In spite of the measures that discourage employment by forcing up labor costs, there may even be further improvement in employment.

But what will happen when all this inflationary tinder catches fire, as it eventually will? What will happen if world confidence in the dollar is shaken again? What will happen if the run on gold is suddenly resumed? What will happen, in brief, if the inflation, now so devoutly prayed for in the Administration in the belief that it will restore employment, not only arrives but starts to get out of hand? For as other governments have learned to their bitter cost, this is the way of “planned” inflations.

The Kennedy program, as unfolded in the first 100 days, is a program of inflation and welfare-statism. During the past two decades, the wrecks of such programs have been scattered over Europe and Latin America for all to see. The true friends of Mr. Kennedy will warn him of these consequences now, while there is still time to reconsider his course.

Keep the Gold Reserve
May 22, 1961

If Congress, as the Administration now proposes, repeals the requirement for the Federal Reserve System to hold even a 25 percent gold reserve against its note and deposit liabilities, the United States will, in effect, drop the last vestige of a domestic gold standard.

The international gold standard, when it prevailed, was the chief safeguard against tampering with the currency on the part of politicians and bureaucrats. It was the chief safeguard against domestic inflation. It
did not “break down”; it was mismanaged and abandoned; and precisely because the politicians in most countries wanted to inflate. The result has been monetary chaos. In its May letter the First National City Bank of New York prints a table covering 43 countries. It shows that the dollar has been losing more than 2 percent of its purchasing power every year since 1950; the British pound, 4 percent; the currencies of Brazil, Argentina, Paraguay, Chile, and Bolivia, from 14 to 37 percent a year. Even the American depreciation rate would mean the loss of half the value of the currency in 33 years.

Every major step we have taken since 1932 has been away from the discipline of the gold standard. For 30 years the Federal Reserve Banks had been required to keep gold reserves of 40 percent against their notes and of 35 percent against their deposits. In June 1945 the Reserve authorities, fearing the continuation of World War II, asked that the legal reserve ratio be reduced as an “emergency” measure to only 25 percent for both notes and deposits. Though the war went on only a couple of months more, the higher reserve requirement was never restored.

BLOW TO CONFIDENCE
Meanwhile, we have continued to expand our credit and paper-money supply. Our total of demand and time deposits and currency outside of banks has increased from $150 billion at the end of 1945 to $250 billion. As its expiring act, the Eisenhower Administration prohibited Americans from buying or owning gold even abroad. And now the Kennedy Administration asks that even the legal requirement for a 25 percent gold reserve be abandoned.

Whether the first effect of such a measure would be to increase or undermine confidence in the dollar abroad, to reduce or intensify the foreign drain on our gold, we would learn very shortly. But its long-run effect could only be to undermine confidence in the dollar still further, both at home and abroad. Some Americans may fear that foreigners would drain us of gold, leaving us with no gold backing for our dollars at all. Even if such fears prove to be exaggerated, the last legal obstacle to an indefinite expansion of the Federal Reserve’s note and deposit liabilities would be removed. Congress would be assumed to have given a green light to further inflation.

HALT THE INFLATION
Only under one condition would even a temporary suspension of the 25 percent gold-reserve requirement (already legally possible by simple vote of the Federal Reserve Board) be justified. This would be to accompany the suspension by the requirement that neither Federal Reserve Banks nor member banks would be permitted to expand their total net loans or investments by a single dollar until the reserve ratio was restored.

Even this would not be too much assurance against further inflation. The present reserve ratio is 38 percent. This would still permit a substantial credit expansion under the present 25 percent legal minimum.

The abandonment of the 25 percent gold-reserve requirement, in brief, is the very opposite of what should now be done. What is required is a statement by the Kennedy Administration, accompanied by appropriate action, that our inflation can and will be halted. But every major economic measure that the Administration has so far supported moves toward more inflation.

We seem to have come to a point where the least-harmful immediate steps would be to put a temporary embargo on gold export, and permit a free market in gold. Later we could try to fix a sustainable value for the dollar and return to the discipline of a full gold standard.

How to Cure Poverty
May 29, 1961

The “real issue” in the Western Hemisphere, according to Secretary of State Dean Rusk, is the battle against poverty. Foreign aid, he keeps repeating, must be concerned with “social” as well as “economic” objectives; it must not perpetuate the gap between the rich and the poor.

Is the battle against poverty the “real” issue? Is it the problem with which Americans think their Secretary of State should be primarily charged? Or isn’t that problem really the battle against Communist subversion and aggression?

The problem of poverty has existed from time immemorial. It is as old as man. Since the birth of capitalism—the Industrial Revolution—tremendous strides have been made toward its solution. But the problem of Communist subversion and aggression is peculiarly the problem of our time, our decade, of 1961. It is this that Americans are worried about. They are a generous people and would like to see other people better off. They have in fact done more in this direction than any other people in history. But the poverty in India, or the gap between the rich and the poor in Brazil, is not what keeps them awake nights.

Secretary Rusk seems to think that poverty is the primary cause of Communism, and that an increase in incomes would be the primary cure. Experience and statistics do not bear him out. In Italy and in a score of
other countries, Communism is nearly always found to be higher in the richer industrial districts than in the poorer agricultural sections. Communism has been growing while world income has been growing. The Broadway and Hollywood Communists also spoil the Secretary’s thesis.

NOT BY GIVEAWAY
One of the things we have been told for years by the advocates of foreign aid is that the world cannot exist half rich and half poor. It has in fact so existed for centuries. Of course poor nations do not buy much from us nor sell much to us. But neither do they threaten us militarily. It is nations well-off enough to embark on huge armament programs, like Nazi Germany, prewar Japan, and Communist Russia, that can do that. The latter can also subsidize aggression against us in the poorer countries.

Of course it is always desirable to reduce poverty, where and to the extent that we can. But what is the method or system most likely to do that? It is precisely here that Secretary Rusk and the advocates of bigger and longer-term foreign aid are most wrong in their implications. For they assume that the way to cure foreign poverty is by government-to-government giveaway programs, by state projects, state spending, state planning. In a word, by socialism.

BRAZIL AND INDIA
This is made clear not only in their generalities but in their specific programs. A $2 billion “international financial rescue package” is being prepared for Brazil, with smaller packages to bolster the economies of Venezuela and Bolivia. But the difficulties of these countries are of their own making. They are the result of their inflationism, socialism, Brasilias and other grandiose state-planned projects. Now that they have run out of their own money, the U.S. is offering Latin American governments a $600 million “social development fund” for more of the same. Our planners are also planning to lend India $1 billion in the next two years to meet the foreign-exchange requirements of India’s third Five-Year Plan, and to help India build a nuclear power plant and a government steel mill. India having borrowed and spent itself to the brink of bankruptcy, it is considered our duty to forget all about our own balance-of-payments problem and rush to the rescue of Indian socialism.

If the Kennedy Administration is right in thinking that foreign poverty is the “real” problem, it has chosen precisely the wrong way to solve it. The problem of poverty cannot be solved by Communism, socialism, or state planning, but by capitalism—by the system of freedom of private property, private enterprise, and free markets. But few of our officials, despite occasional lip service, seem to have any real faith in the system that has made it possible for us to keep bailing out the socialist failures.

Gold and the Dollar
June 5, 1961

The Kennedy Administration’s proposal to eliminate the gold-reserve requirements for Federal Reserve Banks is extremely ill-advised and dangerous. It is fortunate that the opposition to it was so extensive as to cause Congress to postpone the scheduled hearings. We should utilize the breathing space to consider not only the objections to such a drastic measure but what positive steps we need to take in monetary reform.

The most important step is to halt the inflation. It is the almost uninterrupted inflation of the last quarter century that has created the whole gold and dollar problem. The inflation has been the primary cause of the “deficit” in our balance of payments. It has been the primary cause of our loss of gold, and of the threat of further loss. It is the inflation that has undermined confidence in the dollar. It is the inflation that has raised our prices and wages to a point where we are having increasing difficulty in competing in the world market.

To halt the inflation it is simply necessary to stop expanding the supply of money and credit. We must balance the budget. We must end the folly of foreign economic aid. We must cut Federal nondefense expenditures on scores of projects. We must stop all Federal Reserve or government efforts to push down interest rates. We may even have to freeze the total of bank loans and investments till we are sure the inflation is halted.

INFLATION VS. FIXITY
But the Administration today does not dream of taking even the mildest of these measures. It looks upon an unbalanced budget with complete complacency. It is expanding all the old spending programs and proposing scores of new ones. It is increasing the pace of inflation, and daily intensifying the very dollar problem it is trying to solve.

But—and this is the sad situation at which we have arrived—even if the Administration took every requisite measure to halt the inflation, it could not solve the immediate problem that confronts us. That problem is the result of 27 years of inflation combined with the maintenance of a fixed exchange rate for the dollar
and the commitment to sell gold at $35 an ounce to any amount asked for by foreign central banks.

Our gold base has become too narrow in comparison with the vastly increased amount of notes and deposits created against it. Since 1934 our average domestic price level has more than doubled, but an ounce of gold can be obtained for the same price. Our increased money supply and price level encourages imports, discourages exports, and makes our gold the biggest price bargain the U.S. offers the rest of the world. If we keep our $35 an ounce price, and allow foreigners to draw out as much gold as they want at that price, we stand to lose our entire gold supply. The only alternative would be a deflation so drastic that our people would find it intolerable.

**IS $35 TENABLE?**

This is what those who think we could keep gold convertibility at the present price, and even extend it to American citizens, fail to see. They refuse to face the fact that our inflation has already gone too far to make the $35 an ounce price any longer tenable—unless, of course, we turn the ostensible “convertibility” of our dollar into a meaningless fiction.

The least harmful thing we could do, therefore (reluctant as one is to make the suggestion), would be to put a temporary embargo on gold export. The next step would be to legalize a free exchange market and a free gold market. Special arrangements could be made to protect foreign central banks against loss (in terms of their own currencies) on their existing dollar claims on us. Then we could try to set a new gold value for the dollar that would be neither inflationary nor deflationary, and return to a full gold standard, with convertibility for Americans as well as foreigners.

Whatever objections there may be to such a course, it is infinitely preferable to any of the alternatives now being proposed, such as trying to maintain the present mock gold standard at $35 an ounce, or plunging into a new worldwide inflation through the Triffin plan or a money-printing IMF, or abandoning our own gold-reserve requirement.

---

**Reaching for the Moon**

**June 12, 1961**

The May 25 message of President Kennedy to Congress is a profoundly disheartening document. At a time when total planned Federal expenditures (including social security) are already in excess of $100 billion a year, when we are already anticipating serious deficits, when taxes on enterprise and investment are already so burdensome that they are reducing incentives and employment and slowing down economic growth, and when we have already piled up enough inflationary tender to threaten a grave new inflation, Mr. Kennedy calls for bigger spending, bigger deficits, and more burdensome tax rates. His latest proposals increase the inflationary threat still further.

Since he came into office, Mr. Kennedy has put in requests for over $6.5 billion additional spending for the current fiscal year and the fiscal year to end June 30, 1962. A small part of this addition is for defense. But most of it is for new or expanded “welfare” programs, including increased foreign economic aid, increased social-security benefits, medical care for the aged, Federal aid to education, housing, and urban renewal, increased funds to farmers, to veterans, to unemployed workers.

**EXPENSIVE STUNT**

And now, on top of all, the President asks us to spend $7 billion to $9 billion over the next five years, and perhaps $40 billion over the next ten years, to land a man on the moon and get him back.

Why? So far as the scientific value is concerned, Dr. Vannevar Bush, head of the Office of Research and Development during World War II, some time ago characterized the man-in-space program as “a vastly over-rated stunt. . . . There is nothing a man can do in space that can’t be done better and more cheaply by instruments. Suppose it cost $1 billion to put a man on the moon. For the same money you could support 1,000 research projects for 40 years. We need more basic research in physics, chemistry, and biology. We need to finish the job of handling arthritis. We need to know more about the genetics of viruses. I believe we can spend money to better advantage on earth than by shooting it into space.”

If the scientific value of this stunt is minimal, compared with the cost and with the potentialities of alternative projects, what other purpose would justify it? Propaganda? Instead of trying to outdo the Russians with Buck Rogers marvels, it would be enormously cheaper and more effective to make more propaganda use than we have so far dreamed of making of the freedom and productivity achieved under our private-enterprise system—a freedom and all-around productivity with which no socialist or Communist system can compete at all.

**SACRIFICE—FOR WHAT?**

The President speaks of the need of making sacrifices. But sacrifices for the mere sake of sacrifice don’t make sense. We must sometimes give up what is good today to achieve a greater good tomorrow. Mr. Kennedy is
asking us to sacrifice what is good to achieve something of much more questionable value. Monetary stability, the welfare of consumers, the incentive to earn more and produce more, are not minor goods. Before we give them up, we should take a hard look at what we are offered instead.

And we cannot get a quart out of a pint jug. Whatever resources are devoted to new purposes and new projects must be withdrawn from old purposes and old projects. There is no economic fourth dimension. Mr. Kennedy sometimes talks as if there were, and as if it were created by government spending. But whatever the government spends on new programs it must either take from old programs or take from Americans in increased taxes. This means that alleged new needs can be met more adequately only if old needs are met less adequately.

True economy means wisdom in spending. It means saving on what is less necessary or less urgent in order to devote limited resources to what is more necessary or more urgent. It means putting first things first, establishing priorities. When the American people are urged to make sacrifices in their living standards in order to shoot a man to the moon, it is time to ask what has happened to our national sense of proportion.

The Dollar Problem

June 19, 1961

In the issue of June 5, I suggested that the least harmful solution of the dollar problem today would be to put a temporary embargo on gold export, to legalize a free exchange market and a free gold market, to guarantee foreign central banks against any long-run loss (in terms of their own currencies) on their existing dollar claims against us, and then, after setting a new gold value for the dollar that would be neither inflationary nor deflationary, to return to a full gold standard.

Whatever objections there may be to such a course, it is infinitely preferable to the alternatives. Four main courses are now being advocated by various groups: (1) The Administration plan to abandon our whole legal gold reserve requirement. (2) The proposal to keep our gold reserve requirement, and to make the dollar convertible at $35 an ounce, not only by foreign central banks, but by American citizens. (3) Devaluation of the dollar, with the retention of the present International Monetary Fund system. (4) The Triffin plan or some similar proposal to turn the IMF into a world central bank with power to create “reserves” (i.e., more paper money) for national central banks.

RESERVES AS A BRAKE

Every one of these courses is inadvisable and dangerous. But the Administration plan to abandon the legal gold reserve would do the quickest irreparable harm. I discussed this in Newsweek of May 22. Here I will content myself with an excerpt from the vigorous analysis by Prof. Walter E. Spahr of the Economists’ National Committee on Economic Policy:

“The common experience of nations with central banks lacking the protective device of reserve controls has been overexpansion of nongold money and credit, decline in the purchasing power of the currencies, and repeated devaluations... Bank reserves are needed... to place restraints on the extension of notes and deposits... Under present reserve requirements, the braking mechanism is in the form of a normal minimum requirement of 25 percent and a progressive tax on deficiencies below that percentage. Without this protective device, foreign holders of nongold dollars could take all our reserves, and without penalty, leaving our money and banking system a hollow shell of irredeemable paper money the value of which could fall, quickly or slowly, to any depth. Our people and nation could be ruined as a consequence.”

FREE-MARKETIZATION

Unfortunately, however, our inflation, our increase in notes and deposits, and the increase in our price and wage level have all gone so far since 1934 or even since 1945 that it will soon no longer be possible to maintain real gold convertibility of the dollar at $35 an ounce, even for foreign central banks, let alone for American citizens. If we tried such a thing, the Federal Reserve System would quickly be drained of all its gold or we would have to impose a drastic deflation to prevent it. Either consequence would be intolerable. Those of us who have been fighting inflation for twenty years must be realistic enough to recognize that it has now gone too far to make real redemption at a rate of $35 an ounce any longer possible.

This does not mean, however, that it would be necessary or wise to devalue the dollar at some arbitrary rate (say at $70 an ounce) and go on with the present IMF mock-gold system. The rate so fixed might be inflationary. A new inflation would probably take off again from that point. The proposal for a “free-marketization” of gold, with the purpose of getting back eventually to a full gold standard, should not be confused with a new dollar devaluation.

The greatest danger at present, apart from the abandonment of our legal gold reserve, is the adoption of...
the Triffin plan or its equivalent. British publicists are pushing hard for this plan. Its appeal is that it looks like a simple and easy way of increasing world “reserves” (of IMF paper money) so that the bureaucrats of all countries could go right on with their inflation. If its sponsors could succeed in putting over such a plan, the gold standard would become the merest fiction, and the world would be launched on an inflationary binge without visible end. 

**Day of Disillusion**

**June 26, 1961**

When the foreign-aid program was first proposed by Secretary Marshall in 1947, its chief declared purpose was to repair the ravages of war in Europe and to promote a swift recovery. Later, the declared purpose was to raise living standards in the recipient countries. Later, a chief declared purpose was to halt the spread of Communism. Another announced purpose was to win allies or at least friends for the U.S. Another was to raise U.S. prestige. Another was to promote stable democratic government in the countries aided.

In the light of the fourteen-year record, these announced purposes now seem ironic. True, the European countries originally aided have recovered from the ravages of war. But history shows that countries always recover with surprising rapidity from the ravages of war. And the countries that we aided least, like Germany and Japan, made far more rapid recoveries than countries that we aided most. As for living standards, the only way to raise them is through increased formation of capital, seldom encouraged by governments of underdeveloped countries.

Communism has spread to an appalling extent since the foreign-aid program was launched. We have lost friends every year. Our prestige abroad has been falling at an accelerative rate. We have been powerless to promote stable democratic government even where our aid and intervention have been greatest. To recall what the foreign-aid program has not accomplished, it is enough to mention Laos, Cuba, Korea.

**HARM UNFORESEEN**

But the foreign-aid program has brought results that its sponsors failed to foresee. Even before the program started to promote socialism abroad by direct encouragement, as in India, it made its continuation possible by subsidizing governments that carried on socialistic projects. It has systematically bred unfriendliness to the United States. Every little “strong man” who receives aid from us is forced to show his own people, by snubbing or denouncing us, that he is not giving up his independence or the national pride in return for our aid. Since the end of World War II our foreign aid of all sorts has reached the fantastic total of $90 billion. A simple statistical comparison shows that it has been responsible for our whole net budget deficit since the program was launched, for the whole net increase in our national debt since then, and for an increased tax burden besides. It has been the chief fiscal cause of the inflation, of the unfavorable balance of payments, and of our loss of gold.

Yet the Kennedy Administration not only wishes to increase foreign aid substantially, but to avoid the necessity for annual Congressional approval by authority to borrow $7.3 billion for it over the next five years.

**FOREIGN AID IN TROUBLE**

In *The New York Times*, Cabell Phillips reports growing signs that the economic-aid program of nearly $3 billion for this year “will encounter greater difficulties with Congress than aid programs have met in many years.” He attributes this largely to “articulate and well-organized . . . lobbies working against the bill.” The only lobby he finds room to discuss is the Citizens Foreign Aid Committee, headed by Walter Harnischfeger, Brig. Gen. Bonner Fellers, and Clarence E. Manion, which consists of only 44 members and operates on a budget of around $50,000 a year. “There is not, on the other side,” declares Phillips, “a comparable lobby with the same singleness of purpose or the same resources to propagandize at the grass roots.” This statement astonishingly overlooks the government foreign-aid agencies themselves, with their thousands of employees and millions of the taxpayers’ own money to propagandize the full year round for the continuation and expansion of their activities and funds.

If a tiny organization like the Citizens Foreign Aid Committee, with a Multigraph machine, can have real success in bucking this full-time bureaucratic lobby, it must be incredibly “articulate and well-organized.” Yet with all due admiration, its success may, perhaps, be attributed to an additional factor. It may just be that congressmen recognize that what the committee is saying is true.

**Mock Gold Standard**

**July 3, 1961**

How does it come about that not only the present Administration, but some of our private bankers, now
think it would solve our monetary problems to abolish any legal requirement to hold a gold reserve?

For a full answer we need to go back to the origin of banking and of fractional reserves. The original goldsmiths, or banks, kept gold for safe-keeping and loaned it out at interest. But depositors or borrowers seldom drew out the entire amount to which they were entitled. They merely signed drafts or checks ordering the bank to pay over specific amounts to third parties. These third parties in turn were often content to leave their gold on deposit and draw checks only as they needed to make payments.

Thus bank deposits subject to check came into being. And the volume of this bank-deposit money was much greater than the gold “base” into which it was all nominally convertible on demand. The system worked as long as everybody accepted the deposit credits as being “as good as gold” itself. The system, in brief, rested on confidence—confidence that it would never be abused, and that individual banks would be at all times not only solvent but liquid.

**INVERTED PYRAMID**

Then governments stepped in, and based national currency systems on the fractional reserve principle. They developed further “economies” in the use of gold. In other words, they developed a system by which a still bigger inverted pyramid of bank notes and bank credit could be based on the available supply of gold. This was the central bank. The central bank was authorized to issue its own bank notes (which were made legal tender) against its gold stock. It could “centralize reserves” by ordering “member” banks to leave gold or cash reserves permanently on deposit with it. It could make loans to these member banks which they, in turn, could count as “reserves” against which they could issue still more deposit money.

In the United States, in 1932 and 1933, the confidence of holders of Federal Reserve notes that they would be able to convert into gold at any time they wanted collapsed. They rushed to convert. Their distrust proved justified. Gold redemption was suspended. The government did not blame its own monetary policies. It denounced the people who had lost confidence and had demanded gold. It devalued the dollar, thus breaking faith with everybody who had relied on its most solemn pledge. It not only terminated the right of its own citizens to demand gold for their notes; it made it a crime for them to buy or own gold no matter where they got or held it.

**WATER IN THE MILK**

But the government wanted to maintain the new parity for the dollar in terms of other currencies, so it allowed foreign governments and central banks, and them alone, to demand gold. Our official monetary authorities found that by following this restricted convertibility they could build up a still bigger inverted pyramid of credit on their existing gold supply. But now that they have built the inverted pyramid and the wage-price level so high that even foreign central banks have begun to lose confidence, the Administration and a few bankers now ask: Why have any gold reserve at all? Isn’t the whole thing an economic waste, an outworn superstition, a “barbaric relic”? Why can’t we leave it to “able and responsible men” to regulate our money supply, which will consist purely of engraved slips of paper?

What this demonstrates is that once you begin diluting the money supply, the pressure grows for more and more dilution. The milkman who has been caught watering the milk then tries to convince his customers that they are better off with plain water. As the connection between the gold basis and the currency outstanding against it becomes increasingly remote, tenuous, and purely symbolic if not fictional, people begin to ask why it cannot be abolished altogether. The answer is that when the unit of money represents no real tangible value, but a scrap of paper whose supply is determined by the mere discretion or caprice of the politicians in power, history shows that the inevitable end result is monetary instability and uncontrolled inflation.

---

**Labor Law Gone Wrong**

July 10, 1961

A quarter of a century ago, in the first Franklin Roosevelt Administration, Federal labor law took a wrong turn. It was based on the theory that the chief reason there were strikes and labor dissensions was that unions were too weak and lacked “bargaining power.” The Wagner Act in effect put the government into the union-organizing business. It made it compulsory for employers to recognize any union, certified by a government board as comprising a majority of the employees of an “appropriate” group, as the exclusive bargaining agent for all employees in that group. A company was forced to “bargain collectively” with the representatives of this group—and with no one else.

The act thus rested on a legal principle never countenanced in any other field. While it was cloaked with the phrase “free collective bargaining,” it was in fact a denial of the freedom to bargain. It took away from the employer the right to choose the persons with whom he bargained. It took away from any individual worker
the right to bargain for himself, and from any minority union the right to bargain for its own members.

**RESORT TO VIOLENCE**

If the same principle were extended, a company management could be compelled to “recognize” and to “bargain with” only one particular supplier of raw materials. No matter how bad the material offered, no matter how unreasonable the price asked, no matter if the supplier insulted and denounced him, he would have to continue “negotiating” and “bargaining with” that supplier. He could not simply break off and ask for competitive bids from other suppliers, lest be haled before a Federal board and condemned and penalized for an “unfair practice.”

But the legal situation of labor-management relations is much worse than this. For the unions enjoy *de facto* the right to throw mass picket lines around any plant or in front of any dock or ship and intimidate any other workers from applying for the jobs the strikers have deserted. Worse than this, they can often with impunity resort to flagrant vandalism and physical violence. Those interested in typical details should read *The Kohler Strike* by Sylvester Petro.

Yet for 25 years no one in power has seriously re-examined the premises of the Wagner Act. The Taft-Hartley Act amended the Wagner Act in minor respects, but it kept its principal compulsions on the employer and its principal immunities for labor unions. The Norris-LaGuardia Act, since 1932, has in effect denied the employer injunctive relief from intimidation and violence. The Supreme Court, with its doctrine of “preemption,” has further discouraged action by the local authorities to prevent strike violence. And each time a new nationwide strike has broken out, paralyzing essential production or transport, the Administration in power has talked and acted as if there were perfect freedom of bargaining on both sides and no intimidation at work.

**ONE-SIDED DURESS**

In the maritime strike, Secretary Goldberg, ignoring the picketing and violence at the piers and oil refineries, requested all parties to “talk,” to “resume direct negotiations”—just as if one party, the employers, were not in effect acting under duress. He has declared that the Taft-Hartley Act does not give the President “a sufficient arsenal of weapons to deal with a problem of this character.”

Someone, I hope, will at last suggest that the trouble is the opposite of this—that the Federal government has intervened too much in labor disputes, and in the wrong way; that if the employer had the clearly recognized legal right to discharge strikers and to replace them; if intimidatory mass picketing were forbidden, and the laws against violence enforced; if the freedom to bargain were restored to the employer and to the individual worker, there would be an astonishing drop in the number of irresponsible strikes called, and unions would greatly moderate the unreasonable demands that present labor law now encourages them to make. The government would not have to ask for dubious 80-day Taft-Hartley strike injunctions, which politicize every strike settlement, and must finally lead to the desperate expedient of compulsory arbitration.

---

**Could Credit Collapse?**

July 17, 1961

At the end of June there was a minor “gold rush” in Europe. Some dispatches attributed the increase in demand for gold to a series of articles published in British and Continental newspapers by Jacques Rueff, the French economist and financier. Rueff argued that unless the present international monetary system was changed, the world was heading for another crash of the proportions of that of 1929.

He has also put this argument forward in the July issue of *Fortune*. A great peril, he contends, hangs over the economy of the West. “The instability in our monetary system is such that a minor international incident or . . . disturbance could set off a worldwide disaster.” The measures suggested for dealing with this peril fail to go to the roots of what is wrong. “The nature of the disease is apparent in this fact: During the decade 1951–60, while the U.S. was piling up balance-of-payments deficits totaling $18.1 billion, some $13 billion accumulated in foreign hands in the form of sight deposits or short-term investments in the United States money markets. This $13 billion constitutes a claim on the U.S. gold reserve that could be called at any time—with catastrophic consequences.”

**A ‘PRODIGIOUS ERROR’**

“This came about because, in the countries that were creditors to the U.S., the central banks were content to accept dollars in settlement instead of demanding payment in gold. . . . Paradoxically, the danger we are in was brought about not because the U.S. lost gold, but because it lost so little gold. During the decade U.S. gold reserves fell by only $5.3 billion. If the U.S. had settled its balance-of-payments deficits entirely in gold,
its reserves would have dropped—all other things being equal—by $18.1 billion, and today they would amount to a mere $4.7 billion. By all the evidence, such an unthinkable drop in reserves would not have been tolerated. Action would have been taken much earlier to stop the deficits.”

Rueff concludes that “the American balance-of-payments deficits were allowed to persist for the last ten years only because the U.S. was not really required to settle its debts abroad.” This situation “is the product of a prodigious collective error.”

This error, in Rueff’s opinion, was the passage at the International Economic Conference in Genoa, back in 1922 (eleven years before the U.S. went off the gold standard), of Resolution 9, which recommended adoption of an international convention embodying “some means of economizing the use of gold by maintaining reserves in the form of foreign balances.” This brought into existence the “gold exchange standard,” under which central banks consider themselves authorized to create money not only against gold or government bonds, but also against any foreign currency considered as good as gold.

CREDIT PYRAMID

Under this system, the U.S. has enjoyed a “deficit without tears.” Foreign countries could leave their dollars on deposit with us, thus enabling us to continue building credit on them, while they built their own inverted pyramid of credit on them. It is this “double pyramid of credit” that is in danger of toppling.

What is the remedy? Rueff rightly points out that it is certainly not the Triffin plan, which would give the International Monetary Fund the power to issue its own international money and increase the world inflation. He quite properly insists, also, that we must eventually “liquidate the unstable and dangerously vulnerable situation resulting from the duplication of the credit structure, built on the gold reserves of those currencies with key currencies.”

It is when he gets to this point that Rueff’s otherwise brilliant discussion becomes unsatisfactory. He is right when he insists that we must halt both the U.S. and the world inflation. But we cannot tolerate an American or a world deflation either. This would almost certainly be the consequence of any attempt, however gradual, to “pay off in gold [presumably at $35 an ounce] all the dollar assets held by central banks outside the U.S.” First of all (preferably through a transitional free market in gold) we must get back to a tenable gold rate for today’s depreciated dollar.

A ‘Dual Economy’?

July 24, 1961

If you want a quick reputation as a brilliant economist, the formula is simple. Just put forward “new” reasons for still more government intervention, more government spending, and more inflation.

This was the secret of the enormous success of Lord Keynes. The theories of J.K. Galbraith have superseded those of Keynes because where Keynes advocated more government spending and controls only periodically, to combat mass unemployment, Galbraith advocates them as permanent and uninterrupted policies.

Galbraith wants to siphon more and more purchasing power out of the “private sector” of the economy and into the “public sector.” Individuals who earn their own incomes, he argues, only spend them in trivial and foolish ways. Let the politicians seize more and more of the individual’s income and spend it as their own infinite wisdom dictates.

Alvin H. Hansen, the former Harvard economist, has now solemnized this theory with a new name—“the dual economy.” He agrees that private spending must be supplemented by massive Federal spending. The “private sector” and the “public sector,” he argues, support each other by mutual “exchange” just as do manufacturing and agriculture. Each sector “contributes to the total flow of real income and each takes its share out of the income stream either by charging a price or by collecting a tax.” Hansen can see no essential difference between voluntarily paying a price for something one wants and being forced to pay a tax for something one may not want nor even get.

THAT ‘PUBLIC SECTOR’

In the summer issue of the New Individualist Review, Murray N. Rothbard subjects this concept of the “public sector” to realistic dissection. He points to its “hidden assumptions: That the national product is something like a pie, consisting of several ‘sectors,’ and that these sectors, public and private alike, are added to make the product of the economy as a whole. In this way, the assumption is smuggled into the analysis that the public and private sectors are equally productive, equally important, and on an equal footing altogether.”

But Rothbard goes on to point out the profound differences. Government acquires its revenues by coercion and not by voluntary payment. “Production” has a dubious meaning unless it means the production of things consumers demand and willingly buy. “In the private sector, a firm’s productivity is gauged by how much the consumers voluntarily spend on its product.
But in the public sector, the government’s ‘productivity’ is measured . . . by how much it spends!"

ADD OR SUBTRACT?
The truth, contends Rothbard, is that far from adding to the private sector, the public sector can only feed off the private sector; it necessarily lives parasitically upon the private economy. It directs production not toward but away from the needs of individual consumers. In brief, the public sector is “anti-productive; it subtracts from, rather than adds to, the private sector of the economy.”

(I should like to add my own note that, while it may be reasonable to assume that certain necessary governmental services, like police and fire protection, add to national production, there is no possible way of determining how much they add. Of course schemes like foreign aid and subsidizing farmers to reduce output clearly reduce our national output and income.)

Rothbard also pays his respects to Galbraith’s argument that private wants are all artificially induced by business advertising which automatically “creates” the wants it supposedly serves. If this were so, Rothbard points out, there would be no need whatever for the almost frantic concentration of business on “market research”—no reason to fear that one might make a product that people would not buy. As Rothbard remarks in conclusion, Galbraith is curiously silent on the enormous amount of propaganda by government.

Yet the Keynes-Galbraith-Hansen myth of the “dual economy,” with its two chief “sectors,” has become the new rationalization for a program of reckless and irresponsible spending that must inevitably lead us toward an inflationary crisis. ♦

Too Much Labor Law
July 31, 1961

The Kennedy Administration, according to Newsweek (July 11) and The Wall Street Journal, plans to ask Congress for deep new Federal intervention in labor-management disputes, including the following powers:

1—Power to set up labor-dispute inquiry boards with “a lot more muscle” than those currently authorized by the Taft-Hartley law. They would be empowered to recommend settlement terms, not just find “facts.” They could jump in at Presidential direction before a strike occurs.

2—Power to seize key industries, putting them under government management when deemed necessary to stop or avoid crippling strikes.

3—Power for the President to force strikers back to work by decreeing a “cooling-off” period without the present necessity of going to court and convincing a judge that a national emergency requires issuing an injunction.

These powers would amount to compulsory arbitration. They would in effect enable the government to fix wages. In the long run they would carry us into a completely controlled economy. A President could hand-pick boards to bring in the kind of decision he wanted. Settlement of every major strike would be thrown into politics. Few Presidents could resist the temptation to press for the settlement that seemed to yield the maximum political profit at the moment.

YIELDING TO DEMANDS
This would mean substantially yielding to the unions’ demands. As in the past, this would be disguised from the unsophisticated because the unions would always demand more than they actually expected to get. Anybody inclined to doubt this yielding has merely to notice what has happened even under the “weak” and “conservative” Taft-Hartley injunctions as they stand. The 1959 steel strike was finally settled (through the intervention of Vice President Nixon) only by a grossly inflationary wage increase. Settlements would be even worse if the government had still greater coercive powers.

The new powers would not reduce the number of strikes or strike threats, but immensely increase them. Whenever one of the compulsory arbitration boards “recommended” a settlement (which, as experience with the railroads proves, would be binding on the employers but not necessarily on the unions), 100 unions would contend that they were entitled to an equal wage increase or benefit, an equal “pattern.” The government would soon be setting wages all around the circle.

PENALIZE THE VICTIM?
The new powers would be almost certainly abused. Seizure of the companies would not penalize the strikers but the struck-against. During any tenure as operator, the government would be in a position to grant increased wages and other benefits which corporate managers could not easily rescind when they regained control. Truman tried to set a pattern like this when he seized—illegally—the steel companies in 1952.

With the Railway Labor Act of 1926, the Norris-LaGuardia Act of 1932, the Wagner Act of 1935, and the Taft-Hartley Act of 1947, Congress has tried to cure the evils brought on by government intervention in labor-management disputes by still more intervention. For a generation, the government has asked and Congress granted more and more “powers”—a larger and larger “arsenal of weapons,” as Mr. Kennedy and
Secretary Goldberg call it. The situation has grown steadily worse.

And almost no one has dared to ask for the one clear remedy—the simple restoration of freedom. Not freedom for “collective” bargaining only but freedom for all bargaining—freedom for a minority union to bargain for its own members, freedom for any individual worker to bargain for himself, legal freedom for the employer to bargain with anyone, to hire, discharge, or replace whom he pleases. Plus protection for individual workers and employers against violence and coercion, or intimidation by mass picket lines.

In brief, the solution most likely to provide maximum labor peace, maximum wages, and maximum employment would be to repeal all Federal “labor-relations” laws and restore freedom of choice for the individual.

Irresponsible Budget
August 7, 1961

In his Budget Message of January 1960, President Eisenhower estimated there would be a surplus of $4.2 billion in the fiscal year 1961. In January of this year he slashed his estimate to a thin surplus of only $79 million. On March 25 President Kennedy estimated that instead of a thin surplus there would be a $2.2 billion deficit in the fiscal year to end on June 30. When the final returns came in, the deficit turned out to be $3.9 billion.

In January, President Eisenhower estimated a surplus of $1.5 billion for the fiscal year 1962. In March Mr. Kennedy said that, instead, there would be a deficit of $2.8 billion. Then the official estimate was raised to a deficit of $3.7 billion. It is now raised again to more than $5 billion.

These figures are in themselves evidence of fiscal irresponsibility. Our political leaders and Treasury experts seem unable to make a reasonably accurate estimate of a fiscal year’s result even a couple of months before its end, let alone a year in advance. Recently the forecasts have been systematically wrong in the same direction—overestimating revenues and underestimating expenditures. Congress and the country have been faced with increased expenditure estimates almost every few weeks.

‘APPROPRIATE’ DEFICIT

Even more disquieting than this budgetary slovenliness is Washington’s indifference toward it—as if it were not very important whether forecasts were wide of the mark or not. This goes back to the growing acceptance in official circles of the belief that a budget balance is not important. Last March Mr. Kennedy said it really didn’t matter whether the budget was balanced each year. All that was necessary was a “balance over the years of the business cycle.”

The implication was that a budget deficit would in itself bring the full employment that would bring the tax revenues that would eventually bring balance. Even a couple of months ago Secretary of the Treasury Dillon was saying: “Such a deficit [$2 billion for 1961] is not a cause for alarm in times like these. . . . Another deficit is in prospect for fiscal ’62, one of about $3 billion. This, too, will be entirely appropriate.” In fact, the fashionable idea is that deficits are actually necessary for “creating demand,” for “full employment,” and for “growth.”

URGENT TAX REFORMS

There is not room here to go over again all the fallacies and confusions in this view. But it may be worth pointing out that if a budget deficit were desirable, then the most desirable kind would be not one achieved by increasing government expenditures but by cutting taxes. Most of the deficit zealots want increased government expenditures to give increased “consumer purchasing power.” They overlook that what is enormously more important for economic growth and increased real wages and productivity is increased savings and investment, and that the way to get this is to mitigate the onerous taxes that now reduce incentive and production.

The most urgent reforms are more adequate tax write-offs for depreciation of plant and equipment, less drastic corporation income taxes, a revision of capital-gains taxes, and abolition of confiscatory progressive income-tax rates above 50 percent. Such reforms, in fact, would probably yield more rather than less revenues, and would give enormous stimulation to national output.

Instead of discussing this, Administration officials are now talking of an actual increase in taxes. This increase is said to be necessary to pay for the costs of defending Berlin. In view of the billions of dollars that the Administration has been asking and mainly getting for foreign aid, farm aid, social security, highways, and housing, it would be disingenuous to blame a tax increase on added Berlin costs. A boost in tax rates above present levels, moreover, might actually reduce tax revenues. It would certainly discourage investment and production.

The road back to fiscal sanity lies in recognizing that though budgets must be balanced, the health and growth of the economy demand that the balance be
achieved by cutting both excessive expenditures and excessive tax burdens.

**Tax Cuts for Growth**
*August 14, 1961*

It was not only right but imperative that President Kennedy give Khrushchev clear warning that we mean to defend Berlin at all costs. It was perhaps just as essential to show we were not bluffing by ordering an immediate build-up of our defenses. But the broader economic program outlined by Mr. Kennedy was unnecessary. It is more likely in the long run to thwart our national purposes than to help them.

The President told Congress that in order to improve our posture with regard to the defense of Berlin we need to spend $3.5 billion more in this fiscal year. This is a total increase in the defense budget of $6 billion since January. Suppose we accept the need for this $6 billion. Why was it not asked for in May, when Mr. Kennedy requested only $2.5 billion additional? The objective situation has not visibly changed. Khrushchev was threatening Berlin in May. We already knew then that he would threaten Berlin again and probably half a dozen other places. The new request gives an air of improvisation to the May request. It raises the question whether the present request may not also be improvised. Is Mr. Kennedy going to ask for new billions every time Khrushchev makes a new threat? That would give Khrushchev a cheap and easy way to lure us into spending ourselves into a runaway inflation or crushing taxation.

**SWOLLEN EXPENDITURES**
The President’s new requests raise his total defense budget to $47.5 billion. Whenever any serious investigation has been made of military spending—by the Hoover commission or a Congressional committee—it has turned up huge waste and duplication. It is discouraging that Mr. Kennedy’s reviews of the military budget have suggested no offsetting economies of any importance.

We come now to the non-defense budget. The overwhelming bulk of discussion consistently forgets that this is tremendous. The total Federal spending budget, including social security, exceeds $100 billion. Non-defense expenditures exceed $50 billion, or more than half. Yet not only has Mr. Kennedy not suggested any offsetting economies in any of these, he has poured into Congress since he came into office some 50 messages, nearly all of which have called for more spending in some new direction. In this $50 billion of non-defense expenditures, covering every conceivable activity, from aiding “depressed areas” to landing a man on the moon, there are infinitely rich opportunities for economy. Probably $3.5 billion could profitably be cut out of either crop supports or foreign aid alone.

**NO BALANCE TILL 1963**
Yet the President looks with complacency upon a budget deficit of more than $5 billion in the current fiscal year (which still has nearly eleven months to run) on top of that of nearly $4 billion for the fiscal year just closed. Not until the fiscal year 1963 does he promise a budget “strictly in balance.” Even this balance, he hints, is to be achieved not by economies but by “an increase in taxes.” Thus the President would put even more burdens on the already overburdened taxpayer. He neither asks nor hints at any sacrifices whatever for the multitudinous pressure groups that are now parasitic on the taxpayer.

But the necessity for reducing both government expenditures and taxes does not rest primarily on the argument for equity or fairness. It rests on the far stronger argument that this reduction is essential for promoting, instead of retarding, increased capital accumulation, production, and economic growth. We need to abolish all personal income tax rates above 50 percent. These bring in barely enough revenue to support the government for a half a week. They are confiscatory and purely punitive. If the personal income tax rates above 50 percent were abandoned, the revenues of the government would probably increase; the country’s production would certainly increase.

There would also probably be more revenues and certainly greater national production and income if the double tax on corporate dividends were mitigated, if capital gains taxes were more realistic and less one-sided, and if more generous tax write-offs were allowed for depreciation and new investment.

**The New Manifesto**
*August 21, 1961*

The new 50,000-word *Communist Manifesto* is just one more missile in an uninterrupted war, blowing hot and cold, against the West. It is intended at least as much for U.S. consumption as for home consumption. And what it says has no necessary relation to what the Communist rulers seriously believe or intend.

It says, moreover, contradictory things. Some commentators attach great significance to Khrushchev’s abandonment of the dogma of the inevitability of war between Communism and capitalism. Yet this has the obvious propagandistic advantage of inducing us
to relax our guard. Throughout the document, war is alternately threatened and disavowed. “The Communist Party of the Soviet Union . . . will continue to oppose all wars of conquest” (no mention of Tibet, Hungary, etc.) but “consider it their duty to support the sacred struggle of the oppressed peoples and their just anti-imperialist wars of liberation.” In plainer words, any wars that the Russian Communists want to start (e.g., over Berlin) will be “anti-imperialist wars of liberation.”

When Khrushchev says “We will bury you,” and then talks of “peaceful coexistence,” we in the West may regard it as double-speak. But for Khrushchev’s propaganda purposes there is no contradiction. The threats to bury us are intended to scare some of us into appeasing him; the peaceful coexistence slogans are intended to lull and lure the rest of us into appeasing him. The “peaceful coexistence” will be obtainable—as long as we surrender to his terms, on Berlin, a divided Germany, Laos, Cuba, until we have lost the will or power to resist. The new manifesto aims at sapping our moral resolution and our faith in our own cause and system.

HOMAGE TO PROFIT
The manifesto is for the most part a rehash of practically all the stale Marxist dogmas about the inevitable triumph of socialism and Communism and the equally inevitable disintegration and defeat of capitalism. As part of the double-speak, there are attacks on “dogmatism” but even stronger attacks on “revisionism.” Yet revisionism occasionally raises its ugly head. We are suddenly surprised to discover, for example, that: “Prices must, to a growing extent . . . insure . . . a certain profit for each normally operating enterprise.” In the older literature of Communism, “profit” was a dirty word; it existed under capitalism only because employers “exploited” the workers by “withholding” from them the full product of their labor. If profit is now normal and necessary even under Communism, why is it so reprehensible under capitalism?

Here are the pie-in-the-sky promises for 1980 which the manifesto makes: “The people’s standard of living and their cultural and technical standards will improve substantially; everyone will live in easy circumstances; all collective and state farms will become highly productive and profitable enterprises; the demand of the Soviet people for well-appointed housing will in the main be satisfied; hard physical work will disappear; the U.S.S.R. will become the country with the shortest working day.”

PROMISE VS. REALITY
People like Senator Fulbright take this sort of pipe dream in deadly earnest. He tells us that Russia can achieve these goals, that “the big question is the maturity of our response,” and that “we must also develop our economy.” Such people, bewitched by the phony statistics that Russia is constantly publishing, ignore the miserable conditions that still exist there after 44 years of Communist rule—slave-labor camps, people packed six to a room in huge slums with communal kitchens and bathrooms, women working like beasts of burden, lands ravaged by chronic crop shortages, and recurrent famine.

The Soviet economic achievement, except in the few things on which they have concentrated their resources and their efforts—armament, missiles, and spectacular space stunts—has been wretched. Though they are still far behind us (and even most countries of Europe), they are always going to pass us in the sweet by-and-by—this time twenty years from now, when the people who are making these extravagant promises will not be around to be held responsible for their non-fulfillment.

Foreign-Aid Fallacies
August 28, 1961

The Administration’s foreign-aid program disregards nearly every sound principle of constitutional balance, foreign policy, or economics.

Even if we were to grant that a foreign-aid program of the present dimensions is economically necessary or desirable, the request of the President for authority to borrow $8.8 billion from the Treasury over the next five years to finance long-term “development” loans violates sound democratic and constitutional procedure. Congress is asked to give up, to that extent, its essential annual control of Federal expenditures. It is asked, in other words, to vote a lack of confidence in its future self. It is asked to prevent itself from reconsidering the program next year on its merits, and deciding the question in accordance with its judgment of the situation as it exists at that time.

It is also asked, in effect, to limit the freedom of action of the next Congress. If the voters were to return a conservative or a Republican House to power in November 1962, for example, and the new members felt that part of their mandate was to cut down or halt foreign aid, they would be prevented from doing so by an unwarranted “moral commitment” made by the present Congress. This is a denial of democratic principle.

FIVE YEAR PLANS
The President’s request rests, in addition, on unsound economic assumptions. The Rusk-Dillon plea declared:
“It will be necessary to free our development lending program from the difficulties of working under the uncertainties inherent in annual requests for funds.” Why can’t foreign governments operate under the same “uncertainties” as our own government departments do? The Administration’s argument apparently assumes that the key to prosperity and economic growth is not free enterprise, but government planning, as typified by the Five Year plans that India and other nations have aped from Russia.

President Kennedy and Secretary Dillon have promised huge sums to Latin American countries in our Alliance for Progress on condition that they institute “reforms.” These reforms are not in the direction of encouraging free enterprise, removing vexatious controls, safeguarding private property, reducing onerous taxation and government extravagance, balancing their budgets, and halting inflation. The money has been offered on the contrary, on the condition that the Latin American countries will undertake “national [i.e., governmental] planning,” “land reform,” and socialized housing—in brief, if they will move still further toward socialism and the welfare state. So-called “land reform” abroad has usually meant a grave infringement of private-property rights. It has more often resulted in a reduction rather than an increase of agricultural output.

**WHAT PRICE COFFEE?**

Secretary Dillon has promised the Latin American countries “at least $20 billion” in return for such socialist measures. In addition, he has promised help in pushing up the price of coffee and tin, for example, against American consumers. He has not only endorsed export quotas of these products from Latin American producers, but recommended policing imports into the U.S. He ignores the collapse of all the old Brazilian coffee valorization plans and similar “stabilization” schemes, and the expensive fiasco of our own crop-support programs.

In brief, the Administration does not trust or understand the function of free prices and free markets in adjusting production to consumption and supply to demand. The whole folly of government price-control and production-control is to be launched on a new and international scale.

The result can only be to encourage and prolong all the unsound economic policies of South American governments, and to slow down rather than accelerate sound and continuous South American economic growth.

All this is apart from the economic harm that the foreign-aid program is now doing to the United States itself, in unbalancing our budget, threatening greater inflation and a still greater increase in the tax burden on productive enterprise, increasing the deficit in our balance of payments, and undermining the dollar just when it is most essential for our own stability and world stability to strengthen it.

**Hostility to Business**

September 4, 1961

Growing signs of hostility to business on the part of prominent members of the Kennedy Administration culminated in the indictment on Aug. 17 of three of the nation’s largest manufacturers of antibiotics and three of their top executives on criminal antitrust charges. The defendants were accused of maintaining unreasonably high and noncompetitive prices, and of monopolizing production and distribution of the drugs.

The legal guilt or innocence of the defendants must be determined by the courts. But something may be said about the curious ideas of the Administration concerning what constitutes “noncompetitive” pricing. Unless identical or equivalent products are offered at the same price, the overpriced product cannot be competitively sold. Yet the Federal government seems to regard such equality of pricing as a prima facie sign of conspiratorial price-fixing.

An even broader question is raised by the existing anti-monopoly laws themselves. Apart from the specific wisdom of some of these laws, it is the first requirement of the ideal of the Rule of Law that laws ought not to discriminate between groups or persons. Equality before the law means that whatever is permitted to A is permitted to B, and whatever is forbidden to A is forbidden to B.

**DOUBLE STANDARD**

But for the anti-monopoly laws there is a flagrant double standard. Labor unions are not only permitted to do what is forbidden to businessmen, but employers are compelled by Federal law to deal with these labor monopolies. Unions are in practice even allowed to enforce their demands by physical intimidation and violence, to prevent others from taking the jobs their members have voluntarily vacated. The country’s farmers for decades have not only been permitted to engage in monopolistic price-fixing; they had done so with government help, and even under government coercion. Not so long ago the coal industry was forced to fix minimum prices by Federal law. Before that all industry was forced to fix prices under the NRA code.
It would be hard to think of an industry that, in the last twenty years, has conferred a greater boon on the American people, and on humanity, than the American drug industry. It has made an enormous and unmatched contribution to relief from disease and pain, and to the prolongation of human life. Yet instead of winning praise and gratitude for this, it has only aroused the animosity of the politicians. Last week my colleague Raymond Moley discussed the extraordinarily one-sided investigation that the Kefauver Senate sub-committee has conducted for several years against the industry, with hearings published in 26 volumes comprising 16,505 pages. He also discusses this week some questions of prices and profits in the drug business. I should like to supplement this with some considerations that apply also to the role that profits play in business generally.

BENEFICENT INDUSTRY

Ignoring the hundreds of thousands of lives that the American drug industry has prolonged or made more worth living, Senator Kefauver concentrates on the suspicion that the companies may have overpriced their drugs by excessive markups. The drug industry has replied that the average person spends no more of his health dollar, and a smaller portion of his income, for drugs today than he did in 1929.

It is true that the drug industry in recent years has made higher profit margins than most industries. This has been fortunate for the country. It has provided the funds for research to develop new and better drugs. It has led to the expansion of the industry. It has attracted more firms into it. The research has brought down some prices sensationaly. The competition has also brought down prices. In a free system, the cure for high prices is high prices.

The political hostility to the drug business, the attempt to treat the heads of the big drug companies like common criminals, and put them in jail, because their pricing policies may not conform with the naïve preconceived ideas of politicians, must threaten the growth and potential usefulness of one of America's most beneficient industries.

Aid vs. Trade

September 11, 1961

Two recent actions by the Administration emphasize the deep confusion that exists about the causes and cure of the “deficit” in our balance of payments. One was the announcement that the United States would shift from European to domestic producers for the coal and coke it needs to supply its forces in West Germany. The other was the reduction in the duty-free allowance of Americans returning from abroad from $500 worth of goods each to only $100 worth. Both actions were taken on the argument that they would improve the U.S. balance of payments.

The first thing that strikes one about these actions is the utter insignificance of the sums involved compared to the size of the problem. The deficit in the balance of payments has been running into billions a year. Our foreign aid, consisting mainly of gifts and soft loans, is more than $4 billion a year. The annual cost of the coal our forces use in West Germany is placed at $15 million. In the present fiscal year, 40 percent has already been contracted for in Europe, leaving about $9 million worth to be bought. So against the $4 billion we give away in foreign aid we “save” $9 million on coal, or roughly one-fourth of 1 percent. Put another way, we are to give in foreign aid 400 times as much as we “save” on the cost of coal. What we “save” in foreign exchange by cutting the duty-free allowance of American tourists is also insignificant.

BREEDING ILL WILL

Both actions are unwise from the standpoint of our foreign relations. The State Department is said to have opposed the decision to buy coal for our West German forces here because the German industry is also in economic difficulties. Our reduced tourist allowance will do great damage at special points—for example, at Curaçao, where Caribbean tourists stop largely for the “bargains.” We spend enormous sums to try to buy foreign friendship, and then offset them by petty “savings” that breed ill will.

These actions reveal above all a complete misunderstanding of the meaning and causes of a “deficit” in the balance of payments and the consequences of trying to cure it by reducing imports.

Let us consider first the differences between a real deficit in the balance of payments and a technical one. A real deficit is created by foreign aid—by goods (or dollars) that we give away for nothing tangible in return. A technical deficit in the balance of payments is the excess of gold and dollars that are transferred to foreigners on commercial account above those we get back. We may call this a technical deficit because the gold or money has not been lost; we have bought something in return for it.

IMPORTS AND EXPORTS

The point about a technical deficit is that, if a country avoids inflation or if it allows freedom of exchange rates, such a deficit will always tend to correct itself. The reason is simple. There is no advantage in foreigners’ holding
on to that country’s currency forever. Eventually they must buy something with it—in that country. Given free prices and free currencies, changes in comparative prices or in exchange rates must in time correct payments deficits.

The present deficit in the American balance of payments has been brought about by unsound government policies over a long period. We have domestic inflation, reflected in costs, wages, and prices, making American goods high in price, and foreign goods comparatively attractive. We have a dollar overvalued in terms of gold, combined with arbitrary exchange rate fixity. Gold, which has not gone up in price in 25 years, is our biggest bargain for foreigners.

This situation cannot be corrected by discouraging imports. By the exact amount that we cut down our purchases from abroad, we ultimately cut down our sales abroad, by depriving foreigners of the dollar purchasing power to buy them. We compound our problem by paying up to 25 percent more for the coal we buy at home. Ironically, what we discourage is sales to us that enable foreigners to earn dollars to buy from us. We much prefer to give dollars away, while increasing the inflation that causes the payments deficit.

In Defense of Gold
September 18, 1961

Between 1946 and 1954 the eminent French economist Charles Rist, who died in 1955, wrote a series of articles advocating a return to the international gold standard. He published these as a short book. Now Philip Cortney has performed a public service by translating this into English, under the title The Triumph of Gold (Philosophical Library, $4), and writing an introduction.

Rist’s central theme is that gold is the only metal capable of serving as a base for international commerce, because it is the only one that is asked for and accepted in payment in all countries, as bullion or in the form of money. It holds its value because of the rarity imposed on it by nature. It is precisely this rarity and this retention of value over time that makes it infinitely superior to paper money. The demand for it, as money, has existed since the beginning of history.

Rist devotes a great deal of his space to answering the specious arguments offered in defense of paper money. For many writers, he points out, contempt for gold is a new idea and praise of paper money an original thought. The history of ideas about money shows, on the contrary, that this is a very old conflict.

JOHN LAW

Rist’s book is beautifully lucid and readable. One of his most fascinating chapters is that in which he traces current arguments and even phrases denouncing gold and praising paper back to the Scottish adventurer John Law, who instituted a paper-money system in France and defended it in letters published in 1720.

Rist reminds us that Law suspended the convertibility of bank notes in order to issue larger quantities. In order to prevent the depreciation of the paper from being apparent in exchange for gold or silver, he forbade the possession of gold and silver by the public, “exactly as was done by President Roosevelt in 1933.” Law ordered searches in homes. He encouraged denunciations. He seized silver deposited with notaries and in savings banks and replaced it with paper money.

Rist believed that only by a return to a full international gold standard could the world get back to monetary stability and insure the continuance or resumption of a truly international economy. But he did not believe it would be possible to retain the gold value of the dollar at $35 an ounce. Any effort to do this, he was convinced, would precipitate an American and a world deflation that would have consequences equivalent to those of the depression of 1929.

$70 AN OUNCE?

He looked forward to action on the part of the United States, or a world conference, to revalue gold in terms of currencies and prevent such a deflation. “It will become indispensable not, as is currently said, to modify the price of gold in paper dollars, but, more correctly, to modify the price of the paper dollar in gold.”

Though he saw that the problem would involve difficulties, uncertainties, and chance, his opinion (in 1952), on the basis of the price rise and the currency increase that had taken place since 1940, was that the price of gold should be raised from $35 to $70 an ounce.

Philip Cortney, in an introduction that pleads eloquently and convincingly for a return to the gold standard, and dissects further arguments of the defenders of a managed paper money, also, and with more confidence than Rist, insists that “the price of gold will have to be raised to at least $70 an ounce.”

I find myself in agreement with Rist and Cortney on practically every point but the exact procedure for getting back to gold convertibility at a new valuation for the paper dollar. I am inclined to believe, though I am not sure, that a price of $70 an ounce might be strongly inflationary. A safer way to proceed, in any case, would be a temporary suspension of export of the government’s gold supply, accompanied by authorization of a free gold market. This would help the government
in fixing a tenable new gold value for the dollar. What cannot go on is continued inflation and a continued adverse balance of payments accompanied by the right of foreign central banks to withdraw all the gold they want until our supply is exhausted.

**An International Order**

September 25, 1961

TURIN—Economists and political scientists from eighteen nations met (Sept. 3 to 9) in this Italian city to discuss some of the world’s political and economic problems.

They are members of the Mont Pèlerin Society, named after the place where it first met in Switzerland fourteen years ago. The original meeting was attended by only 47 persons from little more than half a dozen countries—the U.S., Britain, France, Italy, Switzerland, Belgium, Holland, and Norway. Chiefly under the leadership of F. A. Hayek, author of *The Road to Serfdom*, who became the society’s first president, the group was united by a common belief in libertarian principles—in limited government, in free, private, competitive enterprise, in the lowering or abolition of the barriers to international trade, in the restoration of a world monetary order, in the restoration of a Rule of Law, internally and externally. They were against the network of price controls and exchange controls that then existed, against the drift into socialism, collectivism, national planning, and the welfare state, that seemed so irresistible in Europe and so fashionable in the U.S.

The group that met in 1947 felt isolated. Those especially who came from Continental Europe thought of themselves as “liberals,” and called themselves that; but their principles—of traditional liberalism—were regarded as reactionary, outmoded, and unreal by their socialist and welfare-statist colleagues in the academic world. For the great majority of those who met were university professors.

**MEN OF INFLUENCE**

In the following decade, however, the Mont Pèlerin Society met with more success than its original members had dared to hope for. Its membership now exceeds 200, from more than twenty countries, including non-European countries such as Japan, India, Argentina, and Peru. And its membership, though still dominantly made up of professors and scholars, includes men who occupy or have occupied positions of great influence or power in their own countries—Sen. Luigi Einaudi, former President of Italy, Dr. Ludwig Erhard, Economics Minister of West Germany, Jacques Rueff, author of the Rueff economic program in France, Pedro Beltran, the Premier of Peru, to name a few.

The original members of the society have lived to see stifling economic controls, internal and external, lifted in a score of countries, currencies stabilized, inflations in many countries brought to a comparative halt, and a wide disenchantment with socialist panaceas. Some of the members have been influential in bringing about these reforms. But they have acted always as individuals. The society is in no sense a propaganda organization; it has no platform, program, or declared statement of principles. It meets purely for the exchange of ideas, and though it is pervaded by a libertarian philosophy and spirit, there are differences of opinion on details.

**GLOBAL TOPICS**

At the meeting the members discussed such topics as the relationship of democracy and liberalism, the responsibilities of the Western countries to the underdeveloped areas, the status of Communism, particularly in Italy, France, and South America, and the possibility of a return to an international monetary order.

Again, in the shadow of the Berlin crisis and the threats and actions of Khrushchev, many members expressed the deepest misgivings about the outlook for economic order and freedom. Yet there was a surprising area of agreement among the recommendations of individual speakers for national and international currency reform. What was remarkable was the almost unanimous conclusion that the only alternative to inflation and continued monetary chaos was a restoration of the international gold standard.

There was, to be sure, some dissent from this view. There was even more disagreement among individual speakers concerning the exact method of returning to a full gold standard and of adopting new currency unit values in terms of gold. But not a single speaker expressed satisfaction with the present International Monetary Fund system. Several, indeed, dismissed it as a pseudo-gold standard, a “gilded” standard with a built-in world inflationary bias.

**Secret of Switzerland**

October 2, 1961

ZURICH—Apart from reports of international conferences, Switzerland is less in the news than any other country of comparable importance. No revolutions, popular or palace, no upheavals, no government crises, no new five-year economic plans, no “austerity” programs, no inflation or deflation crises, no “dollar
shortage,” no demands for aid. Unlike so many other countries, in short, Switzerland is not constantly being threatened with collapse and as constantly being saved.

In part this must be attributed to the character of the people. The passion for tidiness, order, and good management seems more widespread here than among any other people in the world. It is reflected not only in the cities and parks, but in a countryside so beautifully kept that it seems like one enormous golf course.

But at least as much credit must go to Switzerland’s form of government and the spirit in which it is carried on. It is first of all a federal government, like our own—or like what our government was originally, and largely remained, until the tremendous centralization of power in Washington following two world wars. Most of the governmental power is in the 22 cantons, as ours was originally in the States. And there is no final power even in the federal Parliament. If 30,000 citizens don’t like a law, they can force a referendum on it and the people can veto it. Such referendums may occur two or three times a year. The upper house is modeled on our Senate, with two members from each canton. The lower house is elected on the basis of population.

NO VETO
But the great blessing of Switzerland is that it has no “strong” man, no “indispensable” man, and cannot have under its constitution. The two houses of Parliament together elect a Federal Council, consisting of seven members, and one of these is elected President of the Confederation for a term of one year. He cannot succeed himself (except theoretically after the expiration of another year) and in practice the Presidency is rotated annually among the seven members of the council. The President has few powers, and cannot veto bills. The result is that not many outside of Switzerland even know the incumbent President’s name. (It happens at the moment to be Wahlen.)

So, while people everywhere wonder what would happen in France without de Gaulle, in Spain without Franco, in India without Nehru, and so on, no one worries what would happen in Switzerland without Wahlen. Everything, it is assumed, would continue to be stable, orderly, and predictable with or without him.

And Switzerland has managed very well. In the calendar year 1960 it had a budget surplus of 279 million francs. In 1959 the budget surplus was 163 million. This year another surplus is expected. The national debt has been reduced from 8.5 billion francs in 1945 to 6.2 billion today.

GOLD BASIS
For a number of years now, Switzerland has boasted “the hardest currency in the world.” It is on a real gold basis. Any citizen can turn in his francs for gold. The gold coverage—about 10.5 billion francs—is more than 150 percent of the 6.8 billion francs in circulation. Gold has come to Switzerland as a result of its hard-money policy, and the Swiss today deliberately “sterilize” part of their gold supply to prevent inflation. But little Switzerland is like an island threatened by the great tidal waves of international currency disturbances, and such disturbances anywhere—inflation in the U.S., the drop in the Canadian dollar, even the recent upward valuations of the Dutch and German currency units—worry Swiss economists and bankers.

The Swiss economy is bursting at the seams. Not only is there practically no unemployment, but Switzerland has had to import about 500,000 foreign workers, mainly Italian and Spanish. As the population of Switzerland is only 5.4 million, this foreign influx of workers is substantial.

One of Switzerland’s most important problems at the moment is the future of its foreign trade. It does not like the idea of joining the Common Market, which it regards as a political organization not compatible with Switzerland’s traditional neutrality (It is not a member either of the IMF or even the U.N.) But, if Britain joins, Switzerland’s hand may be forced.

Galbraith Revisited
October 9, 1961

Over the last twelve months I have on one or two occasions examined the economic ideas of J. Kenneth Galbraith, our present ambassador to India, as expounded in his book The Affluent Society. This examination seems justified by the great influence of his ideas not only in academic circles but in the Kennedy Administration. Galbraith’s ideas were the subject of discussion at a meeting of the Mont Pèlerin Society, an international group of economists, a year ago in Germany; but the full text of the discussion has only now become available in The Mont Pèlerin Quarterly dated April–July 1961. It provides an opportunity to examine his ideas afresh.

So many good points were made by several speakers that the task of selection is difficult. The main thesis of Galbraith’s book, as summed up by Prof. George J. Stigler, “is that we are now wealthy and that an economic theory and a viewpoint which are based upon general poverty and the need for efficient production are obsolete.” Galbraith’s message is also summed up by Prof. David McCord Wright as: “Escape from the thralldom of productive efficiency”—stick to the
out-of-date method, don’t adjust, do less work.” The disastrous effects of such a program upon American capacity and world growth are obvious.

**WE SILLY SPENDERS**

Stigler points out that if we accept Galbraith’s thesis that people are essentially silly in spending their income, and fall for the blandishments of persuasive advertising by buying trifling or wholly nonsensical or harmful commodities, we are likely also to believe that people are stupid in other departments of life: “It is a very short step to say that not only are they incompetent in disposing of their money, but that they obviously are incompetent in disposing of their votes intelligently.”

George Schwartz points out that: “One of the greatest pleasures in life is to disapprove of the way the people next door spend their money. I bet that every woman in the world does not think much of the curtains chosen by the woman next door.” He adds that the Galbraith thesis is just a new twist to the anti-capitalist argument: “Admittedly the capitalist order can turn out the goods; admittedly it can provide a high degree of employment . . . . Now if you make all those admissions what have you got to sell? The Galbraith line is just a desperate turn to something new, to the argument: ‘All right, the goods are there, but they are the wrong goods’.”

**‘DEPENDENCE EFFECT’**

Prof. F.A. Hayek contends that the Galbraith argument really turns upon the “Dependence Effect” explained in Chapter XI of *The Affluent Society*. This argument starts from the assertion that a great part of the wants which are still unsatisfied in modern society are not wants that would be experienced spontaneously by the individual if left to himself, but are wants which are created by the process by which they are satisfied:

“It is then represented as self-evident that for this reason such wants cannot be urgent or important. This crucial conclusion appears to be a complete non sequitur, and it would seem that with it the whole argument of the book collapses.

“The first part of the argument is of course perfectly true: We would not desire any of the amenities of civilization—or even the most primitive culture—if we did not live in a society in which others provide them. The innate wants are probably confined to food, shelter, and sex. All the rest we learn to desire because we see others enjoying various things. To say that a desire is not important because it is not innate is to say that the whole cultural achievement of man is not important. . . . How complete a non sequitur Professor Galbraith’s conclusion represents is seen most clearly if we apply the argument to any product of the arts, be it music, painting, or literature.”

And Hayek, too, points out that the Galbraith thesis merely reverses the old socialist argument: “For over a hundred years we have been exhorted to embrace socialism because it would give us more goods. Since it has so lamentably failed to achieve this where it has been tried, we are now urged to adopt it because more goods after all are not important.”

**False Internationalism**

October 16, 1961

LONDON—The main impression left by a month’s visit covering France, Italy, Switzerland, Austria, and the British Isles is that the political and economic problems of individual countries are today overshadowed by their common international problems. By this I do not mean only the threat of a third world war of unparalleled devastation, but immediate day-to-day problems. We are witnessing, for example, an almost simultaneous crisis in the international organizations that were set up in 1945 or later with a great flourish of trumpets, based on utopian hopes, emotional catchwords (like “one world”), and false political and economic assumptions.

The main crisis is in the main organization, the United Nations. This is not merely the result of the death of its Secretary-General, Dag Hammarskjöld, but of cumulative experience of the ineffectiveness of the U.N. in solving or averting any major dispute or crisis. Nearly five years ago, even before more than a score of tiny new Asian and African “nations” were created and admitted, Viscount Cherwell pointed out that in the Assembly, “the ultimate governing body of the U.N. . . . 5 percent of the world’s population can carry the day against the other 95 percent.” To rely on the U.N., he thought, was “to live in a fool’s paradise.” It is “nonsense,” he concluded, for nations to submit their “vital interests to a body so absurdly constituted.”

**COMMON MARKET**

The culminating result is the spectacle in the Congo of the United Nations resorting to military force to try to compel Katanga to get rid of its Western advisers and “unite” under a Communist-dominated confederation. This denial of the right of self-determination, elsewhere one of the great slogans of the U.N., has shocked a substantial section of British opinion. Many Britons are baffled by the apparently incurable determination of our government to abdicate its own moral responsibility and put its conscience in the hands of other nations.
The British are having their own troubles with one of the new international organizations, the Common Market. They are deeply divided on the wisdom of joining it. They fear that the political result may be to break up the Commonwealth. They are not sure whether the economic result will be to carry them in the direction of freer trade or of more protection. For if they would have to lower their tariffs against European industrial goods, they fear that the might have to raise them against agricultural products and raw material from the Commonwealth as well as other countries. If there were a true world will to freer trade, some point out, no such discriminatory organization as the Common Market would be needed. Each nation would simply reduce its own tariff barriers and accept the nondiscriminatory most favored-nation principle.

**MONETARY FUND**

One international organization certain to get more critical scrutiny than it has ever received before is the International Monetary Fund. The U.S. Government is trying to postpone the necessity for putting its monetary house in order by building up the reserves and lending capacity of the fund. But it is becoming clear to the world’s monetary economists that the fund, with its credits and “drawing rights,” has been a powerful contributory force in keeping world inflation going. There is ultimately no substitute for each nation’s responsibility to keep its own currency sound.

This responsibility devolves above all on the U.S. As Groseclose, Williams & Associates put it in a recent (July–August) *Washington Letter*: “With dollars and sterling (mainly dollars) as 45 percent of the backing of the free-world currencies, the importance of a sound dollar to the free world is plain. The maintenance of the value of the dollar thus becomes the most important task of the U.S. Government both at home and abroad.

Yet, ironically, we are undermining the value of the dollar by a huge domestic spending program, a huge “foreign-aid” program, cheap-money policies, and a prospective deficit this fiscal year of more than $6.5 billion. Where we could have helped other nations most by keeping ourselves strong, we are threatening world stability by weakening our own position.

**Can Statistics Predict?**

October 23, 1961

In 1957 the Council of Economic Advisers suggested that the Census Bureau, with the cooperation of the National Bureau of Economic Research, a private statistical organization of high standing, “develop methods of appraising current business fluctuations in a monthly report that would take advantage of new findings about . . . economic processes over time, the availability of a great many economic time series, and large-scale electronic computers.”

As a result, Julius Shiskin took a leave of absence from his job as chief economic statistician at the Bureau of the Census to make a study for the NBER. The results now appear in a report entitled: “Signals of Recession and Recovery: An Experiment With Monthly Reporting.”

To estimate what Shiskin and his associates have accomplished, let us look first at the problem they were given to solve. As an aid in predicting the future of business, or even in ascertaining its present state, statisticians, private and governmental, have developed over the years an increasing number of statistical “series.” Shiskin estimates that in *Economic Indicators*, the *Survey of Current Business*, the *Federal Reserve Bulletin*, and magazines and newspapers, there are now well over 2,500 aggregate and component monthly or quarterly economic series. They cover an immense range of economic activity.

**ROLE OF COMPUTERS**

Obviously “this enrichment of the data available,” as Shiskin points out, “was not an unmitigated boon for the analyst . . . It was beyond the resources of any individual . . . to carry out the calculations, such as seasonal adjustments, needed to make the series useful for current business cycle analysis.” Fortunately, “a major breakthrough came in the early 1950s, with the advent of the large-scale, general-purpose electronic computer.” A computer program can “adjust and summarize” statistics quickly, and give “early-warning signals” of business recessions and recoveries.

So Shiskin takes 65 economic indicators and presents elaborate tables showing their “behavior in past business cycles.” It will take time to assess the value of his result. They will begin to be tested on Oct. 23, when the Department of Commerce will initiate a new monthly report, showing how some 70 different “economic indicators” have acted during the preceding month. These will include at least 29 indicators that usually lead the business cycle, fourteen roughly coincident with it, an seven that have usually lagged behind. A few preliminary observation may be made:

1—Electronic computers are amazingly quick, but there is no scientific magic in them. They can give only the answers that are fed into them. If statisticians feed in the wrong kind of “adjustments,” weights or averages, computers will make the wrong kind.
2—Statistics, even statistics that “lead” the business cycle, such as stock prices or length of the average work week, are always the record of past events. As Ludwig von Mises has put it, statistics are history.

3—Even if we assume that the future is inevitably determined by the past, statistics give too partial a picture. They are mere abstractions and averages. They leave out, among other things, all the political decisions or events, domestic or foreign, that profoundly affect business.

4—Shiskin and his associates think better business indicators will help the government to fight depressions and keep business on an even keel. But free markets can do this better than anything else. Governments always seek perpetual boom.

5—It is not correct foresight itself that yields profits, but only better foresight than the majority.

6—Business predictions themselves affect the future they predict. In fact, as Albert Hahn has pointed out, if the business cycle were predictable, there would be no cycle, as everybody would hedge against it.

Let us welcome the new statistical series. It should help us collectively, and no businessman can afford to be ignorant of the results. But those results can never be conclusive or completely “scientific.” The future will always be uncertain. The individual businessman, as always, will have to rely also on his knowledge of special situations and on his own hunches. ✽

Shadow of Price Control
October 30, 1961

In a letter of Sept. 6, Mr. Kennedy warned the heads of twelve major steel companies that if they raised their prices to cover the further increase in steel wages on Oct. 1 they would be contributing to inflation. The President’s policy on this matter could have fateful consequences not only for the steel industry but the whole American economy. It is gratifying, therefore, to find the subject so ably analyzed in the current October monthly letter of the First National City Bank of New York.

The best factual reply to the President’s letter came from Roger M. Blough, chairman of United States Steel. Among Blough’s points:

1—“From 1940 through 1960 steel prices rose 174 percent, but the industry’s hourly employment costs rose 322 percent, or nearly twice as much. I use 1940 as a starting point rather than 1947 [as the President did] because during the war-affected years of 1940 through 1944 steel wages rose substantially as did the level of wholesale prices; but steel prices increased not at all. Any comparison of these trends which starts with post-war 1947 as a base therefore obscures rather than reveals the realities which the steel companies have had to face throughout this entire period of inflation.”

2—“Profits [as a percentage of sales] have only once in the past twenty years equaled the 8 percent level at which they stood in 1940 and have averaged only 6½ percent in the past five years, thus demonstrating clearly that steel price increases during this period have not fully covered the rapid rise in total steelmaking costs.”

3—“The industry’s profit rate is merely an average—and averages can be dangerously misleading. Some companies will earn more than the average, while some may be suffering losses which they cannot sustain indefinitely. So it was in 1960 that among the 30 largest steel companies the profit rate as a percentage of sales ranged from a plus 9.3 percent to a loss of 5.2 percent.”

In addition to such factual points, Blough made some more general observations. He stressed one conclusion from a government report last year, prepared for the Department of Labor by Professor Livernash of Harvard University: “Obviously while price policy can be debated in the short run, in the long run all cost increases must be met. Steel has done no more than this.”

What alarms the City Bank is a broader issue than steel prices. Though the President’s letter was moderate in tone, behind it seemed to lie the threat of a general price control. A few weeks earlier Sen. Albert Gore had suggested that the Federal Trade Commission “could move to police the steel industry,” that the Department of Justice could perhaps break up the big steel companies, and “lastly, if all else fails, steel prices can be brought under utility-type regulations.”

REPPRESSED INFLATION

“There are worse things,” comments the City Bank, “that could happen to this country than an increase in the price of steel. One of these is the destruction of the freedoms of the market place and the substitution of political price-fixing, beginning with steel and spreading perhaps throughout industry. If nothing else, our wartime experiences with price-setting bureaucracies, black markets, and deteriorations of quality should warn us against this course.”

From the end of World War II until a few years ago, the same government policy repeated itself depressingly in one European country after another, as it is repeating itself now with even greater violence among our South American neighbors. This is the policy of “repressed
President Kennedy has so far sent to Congress. When a prudent individual finds that he has to spend more on some unexpected emergency, such as illness in his family, he normally cuts down his spending on something else. But the Kennedy Administration, instead of reducing its civilian spending plans when faced with a bigger defense budget, keeps adding to them.

Making a scapegoat of defense spending has, in fact, become a shopworn device. On Jan. 4, 1940, President Roosevelt said: “For several years we have been compelled to strengthen our own national defense. This has created a very large portion of our Treasury deficits.”

If it is possible to balance the budget, why must we wait until fiscal year 1963? Why not try it in the current fiscal year, which still has eight months to run? Why can the budget never be balanced this year but only in some sweet by-and-by?

NEVER THIS YEAR

I raised this question in a Newsweek column (Nov. 2, 1953) and cited the sad record of three Administrations. Space permits only a few elliptic quotations:

Franklin D. Roosevelt: “I give you assurance that . . . within a year the income of the government will be sufficient to cover the expenditures of the government”—March 10, 1933. “We approach a balance of the national budget”—Jan. 3, 1936. “If [the national income] keeps on rising at the present rate, as I am confident it will, the receipts [of the government] . . . within a year or two, will be sufficient . . . to balance the annual budget”—Oct. 1, 1936. (The budget was never balanced in any of the twelve years that FDR was in office.)

Harry S. Truman: “The budget for the fiscal year 1949 . . . will balanced . . . and provide $4.8 billion which should be used to reduce the public debt”—Jan. 12, 1948. (There was actually a deficit of $1.8 billion.)

Dwight D. Eisenhower: “The first order of business is the elimination of the annual deficit”—Feb. 2, 1953. (There was a deficit for fiscal 1953, fiscal 1954, and fiscal 1955.)

In the last 31 years there have been 25 deficits. As I concluded my column of eight years ago: “Each President began with pious promises of a budget balance, but there were always reasons why this could be done only in some indefinite future and not now. Meanwhile, the national debt keeps mounting and the purchasing power of the dollar keeps shrinking and a Republican budget director is warning against ‘the disturbing effects on the economy’ of spending cuts that are ‘too abrupt.’” Isn’t this where we came in? 

In the Sweet By and By

November 6, 1961

Let me repeat so there will be no mistake: The President intends to submit to Congress next January a balanced budget for fiscal 1963.

Secretary of the Treasury
Douglas Dillon, Oct. 17.

This pledge is reassuring. Yet the record of the past makes it less reassuring than it could have been. In January President Eisenhower estimated a surplus for the fiscal year 1962 of $1.5 billion. In March Mr. Kennedy said that, instead, there would be a deficit of $2.8 billion. Then the official estimate was raised to a deficit of $3.7 billion. In July it was raised again to $5.3 billion. On Oct. 29, the Budget Bureau estimated the deficit would be $6.9 billion.

If the estimated budget deficit even for the current fiscal year is to be raised by another billion dollars or so every couple of months, what real assurance can we have that the President will present a balanced budget estimate next January and that, come June 30, 1963, such a balance will in fact be realized?

It is argued that the estimated budget deficit has had to be unexpectedly raised in recent months because of the Berlin crisis and the need to increase defense spending. But even if we accept every dollar of our military spending as absolutely necessary, most of our annual Federal expenditures—more than $50 billion, if we include social security—are for civilian purposes.

NON-DEFENSE BUDGET

This includes all the dubious billions spent on foreign aid or farm price supports. It includes all the new billions recommended in the 50 or so messages that President Kennedy has so far sent to Congress. When a prudent individual finds that he has to spend more on some unexpected emergency, such as illness in his family, he normally cuts down his spending on something else. But the Kennedy Administration, instead of reducing its civilian spending plans when faced with a bigger defense budget, keeps adding to them.

Making a scapegoat of defense spending has, in fact, become a shopworn device. On Jan. 4, 1940, President Roosevelt said: “For several years we have been compelled to strengthen our own national defense. This has created a very large portion of our Treasury deficits.”

If it is possible to balance the budget, why must we wait until fiscal year 1963? Why not try it in the current fiscal year, which still has eight months to run? Why can the budget never be balanced this year but only in some sweet by-and-by?

NEVER THIS YEAR

I raised this question in a Newsweek column (Nov. 2, 1953) and cited the sad record of three Administrations. Space permits only a few elliptic quotations:

Franklin D. Roosevelt: “I give you assurance that . . . within a year the income of the government will be sufficient to cover the expenditures of the government”—March 10, 1933. “We approach a balance of the national budget”—Jan. 3, 1936. “If [the national income] keeps on rising at the present rate, as I am confident it will, the receipts [of the government] . . . within a year or two, will be sufficient . . . to balance the annual budget”—Oct. 1, 1936. (The budget was never balanced in any of the twelve years that FDR was in office.)

Harry S. Truman: “The budget for the fiscal year 1949 . . . will balanced . . . and provide $4.8 billion which should be used to reduce the public debt”—Jan. 12, 1948. (There was actually a deficit of $1.8 billion.)

Dwight D. Eisenhower: “The first order of business is the elimination of the annual deficit”—Feb. 2, 1953. (There was a deficit for fiscal 1953, fiscal 1954, and fiscal 1955.)

In the last 31 years there have been 25 deficits. As I concluded my column of eight years ago: “Each President began with pious promises of a budget balance, but there were always reasons why this could be done only in some indefinite future and not now. Meanwhile, the national debt keeps mounting and the purchasing power of the dollar keeps shrinking and a Republican budget director is warning against ‘the disturbing effects on the economy’ of spending cuts that are ‘too abrupt.’” Isn’t this where we came in? 

Inflation.” It consists, on the one hand, in creating inflation through government encouragement of excessive wage increases, huge government spending and deficits, and cheap-money policies, and then throwing the blame on business and trying to prevent the inevitable price rise by price controls. The price-fixing does even more harm than the inflation itself. It misdirects, unbalances, and disrupts production, and breeds class hatreds by directing suspicion against businessmen and producers.

This is the direction in which we seem to be drifting. But with courage and clarity, there is still time to reverse our course. ✿
Downgrading Ourselves
November 13, 1961

In addressing an international meeting of economists at Turin, Italy, last September, Karl Brandt, formerly a member of President Eisenhower’s Council of Economic Advisers, warned his listeners that:

“This task of undermining the self-assurance and good conscience of the public in the leading Western countries is the easiest part of the Soviet’s ideological warfare. . . . The weakening of the Western position is made relatively easy for the Soviets and their sympathizers by all those Western ex post anti-colonialists to whom the history of Western civilization is one chain of many centuries of crimes, exploitation, and brutality. . . .

“Nothing could better serve the cause of those who one day promise to bury us, another day threaten to wipe England and France off the map with twenty rockets, and do their utmost to destroy the prestige of the West than the masochistic and morose auditing of nothing but the errors and shortcomings of our history by so many academic professors in Western universities.”

ON WHOSE SIDE GOD?
A perfect example is a speech on Oct. 27 (i.e., in the week between Soviet Russia’s explosion of the 30-megaton thermonuclear bomb and its explosion of the 50-megaton bomb) by the Rev. Dr. John C. Bennett, Dean of the Faculty at the Union Theological Seminary:

“It is our temptation to assume that, because our opponents are atheists, God must be on our side and to overlook the extent to which Communism itself is a judgment upon the sins and failures of the middle-class world, upon the Christian world. The very atheism of Communism is a judgment upon the churches which for so long were unconcerned about the victims of the industrial revolution and early capitalism and which have usually been ornaments of the status quo, no matter how unjust it has been.”

There are two chief implications here. One is that God may be a Neutralist, or is belatedly punishing the present generation of the Western world for the sins committed by some of its ancestors nearly two centuries ago. I shall leave analysis of this argument to Dr. Bennett’s fellow theologians. But his second implication is economic. It is that the Industrial Revolution and early capitalism was a period in which economic conditions became more unjust and more miserable than in the periods preceding.

MARXIST HISTORY
Dr. Bennett no doubt came by this opinion innocently enough. Under the influence and example of Marx and Engels, it was the idea popularized by a whole school of nineteenth- and early-twentieth-century historians. But a sober review of the facts shows it to be false. The Industrial Revolution was a period of greatly accelerated economic progress. It was marked both by a great rise in wages and a dramatic increase in population. (England had 8.5 million inhabitants in 1770, 16 million in 1831.) By cheapening goods through mass factory production the Industrial Revolution first made possible consumption of such goods by the masses.

In the light of our present standards many of the conditions of early capitalism seem shockingly bad. But it was precisely the accelerative economic growth that capitalism, factory production, and free markets themselves made possible, which led to the infinitely improved working and living standards of today by which we so harshly judge early capitalism.

What is most “amazing to contemplate” is not (as the Dean insists) “the utterly self-defeating character of the intransigent forms of conservative anti-Communism in this country,” but, I suggest, the utter defeatism of the intransigent anti-anti-Communists whose guilt complex keeps supplying propaganda material for the Russian Communists to use against us. It is time our self-styled intellectuals learned and called attention to the truly enormous and inspiring achievements of the West, made possible by its respect for private property and economic freedom.
Of course the “reforms” recommended by Bowles would frighten off domestic saving and investment, disrupt and demoralize production, move toward socialism, totalitarianism, or chaos—and of course enormously increase the foreign aid burden that the American taxpayer will be asked to assume.

The real reforms are the precise opposite. What the retarded countries need most is political stability, internal peace and order, security of life and property, due process of law, economy, balanced budgets, a halt to inflation, and the maintenance of free markets. The policies that would do most to attract private investment from abroad are precisely those that would encourage saving and investment at home.

Inflation for Growth?
November 27, 1961

As Lawrence Fertig points out in his new book, *Prosperity through Freedom* (Regnery, $3.95), there is only one way in which a nation can achieve economic growth. That is by capital accumulation—i.e., “by increased savings and by increased investment in the tools of production.” Yet it is precisely the people who most ostentatiously clamor for a speedup in our rate of economic growth who most persistently ignore this truth. They want to get economic growth through inflation. And as Fertig emphasizes not only by reasoning but also by citing the record of postwar Germany and the Rueff plan in France, sound, long-run growth is achieved not by encouraging inflation, but by bringing it to a halt.

The German experience throws a brilliant light on this. In 1951 the U.S. State Department sent a commission of American economists to West Germany to investigate and to make recommendations to that government on fiscal policy. The chairman of the commission was Prof. Alvin W. Hansen of Harvard. Prof. Walter W. Heller, now chairman of President Kennedy’s Council of Economic Advisers, joined the commission and is credited with having participated in writing the report. This report was long classified as a secret document. It was not declassified until April of this year.

The German ‘Miracle’

Here are some of its recommendations: (1) That Germany had an “excessive concern for price stability,” and tended to “confuse wartime inflation with the normal operation of peacetime credit.” (2) That “a rate of interest high enough to stimulate any large volume of personal savings would seriously curtail investment.”
(3) That to give special inducement to corporations to increase their investment in new plant and equipment by permitting fast depreciation allowances “was an expenditure of tax funds which would otherwise have been collected by the government.” (4) That “the nostalgic hopes . . . looking toward a revival, of the nineteenth-century role of a capital market are doomed to disappointment.”

Fortunately for Germany and the world, Ludwig Erhard, the German Economics Minister, rejected the recommendations in toto. He put a tight lid on any increase in the money supply. He refused to pursue a cheap-money policy. He encouraged saving by a high rate of interest. He permitted rapid depreciation on investment. He restored the capital market. He refused to impose a top income tax rate higher than 50 percent, balanced the budget, encouraged private enterprise, restored incentives. In his own words, he “abolished practically all control for allocation, prices, and wages” and “reintroduced the old rules of a free economy.”

GOVERNMENT’S ROLE

The result was “the miracle of German recovery,” a record unequaled in the same period in the entire Western world. Had the Hansen-Heller recommendations been adopted, Germany would have been plunged into another orgy of state planning and inflation. David McCord Wright, comparing the German record with the British record under Labor government, found that British prices under inflation (1948–56) increased 45 percent while German prices fell 5 percent. While real wages in Germany more than doubled, British workers got a bare 10 percent increase. Germany’s manufactured exports, with lower costs, rose from 7 percent of the world market to more than 15 percent. Its gold and dollar surplus soared, while that of the British declined.

Lawrence Fertig’s important and stimulating book covers not only the subject of economic growth but also the whole range of modern economic issues—wages and prices, profits and employment, monetary and fiscal policy, unions, inflation, foreign trade, capitalism, socialism, Communism. It is the people, as Fertig keeps insisting, and not governments, that produce wealth, not government officials, that keep the currency honest and strong, to keep markets competitive and free, to maintain law and order and security of life and property, to remove the restrictions it has itself imposed on trade and production—in brief to release the energies of a free people and then get out of the way.

To Preserve the Dollar

December 4, 1961

The world in the last few decades has not been on the gold standard, but on an American dollar standard. Under the International Monetary Fund system, most other countries have fixed official par values for their currencies in terms of the dollar. Relying on our promise and our ability to keep their dollar holdings convertible into gold at $35 an ounce, foreign central banks have based their own operations on the assumption that the dollar is “as good as gold.” They have used dollars, precisely as they have used gold itself, as part of the reserves on which their own internal credit structures and national currency units are based.

If anything should happen to the integrity of the dollar—if we should find ourselves obliged to pay out gold until our reserves were exhausted, or if, to avoid this, we should either suspend exports of gold or devalue the dollar, we would not only destroy the international status of the dollar and irreparably impair our own prestige, both political and economic, but also we would do immeasurable damage to world confidence. As Secretary Dillon has admitted: “The dollar, as the world’s basic reserve currency, is the very foundation of international trade and commerce.”

PLEDGES NOT ENOUGH

Yet, grave as this danger is today, it is being treated in Washington with levity. President Kennedy did, indeed, take the first necessary step when he gave assurance in his first month in office that “the dollar must be protected . . . in its present value” and went on to pledge more specifically that he would take no action “to increase the dollar price of gold from $35 an ounce” or “to impose exchange controls.” But the dollar cannot be defended merely by uttering the right phrases. These must be followed by actions and policies which will give the world assurance that such pledges can and will be kept.

The policies Mr. Kennedy has been following, far from giving such assurance, are calculated to give rise to the deepest misgivings. The President and his aides have dealt, at best, only with short-term expedients or surface symptoms. They have attempted to deal directly with the balance-of-payments problem by reducing the duty-free allowance of returning American travelers from $500 to $100 and by ordering our forces in West Germany to buy their coal from the U.S. Such measures are trivial; they do nothing to remedy the basic situation. To the extent that we discourage imports we discourage exports, by depriving foreign counties of that amount of dollar exchange with which to buy our goods.
The social function of profit and loss is (1) to maximize incentives for production; (2) to balance production among thousands of different commodities and services so as to supply them in the proportions most wanted by consumers; (3) to stimulate incessant improvements in efficiency, to reduce costs and so prices; and (4) to put capital and the direction of production into the hands of those who have shown themselves best able to serve the consumers.

In a massive, thorough, and desperately needed book, Understanding Profits (Van Nostrand, $13.75), the late Claude Robinson argues the case for the profit-and-loss system and endeavors to catch up with age-old misconceptions and slanders. His book is especially strong on the statistical side. Its appendix contains a hundred pages of tables analyzing the profits over long periods not only of industries but of every big corporation.

WHO GETS WHAT?

Robinson is concerned particularly to show how the extent of profit is commonly exaggerated. Thus he points out that in the ten years 1949 through 1958 the average profit of all U.S. manufacturing corporations was only 3.9 percent on total sales and only 8.6 percent on investment (in spite of inflation during the period). The apparel trades and meat packers made a profit of less than 1 percent on sales during the ten-year period.

As to the division of corporation income between employees and owners, he shows that for the 22-year period 1938–1959 employees got 84 cents out of every dollar available for both groups, and the stockholders only 16 cents. This 16 cents was in turn divided into 7 cents reinvested in the business and 9 cents paid out in dividends. Thus, year by year, the workers in the corporations got more than five times as much as was available for the owners, and more than nine times as much as the latter actually received. High corporation income, in short, is no less important to the workers than to the owners.

When a book gives so much information, it seems ungrateful to complain that it does not give more. But I wish it contained one table comparing corporate profits, employment, and wages year by year since, say, 1929. This would have shown how profits, employment, and wages go up and down together.

CREATING ABUNDANCE

Part of the function of profits is to direct production into the right products—i.e., those most wanted by consumers. In the ten-year period 1950 through 1959 leading drug companies on the average made 10.9 percent profit on sales and 20.5 percent on investment. This
compared with an average of only 5.8 percent on sales and 12.6 percent on investment for leading companies in manufacturing. Such a result will be deplored only by those who fail to recognize its consequences. In 1948 the drug industry spent $30 million on research; in 1959 it devoted $170 million to research. Result? Not only the discovery of a multitude of drugs that prolong life and relieve suffering and pain, but also a sensational drop in drug prices. Penicillin was sold at $100 for 100,000 units in 1943 and for 22 cents in 1956. Cortone was put on the market at $200 a gram in 1949, and had been cut to $2 by 1957.

The supreme folly is to believe that politicians “protect” the consumer when they set an arbitrary ceiling on prices or profits. It is precisely high profits that stimulate the maximum investment, competition, and research to increase the output and bring down the costs of the things most wanted. It is the quest for high profits that brings abundance and low prices.

**Growth Means Capital**

December 18, 1961

The chief slogan of the self-styled liberals, once Full Employment, is now Economic Growth. Yet it is precisely the people who are most insistent on “a higher rate of economic growth” who exhibit the least understanding of how to achieve it. Nearly always they favor more inflation and more socialism—spending, deficits, controls, hostility to profits, punitive taxation—in brief, all the things that discourage true economic growth.

The central requirement for a continuous improvement in economic conditions is a continuous increase in the amount of real capital per head of the population—in other words, a constant increase and improvement in the plants, equipment, machines that increase productivity. Economic growth is the growth of capital formation. It is because the American economy puts more and more capital behind each worker that American wages and living standards are the highest in the world.

Yet growth in capital formation does not occur automatically. In recent decades it has been slowing down. This is the conclusion of a monumental study carried on since 1950 under the direction of Simon Kuznets for the National Bureau of Economic Research. His *Capital in the American Economy: Its Formation and Financing* is the seventh and final volume of the study.

**DECLINE IN SAVINGS**

Here are some of the significant findings. There is no support whatever for the thesis, so popular in the 1930s, that the American economy faces economic stagnation—that investment opportunities are drying up. On the contrary, the outlets for capital use have multiplied faster than the rate at which current product is saved. In the decades ahead “the supply of voluntary savings may not be adequate.”

*Gross* capital formation (which includes what corporations set aside for depreciation and replacement) has been comparatively constant over 85 years as a percentage of gross national product. It has declined from 22.6 percent (at constant prices) in 1869–88 to 17.6 percent in 1946–55. Corporations supply about two-thirds of *gross* capital formation.

*Net* capital formation, however, or the amount of new *additions* to the capital stock, has shown a distinct downward trend as a percentage of national income. For volumes in constant prices, the share declined from 14.6 percent in 1869–88, to 11.2 percent in 1909–28, and to 7.0 percent in 1946–55. For these *additions* to the capital stock, the relationship between corporate and personal contributions is reversed. Personal savings account for more than two-thirds of *net* capital formation.

Now if, as Dr. Kuznets declares, ‘capital formation is . . . our primary interest because it is essential to economic productivity and economic growth,” and if, “on a countrywide scale it represents the real savings of the nation,” we come to the problem of why real savings, as a percentage of income, have been declining.

**ROLE OF HIGH TAXES**

Here, I think, two factors can be emphasized—inflation and taxation. In periods of inflation, saving is discouraged because of the declining value of money. But a more constant factor is taxation. When the government takes 52 percent of corporate income, and taxes higher personal incomes at rates up to 91 percent, it soaks up and uses for current consumption or dissaving (particularly with deficit financing) precisely the funds otherwise most likely to go into saving and new investment.

If we really want a high rate of capital formation and economic growth, therefore, we will completely reform our Federal spending and tax program. We will allow rapid depreciation allowances, knowing that these encourage investment (and in the long run even higher government revenues). We will reduce the corporate tax rate and the extent of double taxation of corporate dividends. And we will slash progressive income-tax rates—especially the confiscatory rates above 50 percent.

If our primary aim is *not* to improve the productivity and real wages of labor, however, but to continue a purely vindictive policy of “soaking the rich,” we will hold fast to our present confiscatory tax rates.
Remove Trade Barriers
December 25, 1961

So many strands have become twisted and tangled together in our discussion of foreign-trade policy that a first task is to unravel a few for separate consideration.

1—The President deserves the fullest support in his advocacy of greater freedom of trade. But we must be clear concerning precisely why freer trade is desirable. The chief reason is that free trade maximizes the economies and efficiencies of world production. When each country devotes itself to producing what it can produce better and cheaper than any other, world production and consumer satisfactions are maximized.

2—From the standpoint of each country, the only direct advantage of foreign trade consists in the imports. It is through these that a country obtains the things it either could not produce at all, or produce only at a greater cost than the cost of what it exports to pay for them. As John Stuart Mill insisted, it is what a country obtains from foreign trade, not what it parts with, that constitutes the real gain to it. At points in his speech to the NAM, Mr. Kennedy recognized this: “We need those imports to give our consumers a wide choice of goods at competitive prices.” But more often he talked as if the real gain were in greater exports. Thus when he quoted favorably the “British” (unfortunately also the Hitler) slogan “Export or Die,” he forgot its basic meaning. The meaning was that unless a manufacturing country exported enough to pay for its necessary imports of foodstuffs and raw materials, it would die.

3—In the long run, the number of “jobs” is irrelevant to the height of trade barriers. The real difference is that when trade barriers are high production is less efficient and real wages are lower. If lower trade barriers give more jobs in export industries, they may take away a corresponding number of jobs in industries hurt by imports. It is a sudden raising or lowering of tariffs that disrupts the balance of industries and creates unemployment. As changes either way are unsettling, they should be infrequent and gradual.

4—Sweeping and sudden tariff changes are therefore to be avoided. More study should be given to gradualism. Even if it is decided, for example, that an ad valorem duty of 60 percent on some import ought to be completely abolished, it might be better to reduce it by 1 percentage point a month over five years than with an ax. The worst way of making such an adjustment is by subsidies to home industry. These would breed discrimination, favoritism, and corruption, and tend to be self-perpetuating. They would nullify the very purpose of lower tariffs.

5—Today tariff levels are among the least rather than the most important barriers to international trade. One of the worst barriers is the import quota system, as on petroleum and sugar. Import quotas are discriminatory, arbitrary, inflexible, and an instrument of political favoritism. A first step should be to abolish them and substitute a non-discriminatory tariff, which would at least permit price and efficiency competition among individual importers and exporters.

6—If the Administration favors freer foreign trade, its policy must be consistent. It must abandon such efforts to discourage imports as the drastic reduction of duty-free tourists allowances. It must abandon its short-sighted discouragement of American foreign investment, or its attempt to force such investment into the areas where it thinks it should go rather than where investors want to put it. It must abandon its efforts to dump our agricultural “surpluses” (created by government policy) onto foreign markets. It must stop subsidizing raw cotton exports and penalizing the American textile industry.

7—Finally, it should halt the inflation which is making it increasingly difficult for American manufacturers to compete abroad. It must change the legal and political setup that encourages excessive wage rises. Mr. Kennedy, in his speech to the NAM, promised to “stress” the need for wage restraint in addressing the AFL-CIO, but merely expressed a “hope” that was dashed the next day by his Secretary of Labor’s insistence that there was “plenty of room” for further wage increases and that the Administration did not “propose in any way to restrict the ability of collective bargaining” to get them. ✽
Common Market and Us
January 1, 1962

Last week I discussed seven basic issues and principles involved in foreign-trade policy, but never got to the complicated problem of the European Common Market and what our relations with it ought to be.

At the heart of that problem is the difficulty of knowing whether the Common Market will prove in the long run to be a step toward free trade or a step toward increased protection. It is a step toward freer trade among its six members—France, West Germany, Italy, Belgium, Luxembourg, and the Netherlands—but it remains a protectionist area against the rest of the world. Even internally it is not yet certain whether its net effect will be to encourage a free economy or collectivist controls. So far as agricultural products are concerned, subsidies, tariffs, and quotas on the part of member nations are as entrenched as ever. Industrial products, such as coal and steel, are on a cartel and quota basis. And unless the Six either adopt a common currency, or return individually to a gold basis, free trade among them will not in the long run be feasible.

DISCRIMINATION
In seeking free trade within the area, but continued discrimination against non-members, the Common Market suffers from an internal contradiction. It says to the Italian automobile manufacturer: We will continue to protect you against the competition of the Ford, but you must now accept the competition of the Volkswagen, because the Germans are now One of Us. We will let you buy raw materials from Germany if you can get them cheaper there, but we will not let you buy them from the U.S. because Americans are Foreigners. And the Common Market likewise says to the Italian consumer: To give you a wider range of choice and price, we will let you buy a Volkswagen from Germany; but we will not let you buy a Falcon or a Cadillac, unless you pay a stiff penalty tariff.

In brief, the Common Market discriminates against American products. This is what it was intended to do. Yet our own officials have from the beginning actively encouraged the Common Market. They have even gratuitously interfered to encourage the Common Market as against the European Free Trade Association, or Outer Seven, though the latter worked on the much sounder principle of lowering their trade barriers vis-à-vis each other without requiring any member to raise its tariffs against non-member nations.

BARGAINING FALLACY
As of now, the Common Market has triumphed over the Free Trade Area, not because it is nearer to free trade, but because it is farther from it. It is precisely its discrimination as a unit against non-members that gives it the bargaining power to force others to negotiate to “get in under the tent.” If Britain joins, and others of the Outer Seven follow suit, the chief country against which it will discriminate will be the United States. And if we joined, against whom would the common tariff wall be built? Katanga?

The President has not suggested that we join the Common Market. He has correctly insisted that we adhere to “our traditional most-favored-nation policy.” This means that we would not discriminate against any nation, but grant to every one as free an entrance or as low a duty for specific products as we grant to the “most favored.” Surely this is the policy that we ought to follow, not only vis-à-vis the Atlantic Community, but the whole non-Communist world.

But with such a policy, nation-to-nation or region-to-region bargaining would be not only unnecessary but inconsistent. Each nation could act by itself, realizing that it helps its own consumers and even the great bulk of its own producers by reducing trade barriers even if other countries refuse to do likewise.

Today this may sound like a counsel of perfection. The Common Market is a fact; and perhaps the most effective way of dealing with it, as of now, is through reciprocal bargaining. But let us not forget that such reciprocal bargaining rests on the protectionist fallacy that reduction of barriers to imports is a “sacrifice” or “concession” justified only by the reciprocal “concession” another country makes in favor of our exports to it.

Inflation Must End
January 8, 1962

Those of us who, for the past fifteen years or more, have been warning against inflationary policies, have found ourselves doing it with little help on net balance from the academic community, particularly that part of it clustered around Cambridge, Mass. Such Harvard faculty names as Seymour Harris, Alvin Hansen, J.K. Galbraith, and the late Sumner Slichter have been associated, if not with direct advocacy of inflation, at least with advocacy of such inflationary policies as continuous credit expansion, cheap money, increased government spending, and unbalanced budgets.

Now, out of Harvard itself, comes a powerful voice that not only warns against inflation, but correctly
analyzes its causes and courageously recommends its cures. Gottfried Haberler is not only a Harvard professor; he is a former president of the International Economic Association and will be president of the American Economic Association. Because of his prestige and the power of his argument, his 85-page pamphlet, *Inflation: Its Causes and Cures* (Revised and enlarged edition, American Enterprise Association, Washington, $1) may well mark a turn of at least the academic tide of thought on the subject.

**PAYMENTS CRISIS**

Because of the deterioration in the U.S. trade and payments position the tone of the revised edition is urgent:

“In view of the changed competitive position the U.S. can no longer afford even a ‘little’ inflation without losing gold. Moreover, disinflation or at least holding the pace of inflation below that of our principal competitors is the main prerequisite for a correction of the imbalance.

“Here is not the place to discuss other measures that could be taken to improve the balance—elimination of discrimination against dollar exports, larger contributions by Europe for mutual defense and for economic aid to underdeveloped countries, tied loans, and so on. The effect on the balance of payments of all these measures combined will probably be insufficient to eliminate the deficit and, at any rate, it could be easily wiped out by loose financial policies. The position of the U.S. as the world’s foremost banker and of the dollar as the world’s principal reserve currency greatly increases our responsibilities. At the same time, it excludes easy solutions which would be open to others. . . .

“The U.S. cannot tamper with the gold value of the dollar without committing a crass breach of the confidence of all those who have entrusted us with keeping their international reserves and without provoking an international financial crisis which would greatly weaken American leadership in the free world. . . .

“The conclusion is that, from now on not only considerations of international stability and sustained growth, but also the international position of the U.S. imperatively require that inflation be stopped.”

**TO CURB WAGE DEMANDS**

It is possible to cavil at a few aspects of Haberler’s study. But any shortcomings are far overbalanced by enormous merits. Several aspects of the American inflation in recent years get a more thorough analysis than they have received anywhere else. And Haberler is emphatic on the essentials: “Let us start from the basic fact that there is no record in the economic history of the whole world, anywhere or at any time, of a serious and prolonged inflation which has not been accompanied and made possible, if not directly caused by a large increase in the quantity of money.”

Finally, he recognizes the necessity of curbing excessive union wage demands if inflation is ever to be halted. And he points out that this can be done by legal reforms that in no way infringe liberties, but merely restore a more balanced power equilibrium between the parties in wage bargains, and eliminate violence and intimidation. More basic than legal reform would be a change in public opinion. “Aroused public opinion could force the government in its executive as well as in its legislative branch to pick up some courage, instead of maintaining a studious neutrality in wage bargaining, and issuing platitudinous appeals to everybody to behave, or outrightly capitulating to striking unions and bringing pressure on employers to capitulate.”

---

**Are We Anti-Capitalist?**

January 15, 1962

Two weeks ago my colleague Raymond Moley pointed to the strange fact that our government was supporting the action of the U.N. in systematically destroying, among other things, the properties of the Union Minière, which would have been the major source of supply for the entire Congo. “Since that company represents capitalism,” he continued, “it is easy to see why the Soviet so eagerly supported the U.N. resolution which precipitated the war.” But how explain our own government’s action? “Could not the President and his many advisers understand the consequences and also the inconsistency of ruthlessly destroying the Congo’s economic viability and then spending billions to restore it through foreign aid?”

This strange attitude was revealed afresh in the attack by Carl T. Rowan, Deputy Assistant Secretary of State for Public Affairs, on Dec. 27:

“Out of Katanga’s rich veins, Union Minière was producing 8 percent of the world’s copper, 60 percent of its cobalt, and many other minerals. Union Minière was a classic example of the profitable side of colonialism. Despite all the Congo’s troubles, this Belgian-controlled firm had net profits of $47 million in 1960 . . . . Union Minière pays about 80 percent of the tax revenues of Katanga. . . . Now isn’t it natural that those with financial interests in Union Minière would rather see Katanga as an easily controlled ‘separate nation’ than as part of a larger Congo nation whose government might not be as friendly as Mr. Tshombe and his associates? . . . Much of Mr. Tshombe’s most vocal support arises not so much from the fact that he
January 22, 1962

So all those who say that there’s nothing left to be done, that we should rest on our laurels, that the function of the national . . . government is to sit and lie at anchor are wholly wrong and we do not propose to follow their advice.”

President Kennedy at Columbus, Ohio, Jan. 6

Who are these people who say that there’s nothing left to be done? I have never met one. Are there people who actually believe that the 12,437,668 civilian employees on the Federal payroll should sit back and do nothing because there is nothing to do? Rightly or wrongly, the overwhelming majority of Americans have acquiesced with only minor reservations in the enormous proliferation of Federal programs and powers that has developed since the first and second world wars. A majority have in fact accepted the 2,133 different functioning agencies, bureaus, departments, and divisions found by the Hoover commission even in the Federal government of 1954.

Some Americans, confronting Federal expenditures of $89 billion in the current fiscal year and some $94 billion in the 1963 fiscal year, may look back wistfully to 1955, when such expenditures were “only” $64.5 billion. But no one dares to dream of a return to the $4.6 billion level of 1932, when candidate F.D. Roosevelt was demanding drastic economies.

WHO SHOULDN’T DO IT?

Mr. Kennedy is, in fact, attributing an extreme laissez-faire and do-nothing philosophy not only to everybody who wants to cut back a little on some of the thousands of existing Federal programs, but to everybody who thinks maybe the Federal government is sufficiently overgrown and over expanded and ought to try to straighten out the messes in, say, foreign aid and farm subsidies, before taking on still more programs.

The assumption implicit in the President’s statements seems to be that if any “unfilled need” can be shown to exist anywhere, it is the duty of the Federal government to fill it; and if there is anything that ought to be done in any field, it is the Federal government that should do it. And so he wants it to pay the medical bills of the aged, or the tuition of needy college students, or to cure mental retardation, or to solve any other problem. It is because such assumptions have now become perennial that practically every new Congress enacts more than a thousand new laws.

Yet the truth is that the proliferation of new Federal programs, with their corresponding expenditures, does...
not on net balance meet new needs. Whatever the government gives to B it must take from A. It taxes Peter to subsidize Paul. It transfers part of the earnings of some people to other people. Instead of allowing those who have earned money to spend it on their own wants or needs, the bureaucrats seize the money to be spent more “wisely,” or on other people’s real or supposed wants or needs. The politicians may spend the tax money on real collective needs, or in the directions designed to influence the most votes.

**THAT ‘PUBLIC’ SECTOR**

The process has semantically come to be known as squeezing the “private” sector (by implication selfish) to expand the “public” sector (by implication benevolent). It would be more accurate to say that the government forces a relatively shrinking free-enterprise sector to subsidize an expanding socialized sector.

This constant expansion of the Federal government does much more than merely transfer income from one set of pockets to another. It abridges the liberties of the individual. It feeds the growth of bureaucracy. It reduces the incentives to production of those who earn money and reduces the incentives to self-help of those who get the increasing Federal aid.

The heavy personal income and corporate taxes soak up precisely the funds that would otherwise have been devoted to savings, to capital accumulation, to the creation of new equipment. The final effect, therefore, of increasing Federal programs and Federal spending must be the opposite of what Mr. Kennedy hopes for. Even if they do not bring on further inflation and imperil the dollar, they must tend to slow down the rate of economic growth, and the rate of increase in real wages and in standards of living. ✽

‘Power to Lay Duties’

January 29, 1962

In his State of the Union Message the President asked Congress for two major delegations of power. One concerned its constitutional power “to levy and collect taxes,” the other its power to lay “duties.”

“We need, first,” he declared, “Presidential standby authority subject to congressional veto to adjust personal income-tax rates downward within a specified range and time.” There are weighty reasons, both constitutional and economic, why Congress should refuse to delegate this power. Congress has already, through delegation or default, lost too many powers to the Presidency. The peacetime power of that office is already swollen beyond parallel.

The chief economic assumption behind the President’s request for standby powers over income-tax rates—that they must be quickly lowered “to slow down an economic decline before it has dragged us all down”—is fashionable but false. This assumes that the sure cure for recession or unemployment is a budget deficit. A budget deficit is sure to bring on inflation, but whether it slows down a decline or reduces unemployment will depend upon what happens to wage rates and a score of other factors. If inflation through bigger deficits were a remedy for recession, there would always be time for the President to send an urgent message to Congress or to call a special session. If Congress is to be asked to delegate powers on the assumption that it is incapable of acting in time, it could more logically be asked to delegate to the President its constitutional power to declare war.

**FOR A NEW SAFEGUARD**

Constitutional objections to the transfer of taxing power apply just as much in principle to transfer of power over tariffs. Economically, however, the President is here on firmer ground. Even constitutionally there are important mitigating considerations. Congress has already been delegating such powers, under successive reciprocal-trade acts, for 28 years. There are practical reasons for this. The setting of tariff rates, item by item, involves infinite detail. Before the era of reciprocal-trade acts the final set of schedules was the result of unconscionable logrolling among congressmen, each haggling for the industries in his district. Congress is of course utterly unequipped to bargain separately with each foreign country or trading unit.

There are strong precedents and practical reasons, therefore, why Congress should continue to grant the President discretionary reciprocal trading powers. But because the President’s request goes much beyond the powers granted in the past, Congress would be justified in surrounding such a delegation of power with additional safeguards. The most important of these was suggested by the President himself in his request for discretionary power over income tax rates. Delegation of tariff bargaining powers should be “subject to Congressional veto.”

‘RECIPROCITY’

How would this be practically possible? Congress could provide that every trade agreement the Executive power negotiated should be submitted to it before going into effect. It could agree in the new law to accept or reject such an agreement in toto, without trying to amend it in detail. (Though if it returned an agreement
unrated if it might indicate what changes would make it acceptable.) And it could provide further that, if it failed to take any action either way within 30 or 60 days, the agreement would automatically go into effect. Thus Congress, without obstructive delays, could force the American bargainers to keep constantly in mind the overall acceptability to Congress of each agreement.

It remains to be said that the method of reciprocal-tariff bargaining, though we have followed it for the last 28 years, is dubious in principle. It rests at bottom on the protectionist assumption by each party to the bargaining that though exports are good for a country, imports are bad for it. Barriers to imports are therefore lowered only as a “concession” in return for a reciprocal “concession.” Hence there is an incentive to each country to boost its tariffs high in the first place so that it may have more to concede. ✗

Notes on the Budget
February 5, 1962

Is It Balanced? The President estimates that the Federal government will spend $92.5 billion in the fiscal year 1963, and will take in revenues of $93 billion, leaving a surplus of $463 million. This would be the first surplus in three years and the second in six. But the forecast is based on a series of the most optimistic assumptions. Revenue forecasts, for example, are based on the expectation of unparalleled prosperity. With no important net change in tax rates, revenues are counted upon to jump from $82.1 billion in fiscal 1962 to $93 billion in fiscal 1963. If revenues did not increase, the predicted surplus of half a billion would become a deficit of $10.4 billion.

How Reliable? In the light of the past record, how much confidence can we place in the new estimates? It is ironic to recall that for the fiscal year 1959, which ended with a deficit of $12.4 billion, Eisenhower originally estimated a surplus of nearly half a billion, almost exactly what Mr. Kennedy now estimates for 1963. But in 1959 expenditures turned out to be $6.8 billion more than the estimate, and receipts $6.1 billion less. Eisenhower originally estimated a surplus for the current fiscal year of $1.5 billion. Last March Mr. Kennedy estimated instead a deficit of $2.8 billion. In July this was raised to $5.3 billion. It is now estimated at $7 billion—with the year only a little more than half over. If an estimated deficit is raised a billion dollars or so every two or three months, what confidence can we have in a paper-thin surplus forecast seventeen months ahead?

Why So Big? The spending estimates for fiscal 1963 are the highest on record in peacetime—$111 billion higher than in 1961 and $28 billion higher than in 1955. The taxes to support such spending must undermine productive incentives and siphon off the funds for investment. Sentences in the President’s message give the impression that the rise in Federal spending is almost entirely caused by increased costs of defense. But even with the heavy increase in proposed defense spending to $82.7 billion, more than half of our total spending of $114.8 billion (when we count social security and similar payments) is still on nondefense and welfare items. Even when we confine ourselves to the regular budget, we find that compared with the last completed year, 1961, though projected national defense expenditures have increased $5.2 billion, nondefense and other expenditures have increased $5.8 billion. Nondefense expenditures of $39.8 billion projected for fiscal 1963 are almost double the $20.9 billion nondefense expenditures in 1954.

More ‘Needs’ Met? It is a fallacy to suppose that the enormous new budget enables the American people to “meet more needs” on net balance than before. All it does is to transfer expenditures from the free enterprise sector of the economy to the socialized sector, from the voluntary sector to the compulsory sector. The government can give nothing to Peter that it does not take from Paul. Everybody is forced to pay for somebody else’s education or illness. As Bastiat put it more than a century ago: “Government is the great fiction through which everybody tries to live at the expense of everybody else.”

Inflation Threat: A few months ago Mr. Kennedy gave his support to the theory that an annually balanced budget was unnecessary; all that was needed was a “balance over the years of the business cycle.” But even this theory involved the implicit assumption that if, say, we ran deficits of $7 billion to $12 billion in our bad years, we would have to run equally huge surpluses in our good years. Now Mr. Kennedy’s Budget Message rests explicitly on the theory that though we need heavy deficits to turn the business cycle “from recession to recovery,” even a budget balance at any time, let alone an actual surplus, may endanger prosperity, and that the President needs discretionary stand-by powers to cut taxes or increase spending to cure unemployment.

This theory is very fashionable but quite fallacious. Not merely the new budget itself, but even more the new explicit budget philosophy behind it, must increase the threat and fear of inflation and undermine confidence in the American dollar. ✗
Growth by Rhetoric?
February 12, 1962

Throughout the Economic Report of the President and his advisers run a multitude of supremely confident assumptions. They know just where the GNP is going to go. They know just how much economic growth we ought to have every year and just how to get it. They know the “guideposts” and formulas for fixing wages and prices. They know just what to do if things start to turn for the worse. All that is necessary is for Congress to surrender some of its constitutional powers and responsibilities now and turn them over to the President to use in an “emergency.”

“As 1961 ended, actual output was still $25 billion to $30 billion short of potential.” If we attained our “maximum,” GNP in 1963 would reach “approximately $600 billion.” “We should not settle for less” than a growth rate of 4½ percent a year. In fact, in November, together with our nineteen fellow members, “we pledged ourselves to adopt national and international policies aimed at increasing the combined output of the Atlantic Community by 50 percent between 1960 and 1970.” Well, as Shakespeare put it: “If to do were easy as to know what were good to do, chapels had been churches, and poor men’s cottages princes’ palaces.”

NEED FOR INVESTMENT
Economic growth depends on one thing: The volume of new investment—the amount of capital put into new machinery, plant, and equipment to increase productivity. In all the Administration proposals outlined in the Economic Report only one—a modest investment tax credit and revised depreciation allowance—is directly calculated to encourage increased private investment. Nearly all the other proposals would discourage it. They would increase government spending, increase deficits, and increase the tremendous burden of corporate and personal income taxes that already discourage and reduce our rate of economic growth. For they reduce incentives at the same time as they siphon off for nonproductive government spending the funds that would otherwise have gone into new investment.

The main assumption behind the Economic Report, in brief, is that the cure for unemployment is inflation, if you can only get enough of it. On this assumption the President asks for emergency stand-by power (1) to cut income taxes by as much as $10 billion a year and (2) to increase spending on public works by $2 billion a year. He also asks for longer and bigger unemployment benefit payments.

DEFICITS VS. JOBS
The assumption is that huge deficits are always a sure cure for unemployment. Nowhere in the report is there any reference to our experience in the ten years from 1931 to 1940 inclusive, when uninterrupted deficits averaging 3.6 percent of the gross national product (equivalent to $18.7 billion a year at present GNP levels) were accompanied by average annual unemployment of 18.6 percent of the total working force (equal then to 10 million and now to more than 13 million unemployed). Nor is there the slightest hint that unemployment may be the result of excessive wage rates or that anything effective should be done to mitigate union demands. Nor is there the slightest suspicion that higher and longer unemployment benefits might directly and indirectly increase unemployment.

Even if there were reason to think that the President’s proposed spending and taxing policies might reduce unemployment without increasing inflation, there would be no reason for Congress’s granting him stand-by powers. The President could always send an urgent message or call a special session and allow Congress to use its own judgment in the light of conditions at the time.

In brief, the President’s proposed policies seem likely to bring about precisely the opposite of the goals he wishes to achieve. They would slow down economic growth by reducing incentives to work and save and invest. They might increase rather than reduce unemployment. They would almost certainly increase inflation and thereby (together with his light-hearted suggestion that our 25 percent gold-reserve requirement might be repealed) undermine that confidence in the dollar which he is so eager to preserve.

More Planned Chaos
February 19, 1962

President Kennedy’s call for a Congressional investigation of the government’s war-emergency stockpile program is gratifying. Such an investigation, in fact, is long overdue. Let us hope that it will not deteriorate into mere personal and partisan charges, but will confine itself mainly to essentials and basic principles.

If the investigation is partisan, neither party is likely to derive much credit from it. The program was started in 1939, under Roosevelt, resumed by Truman in 1946, and expanded by Eisenhower. In fact, it is astonishing that Mr. Kennedy was “astonished” to find that the nation’s strategic stockpile now contains $7.7 billion worth of materials. This does not differ much from
the figures have been published monthly for more than two years by the Byrd Joint Committee on Reduction of Nonessential Federal Expenditures.

Mr. Kennedy declared that the materials the government is holding exceed the nation’s “emergency requirements as presently determined by nearly $3.4 billion” even though these requirements are based on the highly improbable assumption that a (presumably nuclear) war today would last as long as three years. But this overbuying has also long been common knowledge.

HANDOUT TO INDUSTRY

Five years ago official estimates indicated that the U.S. had enough tungsten aboveground to last for six years at the peak wartime rate of consumption. Even a tungsten producer, Philip M. McKenna, pointed this out, and opposed Federal subsidies to domestic tungsten producers as neither necessary nor desirable. The government purchases of lead and zinc were also widely recognized five years ago as nothing more than a hand-out to industry.

The stockpiling program demonstrates once more that when the government embarks on a commodity buying, subsidizing, or “stabilizing” program even for “essential” purposes, political pressures and momentum develop that carry it far beyond its original or any rational purpose. It now includes some 76 commodities. The government dare not reverse its program, and fears even to halt it, lest it demoralize the very markets and producers it was trying to help.

In the press conference in which Mr. Kennedy called for an investigation of stockpiling, he only incidentally mentioned the most costly stockpiling program of them all, that of agricultural commodities. The Byrd committee figures show that on Nov. 30 the total cost value of stockpiles under the General Services Administration was $8.7 billion, but the agricultural price support program added $5.4 billion more, bringing the total above $14 billion. For the fiscal year 1961, annual storage costs of agricultural stockpiles were $460 million, out of a total $475 million.

‘AID’ MEANS CONTROLS

Ironically, on the same day as the President publicly worried about the strategic stockpiles, he submitted to Congress a new agricultural support program. True, he argued that this would reduce surpluses. But his argument rested on the assumption that in return for their subsidies the farmers will accept the most complicated and drastic controls, not only over acreage but over marketing quotas, to which they have ever been subjected. The alternative with which they are faced is that if they refuse to accept such controls not only will all price supports be dropped but also the government will dump its holdings of crops on the open market.

The present predicament of these programs emphasizes once more the danger to producers from accepting government “aid” and subsidies. Always, eventually, these lead to governmental control and dictation. Let us hope that the colleges and the score of other present applicants for Federal funds can learn this elementary lesson.

Meanwhile, it is worth pointing out that government “stabilizing” programs are always, in the long run, unstabilizing programs. The President’s own farm message concedes that the government’s past farm programs have led to “the drift toward a chaotic, inefficient, surplus-ridden farm economy.”

Freedom to Bargain

February 26, 1962

In January electrical workers in New York City, who had been working a 30-hour week at $4.40 an hour ($6.60 for overtime), struck and demanded a twenty-hour week at higher pay. They finally settled for a basic five-hour day and 25-hour week at $4.96 an hour, with a guaranteed sixth hour at $7.44, or $161.20 for a 30-hour week. The shorter week was demanded in spite of the fact that a serious shortage of skilled electricians already existed in the New York area.

There is hardly need to point out that the new contract (particularly if it becomes a “pattern”) must reduce national production, raise the cost of factories and homes, reduce our ability to compete abroad, create unemployment, and lead to further inflation. The Kennedy Administration and even the AFL-CIO have disapproved the settlement. Yet the unreasonable demands were made and granted.

And now, to prevent a repetition of anything like the 116-day steel strike of 1959, or even abnormal stockpiling, the Administration has already intervened in the steel wage negotiations to plead with both sides for “industrial statesmanship” and “an early and non-inflationary settlement in the public interest.” Wages in the steel industry are already $3.24 an hour compared with an average in all manufacturing of $2.36.

FIXING RIGHT WAGES

Behind this intervention is the implication that the government knows what a proper or statesmanlike wage ought to be. This implication, in spite of many reservations, is found in the latest annual report of the Council of Economic Advisers. “The general guide for
noninflationary wage behavior,” it tells us, “is that the rate of increase in wage rates (including fringe benefits) in each industry be equal to the trend rate of overall productivity increase.” After describing “important modifications” of this guide, it concludes that “productivity is the central guidepost for wage settlements. Ultimately, it is rising output per man-hour which must yield the ingredients of a rising standard of living. Growth in productivity makes it possible for real wages and real profits to rise side by side.”

It is gratifying to find explicit government recognition that real-wage rates are limited by productivity. But the truth is that neither “overall productivity” nor “output per man-hour” can be accepted as a wage-rate guide. “Overall productivity” is not productivity of labor, but of land, labor, management, and capital combined. “Output per man-hour” is a misleading ellipsis for output per man-machine-hour. The council report itself admits this at one point: “Output per man-hour rises mainly in response to improvements in the quantity and quality of capital goods with which employees are equipped.” Now if the rise in productivity is mainly owing to the creation and use of more and better machines, and if all the money earned by these machines (and needed to amortize them) is to be sucked into high wages for the workers who use them, what incentive is left for new investment?

EMPLOYERS COERCED

Why is the government drifting toward the idea of compulsory wage arbitration? The reason is that our one-sided labor laws grant so much power, privileges, and immunities to the labor unions that they can make unreasonable demands which the employers are impotent to resist. The latter find their own freedom to bargain abridged. The employers are legally forced to “recognize” and “bargain with” specific unions that are legally granted exclusive bargaining power. In addition, unions are allowed to use mass picketing and intimidation to prevent anybody else from taking the jobs that the union members have voluntarily vacated by a strike.

If these one-sided laws were repealed, if freedom, not merely of “collective bargaining” but of all bargaining, were restored, competition of workers and employers would set workable and “noninflationary” wages, prices, and profits, without need of coercive government slide rules. If two-sided freedom of bargaining is not restored, we will continue to drift toward compulsory arbitration, government wage and price and profit fixing, and totalitarian controls.

Automation Makes Jobs

March 5, 1962

Ever since technological progress began, men have feared efficiency and machinery as a threat to their jobs. In the Industrial Revolution new stocking frames as they were introduced were destroyed by the handicraft workmen (more than 1,000 in a single riot), houses were burned, the inventors were threatened and obliged to flee for their lives. Yet before the end of the nineteenth century the stocking industry was employing at least a hundred men for every man it employed at the beginning of the century. And so with scores of other industries.

Yet the belief that machines on net balance destroy jobs, no matter how often disproved, never dies. Whenever there is prolonged unemployment, machines get the blame anew. In the depression of 1932, a group called the Technocrats emerged to blame the mass unemployment in that era once more on the machine.

Well, here we go again. A reporter at the press conference on Feb. 14 cited an estimate by the U.S. Labor Department that 1.8 million jobholders are replaced every year by machines. “How urgent,” he asked, “do you view this problem—automation?” And the President replied: “It is a fact that we have to find over a ten-year period 25,000 new jobs every week to take care of those who are displaced by machines and those who are coming into the labor market. So that this places a major burden upon our economy. . . . I regard it as the major domestic challenge, really, of the ‘60s—to maintain full employment at a time when automation, of course, is replacing men.”

RECORD EMPLOYMENT

Now “automation,” in its broader sense, is simply the latest name for increased technological progress. To regard this as “a major burden” or “the major challenge” is to misunderstand it completely. It is true that machinery or automation can displace specific men from specific jobs, and this creates a problem. But it is not true that mechanization destroys jobs on net balance. Historically, it has always created jobs. In spite of our unemployment, U.S. employment in January exceeded 65 million, the highest for any January in our history.

It is important to understand not only that mechanization, automation or scientific progress has never reduced the total number of jobs, but just why it does not. First, a huge number of new jobs are created just to make the new automated machines. Secondly, scientific progress turns out innumerable products—telephones, motor cars, planes, air conditioning, radios, television, plastics, synthetics, miracle drugs—that never even
exists before. A huge new demand is created. Thirdly, automation is most often adopted because it reduces costs of production. This means that it brings down prices. Then people either buy more of a product or have more money left over to buy other products. More jobs are created.

**IT RAISES WAGES**

Mass production, in brief, has made possible mass consumption. Mechanization increases production, real wages, and living standards.

When this is not understood, the policies adopted are precisely the opposite of what they should be. Unions no longer smash machines; but they still insist on slowdowns, make-work practices, featherbedding, retention of wholly unneeded workers, and other penalties to discourage mechanization. These policies injure all of us, and workers most of all.

It is not true, as the Administration thinks, that the government must “do something” to “find” jobs lost by automation. It is above all not true that it must resort to inflation or to massive new spending to “create jobs.” What it must undo are the ill-considered laws that have destroyed jobs.

To blame automation for current unemployment is to divert attention from the real cause. That cause is excessive wage rates in certain lines. It is no accident that some of our most serious unemployment is in the coal and steel industries, in which hourly wages have been $3.10 and $3.26 an hour respectively, compared with an average of $2.34 an hour in all manufacturing. And these job-destroying wage rates are the result, in turn, of the special legal powers and immunities that government has conferred on the unions.

**Jobs by Inflation?**

March 12, 1962

The President has sent to Congress, accompanied by a letter urging its passage now, a pre-drafted “Stand-by Capital Improvements Act of 1962.” The proposed law would give the President authority to spend $2 billion on expanded public-works programs whenever government unemployment figures signaled a slump. Projects would be designed to create jobs, inject Federal money quickly into the economy, draw state and local matching funds after it, and expand consumer purchasing power.

Congress is being asked, in effect, to transfer in advance part of its power of the purse to the President. The President’s argument for having these stand-by spending powers is that, if a recession gave statistical signs of beginning, Congress would be incapable of acting soon enough. It is hard to see any force in this argument. In the event that statistics took the turn the President now contemplates, he could send an immediate emergency message to Congress on the day the discovery was made. If Congress were not in session, he could call a special session within a week. Congress could then act.

**CONGRESS CAN BE QUICK**

The President, therefore, must either think that Congress is incapable of acting promptly, or that it might not wish to do so. The historic record shows that the first assumption is not true. Congress has repeatedly declared war within a few hours after being asked to do so by a President. In the early weeks of the Roosevelt Administration, in 1933, laws were often enacted within a day or two after they were proposed. On May 25, 1946, when President Truman asked Congress for authority to draft striking railroad workers into the Army, the House voted the same day to grant him the powers he had asked (an action fortunately later rescinded by the Senate).

If, however, the argument is that Congress may not wish to authorize the increased spending at the time when the trigger conditions envisaged by the proposed stand-by law occur, that is the best of all reasons why Congress should not enact a self-paralyzing law now. This is asking it to vote now not to trust its own future judgment, but to agree to be bound in advance to authorize an automatic response to a statistical barometer without knowing the full circumstances of a future situation.

If we turn from the political imprudence of the proposed law to its economic consequences, we find that it rests on all the old pump-priming fallacies—on the assumption that a net increase in jobs is always created by bigger deficits, achieved either by more spending or by cutting taxes—on the assumption, in other words, that more jobs can always be created by injecting more money into the economy—in plainer words, that the total number of jobs can always be increased by more inflation.

**KEYNESIAN FALLACY**

This is the fallacy on which governments all over the world have been operating for the last generation, and especially since Lord Keynes built up an elaborate rationale for it in 1936. Those who believe in it forget that heavy unemployment has frequently occurred in the very midst of a major inflation. That increased deficit spending will bring on more inflation is practically certain; but whether it creates more jobs will depend
on whether or not prices rise faster than wage rates and increase profit margins. The Administration remains persistently blind to the effect of excessive wage rates in causing the unemployment of which it complains. Such wage rates, instead of being allowed to correct themselves, would under the proposed law be subsidized with Federal funds.

The only direct employment provided by the President’s automatic pump-priming plan would be in the construction industry. But construction workers might be those in least need of subsidy. Today they earn an average of $3.24 an hour, compared with an average of $2.36 in all manufacturing and $1.71 in retail trade.

Finally, the projects on which the $2 billion would be spent would be projects dreamed up just to spend the money. For the inference is that if the unemployment thermostat did not hit the trigger levels, we could get along without the projects.

How to Remove Barriers
March 19, 1962

The proposal that we associate ourselves with the European Common Market has diverted attention from the real problems of American foreign trade. Administration spokesmen talk as if such an association would be necessarily a step toward lower trade barriers in general, and as if any other course would be necessarily toward more protection. But the problem is less simple than that.

1—It may be wise for us to bargain with the Common Market. But this would not necessarily be a step toward freer trade. It is still uncertain whether the Common Market will prove to be a step toward lower trade barriers in general, and as if any other course would be necessarily toward more protection. But the problem is less simple than that.

2—Our most important need is not to start bargaining reciprocal concessions with the Common Market, but to make and keep ourselves competitive in foreign trade. This means that we must slash, and not increase, Federal spending; that we must stop the deficits; that we must halt inflation, and every policy that undermines confidence in the dollar. We must keep down our prices and costs. We must revise or repeal all Federal labor laws that encourage excessive union demands and lead to faster rises in wage rates than in marginal labor productivity. We must revise our tax laws to give more incentives to industry, particularly for investment in cost-cutting or quality-raising equipment. Only such thoroughgoing reforms can keep us competitive in world markets.

3—The first step we must take in reducing foreign trade barriers is to abolish the import quota system we have been building up in recent years—on sugar, on petroleum, on cotton textiles. There is no legitimate aim of a quota system that cannot be accomplished as well or better by a tariff. Quotas are a totalitarian device that require detailed farm-by-farm or firm-by-firm output or import quotas, that reduce or eliminate competition even by domestic producers or importers with each other. A tariff at least permits domestic competition, and so tends to hold down domestic costs. It also brings in revenue.

4—When we have abolished quotas, we can start reducing tariffs. But it is extremely important that this be done gradually, to bring a minimum of disruption to industry, and to allow time for adjustment. Tariffs might even be reduced, by pre-set schedule, by very small changes month by month over a number of years. It is violent and unforeseen changes in tariffs, either way, that cause most uncertainty and disruption.

5—The worst course would be to reduce tariffs suddenly or sweepingly and then, as the Administration bill proposes, offer government cash payments or other forms of “adjustment assistance” to the workers or firms injured. It would be impossible, in fact, to know precisely how much or which unemployment or injury could be attributed to a tariff reduction. The decision would have to be arbitrary. “Adjustment assistance,” in brief, will lend itself to discrimination, favoritism, and corruption, and will expand the area of government paternalism and controls.

SELF-DEFEATING CURE

There is no good reason, moreover, why workers presumptively unemployed because of tariff changes should be more generously treated in length or amount of benefit payments than workers unemployed through other reasons that may be no direct fault of their own. Or why firms presumptively hurt by tariff changes should get better tax treatment or bigger government loans than firms hurt by other causes outside their control. To keep our high-cost inefficient producers going artificially, at public expense, would defeat the very purpose of tariff reduction.
And high tariffs, bad as they are, are infinitely less dangerous to a free economy than paternalistic government subsidies, direct or indirect.

**Incentives Bring Growth**
March 26, 1962

My colleague Raymond Moley has just written the biography of a remarkable man—*The American Century of John C. Lincoln* (Duell, Sloan and Pearce, $4.95). John Lincoln was a genius peculiarly American—a sort of amalgam of Thomas Edison and Henry Ford. Like Edison, he was a prolific inventor. He took out 54 patents over a period of 65 years. Like Edison, again, his inventions showed amazing versatility—electric motors, brakes, drills, arc lamps, apparatus for curing meat, new types of steel springs. His chief contributions were in the field of electric welding of metals. As with Edison, some of his schemes and inventions were commercial failures, but his successes enormously outnumbered them. Like Edison, finally, his interest was primarily in invention or problem-solving for its own sake, rather than in the profits that it brought.

There were also, in his career and temperament, striking similarities to Henry Ford. His genius was dominantly practical. He was constantly devising methods of reducing costs, of making things cheaper, faster, better. Like Ford, he lived far below the level that his income would have permitted, and kept plowing back his profits into the expansion of his business.

**PHENOMENAL WAGES**

He started the Lincoln Electric Co. in 1895 with a capital of $200. By 1906 it was duly incorporated with a capital of $10,000. Its twenty employees grew to 70 by 1910, to 100 by 1911, to 150 by 1914. In 1907 Lincoln’s brother, James F., his junior by seventeen years, entered his employ at the age of 24. In 1913, at 47, John decided that he preferred a life of engineering and invention to a career as a business executive. As he found in James all the characteristics that make a successful head of a growing company, they entered into an arrangement in 1914 by which James took over the business management.

Under James’s management, the business of the company grew prodigiously. In 1961 it had 1,345 employees and did a gross annual business of nearly $60 million. Its prosperity has been based on the inventive genius of John C., on an initial lead in building certain types of motors, concentration on finding lower-cost methods, the wise use of engineering talent, and the “incentive management” system of James F., including profit-sharing, piecework, bonuses, employee stock ownership, and merit rating. Lincoln Electric’s wage policy has been extraordinary. The earnings of its factory workers range from $5,500 to $14,000 a year.

**LINCOLNS AND FORDS**

John C. Lincoln died in 1959, at the ripe age of 93. What is amazing is the range of his activities and inventions after he had passed the conventional retirement age of 65. He was making major inventions after 70. At 78 he took over and rehabilitated the Bagdad copper properties. In his late 70s, he wrote and published an analysis of the New Testament, and was actively preaching and propagating the tax theories of Henry George.

Will there be another career like that of John C. Lincoln? asks Moley at the end of his book. That, I am inclined to answer, depends on our future national policy. Certainly there will be other men born with the temperament of John Lincoln—men to whom life is a constant adventure and an unending quest, men with tireless drive and unquenchable curiosity, men more interested in invention and problem-solving than in any money profit that may come from them. But an atmosphere of hostility toward business, a tax on corporate profits of 52 percent, and of up to 91 percent on the personal income that may remain, must drastically restrict what even such men can achieve.

The profits that men like Henry Ford and John C. Lincoln plowed back into their businesses, increasing employment, production, wages and the amenities, welfare and living standards of the consuming community, were as surely “devoted to a public purpose” as any government activity. It is this capital investment that is the true and only source of that “national economic growth” that our political leaders profess to be so eager to increase. It will not be increased, but retarded, by punitive taxation, reckless government spending, and printing more paper money.

**Are Consumers Boobs?**
April 2, 1962

If you believe the books of Vance Packard and J.K. Galbraith and the speeches of Senators Kefauver and Douglas, the consumer is an ignoramus and a fool, unable to compare one product with another, swallowing every advertising claim, incompetent to spend his own money. The President’s 5,000-word message to Congress on March 15 (his fourteenth this year) implies that these assumptions are correct. So he calls
for scores of new Federal controls, and an army of new bureaucrats to enforce them.

If these assumptions are true, the country would be in a bad way. For if the American people are too stupid to buy intelligently, how can they be expected to vote intelligently, or to know how to discriminate among the rival claims of politicians?

Yet the consumers may not be as helpless as Mr. Kennedy assumes. He says: “They are the only important group in the economy who are not effectively organized, whose views are often not heard.” They do not need to organize. Their views are heard every day in their purchases and failures to purchase. With every penny that he spends, the individual consumer is casting his vote for this product or against that. He does not need to sign petitions or march on picket lines. If he patronizes a product, the firm that makes it prospers and grows; if he stops buying a product, the firm that makes it goes out of business. The consumer is the boss. The producers must please him or die.

THE REAL PROTECTION

The great protection of the consumer is competition. It is true, as the President says, that advertisers (like politicians) utilize “highly developed arts of persuasion.” But their advertising is competitive. When each of a score of firms in each line claims that its coffee, or its cigarette, or its car is the best, the consumer must compare. If a coffee, say, is not to a housewife’s liking, she buys only one can, and then tries another. She does not have to stick with one brand (as she does with one senator) for six years. If she feels cheated in quantity or quality, she does not repeat her purchase.

Even the President’s message admits that: “The typical supermarket before World War II stocked about 1,500 separate food items—an impressive figure by any standard. But today it carries over 6,000.” This enormous range of choice was produced by freedom and competition, not by government restraints and bureaucrats.

Yet Mr. Kennedy’s solution for every problem seems to be more and more laws, more and more agencies, thousands of more bureaucrats, more and more government power, controls, and restraints.

SOME PROPOSALS

Space permits no adequate examination of his many specific proposals. The First National City Bank of New York, in its March letter, has already explained what is wrong with schemes to force disclosure of the “truth” about interest rates. Mr. Kennedy wants manufacturers to be compelled to make a specified type of TV set. He wants Federal bureaucrats to have power to forbid the sale, not merely of unsafe drugs, but of drugs that they decide are “ineffective” or “worthless.” This would not only ruin firms, but prevent the very clinical experience by which the relative merits of new drugs must be tested. Is this “protecting” the consumer? And would the principle be extended to allow bureaucrats to forbid the sale of “ineffective” or “worthless” paintings, newspapers, magazines, or books?

In spite of its length, there are a lot of things missing from the President’s message. Nothing is said about what the Federal farm program does to raise prices against the food consumer; or how import quotas on oil, sugar, and textiles boost the prices he pays; or how excessive wage demands and featherbedding affect consumer prices and choice. Mr. Kennedy wants “more adequate protection for savings.” But the gravest threat to savings has come from inflationary government spending.

The best way of protecting the consumer is not mentioned by the President. It is not to harass, threaten, hamstring, or intimidate the producer. It is to encourage the producer, by lower taxes and fewer restraints, to invest in new equipment, to expand, and so to reduce costs and prices and increase production.

A Wrong Turning

April 9, 1962

Thirty years ago, the idea took hold in Washington that strikes and most other labor troubles were caused by the weakness of unions and of labor’s bargaining power. So the Wagner Act was passed in 1935 to encourage the formation of unions, to grant them exclusive bargaining powers, and to compel employers to “bargain with” them.

The act had two main purposes. One was embodied in its very title: “An Act to Diminish the Causes of Labor Disputes Burdening or Obstructing Interstate and Foreign Commerce.” The other was to enable unions to raise wages. The first aim was not realized. There was an enormous increase in labor disputes. There were three times as many strikes a year in the decade following the Wagner Act as in the decade preceding it. Whether and to what extent the second aim was realized is a matter of dispute. Money wages were probably forced up higher than otherwise, but it is doubtful that real wages were. And excessive wage rate increases in certain lines brought unemployment and a decrease in total real wage payments.

The Taft–Hartley Act of 1947 amended the Wagner Act but retained its provisions granting exclusive bargaining power to government-certified unions and forcing employers to “bargain with” these unions no
matter how unreasonable or adamant their demands. And under the Norris-LaGuardia Act of 1932, the employer has been in effect left without recourse against coercion, violence, and mass picket lines to prevent other workers from taking the jobs voluntarily abandoned by strikers.

**WHAT THEY FEAR**

Yet events have taken an ironic turn. In recent years the chief fear of government officials has not been that unions would be too weak to demand sufficiently high wage rates, but that they would be so strong that they could demand and get excessively high wage rates—wage rates that would force more inflation, price us out of foreign markets, imperil the dollar, bring unemployment.

This is precisely the fear of the Kennedy Administration today, the most “pro-labor” government that the country has ever had. It is the fear of the chairman of the President’s Council of Economic Advisers, Dr. Walter W. Heller, and of the Secretary of Labor, Arthur J. Goldberg. Both hoped for a “favorable” outcome of the Big Steel wage negotiations. And by a “favorable” outcome they meant a wage increase that was not too high. And so they are delighted by the “noninflationary” tentative settlement of the steel wage dispute.

**VAGUE ‘GUIDELINES’**

To prevent excessive wage-rate increases Secretary Goldberg proposed a government voice in the terms of settlement. Though he denied that he wanted compulsory arbitration of labor disputes, his speech on Feb. 23 came very close to demanding this. In a “definitive” statement of Administration policy, he declared that Federal mediators must “increasingly provide guidelines” at the bargaining table to insure settlements “in the public interest.”

These “guidelines” had to do with “productivity.” The last annual *Economic Report of the President* assumed that such “productivity” can be statistically measured and that such “guidelines” can be set. But this “productivity” turns out to be a very nebulous concept. It has nothing directly to do with physical output per man-hour. The productivity that determines wages is marginal labor productivity. But there is no statistical way of determining this, except hypothetically and retroactively.

George Meany, the president of AFL-CIO, was right, therefore, when he called Secretary Goldberg’s statement “a step in the direction of saying the Federal government should tell either or both sides what to do.” And the NAM is right when it fears that Goldberg’s proposal would “lead to government regulation and control of the economy.” The government seems driven in this direction because it fears the consequences of excessive union bargaining power. Yet no one dares to ask whether our laws took a wrong turning in the 1930s and whether we should not simply revise or repeal the legislation that created the present union dictatorship.

**A Duty of Congress**

April 16, 1962

In the Constitution, Congress alone is granted power “to lay and collect . . . duties” and “to regulate commerce with foreign nations.” In the government’s tariff bill Congress is asked to make a sweeping delegation of these powers to the President.

Few people realize how sweeping that delegation is. Discussion has centered around the proposal that the President be given power to reduce this country’s existing tariffs by as much as 50 percent in return for comparable reductions by other countries—and even to cut tariffs to zero on items on which the U.S. and Common Market together account for 80 percent or more of aggregate world export value. But the bill would also give the President power: (1) To increase any tariff by 50 percent over “the rate existing on July 1, 1934” (i.e., before any of the reductions made in 28 years of reciprocal agreements); (2) to levy new tariffs on duty-free goods up to half of their value; and (3) to impose any “other import restriction . . . as he may determine to be in the national interest.”

**AN ACT TO ABDICATE**

So the Trade Expansion Act of 1962 might more appropriately be called “An Act to Abdicate the Constitutional Power and Responsibility of Congress over Tariffs and Trade and to Turn Everything over to the President.”

There is, of course, a practical argument for a limited delegation of power in this field. Though reciprocal-trade agreements rest on dubious assumptions, Congress has already been delegating its tariff-making powers for 28 years. Individual agreements often involve more than a thousand items. Congress as such is hardly equipped to bargain separately with each foreign country or trading bloc.

But that is no reason why it need surrender its constitutional powers and responsibilities, tie its own hands in advance, and reduce itself to impotence in this field. It can and should provide that the President submit every trade agreement to Congress, but that an agreement go into effect in 60 days unless either house votes against it.
There are ample precedents for such a provision. It is precisely the provision in the Reorganization Act (which enabled Congress to halt the proposed Department of Urban Affairs). The President himself, in asking a few weeks ago for discretionary powers to cut income taxes, suggested that such powers be “subject to Congressional veto.”

CONGRESSIONAL VETO
Yet Under Secretary of State Ball declares: “It would greatly weaken the negotiating position of the United States if it could go through the great agony of making a very complicated trade agreement and then not be able to assure the country with which it was making it that it would be a binding treaty.”

If this argument is sound, the Senate should be deprived of its constitutional power to ratify treaties by a two-thirds vote or to reject them by a vote of one-third plus one. This constitutional provision is a far more formidable hurdle than the safeguard here proposed. It requires a positive two-thirds majority endorsement by the Senate, which can let a negotiated treaty die by mere inaction. Under the proposed Trade Expansion bill amendment, a trade agreement would automatically go into effect unless at least one house acted adversely on it within 60 days. Surely Congress should not allow any agreement to go into effect to which even one house is actively opposed.

Nor is there any substance in Ball’s “agony” argument. Both sets of government negotiators would be paid for their work and time. Those of the foreign country would lose nothing by their own tariff concession if the agreement were rejected; the concessions would simply not go into effect. Our own negotiators would be put in a stronger rather than a weaker bargaining position; they could argue that, if they conceded too much, Congress might kill the whole agreement.

Finally, turning power over to the President is no guarantee against political logrolling—as illustrated by Mr. Kennedy’s order for a sharp increase in the tariffs on woolen carpets and glass, the bulk of which comes from Belgium, in order to win sectional support for his program.

Why Stunt Our Growth?
April 23, 1962

To provide more incentive for capital investment, the Administration has proposed that businesses investing in productive equipment be granted a flat-rate tax credit of 8 percent of the amount of their investment in any year. In addition, the Treasury has begun to reduce its estimates of “useful lives” of property to permit business to take somewhat quicker depreciation allowances than before.

These are certainly steps in the right direction. A modification of the first proposal (a 7-percent tax credit) is embodied in the tax bill as it passed the House and is now before the Senate. But is this proposal excessively generous, as some senators think? Or is it insufficient? And is it better or worse than other proposals designed to attain the same result?

Careful estimates indicate that, as a result of inflation combined with a shortsighted past depreciation policy, about $100 billion of plant and equipment in this country is obsolete and in need of replacement. Other careful estimates hold that our underdepreciation of plant and equipment amounts to $5 billion to $8 billion a year. On this basis business is paying $2.5 billion to $4 billion more in annual taxes than it would with adequate depreciation.

If these calculations are reasonable, then even if the Treasury was correct in its first estimate that its proposed 8-percent credit would mean a tax cut of $1.2 billion a year at the outset, the tax credit would still not enable industry to write off adequate depreciation.

But how does the proposed tax credit compare, in fairness or as an incentive to modernization and new investment, with the method generally used in Europe in recent years, of allowing faster depreciation write-offs or a bigger initial write-off?

The tax credit would no doubt provide some incentive to new investment. But compared, say, with allowing a bigger initial write-off, it would have disadvantages both for industry and for the government. It would favor the already prosperous and growing industries over the older or more depressed. It would be more expensive for the government, because it is a direct offset against a corporation’s tax and would not reduce subsequent depreciation allowances. George Terborgh of the Machinery and Allied Products Institute has calculated that it would require at least a 40 percent initial write-off to match an 8 percent tax credit in overall terms.

OBsolete Plants
If these calculations are reasonable, then even if the Treasury was correct in its first estimate that its proposed 8-percent credit would mean a tax cut of $1.2 billion a year at the outset, the tax credit would still not enable industry to write off adequate depreciation.

But how does the proposed tax credit compare, in fairness or as an incentive to modernization and new investment, with the method generally used in Europe in recent years, of allowing faster depreciation write-offs or a bigger initial write-off?

The tax credit would no doubt provide some incentive to new investment. But compared, say, with allowing a bigger initial write-off, it would have disadvantages both for industry and for the government. It would favor the already prosperous and growing industries over the older or more depressed. It would favor investment in short-lived rather than in long-lived assets. It would be more expensive for the government, because it is a direct offset against a corporation’s tax and would not reduce subsequent depreciation allowances. George Terborgh of the Machinery and Allied Products Institute has calculated that it would require at least a 40 percent initial write-off to match an 8 percent tax credit in overall terms.

FOR FASTER WRITE-OFFS
If it is a choice of one or the other, therefore, allowing faster depreciation on write-offs or a big initial write-off seems fairer as between companies, more promising in the long run as investment incentive, and ultimately better for government revenues, than the proposed tax credit.
The advantage of allowing faster write-offs or a big initial write-off is that the government gets the money back. A corporation can never write off an asset for more than its total cost. If it is allowed to write off 40 percent of that cost the first year, it has only 60 percent left to write off in later years. Depreciation adjustments involve merely transfer of income from one year to another. Past insistence by the Treasury on slow depreciation over the so-called “useful life” of an asset has been not merely arbitrary but shortsighted.

The Treasury itself stands to gain from liberalized depreciation allowances. Maurice E. Peloubet, a certified public accountant, has persuasively argued for adoption of the Canadian method of capital allowances and for “reinvestment depreciation.” A Senate subcommittee recently concluded:

“Liberalized depreciation allowances would generate enough new taxable earnings among producers of capital goods to offset the tax loss from lower profits resulting from increased depreciation allowances. . . . It is doubtful that there would be any revenue loss in the second year after such liberalization, and perhaps none in the first. . . . The economic growth and resulting greater tax base under new depreciation policies should assure the Federal government of a long-term gain in revenue.”

**Blow to Confidence**

April 30, 1962

“But what good came of it at last?” . . .

“Why, that I cannot tell,” said he;

“But ’twas a famous victory.”

Let us see where the President’s great victory over the steel companies is likely to lead us.

The principle has been established that the price of steel, or of any other commodity, ought to be what Mr. Kennedy says it is. How does he know this “right” price? Presumably from his Council of Economic Advisers. They not only know what each price ought to be but what each wage ought to be. In their last annual report they laid down confident “guidelines.” Secretary Goldberg announced that the government would not stand idly by and let wages be decided by free bargaining. It would insure settlements “in the public interest.” When the steel unions settled for an added labor cost of only 10 cents an hour in the first year, he and the President hailed the settlement as “responsible” and “noninflationary.”

There was no Presidential blast at the steel unions for forcing this settlement. Nobody in the White House pointed out that since the steel industry had last adjusted its prices in 1958 there had been four increases in steel wages and benefits amounting to some 40 cents an hour; that the new increase would add another 10 cents; that as compared with average wages of $2.38 an hour in manufacturing in general, wages in the steel industry were already $3.01 an hour—and, plus fringe costs, $4.10 an hour.

**STEEL AS SCAREGOAT**

No, the union was congratulated for its moderation and “statesmanship,” and for getting still another “noninflationary” rise. But when U.S. Steel, in a belated effort to catch up on an increase in employment costs of 12 percent since 1958, and a net increase of 6 percent in all costs, announced a price increase of 3½ percent, the White House turned loose all its fury. It denounced the increase as “a wholly unjustifiable and irresponsible defiance of the public interest.”

The steel companies have long been Washington’s No. 1 political whipping boy. When a 40-cent hourly package pay increase and a 30-month contract were forced on them in 1960, they were warned not to raise prices and didn’t. Last September Mr. Kennedy again warned them that they mustn’t raise their prices to meet the coming wage increase on Oct. 1. Yet many now say that the recent announcement of price increases was “badly timed.” Apparently it is never the right time to raise steel prices, no matter what happens to costs.

According to the new mythology, the cause of inflation is not the enormous increase in the money supply, not irresponsible Federal spending, not chronic deficits, not one-sided laws which give labor unions power to demand ever greater wage increases and to boost production costs. The cause of inflation, we are told, is refusal of the steel industry to “absorb” all these costs.

**VICTORY FOR WHOM?**

The result of the Administration’s policy must be to stunt the steel industry—the foundation of our national defense. Our government wants a big, strong, modernized, growing steel industry—but it mustn’t make profits. In 1961 steel stood only 33rd out of 41 manufacturing industries in return on net assets. Only once in the past twenty years have profits in the industry equaled the 8 cents per dollar of sales that they reached in 1940. In 1961 they were about 5 cents. Yet funds for modernization and expansion can come only out of past profits or out of borrowing in anticipation of adequate future profits. U.S. Steel’s profits available for
reinvestment dropped from $115 million in 1958 to less than $3 million last year.

As Professor Livernash of Harvard put it in a report prepared for the Department of Labor in 1960: “Obviously while price policy can be debated in the short run, in the long run all cost increases must be met.” But suppose a President, through lawless price fixing by fury and threat, can prevent cost increases from being met? Then economic growth, modernization and expansion of plant, employment, wages, and output, must all be less than they would have been.

The President has struck a heavy blow at all business confidence. Who can gain from a climate of fear?

‘In the Public Interest’
May 7, 1962

Unless prompt and convincing steps are taken to offset the consequences of the President’s “cold fury” press conference of April 11 and the punitive measures that followed, unmeasurable harm may be done to American industry.

In that press conference Mr. Kennedy denounced the steel price increase as “a wholly unjustifiable and irresponsible defiance of the public interest.” His private expressions appear to have been even more sweeping. The New York Times reports him as having said: “My father always told me that all businessmen were sons-of-bitches but I never believed it till now.”

In a belated statement on April 19, the Joint Senate-House Republican leadership listed nine actions that followed this conference, ending with that of the FBI in “routing newspapermen out of bed at 3 a.m.” for questioning. The Republican group declared that collectively these actions “imperiled basic American rights, went far beyond the law, and were more characteristic of a police state than a free government.” The Democratic leadership denied none of the Republican allegations of fact. It simply “commended” the President “for taking every appropriate step he could to . . . preserve the public interest.”

SHOCK TO CONFIDENCE

Where does this leave us? It leaves us with an illegal form of price control enforced by denunciation, threat, and intimidation. And nobody knows the new rules. Which businessman can raise the price of his product? By how much? When? In the steel industry we now have a price freeze of unpredictable duration. Under what circumstances, and at what level of labor costs, will a rise in steel prices—or in any other price—cease to be a crime? What is the standard? The personal opinion of the President? Must every price or wage rise be submitted to him in advance?

The President’s action has given a severe shock to business confidence. There is already a profit squeeze. In the last sixteen years corporate profits have been dropping both as a percentage of national income and as a percentage of sales. As a McGraw-Hill compilation has shown, profits dropped from 5 percent of sales during the years 1946–50 to 3.6 percent during 1951–55, to 3.2 percent during 1956–60, and down to 3.1 percent last year. Last year, also, the steel industry stood only 33rd out of 41 manufacturing industries in return on net assets.

A leading Soviet ideologist has just repeated that Russia is “further expanding heavy industry, the cornerstone . . . of the defense of the country.” The President wants faster economic growth and especially a growing steel industry. Yet our expansion can only be financed out of profits. How many steel men—or any other businessmen—will go ahead with heavy capital spending programs when they do not know whether they will be allowed to set prices, subject only to keeping competitive, or where they will be allowed to set them?

UNKNOWN RULES

Sensing the disquiet and fears to which his actions have given rise, and their threat to economic growth, the President on April 18 announced that his Administration “harbors no ill will against any individual, any industry, corporation, or segment of the American economy.” He admitted “the steel industry’s need for profit, modernization, and investment capital.” He declared that “this is a free economy.” He insisted that his action had not set a precedent. “I have not suggested that . . . we have powers to set or that those powers would be desirable to set—prices or to set wages.” But he repeated that he had a “responsibility” to intervene in steel prices because “the public interest” was “mandatory.” Thus one thing contradicts another and everything is left ambiguous.

And the central question remains unanswered. Which is really in “the public interest”? That prices be fixed in accordance with the President’s personal opinion? That profit margins in steel be squeezed tighter, investors frightened, and investment in new steel plant discouraged? Or that industry management be free to try to set prices to yield profit margins that encourage the industry to grow, with a rise in employment and real wages?
To Restore Confidence
May 14, 1962

The speech of the President before the U.S. Chamber of Commerce was gratifying not only for its conciliatory tone but for its recognition of the crucial role of profit in the American economy:

“We want prosperity and in a free enterprise system there can be no prosperity without profit. We want a growing economy, and there can be no growth without the investment that is inspired and financed by profit. . . . Our primary challenge is not how to divide the economic pie, but how to enlarge it.”

Yet, as the response of the stock market has shown, it will take more than verbal reassurance, no matter how well phrased, to restore the confidence so badly shaken by the President’s outburst of April 11 and by some of his subsequent actions. Here are seven measures that might help:

1—The President should abandon all hints that price and wage controls may be desirable or necessary unless labor and management act, in his judgment, “responsibly.” It is not enough for him to say that “We [in Washington] do not want the added burden of determining individual prices for individual products.” He must recognize that the task is impossible, and that it would do immeasurable damage to the economy for the government to attempt it. There are millions of separate prices and billions of interrelationships of prices, wages, and costs. These ever-changing interrelationships determine how much of thousands of different commodities are produced, and when, and how many workers are employed, and where. Arbitrarily to hold down the price of one commodity must reduce its production and disrupt the production of scores of others.

The President must also abandon the belief, sold to him by his Council of Economic Advisers, that any “scientific” formula has been found for fixing prices and wages. He must above all abandon the delusion that wage hikes of 3 percent a year, combined with a price freeze, is such a formula. Any attempt to apply this crude formula would be disastrous.

2—The President should stop asking for increased discretionary powers for himself. Congress should stop abdicating its legislative responsibilities and stop granting him such powers.

3—There should be no more anti-business taxation. This applies particularly against the new tax proposals that would penalize the competitive position of American firms operating abroad. The proposed withholding tax on dividends and interest should be postponed for additional study.

4—The Administration and Congress should halt reckless “welfare” spending. They could begin by slashing a few billions out of farm price supports and foreign aid. If this gross inflationary spending were cut, the Administration would not have to impose still more growth-choking taxation to “balance the budget.”

5—In addition to refraining from measures that shake confidence, the Administration should take positive measures to instill it. Far better than the proposed 8-percent investment tax credit, for simplicity, justice, and incentive, would be to permit an initial depreciation write-off of 30 or 40 percent in the first year, and 10 percent in subsequent years. In the long run, precisely because it gave a strong incentive to new investment and growth, the government would gain not lose revenues.

6—The jungle of our antitrust laws should be reexplored. It has become impossible for the heads of big corporations to know when they are violating one of these “ten thousand commandments,” most of which are ambiguous and many of which conflict with each other. Their enforcement has been haphazard, selective, and discriminatory. Government officials have been able to use them for harassment and intimidation. We might begin by eliminating criminal penalties and by repealing the Celler-Kefauver and Robinson-Patman acts.

7—The double legal standards in dealing with big business and big unionism have led to disorder. But the way to curb unreasonable union demands is not to make the unions subject to the antitrust acts, as so widely proposed, nor to give the President more power to intervene in strikes or set wages, as recommended by a Presidential panel, but to stop tolerating union violence and intimidation and imposing one-sided bargaining compulsions on the employer that force capitulation to strike demands.

Free Prices, Free Wages
May 21, 1962

The market economy is a marvelous but infinitely complicated mechanism. It was once moderately estimated that there are some 9 million different prices of all goods in the United States. This would imply more than 40 trillion interrelationships of these prices.

Under the play of supply and demand these prices change from day to day and from hour to hour. So do their interrelationships. These changes in relative prices, wages, costs, profits, and losses are daily changing the
pattern of consumption and production, driving firms and workers out of some lines and drawing them into others. It is through this wondrous mechanism that the relative output of thousands of different commodities and services, in accordance with the relative demand of consumers, is determined.

If, now, a government official, substituting his personal judgment for that of the market place, steps in to hold down one set of prices (say of steel), what will happen? Because of the smaller relative profit margin, the output of that product will decline. Suppose the government keeps inflating, by undermining confidence in the dollar and increasing the money supply, thus putting upward pressure on all prices and wages, but then insists that everybody must “hold the line” and freeze prices? Then it will impair or nullify the function of the whole price-cost mechanism, disrupt and disorganize production, and bring shortages and unemployment.

**THE 3 PERCENT FALLACY**

Yet there are people who are not only presumptuous enough to suppose that they can fix prices better than the market can fix them, but that they can do this by some simple pat formula. The Council of Economic Advisers, in its last annual report, put forward its own “guidelines” for prices and wages. It modestly disavowed omniscience. It conceded that “productivity is a guide rather than a rule”; that “this is a large and complex subject and there is still much to be learned”; that it had no “mechanical formula for determining whether a particular price or wage decision is inflationary.”

But suddenly the “guidelines” became clear rules and the government knew all. Any price rise whatever (especially in steel) was “inflationary,” but a wage-rate rise or labor-cost rise of 3 percent or less was “non-inflationary.” The President denounced the steel-price rise as a “wholly unjustifiable and irresponsible defiance of the public interest”; but he congratulated the steel union leaders for their “statesmanship” in forcing another 2½ percent labor-cost rise. And when a Presidential emergency board recommends an increase of 10.2 cents an hour, or more than 4 percent, for non-operating railroad employees, the President declares himself “gratified” that the recommendation falls within the council’s guidelines.

**THREAT TO EMPLOYMENT**

These “guidelines” are economic quackery. The council’s own figures show an average annual growth of output per man-hour from 1947 to 1960 of 2.8 percent. But this varied every year. Average man-hour output in 1956, outside of agriculture, was lower than in 1955.

The rate of change was different in every industry in every year, and in every firm within every industry. To impose a Procrustean annual hourly labor-cost increase of 3 percent on every industry and firm would disrupt profits, employment, and production. The formula ignores, moreover, all differences in past increases in wage rates. The average wage increase in the apparel and textile industry in the period 1947–1960 was 38 percent; in steel 113 percent.

Suppose, however, there really was everywhere an increase in man-hour productivity of 3 percent a year? Such increases as occur are brought about, not because everybody works harder every year, but because there has been an increase in investment in new plant and equipment. If the whole of the increased productivity goes to labor, where will the funds come from and where will the incentive come from for future investment?

Any formula whatever of government price and wage control overlooks and destroys the whole function of free prices and free wages, which is to guide and stimulate production, investment, and employment.

---

**Wages Must Be Free**

May 28, 1962

Successive statements have only increased the ambiguity of the President’s attitude on price and wage control. “This Administration,” he told the convention of the United Auto Workers, “has not undertaken and will not undertake to fix prices and wages in the economy.” That sounds clear enough, but he continued: “We can suggest guidelines for the economy, but we cannot fix a single pattern for every plant and every industry. We can and must under the responsibilities given to us by the Constitution and by statute and by necessity point out the national interest.”

Mr. Kennedy denies that he either has or seeks power to fix prices or wages. But he did in fact force the steel industry to rescind its price increase in April. By his action the price of steel is now frozen for an unpredictable period. He denies that he either has or wants any legal powers over prices and wages—but he insists that he has “responsibilities” concerning them. How can one have “responsibilities” where one has no power? He declares that his responsibility is to point out “the national interest.” Is he alone competent to say what the national interest is? Are price-fixing by anger and threat, and profit margins too thin to permit or encourage industrial growth, in the national interest?
mass picketing to prevent struck employers from trying to carry on their business.

The cure for all this is not still more government intervention. It is to restore the conditions everywhere for competition and free markets.

**Toward Freer Trade**

June 4, 1962

The president has been eloquently and rightly pleading that we should not move toward economic isolationism but toward greater freedom of international trade. But the Administration's Trade Expansion bill bears little relation to this plea. It is not primarily a bill to reduce trade barriers. It is a bill under which Congress would abdicate its constitutional tariff powers and turn them over to the President—including the power to raise as well as lower tariffs, to impose import quotas, and to decide which firms and workers should receive special and discriminatory doles and which should not. Every such determination by the President and the “administering agencies” would be final and conclusive, and not reviewable by any court.

A bill primarily designed to reduce international trade barriers would not have to be an enormously complicated 61-page document. It need have only two main provisions: (1) It would abolish all import quotas and similar non-tariff impediments to trade. (2) It would provide unilateral tariff reductions. These reductions would be smooth and gradual, extending over a considerable period, say ten years, to allow time for adjustment and to minimize disruption. They would contain the most-favored-nation clause.

**AMENDMENTS**

I made essentially these suggestions in previous *Newsweek* articles in the issues of Dec. 25 and Jan. 1 last. Similar recommendations have been made in a remarkable article by Prof. Milton Friedman in *National Review* of May 22. But they may sound academic in view of present sentiment in Congress and 28 years of reciprocal tariff negotiations. The more immediate question is what are the minimum changes in the Trade Expansion bill that would lead toward real freedom of trade and retain constitutional processes and protections.

1—The bill should abolish all import quotas or provide for their abolition over a reasonable period. These are today a far more serious barrier to trade than tariffs. We have had for years a creeping quota system. We now have import quotas on some agricultural products,
notably sugar, on petroleum, and on lead and zinc, as well as “voluntary” export quotas on textiles imposed on Japan and Hong Kong. As between quotas and tariffs, tariffs are in every way to be preferred. Quotas are discriminatory, require individual allocations, lead to growth of bureaucracy, become weapons of punitive action or of favoritism, and breed corruption.

2—Of the 61 pages of the original Administration trade bill, 38 are devoted to “adjustment assistance.” These provide for discriminatory doles to workers laid off or business firms injured because of tariff reductions. All these provisions should be stricken out. This discrimination cannot be justified. As chairman Mills of the House Ways and Means Committee asked: “Why should a worker who is out of a job due to import competition be placed in a more favorable light . . . than a worker who is unemployed due to cancellation of defense contracts . . . or technological advances?” It would be impossible to know, moreover, which plants shut down just because of import competition. As the First National City Bank of New York has pointed out: “Curtailments of operations in industry have multiple causes; import competition could almost always be figured as playing some part even though other causes might be paramount—shifting desires of consumers, bad management, exorbitant labor demands, or excessive taxes.”

3—Congress should provide that every trade agreement be subject to Congressional veto, but would automatically go into effect unless within 60 days after submission either House of Congress voted against it. This would be the same provision as that now in the Reorganization Act.

Finally, the Administration itself should adopt a consistent policy of freer trade. It should not try to impose punitive taxation on firms doing business abroad. As for our so-called “balance of payments” problem, it is caused solely by our own inflationary policies (combined with an inflexible exchange rate), and the first step to any cure is to halt these policies. Any other course (such as government speculation in foreign currencies) is a dubious gimmick that can only postpone the day of reckoning.

Richer by Less Work?
June 11, 1962

The demand of David Dubinsky, head of the International Ladies Garment Workers, and of George Meany, head of the AFL-CIO, for a cut in the standard workweek from 40 to 35 hours is senseless from the workers’ point of view.

Without overtime, it would reduce national production by one-eighth, or 12½ percent. Therefore it would reduce real income and “purchasing power” by 12½ percent. If wage rates were not changed to compensate, it would reduce the money-wages of all presently employed workers by 12½ percent. It would not force the employment of 14.3 percent more workers, if only because there are not that many unemployed. Moreover, the percentage of unemployment is different in every industry and locality. Even if the cut in the workweek did force the employment of presently idle workers, presently employed workers would in effect be paying their wages.

That is why the union leaders insist that there must be a compensating hourly wage increase to bring present workers the same take-home pay. This wage increase would have to be more than 14 percent per hour. Putting aside the question of how the union leaders propose to achieve this uniform hourly increase—by law, by Presidential directive, or by individual strikes and “collective bargaining,” the result of achieving it would be to bring on massive unemployment. If, to remedy this unemployment, union leaders demanded enough monetary inflation to raise prices also by some 14 percent, the present workers would in effect take a cut in real weekly wages of 12½ percent.

CRUDE FALLACIES
The union leaders’ demand, in brief, rests on the crudest fallacies. It assumes that there is only a fixed amount of work to be done, and that hours per person must be cut to spread this fixed amount of work around. The union leaders refuse to recognize that even our present unemployment is caused by excessive hourly wage rates in certain lines. The reductio ad absurdum has been put forward by Walter Reuther, who suggests that the greater the percentage of unemployment, the more the workweek must be cut and overtime rates doubled to compensate. This would make the unemployment greater and greater.

Finally, the Administration itself should adopt a consistent policy of freer trade. It should not try to impose punitive taxation on firms doing business abroad. As for our so-called “balance of payments” problem, it is caused solely by our own inflationary policies (combined with an inflexible exchange rate), and the first step to any cure is to halt these policies. Any other course (such as government speculation in foreign currencies) is a dubious gimmick that can only postpone the day of reckoning.

June 11, 1962
REVISE LABOR LAW
Other Administration officials make additional points: (1) A reduction of working hours of skilled labor would not spread work to unemployed that are not skilled. (2) When the workweek is shortened below 40 hours, many workers “moonlight”—i.e., go out and get a second job. (3) There is no evidence that a workweek of less than 40 hours increases efficiency. (4) In three-shift industries it is easier to schedule workers on an eight-hour day than on a seven-hour day, which is what the 35-hour week comes to.

But it is not enough to point out that a further forced 12½ percent cut in the standard workweek would be senseless from the workers’ point of view. Unions have the government-granted powers and immunities to force such cuts. The Ladies Garment Workers already have a 35-hour week. Electrical workers of New York City have forced a basic 25-hour week at $4.96 an hour and $7.44 for overtime. The situation will grow steadily worse (hurting workers most of all) unless we reconsider our labor legislation of the last 30 years.

Two revisions are basic. (1) We must stop compelling employers to “bargain” with specified unions no matter how exorbitant their demands. (2) We must stop allowing unions to enforce a strike by violence or the intimidation of mass picketing. This means revision of the Wagner-Taft-Hartley Act and of the Norris-LaGuardia Act.

To Rebuild Confidence
June 18, 1962

When tens of thousands of investors buy and sell millions of shares, each for his own reasons, no one can say with certainty what specific considerations caused the rise or fall. If more than one factor is involved, which invariably happens, no one can know the precise effect of each factor. But whenever the market has a violent rise or fall it is usually possible to make a few reasonable presumptions. Two main factors seem responsible for the recent crash.

The first was the overvaluation of most shares based on the assumption of rapid and inevitable “growth,” plus the assumption of further inflation. And even though both the inflation and the growth were probable, stocks selling at an average of 23 times earnings (as compared with 11.2 to 14 times earnings in 1954–1957) got too far beyond reasonable expectations. At some time a readjustment was inevitable.

But what triggered that readjustment, and made it far more violent than otherwise, was the President’s “cold-fury” press conference of April 11, denouncing the steel price increase as “unjustifiable and irresponsible,” and ordering punitive measures against it. That action was part of a whole package of policies injurious to business. It was a culminating episode that shook confidence profoundly because it left all businessmen wondering whether they would be allowed to announce price changes or whether everything was to be decided by the President’s personal opinion.

FIVE MEASURES
What can be done now to rebuild confidence? In this column of May 14, under the title, “To Restore Confidence,” I suggested seven measures. Let us consider a few such measures again with a different emphasis:

1—The President should abandon all hints that price and wage controls may be desirable or necessary unless labor and management act (in his judgment) “responsibly.”

2—He must also abandon the notion, sold to him by his Council of Economic Advisers, that they have discovered some “scientific” formula for fixing prices and wages. The idea that such a formula is a 3-percent boost in wage rates every year, with a tight ceiling on prices, is dangerous nonsense. Free markets and free competition can decide this enormously complicated problem, not bureaucrats too cocky to understand the superficiality and pitfalls of their formula. Pushing up wage costs while holding down prices is hardly the best way to create business confidence.

Many other measures that shake confidence ought to be withdrawn or repealed. I discussed some of these in the column of May 14, but several positive measures are possible to instill confidence:

3—Faster depreciation write-off should be permitted. The proposed 8-percent tax credit is a subsidy and a needless gimmick. But a 30 or 40 percent initial write-off of new investments in the first year and short write-off terms thereafter could prove a simple and dramatic incentive.

4—Faster write-offs are not a subsidy, but though in the long run they would increase government revenue, they are equivalent to a slight tax rate cut. This and other tax cuts are desirable. One would be to keep the 52 percent corporate income tax only on retained earnings, and to tax at only 50 percent (i.e., a reduction of 2 percentage points) all dividends paid out. This would reduce the inexcusably heavy double taxation on corporate dividends. In addition, all personal income-tax rates above 65 percent should be dropped to that level, now. The result of these measures would be a probable
Tax Reform Now
June 25, 1962

The Administration is to be congratulated for recognizing that tax reform and a reduction of the total burden of taxes are imperative if we wish to reduce the deterrents to production. But the Administration refuses to consider the reversals in its policies and attitudes that would be necessary to put these reforms into effect. At the moment, it is suffering from schizophrenia. It has begun to talk about a new tax-reform and tax-reduction bill for 1963. But it still insists that Congress must go through with the tax bill now before it. This is as if Mr. Kennedy were to say: “Before you consider a tax bill to restore business confidence you must first of all pass the existing bill that tends to undermine it.”

TO RESTORE CONFIDENCE
Business confidence needs to be restored now, as quickly as possible. A big step in this direction could be taken if the Administration abandoned several features of the existing tax bill and agreed to some changes it is talking about for next year:

1—Congress should abandon, or postpone for further study, the proposal for tax withholding on interest and dividends. This has been correctly described as “impractical, unnecessary, and unwise.” It would create an administrative nightmare both for business and the government.

2—The Administration should abandon its proposals for punitive taxation of income from sources abroad. These proposals would force American companies operating abroad to bear simultaneously the full weight of foreign taxes plus the extra weight of higher U.S. income taxes. Prof. Dan Throop Smith of Harvard has characterized this section of the bill as bad in principle and raising administrative problems “which are little short of appalling.” The June monthly letter of the First National City Bank of New York presents an excellent analysis of the harmful features both of the tax-withholding and foreign-income provisions of the present tax bill.

3—The consensus outside of Administration circles is that the proposed 8 percent investment tax credit is too complicated, inequitable as between various types of business, and a doubtful long-run incentive to investment, especially because of the “compensating” tax revenues the government asks for. It would be far simpler, fairer, and more stimulating to investment to allow a depreciation write-off of, say 30 or 40 percent in the first year, or to write faster depreciation schedules into law, as in Canada.

4—The tax burden on corporations is excessive, and a deterrent to investment and production. At least one reform would be possible immediately. This would be to keep the 52 percent corporate income tax only on retained earnings, and to tax at only 50 percent all dividends paid out. As dividends when received are also taxed as personal income, they are subject to a double taxation that is a drastic discouragement to investment and economic growth. The differential should eventually be much greater than the 2 percentage points here suggested. But at least the principle of differential tax rates on retained and distributed corporate earnings should be established now. If this were substituted for the present $50 dividend exclusion in the personal income tax and the 4 percent tax credit against dividends received it would mean no net loss in government revenues.

5—All personal income-tax rates in excess of 65 percent should be dropped to that level now. This would mean practically no loss in government revenues. In fact, even if the top rates stopped at 50 percent there would almost certainly be a net long-run gain in government revenues. But this would be far less important than the stimulus this change would give to production and investment.

These changes in the tax laws would reduce immediate tax revenues very little, and long-run tax revenues not at all. But their moral effect would be immediate. They would reassure business and stimulate investment. This stimulating effect will not be achieved by tax cuts merely designed to create budget deficits and more inflation, nor will it be achieved by the deplorable kind of speech Mr. Kennedy made at Yale, contemptuously dismissing all criticism of his policies as “worn-out slogans” based on “myths.”

Catechism on Taxes
July 2, 1962

Do we need a tax cut now? Yes. Why? Because the burden of taxation on investment is excessive and undermines incentives. Also, because of the stock-market collapse, a tax cut now is psychologically important.

What taxes should be cut? How much? Those taxes should be cut that most discourage production and investment. We should begin with corporation taxes. First, we should abandon the ill-advised proposals to discriminate against American business investments abroad. For an immediate positive stimulus, a depreciation write-off of, say, 35 percent should be allowed on all investments in the first year, with short total write-off periods. The corporate income tax of 52 percent should be kept only on earnings retained in the business. What a corporation pays out in dividends should be taxed at a lower rate—to begin with, not more than 50 percent. This lower tax on earnings paid out as dividends could be a substitute for the present complex personal $50 allowance and 4 percent credit on dividends.

How much would these reductions reduce government revenues? In the first year or two, perhaps a little. In subsequent years, not at all. They would increase government revenues by their incentives to new income-producing investment, employment, and production.

CUT SPENDING TOO
Would such tax cuts be enough to give the stimulus needed? No; but they are the best possible until real slashes are made in the huge proposed government spending of $92.5 billion in fiscal 1963 ($115 billion counting social security). For the following fiscal year, given a few moderate spending cuts, corporate tax rates might be dropped to 50 percent for retained earnings and to 45 percent for earnings paid out in dividends.

What about personal taxes? Income taxes ought to stop right now at a top rate of 65 percent, instead of soaring to a confiscatory 91 percent.

Wouldn’t that lose revenue? It would probably increase revenue, even in the first year; and certainly in later years. Even if the top rates stopped at 50 percent, the government would lose, at most, a hypothetical amount of less than $1 billion, which is what it now spends in three or four days. In fact, however, even if top rates on personal incomes (keeping other brackets unchanged) stopped at 50 percent, there would be a long-run increase in government revenues—and a dramatic increase in investment and production.

But what about personal income taxes on the lower brackets? It is desirable to reduce tax rates all down the line; but lower rates on lower and middle incomes would mean a very heavy loss in revenues. Such tax cuts are possible only by heavy cuts in government spending.

REAL INFLATION THREAT
With our huge defense needs, are such spending cuts possible? Easily. More than half of our planned $115 billion spending for fiscal 1963 is for non-defense items. To slash foreign aid, farm price supports, etc., would strengthen our economy.

Isn’t the real need now to cut taxes on lower and middle incomes to give a big fillip to “purchasing power”? No; that would only lead to bigger deficits and inflation.

But isn’t the whole inflation danger over, as so many people are now writing and saying? No. With a $7 billion deficit in the fiscal year just ending, and with an increase of $16 billion in money and deposits in the last twelve months, plus the prospect of a further big deficit in 1963, the danger of more inflation is very real.

What of the drop in the stock market, and steady commodity prices? In the midst of every inflation (even the tremendous German inflation of 1923–24) there are occasional violent breaks in the stock market, because speculative guesses of the exact extent and pace of an inflation are constantly changing. The wholesale price index is held down for technical reasons that would take long to explain. But consumer prices have mounted to new high levels this year.

What is the most serious threat of renewed inflation today? Precisely the false assumption that “the danger of inflation is over” and that the country needs another shot in the arm.

Bipartisan Errors
July 9, 1962

What is most disheartening about Mr. Kennedy’s reaction to the deepening crisis of confidence is his complete inability to admit past error or the possibility that he could be wrong. His Yale speech, implying that all criticism of his policies has been made up of “stale phrases,” “myths,” “illusion and platitude,” “traditional labels and worn-out slogans,” and that he alone is interested in “the real problems of our time,” was not calculated to restore confidence but to undermine it further. He did not help matters when he said both before and after the House vote rejecting the farm bill that those who voted against it (including 48 Democrats) did so because they “chose to make a party issue of this matter instead of voting in the national interest.”
The truth is that the farm bill demanded by Mr. Kennedy and Secretary Freeman was incredibly bad. It was disgraceful that it passed the Senate. It should have been defeated in both houses by an overwhelming vote. It would have imposed the worst regimentation in our history on the growing of wheat, corn, and other grains, with Draconian economic punishment against any farmers who dared to violate its provisions.

**FARM FIASCO**

Eisenhower’s broadside against the whole Kennedy economic program contained many a truth. Its central truth was that the present Administration’s difficulty stems “primarily from an inadequate understanding of our American system—of how it really works.” But Eisenhower’s own remarks were marred by partisanship. For the misconceptions and bad policies he attacked were only exaggerations of unsound policies accepted in his own Administration.

The policy of farm price supports, overstimulating production and creating unsalable surpluses, plus the attempt to offset these consequences by acreage and marketing controls, began in the Roosevelt New Deal. But it was continued by the Truman and Eisenhower administrations, with ever-mounting problems, because neither they nor successive Congresses had the courage to stop it. The economic problem is not at all baffling. The situation can be cured by abandoning and reversing the policies that created it. It is merely necessary to halt all further price supports; and to sell the surpluses back to the farmers themselves, on a pro rata basis, below the free-world price, leaving it to the individual farmer to decide whether to hold or resell, and how much to plant under the new conditions. But neither party has had the courage to suggest anything like this. So the problem mounts.

**CANADIAN CRISIS**

This applies also to the stockpiling program. Democratic investigators seem chiefly eager to expose Republican errors. But the policy was and is bipartisan. On Jan. 31, Mr. Kennedy advised that the Federal stockpile of strategic materials be reduced, but as Senator Byrd has pointed out, the $8.7 billion figure of Feb. 1 actually increased by the end of March.

The 26 budget deficits and the inflation of the last 32 years have also been bipartisan. All that Mr. Kennedy and his advisers have added is the doctrine that deficits are often necessary and “appropriate.” As a result of similar policies Canada has just had an exchange crisis. Part of its countermeasures—to cut government spending and to raise the discount rate—are correct. But the added duties on imports, and the borrowing of more U.S. dollars from us and from the International Monetary Fund, are at our expense, and will only intensify our own balance-of-payments problem. Yet the whole IMF monetary system, now stumbling to a crisis, has bipartisan support.

And so with a whole series of other policies—excessive taxation on corporations, double taxation of dividends, niggardly depreciation allowances, confiscatory rates on higher personal incomes, business prosecution under unpredictable interpretations of vague antitrust laws, and Federal labor laws that encourage union demands and strikes to get out of hand.

These bipartisan errors, many of them of more than 30 years’ standing, are having cumulative evil consequences. Will either party have the courage, before it is too late, to reexamine or repudiate them?

---

**Deficits Forever?**

July 16, 1962

For the fiscal year just closed the Federal government reported a deficit of more than $7 billion. Nobody but Senator Byrd seemed to be particularly concerned. Only an insignificant minority in Congress or out was demanding a cut in expenditures. Almost everybody, including congressmen, governors, labor unions, chambers of commerce, was calling for a cut in taxes.

We are losing the very concept of a responsible budget. Consider the strange record of estimates for the fiscal year just closed. In January 1961, the Eisenhower Administration estimated that it would end with a surplus of $1.5 billion. On March 24, 1961, the Kennedy Administration declared that this was unrealistic, and forecast a deficit of $2.1 billion. On May 25, 1961, it raised this deficit estimate to $3.5 billion. On July 25, 1961, it raised its deficit estimate again to more than $5.3 billion; on Oct. 29 again to $6.9 billion; on Jan. 18 of this year to $7 billion.

The 26 budget deficits and the inflation of the last 32 years have also been bipartisan. All that Mr. Kennedy and his advisers have added is the doctrine that deficits are often necessary and “appropriate.” As a result of similar policies Canada has just had an exchange crisis. Part of its countermeasures—to cut government spending and to raise the discount rate—are correct. But the added duties on imports, and the borrowing of more U.S. dollars from us and from the International Monetary Fund, are at our expense, and will only intensify our own balance-of-payments problem. Yet the whole IMF monetary system, now stumbling to a crisis, has bipartisan support.

And so with a whole series of other policies—excessive taxation on corporations, double taxation of dividends, niggardly depreciation allowances, confiscatory rates on higher personal incomes, business prosecution under unpredictable interpretations of vague antitrust laws, and Federal labor laws that encourage union demands and strikes to get out of hand.

These bipartisan errors, many of them of more than 30 years’ standing, are having cumulative evil consequences. Will either party have the courage, before it is too late, to reexamine or repudiate them?
increase, and expenditures are as estimated, the predicted surplus of half a billion will become a deficit of $10.4 billion.

But what of the expenditure side? In May, Senator Byrd pointed out that “some 200 actions and proposals involving increased obligation of public money and credit can be documented in Presidential communications to Congress during the current Administration.” Since then the President has hardly let a week go by without presenting some new major spending proposal. Nothing is said about the effect on total proposed expenditures for the year. These proposals are not accompanied by a revised budget, let alone by any compensating tax increase.

In sum, the outlook is already for a deficit for fiscal 1963 approaching the dimensions of that for the year just closed. We have now had 26 deficits in the past 32 years. We face a 27th.

RATIONALIZATIONS
Instead of showing any concern about this, the Administration has been developing rationalizations that would logically call for perpetual deficits. It began to talk of balancing the budget over “the business cycle” rather than annually. Now Budget Director Bell tells us that even this is “clearly inadequate to deal with a situation such as we have been experiencing for the last five years—a situation in which we have had years of recession clearly enough, but no years of full prosperity.” Whereas “deficits, not balances, are appropriate in years of recession,” and even bring “positive benefits,” there is always, even in a good year, “real danger that the attempt to achieve a budget balance too soon may itself contribute to bringing the recovery to a halt below full employment levels.” The natural conclusion to be drawn is that the only safe policy is one of perpetual deficits.

What must be the effect on foreign confidence in the dollar when, on top of all this, demands are coming from all sides for an immediate cut in taxes, many of them for tax cuts on lower and middle personal incomes in order to “pump more purchasing power” into the economy and insure a thumping inflationary deficit?

The situation raises a grave problem for believers in fiscal responsibility. Tax cuts on productive enterprise are needed, for the sound reason that present taxes are discouraging production and new investment. But those who ask for such cuts must insist on the condition that even greater cuts be made in our fantastically swollen expenditures. Must we wait, like Canada, until a currency crisis is upon us before we start to put our house in order? ✽

Controls and Corruption
July 23, 1962

Since 1934 this country has subjected all sugar imports to a complicated quota system under which each country is allowed to export to us no more than a fixed maximum each year. For such imports the U.S. has been paying a special premium of 2.8 cents a pound above the world price. When this program was altered drastically in 1960 by President Eisenhower’s decision to cut off purchases of Cuban sugar, which had totaled more than two-thirds of the whole U.S. import quota, increased shares were temporarily allotted to other Latin American countries.

The Sugar Act expired June 30. Early this year, President Kennedy wisely requested that the quota system be abandoned on the ground that competition among nations for quota shares often produced ill feeling toward the U.S. He could have recommended that sugar imports be treated like any other imports by converting the 2.8 cents a pound premium payment into a flat tariff for the time being, and otherwise leaving the total of sugar imports and the amount from each country to be settled by the free play of supply and demand. Instead, he suggested a complicated substitute plan still entangled with foreign subsidies.

U.S. AS SUGAR DADDY
The bill that Congress actually passed retained the quota and premium systems. It provided for an increase of the sugar market for domestic producers from 55 to 60 percent, an import quota of 1,205,000 tons divided among 27 countries, plus a special treaty allocation for the Philippines, and a reduction of 10 percent annually in the premium payments. Immediately there was an outcry from the Dominican Republic that the cut in its sugar quota would lead to economic collapse and political upheaval. So the Senate tacked an amendment on to another bill giving the President discretionary power to increase the quotas of the Dominican Republic, Argentina, and Peru over the next three years.

Then a sudden protest came from senators against the practice of foreign governments in lobbying for bigger import quotas for their own countries. It was brought out that 23 countries seeking sugar quotas were represented by Washington lobbyists. All this was denounced as very wicked. But as these individual quotas are necessarily arbitrary, and set openly on a basis of political favoritism, what did Congress expect? Arbitrary quotas must breed lobbies.
PRIVILEGED ACRES
That government “planning” leads to lobbying, to favor-seeking, and finally to corruption, is even more strikingly illustrated with regard to our wholly home-grown crops. On July 2 the General Accounting Office reported to Congress that cotton brokers acting as agents for the government had made illegal profits by selling to themselves more than $400 million worth of government cotton at prices far below the prevailing market. On July 4 it was revealed that two county office managers for the Department of Agriculture had been suspended as a result of a Federal investigation into the alleged sale of Federal rice planting allotments in Texas. On July 6 two Federal farm officials from Oklahoma admitted to a Senate subcommittee that they had each accepted $820 in cash from Billie Sol Estes.

This is probably a prelude to more revelations. Bribery and corruption are an almost inevitable outcome of arbitrary government controls.

The steps are simple. The government, say, guarantees farmers higher prices for certain crops than they could get in a free competitive market. As a result it finds that it has encouraged huge surpluses. To prevent these it limits the number of acres on which each farmer is permitted to grow the subsidized crops. But these privileged acres then sell for enormously higher prices than those on which the subsidized crops are forbidden. So what happens when someone stands to win or lose millions of dollars, depending on the discretionary decision of some petty bureaucrat getting $5,070 or $7,275 a year? The result is the most inevitable consequence of substituting discretionary favoritism for the rule of law. One of the worst consequences of “government economic planning” all over the world has been the corruption of the civil service.

Is Inflation the Cure?
July 30, 1962

The chief economic problem of this country in the last generation has been inflation. This is reflected in 26 deficits in the last 32 years; in a growth of the national debt from $16 billion in 1930 to $298 billion today; in a fourfold expansion of the money supply—from total bank deposits and currency of $68 billion at the end of 1939 to $282 billion today; and in a fall in the purchasing power of the dollar to less than half of its 1939 level.

We cannot throw all this into the past tense. In the fiscal year just closed there was a deficit of $6.3 billion. When the Treasury announced the new depreciation schedules for business, it estimated that the changes would mean a tax cut of $1.5 billion in the first year. But Senator Byrd had already estimated a probable deficit in the current fiscal year of $6 billion. One more item: This year consumer prices have risen nearly every month to a new high level.

BALANCE OF PAYMENTS
The problem that has been worrying government authorities for more than four years has been the deficit in the country’s balance of payments. This amounted to $3.5 billion in 1958, to $3.7 billion in 1959, to $3.9 billion in 1960, and to $2.4 billion in 1961. So far this year, according to a recent statement of Treasury officials, the deficit has been running at a rate of “only” $1 billion to $1.5 billion a year. But this is no ground for complacency. For the deficit is cumulative. The latest figures mean that it has totaled $14 billion in the last four and a half years. This is reflected in a rise in short-term liabilities to foreigners to more than $23 billion, and in a constant fall in our gold reserves, now down to $16.3 billion, the lowest level in 33 years.

This deficit in the balance of payments is being treated by our officials as if it were the cause of our difficulties. It is in fact the consequence of our policies. The real evil is our inflation. This is the cause of the deficit in the balance of payments. For it raises our costs and prices to a point where we can compete less successfully with foreign producers. It makes this country less attractive to buy from and easier to sell to. In addition, our artificially low interest rates make it less profitable for foreigners to invest funds here and more profitable for Americans to invest funds abroad. Finally, gold at $35 an ounce (almost the only thing that hasn’t risen in price in 28 years) seems to many foreigners the biggest bargain we have to offer.

A SLASH IN SPENDING
The problem, to repeat, is inflation. Yet almost everybody has suddenly begun to talk as if the problem were not enough inflation. Almost everybody has begun to demand a tax cut. And most of those who demand the tax cut want it in order to make sure that we will have a thumping deficit in the current year. The deficit of $7 billion in the year just closed is being ignored; so is the prospect of a $6 billion deficit this year, even without a tax cut. Because of the political hazards of asking for a tax cut, the Administration is reported to be looking into the possibilities of speeding up Federal spending as an alternative.

The great fear is that the next deficit may not be big enough. The theory is that we need to pump more “purchasing power,” i.e., more money, into the economy. The theory, in brief, is that we need another dose of inflation.
The country, in other words, is still bewitched by the Keynesian fallacies, still enchanted with inflation. Do we (even though employment is at record levels) have more unemployment than we like? Then let nobody ask whether excessive wage rates in certain lines might be causing it. Let’s soak up all the unemployment by printing more money, by raising everybody’s cost of living. And let’s ignore the desperate need of maintaining confidence in the dollar.

The irony is that we do need a substantial tax cut to relieve the excessive burdens on and discouragements to production and investment. But accompanying that cut we need an even greater slash in government spending if we are to keep our economy sound and vigorous and free. But a major slash in our hysterical spending is something of which no one in politics now dares to speak.

The Welfare Mess
August 6, 1962

When the Senate rejected President Kennedy’s Medical Care for the Aged bill by the narrow vote of 52 to 48, he denounced the vote as “a most serious defeat for every American family. . . . We have to decide,” he continued, “the United States, in 1962, in November, in the Congressional elections, whether we want to stand still or whether we want to support this kind of legislation for the benefit of the people.”

Was the defeat of the medicare bill a defeat, or was it really a victory, for most American families? May it not at least be better to “stand still” for a while than to keep going in the wrong direction—further and further away from individual initiative and self-help, and deeper and deeper into the paternalistic welfare state?

How deep we have already got into the welfare state is documented in the July monthly letter of the First National Bank of New York. In a tabular comparison of public social-welfare expenditures in the fiscal years 1950 and 1961, the bank’s letter shows that old-age, survivors, and disability insurance payments rose from $784 million in 1950 to $12,160 million in 1961, an increase of 1,451 percent. Unemployment benefits rose to nearly $4 billion, an increase of 67 percent. Old-age assistance payments rose to nearly $2 billion, an increase of 33 percent. Aid to dependent children increased 115 percent, hospital and medical care costs 106 percent, government spending on medical research 827 percent, veterans compensation and pensions (at nearly $4 billion) 34 percent. Altogether, total public-welfare expenditures grew from $13.8 billion in 1950 to $37.3 billion in 1961, an increase of 170 percent.

LIMIT TO TAXES
This tremendous total does not include such welfare-related activities as farm-price supports, urban renewal, aid to depressed areas, etc.

The money to pay these gigantic welfare benefits did not come out of some magical fourth dimension. It came out of taxes—nearly half out of a flat tax on payrolls. If the employer’s contribution is considered to be in lieu of higher pay for the worker (as in the long run it must be) the tax on the workers is now at 6¼ percent. The combined tax is now scheduled to rise to 7¼ percent next year, to 8¼ percent in 1966, and to 9¼ percent in 1968. The President’s medicare program, if enacted, would add another ½ of 1 percent. Yet even Secretary Ribicoff declared last February: “I think we have reached a stage of almost maximum taxation under social security. In my mind, I place that at 10 percent of payroll.”

MOUNTING ABUSES
Rates have to be raised to keep the program solvent. But it is a real question whether presently scheduled rates are high enough to do this. No serious thought is given to the enormous “unfunded liabilities” already assumed by the social-security program. Official actuaries have placed these at $350 billion. One former actuary places them at $650 billion.

Yet hardly a week goes by in which a further piling up of liabilities is not recommended. Several Administration proposals would “liberalize” unemployment insurance further.

In the last year or so, reports of abuses and scandals in the welfare programs have been mounting. The bank letter cites a few. From Hollywood, it was reported that a child actor, who turned down a job paying up to $28 a day because he was accustomed to $100–$150 a day, was awarded unemployment benefits. In New York, a ring of six persons was uncovered which allegedly had bilked the public of $41,900 in unemployment compensation by faking employment records. A committee of the New Jersey legislature discovered a family with 23 children that was receiving $969 a month in welfare payments (including social security).

It is obvious that handing out generous welfare benefits to idle people while imposing heavy tax burdens on those who work and produce can only discourage ambition and responsibility, work, production, and economic growth. The President’s medicare program would give heavy (unearned) benefits to the present aged and load the cost onto the present young.

The whole social-security system is in urgent need of reexamination.
**Assurance vs. Acts**

August 13, 1962

In his press conference of July 23 the President announced that “those who speculate against the dollar are going to lose. The United States will not devalue its dollar.” The effect was dramatic. Gold-mining shares fell. The dollar was stronger on the foreign exchanges.

It was gratifying to have this assurance reiterated. But Mr. Kennedy gave this same assurance in his first month in office and it is necessary to point out once more that the dollar cannot be defended merely by uttering the right phrases. These must be followed by actions and policies which will convince the world that such pledges can and will be kept.

The right policies have not followed the right words. The Administration has been pursuing a policy of deficits and cheap money. The outward flow of gold has continued. Three days after the President’s pledge of July 23 the Treasury announced a further weekly loss of $90 million, bringing the nation’s supply of monetary gold down to $16.2 billion, the lowest in 23 years. Against this our short-term liabilities to foreigners and international institutions total $23 billion.

Yet in the same week in which Mr. Kennedy made his renewed assurance he let it be known that he favored a tax cut of “at least $7 billion a year.” As a deficit of some $3 billion to $6 billion is already in prospect, this could mean a total deficit of $10 billion to $13 billion.

**INFLATION THE CAUSE**

Now the blunt truth, as I pointed out in this column of Dec. 4, 1961, and on other occasions, is that our balance-of-payments deficit is simply the consequence of our internal inflation. No matter what solution we adopt for our dollar problem, the first and indispensable step is to halt this inflation. Yet not only the Administration, but the greater part of the business and banking community, has been treating this problem either with astonishing lack of understanding or with disturbing levity. One of the country’s outstanding business organizations has been advocating a big slash in taxes without a corresponding slash in expenditures.

Two exceptions to this irresponsible attitude deserve honorable mention. Last November Hans A. Widenmann, a partner in Carl M. Loeb, Rhoades & Co., pointed out that the only solution to the dollar problem was to “balance our budget and put an end to inflationary trends.” Anything else was a mere “gimmick.” He listed eleven such gimmicks that the Administration had already tried or suggested—from reducing tourist duty-free imports to $100 and the proposal to eliminate the 25 percent gold-reserve requirement to attempts to improve liquidity through the International Monetary Fund. And he showed that each of these gimmicks was at best a stopgap, and that some would mean dangerous steps in the direction of more world inflation.

**UNDERMINING THE DOLLAR**

In May of this year, John Exter, senior vice president of the First National City Bank of New York, made a brilliant analysis of the cause of the dollar crisis. He stated his conclusions bluntly: “A balance-of-payments deficit is caused by monetary policy alone. It is a question of creating too much money . . . of running the printing presses. If one country runs its printing presses faster than other countries run theirs—remember Gresham’s Law—then that country is going to have a balance-of-payments deficit.” He went on, like Widenmann, to list the gimmicks to which the Administration had resorted to solve the problem, and pointed out that they enabled us at best to postpone it. “Why do we continue easy money when it becomes clearer day by day that it is relentlessly undermining the dollar?”

If I may presume to answer his question, I should say: Because we are still under the delusions of Keynesianism and inflationism. Because we still think that economic salvation lies in government spending, in deficits, and in cheap money. Because many of us hold the insane belief that balanced budgets and sound money cause depression and unemployment. Because we have not stopped to ask ourselves how irreparable the damage would be if confidence were once undermined in the world’s anchor currency—the dollar.

**Socialism vs. Freedom**

August 20, 1962

When some visiting Brazilian students interviewed the President one of them asked what the reaction of the U.S. Government would be “in the event we were to socialize the means of production in our country as a way to more effectively wage the battle against underdevelopment.”

Mr. Kennedy replied: “The decision of your country as to the means of providing progress is your decision, and if by socialization you mean ownership of the means of production or of the basic industries, that is a judgment which you must make. What we are opposed to is a denial of civil liberties, a denial of opportunities for people to assemble, to have their press, to make a free choice of what kind of government they want. . . . We prefer the competitive market economy here. We believe that by free competition we can satisfy
the needs of our people best. Every country must make its own choice.”

This reply, though ambiguous in some respects, reveals the ideology behind the Alliance for Progress and our foreign-aid program. A less diplomatic but more instructive reply might have run like this:

**WHICH SYSTEM WORKS?**

Whatever you do in your country is of course your own business, whether it is voting yourself into socialism or voting yourself into a dictatorship, as the Germans did when they chose Hitler or the Argentinians when they accepted Perón. In either case we do not consider it our business to interfere, with either government economic aid or a “warning.” It is only fair to tell you, however, if you are asking our advice, that you will not accelerate your economic development or growth by socializing the means of production. You will, on the contrary, retard it—as your recent governments have in fact retarded it by all sorts of measures hostile not only to foreign investment but to domestic business.

We ourselves got to be the richest and most prosperous country in the world by following the way of free enterprise, of private ownership of the means of production—in a word, of capitalism. Our rate of economic growth was increased by private investment of foreign—chiefly British—capital here. It was attracted here not only because it could get a higher rate of return than at home, but because it ran no risk of discrimination, oppressive taxation, nationalization, or expropriation. It was welcomed, not feared. In the same way, today, the economic growth of Canada has been greatly accelerated by the investment of private United States capital.

**FREEDOM INDIVISIBLE**

It is the anti-capitalistic mentality of the so-called underdeveloped countries that has kept them underdeveloped. It has scared away foreign private capital. It has also discouraged domestic investment. What you seem to be asking is whether, if Brazil socialized the means of production, we would be willing to pour in the American taxpayers’ money to help you do it. We would be even more foolish if we did that than you would be to socialize. For socialization would retard and distort your economic development. Our taxpayers would not only lose their money, but would be encouraging you to follow unsound and hurtful economic policies.

The question is not whether we North Americans “like” or “dislike” socialism; the question is whether socialism tends to increase or retard production of the goods consumers really want. Economic aid to a socialist country is worse than wasted.

And now we come to the question of liberty. Capitalism is merely the name for a system of economic liberty. Under it civil and political liberties flourish and are secure. Under a complete or nearly complete socialism neither economic nor political liberty can exist. Freedom is indivisible. How can there be freedom of press, speech, or assembly when the government owns all the newspapers, presses, and assembly halls? As Leon Trotsky (who knew) wrote in 1937: “In a country where the sole employer is the State, opposition means death by slow starvation: The old principle: Who does not work shall not eat, has been replaced by a new one: Who does not obey shall not eat.”

So if you want to go in for socialism, it’s your funeral. But don’t expect us to subsidize it.

**Where We Are Going**

August 27, 1962

The dollar is the world’s anchor currency. Nearly every other monetary unit is tied to it. It is difficult to estimate what the domestic and world repercussions would be if the dollar went off gold or were devalued.

Yet what is the outcome likely to be if our government continues the policies it has pursued, not only since Mr. Kennedy took office, but practically since the end of World War II?

In 1958, to go no further back, we had a deficit in our balance of payments of $3.5 billion. In 1959 this deficit was $3.7 billion; in 1960, $3.9 billion; in 1961, $2.5 billion. In the first half of the present year the deficit ran at an annual rate of $1.5 billion.

This decline in the annual rate has been hailed by some commentators as very reassuring. But they forgot that the deficit is cumulative. Since the beginning of 1958 it has totaled $15 billion, and is still increasing.

So we continue to lose gold while foreign claims against our remaining supply of it continue to grow. At the end of 1957 our stock of gold amounted to $22.8 billion, and our total short-term liabilities to foreigners (including international institutions) to $15.2 billion. Today the relation is reversed. Our short-term liabilities to foreigners now total $23.5 billion while our gold stock is down to $16.1 billion. In brief, our gold stock is already less than the total direct and indirect short-term foreign claims against it. True, our government is pledged to pay gold only against “official” foreign or international claims. But even these now reach $15.1 billion.

**IF WE LOSE MORE GOLD**

What is likely to happen if a deficit in the balance of payments, even at the present reduced rate, continues?
A 49 Percent Top
September 3, 1962

The basic disagreement in all the recent dispute about a tax cut reduces itself to this: Should a tax cut be accompanied by at least a corresponding cut in expenditures, or not? For all parties to the debate agree on one thing: Present taxes are too high.

This was admirably put by President Kennedy in his television address of Aug. 13: “Our present tax system is a drag on economic recovery and economic growth, biting heavily into the purchasing power of every taxpayer and every consumer. . . . Our tax rates, in short, are so high as to weaken the very essence of the progress of a free society—the incentive for additional return for additional effort.”

In this statement lies the key to the kind of tax cut most likely to provide incentives and stimulate economic growth. It is a reduction of the exorbitant tax rates on productive enterprise and on the higher incomes. The rates on personal income now range from 20 to 91 percent. A cut in the 20 percent rate to 15 percent, now widely advocated, would result in a serious loss of government revenues. Such a 25 percent cut in the basic rate would probably reduce the yield from personal income taxes by nearly the same percentage. But the case would be obviously different in the rates ranging from 50 percent up to 91 percent.

MoNEy FOR THrEE DAys

All the income-tax rates above 50 percent, in fact, today yield a revenue of less than $1 billion—or no more than the Federal government now spends every three or four days. To halt the progression of the personal income-tax rates at 50 percent would restore, to the most productive element in the country, “the incentive for additional return for additional effort.”

In this statement lies the key to the kind of tax cut most likely to provide incentives and stimulate economic growth. It is a reduction of the exorbitant tax rates on productive enterprise and on the higher incomes.

The rates on personal income now range from 20 to 91 percent. A cut in the 20 percent rate to 15 percent, now widely advocated, would result in a serious loss of government revenues. Such a 25 percent cut in the basic rate would probably reduce the yield from personal income taxes by nearly the same percentage. But the case would be obviously different in the rates ranging from 50 percent up to 91 percent.

STOP THE INflATIoN

Our balance-of-payments deficit, and the dwindling confidence in the dollar, are both consequences of the same cause—inflation. Because it raises our costs and prices, inflation makes this a better market to sell to and a poorer one to buy from. Our cheap-money policy makes it less attractive for foreigners to lend or invest here and more attractive for Americans to lend or invest abroad.

The indispensable step in any cure is to halt our inflation. This means that we must allow our interest rates to go up, stop expanding credit and printing money, slash government spending, and balance our budget.

The proposals in Mr. Kennedy’s television address of Aug. 13 were nearly all in the opposite direction. Of the six bills that he wants enacted immediately, one is a tax credit for new investment (which would be good considered in isolation), but four of the other five—for increased public works, “youth employment,” longer unemployment benefits, and education subsidies—involve still more Federal spending. They would increase the prospective deficit. Their enactment would further undermine confidence in the dollar.

Against present note and deposit liabilities of $47.4 billion, the Federal Reserve System is required to hold a gold reserve of 25 percent, i.e., of $11.8 billion. This means that we now hold “free” gold reserves of only $4.3 billion. What will happen if foreigners continue to ask for gold and even this narrow margin shrinks?

It is possible that foreign central banks, worried by the diminution of our “free” gold supply, may become nervous and precipitate a run. Fearful of this, the Kennedy Administration may renew its support of the proposal to abolish the 25 percent gold reserve requirement so as to “free” our entire gold stock for withdrawal. It is doubtful, however, that such a step (which would obviously shake domestic confidence in the dollar) would in fact reassure foreign holders; it might itself precipitate a run.

If the export of gold were suspended, nothing could prevent a violent drop of the dollar on the foreign-exchange markets. If an overnight devaluation of the dollar were announced—say by raising the price of gold from $35 to $70 an ounce—the step would be almost automatically followed by an equal devaluation of other currencies. This would probably be the signal for a new world inflation. But it would not cure our balance-of-payments problem—unless we stopped inflating faster than other countries.

MONEY FOR THREE DAYS

All the income-tax rates above 50 percent, in fact, today yield a revenue of less than $1 billion—or no more than the Federal government now spends every three or four days. To halt the progression of the personal income-tax rates at 50 percent would restore, to the most productive element in the country, “the incentive for additional return for additional effort.” Not only would there be no significant loss of government revenues but probably a very substantial increase. Much more important, such a reform would mean an increase in national output and income, and in the rate of economic growth.

In Sweden, some years ago, a prominent industrialist said to me: “We in Sweden consider any tax rate over 50 percent to be confiscatory.” It seemed a good rule of thumb. If we want to make it more precise, there would be a clear practical and psychological advantage in setting the top personal income-tax rate at 49 percent. For then every taxpayer would feel, in considering a new venture, a new investment, or added personal effort, that he could count on keeping “most” of what he earned.

Many readers, long accustomed to our present confiscatory rates on higher incomes, may be shocked by
any proposal to cut these down to a top rate of 49 percent without at the same time making a corresponding cut in the rates on lower incomes. Certainly there is a strong case for reducing these rates too—when and if expenditures are also cut enough to make this possible without unbalancing the budget.

FOUR REASONS WHY

But the case for an immediate cut in the tax rates above 49 percent, even without other tax reductions, is four-fold: (1) The rates between 50 and 91 percent do not in fact produce revenue, but reduce it. (2) The rates above 50 percent discourage effort and investment and reduce employment and economic growth. (3) These rates encourage many voters to tolerate government extravagance under the illusion (and the figures show that it is an illusion) that only “the rich” are paying for it. (4) The rates are grossly discriminatory and inequitable. They serve no purpose except to gratify envy and malice.

Some economists, in fact, are now coming back to the view that it is hard to justify, either on grounds of justice, revenue production, or economic growth, anything but a simple proportional or flat rate of income tax. Do 90 percent of the voters have a right to impose discriminatory and punitive taxes on the other 10 percent? Prof. Milton Friedman of the University of Chicago has calculated that a flat tax of 23½ percent on taxable income, as presently defined, would yield as much revenue as the present highly graduated rate.

To halt the present tax progression at a top rate of 49 percent would increase government revenues, restore business confidence, and increase economic growth at one simple stroke.

Overregulation

September 10, 1962

Everything possible must be done to prevent a recurrence of the kind of tragedy brought about by thalidomide, a sleeping pill that, when taken by pregnant women, was found to have the frightful side effect of causing deformity in infants.

Stricter legal controls are no doubt part of the answer. And yet they may also bring with them the danger of an overregulation that may itself have the side effect of retarding medical progress without being more than partially effective in curing the evil against which it is aimed.

Take the drug-control bill in the form in which it was unanimously passed by the Senate. If such a bill had already been law, could it have averted the thalidomide tragedy? Would such a law give assurance that no similar tragedy could occur again?

One answer to these questions is that even under existing law Dr. Frances Kelsey did have authority to keep thalidomide off the market and exercised it. What is ironic, as one scientist has put it, is that the real tragedy occurred in Germany (where the drug originated), “a country that has no drug laws that would have prevented it,” and yet it is the U.S. that “takes immediate action to drastically change the strong drug laws it has which actually had prevented that tragedy from occurring here.”

MUST TEST ON MAN

One of the provisions of the Senate bill gives the Secretary of Health, Education, and Welfare discretionary authority to require that new drugs be tested first on animals. Most pharmaceutical firms already make such tests. But an irony of the thalidomide case is that no tests on animals showed the dreadful side effect that developed in pregnant women. Soon or late, a new drug must be tested on human beings. And no one can know in advance what side effects will develop, or in what number of cases, or how long after the drug is taken.

Some of the provisions in the Senate bill could do more harm than good. Among the most serious are those giving the Food and Drug Administration the right to pass on the “efficacy” of new drugs and not merely, as heretofore, on their safety. More than this, the bill puts the burden of proof on the industry rather than on the government. It requires “substantial evidence” that a drug is effective before permitting it on the market. It is a dangerous legal precedent to allow any bureaucrat to keep off the market something that, even though harmless, is in his opinion “ineffective.” This is trying to protect the patient against the judgment of his doctor, trying to protect the consumer against his own judgment. Efficacy can be determined only by freedom of trial, and in no other way.

PROFITS AND PROGRESS

Present legal provisions give the government power to prevent the marketing only of unsafe drugs. They permit a new drug to be marketed if the government takes no action within 60 days after an application is filed. This seems much sounder in principle than provisions that allow a government official to hold up a drug indefinitely until the manufacturer can prove to the official’s satisfaction that it is not only safe but “effective.” This could give a bureaucrat power of life or death over a company.
It is fortunate that the Senate threw out proposed amendments to abridge drug patent rights. Those who sincerely want the American consumer to benefit from more miracle drugs will not begrudge the drug industry its profits. They will want the industry to have maximum incentive to develop new drugs. Sterling Drug, Inc., estimates that already each new drug that reaches the market costs the company an average of $5 million in development costs. Such great sums must come from somewhere. They can only come out of past or prospective profits. Initial high profit margins are the greatest stimulus to expansion of the industry and the entry of new firms. This expansion increases output, stimulates further research, and brings down prices.

It would be tragic if we hastily passed laws whose chief effect was not to safeguard the health of the American public but to slow down the very medical progress that in the last generation has extended the span of life and almost eradicated some of the most dreaded diseases of mankind.

The Basis of Economics
September 17, 1962

The new book by Prof. Ludwig von Mises, The Ultimate Foundation of Economic Science (148 pages, Van Nostrand, $4.50), is what its title implies—a basic investigation not only of the methods appropriate to economics but of how we can discover and prove its fundamental truths and propositions.

His theme might be stated negatively. He tries to show that the present fashionable idea that all sciences, including economics, must imitate the methods of physics, that they must be empirical, experimental, statistical, and quantitative, is not itself a scientific idea, but an arbitrary assumption. He rejects materialism, panphysicist, and logical positivism, in fact, as “metaphysical” ideas that have perverted and set back rather than advanced economics and have led toward a philosophy of collectivism and totalitarianism. Economics, he contends, rests on an utterly different foundation: that of human action. In acting, men strive constantly to substitute a more satisfactory state of affairs for a less satisfactory state. In short, all men pursue ends, and resort to means in order to attain these ends.

I shall not attempt here to follow in detail Mises’s “epistemological” argument, but rather point to some of the practical conclusions to which it leads. One of these is his rejection of the tremendous emphasis placed in recent years on economic statistics and on “mathematical economics.”

MATHEMATICAL MIRAGE

Hosts of authors, deluded by the idea that the sciences of human action must ape the technique of the natural sciences, are intent upon a “quantification” of economics. They assume that economics ought to imitate chemistry, which has progressed from a qualitative to a quantitative state. Their motto is the positivistic maxim: Science is measurement. But in the sphere of economics, i.e., of human action, Mises answers, there are no constant relations between any factors. Consequently, no measurement, no quantification is possible. The only measurable magnitudes that the sciences of human action encounter are quantities of the environment in which man lives and acts—acres of land, bushels of wheat, tons of coal. But these quantities tell us nothing about values, which depend upon human preferences, choices, means, and ends.

Statisticians get into insoluble dilemmas when they indulge, for example, in the modern sport of measuring “the national income.” “Income” itself is a somewhat arbitrary accountant’s concept, as the concept of “the national income” is an arbitrary political concept. Mises shows how this illusive concept depends on changes in the purchasing power of the monetary unit. The more inflation progresses, the higher the national income. Within an economic system in which there is no increase in the supply of money, progressive accumulation of capital and the improvement in technological methods of production to which it led would result in a progressive drop in prices. The amount of goods available for consumption would increase. The average standard of living would improve. But none of these changes would be made visible in the national income statistics.

HOW CONSUMERS RULE

Some of the most interesting passages in Mises’ book deal with issues not directly connected with his central theme. In one of these he explains why private ownership of the means of production so effectively serves the public interest:

“The owner of producers’ goods is forced to employ them for the best possible satisfaction of the wants of the consumers. He forfeits his property if other people eclipse him by better serving the consumers. . . . Private property in the factors of production is a public mandate, as it were, which is withdrawn as soon as the consumers think that other people would employ it more efficiently. By the instrumentality of the profit-and-loss system, the owners are forced to deal with ‘their’ property as if it were other people’s property entrusted to them under the obligation to utilize it for the best possible satisfaction of the virtual beneficiaries, the
consumers. . . . It is precisely the necessity to make profits and to avoid losses that forces the ‘exploiters’ to satisfy the consumers to the best of their abilities.”

The Dream of Planning
September 24, 1962

The immense appeal to so many intellectuals and politicians today of the idea of government economic Planning rests on a simple but glaring oversight. The apostles of Planning forget that each of us, in his private capacity, is constantly planning ahead, regarding his job, his business, his leisure, his spending, his saving for a home or a car or the education of his children. And these millions of individual plans are coordinated through the marvelous mechanism of competition and the free market.

The question then is never whether there should be planning or not, but who should plan for whom? To put it another way, the question is whether all of us should be free to make our own plans, or whether all of us should be forced to work or consume according to some Master Plan drawn up for us by some supposed group of supermen. Most Plans being proposed today are plans for accelerating economic growth. But almost equally popular, under the influence of J.K. Galbraith, are Plans to control our spending and socialize consumption.

According to the Galbraith thesis, most consumers do not know how to spend the incomes they have earned. They buy whatever advertisers tell them to buy. They have atrocious taste, and crave cerise automobiles with ridiculous tailfins. They are, in brief, boobs and suckers, wasting their money on trivialities and junk.

THE TWO ‘SECTORS’
The natural conclusion from all this is that consumers ought to be deprived of freedom of choice, and that government bureaucrats, full of wisdom—of course, of a very unconventional wisdom—should make their consumptive choices for them. The consumers should be supplied not with what they themselves want, but with what bureaucrats of exquisite taste and culture think is good for them. And the way to do this is to tax away from people all the income they have been foolish enough to earn over that required to meet their bare necessities, and turn it over to the bureaucrats to be spent in ways in which the latter think would really do people the most good.

The goods and services for which people voluntarily spend their own money make up, in the Galbraithian vocabulary, the “private sector” of the economy, while the goods and services supplied to them by the government, out of the income seized from them in taxes, make up the “public sector.” This is a neat semantic triumph. For the word “private” is meant to suggest the selfish and exclusive, and the word “public” to suggest the democratic, the shared, and the public-spirited.

VOLUNTARY VS. COERCED
But a truly descriptive vocabulary would throw a different light on the matter. For what Galbraith calls the “private sector” of the economy is, in fact, the voluntary sector; and what he calls the “public sector” is, in fact, the coercive sector. And as this sector grows at the expense of the voluntary sector we come to the essence of the welfare state. In this state nobody pays for the education of his own children, but everybody pays for the education of everybody else’s children. Nobody pays his own medical bills, but everybody pays everybody else’s medical bills. Nobody helps his own old parents, but everybody helps everybody else’s old parents. Nobody provides for the contingency of his own unemployment, his own sickness, his own old age, but everybody provides for the contingency of the unemployment, sickness, or old age of everybody else. The welfare state, as Bastiat put it with uncanny clairvoyance more than a century ago, is the great fiction by which everybody tries to live at the expense of everybody else.

This is not only a fiction; it is bound to be a failure. This is sure to be the outcome whenever effort is separated from reward. When people who earn more than the average have the “surplus,” or the greater part of it, seized from them in taxes, and when people who earn less than the average have the deficiency, or the greater part of it, turned over to them in handouts, the production of everybody must decline; for the energetic and able lose their incentive to produce more than the average, and the slothful and unskilled lose their incentive to improve their condition.

Planning for Growth
October 1, 1962

In a free economic system, production tends to be maximized. This is because, in such a system of private property and free markets, everybody’s reward tends to equal the value of his production. What he gets for his effort or his product, and is allowed to keep, is what it is worth in the market. In a free market, therefore, everyone has the incentive to maximize his satisfactions, whether these consist in more goods or in more leisure.
But along comes the Growth Planner. He finds by statistics (whose reliability he never questions) that the economy has been growing, say, “only” 2.8 percent a year. Whatever the rate is, he decides that it ought to be greater. How does he propose to increase it?

There is among the Growth Planners a profound mystical belief in the power of words. They declare that they “are not satisfied” with a growth rate of a mere 2.8 percent a year. They demand, say, an annual growth rate of 5 percent. And once they have spoken, they act as if half the job had already been done. If they did not assume this, it would be hard to explain the deep earnestness with which they argue among themselves whether the growth rate “ought” to be 4 or 5 or 6 percent.

**MAGIC TARGET RATE**

But why do they assume that setting their magic target rate will increase the rate of production over the existing one? And how is their growth rate supposed to apply as far as the individual is concerned? Is the man who is already making $50,000 a year to be coerced into making $52,500 next year? Is the man making $5,000 a year to be forbidden to make more than $5,250 next year? If not, what is gained by making a specific “annual growth rate” a governmental “target”? Why not simply encourage everyone to do his best, or permit him to make his own decision, and let the average growth be whatever it turns out to be?

The way to get a maximum rate of “economic growth”—assuming this to be our aim—is to give maximum encouragement to production, employment, saving, and investment. And the way to do this is to maintain a free market and a sound currency. It is to encourage profits, which must in turn encourage both investment and employment. It is to refrain from oppressive taxation that siphons away the funds that would otherwise be available for investment. It is to allow free wage rates that encourage full employment.

**HOW TO SLOW DOWN**

The way to slow down the rate of economic growth is of course precisely the opposite of all this. It is to discourage production, employment, saving, and investment by incessant interventions, controls, threats, and harassment. It is to frown upon profits, to declare them to be excessive, to file constant antitrust suits, to control prices by law or by threat, to levy confiscatory taxes that discourage new investment and siphon away the funds that make investment possible, to hold down interest rates artificially to the point where real saving and real investment are discouraged, to deprive employers of real freedom of bargaining, to grant excessive immunities and privileges to labor unions so that their demands are chronically excessive and chronically threaten unemployment—and then to try to offset all this by increased government spending, deficits, and monetary inflation. But we have just described precisely the policies that most of the fanatical Growthmen advocate.

Their [recipe] for inducing growth always turns out to be—inflation. This does lead to the illusion of growth, which is measured in their statistics in monetary terms. What the Growthmen fail to realize is that the magic of inflation is always a short-run magic, and quickly played out. It can work temporarily and under special conditions—when it causes prices to rise faster than wages and so restores or expands profit margins. But this can happen only in the early stages of an inflation that is not expected to continue. The consequences of this short-lived paradise are malinvestment, waste, gambling, social discontent, disillusion, bankruptcy, increased governmental controls, and eventual collapse. This year’s euphoria becomes next year’s hangover. Sound long-run growth is always retarded.

**Worth the Price?**

October 8, 1962

For the fiscal year 1963 the Space Director is asking for nearly $4 billion for his agency alone. Before the race to the moon is finished, the program is expected to cost $20 billion or more.

This is a huge sum. How will it be raised? By higher taxes? But taxes already take away from the corporations more than half of what they earn, and from individuals up to 91 percent of what they earn. As President Kennedy has already told us: “Our present tax system is a drag on economic recovery and economic growth. . . . Our tax rates, in short, are so high as to weaken the very essence of the progress of a free society—the incentive for additional return for additional effort.” Will the money be raised by deficit financing—i.e., by piling up our national debt still further, by printing more money? That way lies more inflation, further undermining confidence in the dollar.

Of course we must spend whatever is needed on national defense. And it is difficult to view the civilian space program entirely apart from missile and other military programs. Just as what was discovered in developing intercontinental missiles made the civilian space program possible, so the civilian program may in turn lead to discoveries of military application. Yet military advances are more likely to be achieved, and sooner and more cheaply, if they are aimed at directly.
DIVERSION OF EFFORT
The space program may also lead to other incidental scientific discoveries and technical advances. It has already led to Telstar, with its immediately dramatic results and immense future possibilities. Scientists point to other potential benefits: Weather observation and prediction, more accurate navigation, improved mapping and miniaturization, new processes and materials.

Yet when all this has been said, the question remains whether these incidental or possible by-products will be enough to justify the huge spending, the huge diversion of national effort, that the space program involves.

Some basic questions are involved. Is it an appropriate function of government to engage in or finance scientific research? To what extent will government research programs supplement private research? To what extent are they likely, in the long run, merely to displace private research? And if the government is to take over the business of scientific research, how will it decide on the relative usefulness or urgency of a thousand different projects?

MORE URGENT PROJECTS
It might be interesting and even exciting to land a man on the moon, but it would not be difficult to think of more necessary, urgent, or useful projects: Research to increase food production ( notwithstanding our own insane farm program) to provide more and cheaper nourishment for the world’s 3 billion population. Developing new and cheaper sources of power. Attacking a hundred human diseases, from cancer to the common cold, and prolonging human life. Finding cheaper and better ways to decontaminate air and water, or to turn salt water into fresh. Research on weather control, to mitigate floods and droughts, or to dissipate smog over cities. And scores of other projects that from the standpoint of increasing human happiness or reducing human misery seem to deserve priority over the Buck Rogers stunt of landing a man on the moon.

It is, indeed, not easy to find a satisfactory answer to the questions raised by former President Eisenhower: “Why the great hurry to get to the moon and the planets?” Are we merely engaged in “a mad effort to win a stunt race?” If we are in a race with Soviet Russia for world “prestige,” should we let the Communists set the terms and the items?

Suppose, one day, after we have spent many billions in trying to land men on the moon, the Russians get there first—a not improbable outcome, judging by experience to date. Then our billions of expenditures will acquire a negative value. Our prestige will be lower than if we had never entered the race. And meanwhile we will have diverted world attention (and our own) from our immeasurable superiorities in the things that matter most—human freedom and dignity and standards of living.

Taxes and Growth
October 15, 1962

LONDON—There is no such thing as an ideal tax system, especially when the total burden is heavy. Every tax is a deterrent to production or consumption.

When we compare the British and American tax systems from this point of view, we find that the British system is better than ours in some respects, but even worse in others. It is much better, for example, in its treatment of corporations. We tax the net income of our own corporations 52 percent. (This comparison throughout is in broad outlines and ignores many qualifications on both sides.) The British tax the net profits of their corporations only 15 percent. In addition they levy an “income” tax on corporate profits of 7 shillings and 9 pence in the pound (38¾ percent), bringing the total to 53½ percent. This seems equivalent to ours. But this full rate applies in effect only to undistributed profits. For when the corporation pays out dividends, the individual shareholders are credited with having already paid their “standard rate” (38¾ percent) of personal income tax on these dividends.

DEPRECIATION
British companies also have an advantage over their American counterparts in depreciation allowances. The system is complex, but a typical example might work out like this: First, the corporation is allowed an “investment credit” equal to 20 percent of the cost of the investment. This is not deducted from its depreciation allowance. Then it is allowed an “initial” depreciation deduction of 10 percent. It may also take, say, a 10 percent depreciation at the end of the first year. In this way, it may write off 40 or 45 percent of a new investment in the first year.

All this is much more favorable than the depreciation treatment given to our own corporations, even under the new tax proposals. But British industrialists still complain that they are at a disadvantage with their competitors in the Common Market because of the much shorter period over which many of the latter may write off their investments entirely.

When we come to taxation on personal income, there seems to be only one major respect in which the British taxpayer enjoys an advantage over our own. This is in the treatment of capital gains. Until this year,
Britons paid no tax on these at all, unless capital gains were a regular part of business income. Now short-term capital gains (within six months for most property, three years for land) will be taxed as ordinary income. But long-term gains are still completely exempt from tax. And owner-occupied dwellings and other property are still exempt even from short-term capital-gains tax.

**HIGH RATE, LOW YIELD**

In practically every other respect the British taxpayer seems much worse off than his American opposite number. Compared with our “normal” tax of 20 percent, the British “standard rate” (beginning at about $1,000 of taxable income) is 38 3/4 percent. Our surtaxes, it is true, go as high as 91 percent, but stiff British surtaxes begin at much lower income levels and they reach a top rate of 88 3/4 percent for incomes above $42,000. And the British death duties rise to 80 percent for those estates in excess of $2.8 million.

The harm that such tax rates do to economic growth can hardly be calculated. Neither in the U.S. nor in Britain do they raise any revenue to speak of. In the U.S. the personal income tax rates over 50 percent raise less than $1 billion—about 1 percent of the total Federal budget and enough to run the government for only three or four days. In Britain all the surtax rates together bring in only £188 million out of total revenues of £6,807,000, or less than 3 percent. All the death duties together bring in £265 million, or less than 4 percent. Yet in both countries such taxes gravely undermine incentives to production and saving. They siphon off the very funds most likely to go into investment. Both hurt wage-earners by retarding the rise in their productivity and real wages. Yet such destructive taxes are kept in the name of “social justice,” and both British and American government officials publicly wonder why the rate of economic growth in their respective countries is so disappointingly low.

**Inflation—or Gold?**

October 22, 1962

LONDON—The more closely we examine the world’s monetary chaos, the more obvious it becomes that the only solution is a return to a full gold standard. This means that currencies must be made unconditionally redeemable in a fixed quantity of gold, on demand, at home or abroad, by anybody, even a citizen of the country that issues the currency.

Some of the reasons why this is in the long run the only satisfactory monetary system were admirably explained in a recent article in *Fortune* by Michael A. Heilperin. Other reasons have become clear in recent years. They were inadvertently emphasized by the proposals at the meeting of the International Monetary Fund in September. The history of the world’s currencies since the operation of the IMF began (i.e., since about 1947) has been a history of chronic inflation, followed by exchange controls, price controls, depreciation, devaluation, and repudiation. The most sweeping devaluations came in the fall of 1949, when the overnight slash of the British pound from $4.03 to $2.80 was followed in a few weeks by corresponding devaluations of 30 or more other currencies.

This process is not safely in the past. On the contrary, within the last twelve months or so, a dozen currencies have been partially or wholly devalued. These include not only those of such chronic offenders as Argentina, Brazil (five devaluations in the past twelve months), Chile, the Congo, Egypt, Israel, Indonesia, and South Korea, but Venezuela and Canada. There is no reason for supposing that this process has ended.

**THE IMF DEPLORES**

It is true that the culprits have violated some of the paper rules of the fund. It is true that the IMF always piously deplores inflation, exchange control, and devaluation, and exhorts its member governments to monetary virtue. But the IMF itself encourages domestic inflation and devaluation by removing or postponing the natural penalties. It is internal inflation that chiefly brings about a deficit in a country’s balance of payments. When that country does not have to meet its external liabilities in gold, when its foreign creditors can be told that it is an ungentlemanly thing to ask for gold and its citizens that it is a criminal thing to own gold, when it can demand credit or support from the IMF as a matter of right to tide it over the difficulties it has brought on itself, it can continue its inflationary policies longer and without sense of guilt.

And it is significant that whenever the IMF meets, the chief proposals by its national members are always for more domestic or world inflation. The British propose that the IMF print its own paper currency for individual central banks to use as “reserves.” The Americans want everybody to conspire to support the dollar, by swapping paper currencies and letting every nation count the others’ paper money as part of its reserves. This is officially called “increasing world liquidity.” A plainer term for it is increasing world inflation.

**HOW TO RETURN**

Only a return to a full gold standard can bring this chronic inflation to a halt. Each inflating nation must be made to pay the penalty for its inflation immediately.
It must no longer be able to demand the automatic support of other nations through the IMF in helping it to continue its inflating.

The problems of how to return to a full gold standard, and at what gold value for the dollar and other currencies, are awkward ones. They are political and legal as well as economic. Heilperin suggests that a new gold price be fixed at $70 an ounce and that the problem be solved internationally through a committee of the Organization for Economic Cooperation and Development. There is much to be said, however, in favor of the U.S. acting alone. If it does act internationally, then the IMF seems the appropriate instrument through which to do it. But once the world, or even the U.S. alone, recognizes the necessity of returning to gold, problems of method should not be insuperable.

One central relationship must be kept in mind. The world is unlikely to halt inflation until it returns to gold; and no nation can stay on gold unless it refrains from serious inflation. ✉️

Taxes in Sweden
October 29, 1962

STOCKHOLM—Some of our more knowledgeable businessmen and accountants, concerned by our government’s niggardly rate of depreciation allowances in the past, have from time to time pointed out how much more liberal these allowances are in Sweden. They are. From 1939 until about four years ago a Swedish company could deduct the entire cost of a new machine in one year. Under present law it is still permitted to write off new machinery and equipment within five years.

In addition to this, a company may set up a deductible “investment reserve” of up to 40 percent of an entire year’s profits. It must, however, deposit 46 percent of this reserve in cash in the Riksbank (the national bank) and, broadly speaking, can invest it only at times approved by the government.

Another substantial tax advantage enjoyed by the Swedish taxpayer is his relative exemption from long-term-capital-gain taxation. He pays straight income tax on 100 percent of capital gains on securities and other assets held for less than two years, but on only 75 percent of the gain on assets held between two and three years, on only 50 percent of the gain if the assets are held one year longer, on only 25 percent if held one year longer still, and no capital-gains tax at all if the asset is held more than five years. And he pays no capital-gains tax on real estate if he has held it more than ten years.

HEAVY IMPACT
But this pretty much exhausts the relative tax advantages of the Swedish taxpayer. The corporate tax rate is roughly equivalent to our own. Corporate income taxes average about 49 percent, and shareholders must pay full income taxes, without deductions, on dividends received. Personal income taxes are extremely heavy. After exemption of only about $400 for single persons and $800 for a family, individuals first pay a local proportional income tax averaging about 15 percent. Then they pay, on the rest of their income, national taxes ranging from 10 to 65 percent. Thus the effective top rate not only can exceed 70 percent, but a family with a national taxable income of only $1,200 could pay 23½ percent, while an individual with a taxable income of only $4,000 would pay about 40 percent. The top rates above 70 percent apply to incomes above $30,000.

And the tax impact is greater than these figures indicate. There is a general retail sales tax of 6 percent in addition to special excise and luxury taxes; a formidable annual capital levy on an individual’s capital assets (regardless of whether he gets any income from them), and a severe inheritance tax.

CAPITAL RESTRAINT
As in the U.S. and Britain, the higher rates give negligible yields. Ignoring the proportional local income tax rate averaging about 15 percent, and concerning ourselves exclusively with the national income tax, we find that the highest national rates—i.e., from 45 to 65 percent—yield about $7 million, or only 1 percent of the total yield of national income tax. In fact, the Swedish Taxpayers’ Association has figured, in a study shortly to be published, that 90 percent of the national income-tax revenues would be realized if the progressive rates stopped at the 25 percent bracket, and that just as much would be collected, without any progressivity of tax rates at all, by a flat national rate of 14 percent.

But though the yield from the high bracket rates is negligible (as is also the yield of the capital tax and inheritance tax) it is impossible to measure the restraining effect of such rates on the creation of income, on savings, and on the supply of venture capital.

Many Swedes tell you they are getting their extensive social-welfare services “free”—education, unemployment insurance, old-age pensions, medical care. But the Taxpayers’ Association study makes it doubtful that there is even much redistribution of income or welfare from the “rich” to the “poor.” Half of the population now pay 30 to 40 percent of their income in taxes. Two-thirds of the tax money levied for redistribution purposes in effect returns as “social services” to the
identical income groups that paid it, after an enormous merry-go-round.

**Will Europe Split?**

November 5, 1962

BERN—Because of our own unique position, few Americans realize the impact of the Common Market on its Western European neighbors. Our own merchandise exports amount annually to only 4 percent of our gross national product, and those to the Common Market countries to only about 1 percent.

Contrast this with the position of some neighboring European countries. Switzerland is already so integrated economically with the rest of Europe that its very survival depends on continuance of this relationship. Its exports amount to 25 percent of its gross national product. In some industries—watches, chemicals, dyes—its exports constitute 90 to 95 percent of total output. The proportion of Swiss trade with Europe reaches about 80 percent for its imports and more than 60 percent for its exports. Last year 62 percent of its imports came from the six Common Market countries and 42 percent of its exports went to them. Switzerland, in short, is already more integrated with the Common Market countries than those countries are with each other.

The relation of Sweden to the rest of Europe is almost as striking. More than 25 percent of Sweden’s national product is exported. Imports are equally high. Both in exports and imports some two-thirds of Swedish foreign trade takes place with the other EEC and EFTA members. Present members of the EEC account for a third of Swedish trade.

**DANGERS OF EXCLUSION**

Both Switzerland and Sweden are following the negotiations between Britain and the Common Market with intense interest. The outcome will affect the terms of their own association, if any. Exclusion from the Common Market could profoundly disrupt their economic life. They have applied for “associate membership.” By this they mean that they are willing to accept in full all the economic obligations implied by membership without the purely political obligations. Switzerland, for example, neutral by long tradition, would like to retain the right to negotiate trade agreements with third countries, or to withdraw in case of war. But our own government, which has taken so active a part in promoting the Common Market, and in urging British membership, is actively discouraging even associate membership by Switzerland, Sweden, or Austria.

I have talked about this problem with a score of the leading bankers, industrialists, labor leaders, and government officials of Sweden and Switzerland, including Switzerland’s Foreign Minister and former President, F.T. Wahlen, Sweden’s Minister of Trade, Gunnar Lange, and its Prime Minister, Tage Erlander. While government officials are careful to refrain from any criticism of the American attitude, it is obvious that they as well as more outspoken private citizens are deeply disturbed by it.

**BUGBEAR OF ‘DILUTION’**

Our government’s objection even to associate membership for Austria, Switzerland, or Sweden is based on a vague fear that this would “dilute” the Common Market. On the economic side, the three countries find this baffling because our government wants to dilute the Common Market by urging the adherence of the British and accepting that of the Norwegians, Danes, and Greeks. As the Swiss, Swedes, and Austrians do not even wish to participate in the political decisions or institutions of the Six, they cannot understand how their purely economic association could in any way reduce the will of the Six to achieve closer political ties with each other.

As the European neutrals see it, the United States can only hurt its own political and economic interests by weakening the ties that already bind these neutrals into the European economy. To keep them out of the Common Market would not only do them immeasurable economic harm, but would tend to drive them for self-preservation toward greater ties with Iron Curtain countries. Many Europeans point to the tremendous Russian pressure now being put on Finland, and the possibility that our government’s indifference may force Finland into the Russian orbit. Our policy, as they see it, may tend not to unite Western Europe, but to split it into two rival camps, weakening or destroying the ties that already exist.

**Shock of Reality**

November 12, 1962

People who write on the future of American business ordinarily do so on the tacit assumption that the forces determining the future of business lie within the realm of business itself. Along comes a Cuban crisis, and suddenly everyone realizes that the future of American business is simply a part of the future of America. What happens to business depends as much on our “foreign” policy as on our “economic” policy.
The truce resulting from President Kennedy’s bold
This was followed five days later by the disastrous failure,
1961, when (after his own State Department, nine days
Wilhelm Röpke put it eight years ago: “Pacifism, merely
France, Britain, and Israel in an action that, without
President Truman must accept responsibility for acceding
to an untenable position for the West at Berlin, and
for his prior ambiguity about our willingness to defend
South Korea. And President Eisenhower must accept
responsibility for not only failing to provide any real aid,
physical or moral, to the Hungarian Freedom Fighters
in 1956, but for actually diverting world attention from
that Communist crime by taking that moment to halt
France, Britain, and Israel in an action that, without
his intervention, would have deposed Nasser and prevented
the immense harm he has since done. It was
the Eisenhower Administration, also, that rushed to
intervention in Cuba by United States armed forces.”
This was followed five days later by the disastrous failure,
through the Administration’s vacillation and timidity, of
the invasion of the Bay of Pigs. This blow to American
prestige was followed by eighteen months of tragic inaction
while the Soviet buildup went on.

RECORD OF Appeasement
But we can now hope that the apparent victory resulting
from our finally firm stand on Cuba may signal
a reversal of the yielding and appeasement that have plagued our foreign policy under both Democratic
and Republican leadership for the last eighteen years.
President Truman must accept responsibility for acceding
in Cuba as “the seizure by international Communism of a base
and bridgehead in the Americas”) President Kennedy declared that “there will not be an under any conditions be an intervention in Cuba by United States armed forces.” This was followed five days later by the disastrous failure,
through the Administration’s vacillation and timidity, of
the invasion of the Bay of Pigs. This blow to American
prestige was followed by eighteen months of tragic inaction
while the Soviet buildup went on.

FRUITS OF FIRMNESS
The truce resulting from President Kennedy’s bold
action once more confirms the ancient truth that honor-
able or tolerable peace is not to be bought by a timorous
appeasement but by firmness. As the Swiss economist
Wilhelm Röpke put it eight years ago: “Pacifism, merely
as an attitude of mind that rejects war, is not only ster-
ile but indeed dangerous to a tragic degree, since at
the very moment when the danger of war is greatest
it further increases that danger immeasurably by
encouraging the attacker. Such pacifism not only fails
but actually becomes one of the fatal links in the chain
of causes which trigger off the war and possibly effect
the triumph of the aggressor. The chief task of war
prevention is to make plain to every potential aggressor,
beforehand and in a completely indubitable way, that
the risk is overwhelming.”

The outcome in Cuba does not mean, of course, that
the dangers of the cold war are past. No one knows what
Khrushchev’s next moves will be in Berlin, or what the
consequences will be if Cuba is allowed to remain as
a Communist “base and bridgehead in the Americas.”
But we have now learned that, in the moment of cri-
sis, time does not allow us to consult a score of other
nations, and that we must decide and act swiftly and
alone, trusting in our own strength and the readiness
of other countries to follow a firm, clear lead.

And what’s best for America is best for American
business.

‘Tax’ Cut vs. Rate Cut
November 19, 1962

Last summer Mr. Kennedy let it be known that he
favored a tax cut of “at least $7 billion a year.” “Our
present tax system,” he declared on Aug. 13, “is a drag
on economic recovery and economic growth. . . . Our
tax rates . . . are so high as to weaken the very essence
of the progress of a free society—the incentive for addi-
tional return for additional effort.”

Everybody agrees that present taxes are too high.
But a cut of the dimensions indicated, without a corre-
sponding cut in spending, would touch off a new spiral
of inflation and endanger the dollar. We have already
had 26 deficits in the past 32 years. The Council of
State Chambers of Commerce, before the Cuban cri-
sis, estimated that the deficit in the current fiscal year
would reach $7.7 billion. A tax cut of $7 billion could
mean an annual deficit of $15 billion. Yet in despair of
the political prospect for any cut in spending, groups
and institutions ordinarily deeply concerned about
inflation now advocate a tax cut even without a spend-
ing cut.

The latest example is the First National City Bank
of New York. After an instructive comparison of the
American tax system with that of other nations, its
November letter concludes: “Our present tax system is
bankrupt. It deters effort and progress. It has not suc-
cceeded in balancing the budget. We desperately need
an imaginative new fiscal combination, even at the initial cost of some continuance of deficits. Easier taxes on enterprise could invigorate the economy [and] build a bigger base of taxable income.”

1 PERCENT OF REVENUES
May it not be possible, however, to reform our tax system without plunging into still bigger deficits in the hope that lower taxes will themselves restore a balanced budget in some sweet by-and-by? We need merely recognize that the greatest harm is being done by the excessive tax rates on the higher personal incomes. All U.S. personal income-tax rates above 50 percent yield less than $1 billion, i.e., less than 1 percent of total Federal revenues. The experience of other countries also shows that such punitive rates produce negligible yields. Yet such confiscatory rates immensely discourage effort, siphon off most of the very funds otherwise available for risk capital, and undermine the incentive to invest what is left.

If we stopped our income-tax progression at the 50 percent rate there can hardly be any doubt that this would result in an actual increase in governmental revenues. It would certainly result in an increase of economic growth from increased effort, increased capital accumulation, increased investment, increased job opportunities, and higher real wages.

DO HIGH RATES PAY?
The City Bank comparisons show that our top rate at 91 percent is the highest of any important country in the world. As the bank points out:

“...it is sometimes thought that high rates and heavy reliance on income taxation necessarily go together. Such is not the case. The bulk of the revenue from the tremendously productive Federal individual income tax is derived from the initial 20 percent rate. In 1960, 86 percent of receipts came from this first bracket rate, to which all taxpayers are subject, while the entire progressive portion up to 91 percent produced only 14 percent of the yield. The collections were 23.3 percent of the total taxable income reported in 1960, which implies that a flat tax of 23.3 percent would produce the same revenue as the present steeply graduated schedule.”

To raise the individual exemption by even $100 would cost some $3 billion in revenues. But to lower the 20 percent rate to 19 percent on the first $1,000 of taxable income, or alternatively, to continue the 20 percent rate (which now applies only to taxable incomes of $2,000 or less for single persons) through the $2,000 to $4,000 bracket (which now pays 22 percent) would mean a revenue loss of only about $750 million.

With such changes at the top and bottom of the rate scale, the complexity of the income-tax schedule would be enormously reduced—from 24 tax rate brackets to eight or nine. This could be a cautious start toward further tax reduction spread over the following years.

---

Tax Cuts for Incentive

November 26, 1962

This year, at the initiative of the Kennedy Administration, two important steps were taken to increase the incentives for new investment. One was the tax credit of 7 percent of the cost of new equipment. The other was the Treasury’s new rulings permitting business to depreciate equipment over shorter periods.

The Treasury estimates that in a full year the tax credit will cost it $1 billion in revenues, and that the new depreciation rulings will cost it another annual loss of about $1.5 billion. If this were so, business could keep $2.5 billion more a year (about 5 percent) of present profits and the added amount would be available for new investment.

But such estimates are likely to apply only in the early years of the new reforms. As business cannot in the long run write off more than 100 percent of the cost of equipment, the government must stand to make up any early revenue loss in later years. Broadly speaking, in fact, all that changes in depreciation allowances do (unless, as in France, they allow also for depreciation of the currency) is to shift the amount of reported earnings, and hence the amount of taxes, as between one year and another. Accelerated depreciation allowances reduce reported profits, and hence taxes, in earlier years at the cost of increasing profits and taxes in later years.

TO STIMULATE GROWTH
Yet because the long-term return on investment in new equipment is always problematical, particularly over more remote years (the rate of obsolescence, or shifts in demand, can never be known in advance), because the principal of the investment is more surely and quickly recouped, and because the net outlay in the early years is less, shorter depreciation periods increase the incentive for new investment. This means two things. As a result of accelerated depreciation the government in the long run increases revenue rather than loses it. More importantly, corporations invest more, scrap obsolescent equipment sooner, expand and modernize, meet foreign competition better, provide higher-paid jobs. In brief, the economy expands faster and so does the tax base.
The Machinery and Allied Products Institute has just published a study of the probable stimulating effects of the new investment credit and the changes in depreciation rules. It estimates that the tax credit is equivalent to an initial depreciation write-off of about 25 percent, and that the credit and shortened depreciation life are together equivalent to an initial write-off of 33 percent.

**INITIAL WRITE-OFF**
The stimulating effect of the changes on new investment may be substantial. This is the kind of “tax reduction” most likely to appeal to conservative members of Congress. It promises to reduce the depressing effect of taxes without in the long run reducing revenues. It might be even better if, instead of the complications of the new investment credit and “guideline class” depreciation rules, we simply followed the example of Sweden and allowed corporations to write off new machinery and equipment within five years, or (as in Britain) to write off 40 percent of a new investment in the first year, or to choose one of several such options. We might be astonished at the effect on our economic growth.

It is reassuring to learn that the Administration's tax planners are considering the possibility of spreading its proposed tax reduction over five years, to prevent a massive budget deficit in a single year that could set off inflation fears. In such a program an initial moderate change in the corporation income tax will probably be considered. One such change might be to keep the present rate of 52 percent on undistributed profits, but to reduce the rate to 48 percent on all profits paid out in dividends. As corporations in recent years have been paying in dividends about 30 percent of their profits before taxes, this would be equivalent to an average overall corporate rate of 50.8 percent. Even if this were made a substitute for the present 4 percent tax credit allowed to individuals on dividends received, it would mitigate the double' tax on dividends in a way less open to misunderstanding.

**What Is a ‘Loophole’?**
December 3, 1962

The Administration seems to be divided on whether it should recommend simply a tax “cut” in 1963 or whether it should also demand tax “reform.” Unfortunately it seems to have precisely the wrong idea of what constitutes true tax reform. True tax reform would make our tax system simpler, less vexatious, less inequitable, less discouraging to business growth. The “reforms” insisted on by the Administration at the last session of Congress were mainly in the opposite direction. It tried unsuccessfully to get interest and dividend withholding that would have created an accounting nightmare. It succeeded in getting punitive taxes on foreign investment, and stringent rulings on business expenses.

Here is *The Wall Street Journal’s* summary of the proposed application by the Internal Revenue Service of the new expense-account law:

“Anyone claiming deductions of $10 or more for travel would have to provide documentation of the cost of transportation, meals, lodgings, telephone expense; date and hour of departure and return; number of days away from home; number of days spent on business at each stop; location of each stop, and the business purpose of the trip, ‘including the nature of the business benefit expected to be derived by the taxpayer as a result of the travel to each place’.”

**KILLING INCENTIVE**
The requirements for entertainment deductions are even more inquisitorial. They would constitute what the Journal calls “a bookkeeping nightmare,” and a “blow to travel and entertainment and indeed all business.” In order to catch a few cheaters, must every taxpayer or businessman be treated as a potential crook?

In its November Survey, the Morgan Guaranty Trust Co. of New York describes the multitudinous ways in which the high corporate and individual income tax rates have distorted business practice, and twisted incentive into strange shapes where they haven’t killed it altogether. Many savings in corporate costs hardly seem worth the effort when it is pointed out that they really amount only to 48 cents on the dollar. “Beyond the dollars and cents,” concludes the bank, “enormous harm has been done to business by the colorful mythology that has grown up around practices designed to help the individual avoid losing the greater part of his pay to taxes. Externally, the exaggerated impression of rampant abuse has damaged public respect for, and confidence in, business. Internally, it has chipped away here and there at business morale and business ethics.”

**CONFISCATORY RATES**
The favorite demand of most tax “reformers” is that we must “close the loopholes.” But what is a loophole? Those who invoke the catchword never refer to the exemptions and deductions that apply to the low-bracket incomes. They use it only to stigmatize the deductions that those who earn high incomes are permitted to take, implicitly or explicitly, by the law. They do not stop to ask whether a deduction is fair or unfair. Do a few abuse it? Then it should be denied to everybody. Even President
Kennedy, in his tax message to Congress on April 20, 1961, said: “The slogan—it’s deductible—should pass from the scene.” He was talking of expense-account abuses; but if his statement were taken without qualification, no expense deduction, no matter how legitimate, would ever be allowed. Even a company that lost money would pay taxes on its gross. It is only because of expense deductions and “loopholes” that most businessmen are able to stay in business at all.

The kind of tax reform we most sorely need is not that proposed by the “loophole” closers. The most important tax reform is to stop confiscation. Any tax rate above 50 percent, on corporate or individual income, is prima facie confiscatory. We need to reduce the multitude of income brackets, to stop penalizing irregular incomes, to deal in a more balanced way with capital gains and losses. If we undertook this kind of reform we could at the same time reduce tax rates and increase revenues. More importantly, we would enormously stimulate income, production, employment, and national economic growth.

No Column This Week
December 10, 1962

In a world drifting toward economic chaos, the weekly problem of choosing a topic, to the neglect of all other topics, sometimes becomes insoluble. Take this week, for instance.

With the Administration talking of a tax cut of $5 billion to $10 billion in 1963, though the outlook for the current fiscal year is already for a deficit of $8 billion without a tax cut, I get to ruminating about the gross and glaring inequities in our income tax. When Treasury officials have been questioned about these in the past, their excuse for retaining them has been, “We need the money.” Now they say they don’t want at least $5 billion of it. But nobody suggests that this might be a good time to end some of these inequities.

Take, for example, the gross unfairness to people with irregular incomes. An official of a small bank with a steady net taxable income of $10,000 a year pays over ten years, on his $100,000, a total income tax of $26,400. But a writer, inventor, or actor, who had no taxable income for nine years but $100,000 such income in the last year, may be forced to pay an income tax on it of $67,320. Yet nearly everyone would prefer a steady and predictable income to an irregular one of the same amount. Then there is the cynical heads–I-win–tails–you-lose policy in taxing capital gains and losses.

But I’ve been writing too much about taxes lately, so I’ll skip that.

INFLATION IN BRAZIL
Then I think of the rampant inflation in Brazil. Prices there have risen more than 50 percent in the last twelve months. Even last August the cost of living had already increased to ten times that of 1953. It now takes more than 700 cruzeros to buy a dollar. People are rushing to change their money for anything. Brazil got into this inflation by the most approved New Frontier method—budget deficits. The budget deficits were also brought about by the methods most approved by our own progressive thinkers—losses on socialized enterprises. The government has also ordered a year-end bonus equivalent to one month’s pay for all Brazil’s salaried workers, and a new and higher legal minimum wage to go into effect in January.

One wonders whether the Brazilian example will cause our tax-cut-happy, big-spending, deficits-for-“growth” theorists to have any second thoughts. One wonders whether the inflation, socialization, and confiscation throughout most of Latin America are causing any second thoughts to the daydreamers about the Alliance for Progress. One wonders whether the Brazilian inflation will even cause anybody to ask whether the International Monetary Fund, under which inflations and devaluations have been occurring with unparalleled frequency, serves any useful purpose at all.

CAPITALISM IN RUSSIA
But then I think of the Russian situation. The U.S.S.R. idolators here have been telling us for years that Russia is growing faster than the U.S. and will soon leave us far behind in the race for production unless we too adopt socialist planning. The only people who begin to have doubts are the Russians themselves. Things are going so badly in Russia, particularly in agriculture, that Khrushchev has decided in desperation to imitate capitalism. Why shouldn’t we “use anything rational and economically advantageous that the capitalists have to offer,” he asks defiantly. So he announces one of the most sweeping reorganizations of the Soviet economy on record. He wants plants and industries to try to maximize profits. He proposes to tie managerial compensation closely to these. Communist radicals even recommend the introduction of a rate of interest on invested capital in Russia, in flat disregard of the Marxist dogma that interest, like profit, is simply exploitation of the workers. I might write a piece on the theme that while the Western radicals want to rush us toward Communism, the Russian radicals are moving
toward capitalism, and in a few years East and West may pass each other going in opposite directions.

But as I can’t make up my mind which of these subjects to take up this week, I won’t do a column on any. There’s too much to write about.

The New Mythology
December 17, 1962

The belief that inflation can solve all the economic problems of mankind has the immortality of the phoenix. Discredited a hundred times by its ultimately tragic consequences, it always rises again in a new form. Its present form is the conviction that whenever the economy needs a lift, the sure way to get it is by a big enough budget deficit.

In a report on Nov. 19, a majority of the President’s Advisory Committee on Labor-Management Policy called for a tax cut in 1963 of $10 billion. A few thought maybe a tax cut of $5 billion would be big enough. Some members urged that, in addition to cutting taxes, the government ought to increase spending. Nobody on the committee suggested that the government should actually reduce spending. The report never troubled to mention the $7.8 billion deficit already officially estimated.

The committee had no doubt that a thumping deficit was the way to “achieve and maintain fuller utilization of manpower, higher industrial operating rates, and a more rapid rate of economic growth.”

Just how deeply embedded the faith in deficits has become was illustrated by an article in The New York Times of Nov. 18: “Economically, there is no longer any essential disagreement among theorists over the fact that deficit spending is a stimulus. . . . If the economy is not generating enough demand to keep it going at close to full tilt then the government must generate the demand, by deficit spending if necessary. . . . This view . . . is central to economic thought and theory in today’s world.”

PRINTING MORE MONEY

It is precisely because this has become the new orthodoxy—which one can challenge only at the cost of being dismissed as hopelessly out-of-date—that the government seems likely to launch on a policy that can only end in monetary collapse.

Let us analyze this theory a little. It assumes that all unemployment or business slack must be the result of “insufficient demand.” But by insufficient “demand” it always means insufficient money. The supporters of the theory want deficits because they want the government to shovel more money into the economy than it takes back in taxes in order that everybody will have more money to buy more things. In brief, they want more inflation.

The theory assumes that bigger deficits, more money, more inflation, will inevitably “lift the economy.” But they can do so only for brief periods and under special conditions. If union pressure forces some wage rates too high in relation to prices, then an added injection of money into the economy may increase either sales or prices, thus restoring sales or profit margins and enabling industry to pay the higher wage rates.

WAGE RATES IGNORED

But this result will follow only if: (1) It does not lead to still further wage demands, or (2) if the price rises are at least greater than the wage rate rises, and (3) if the added dose of money is expected to be the last one, and not merely the beginning of an indefinite number of doses. In the latter case the inflation will get out of control.

The deficit-idolaters always ignore wage rates, and their effect on employment. Under no conditions, apparently, do they think any wage rate should be adjusted downward to coordinate wages, prices, and profits and restore employment. Always the whole level of prices must be raised instead.

But unless distortions are removed from the economy, unless there is freedom, flexibility, and coordination of wages and prices, even the greatest dose of deficit financing cannot restore full employment. All it can do is to intensify our problems. Our costs are getting too high for competition in the world market. More deficits can only make them higher. The deficit in our balance of payments, the outflow of gold, the dwindling confidence in the dollar, are all the result of the inflation we have already had (from 27 deficits in the last 33 years). The prospect of still more inflation can only lead to a renewed outflow of gold, or a devaluation of the dollar and a profound shock to world confidence.

Encouraging Strikes
December 24, 1962

The strike of the printers’ union against New York newspapers raises once more the vexed question of what the attitude of government and the law should be in regard to unions and strikes in general.

A word ought first to be said about the merits of this particular strike. In October the average weekly wage paid in all U.S. manufacturing establishments was $97.
This is why a steel plant or newspaper no longer even attempt to carry on its business during a strike. In New York even strikers, after nine weeks, are entitled to unemployment insurance.

Yet the strange myth continues that the government and the law are “neutral” during a strike. When a strike occurs, instead of there being any demand for revision of the laws that encourage the strike (and reduce its risks) there are demands for still more government intervention—direct intervention of the President or Secretary of Labor, resort to the compulsory return-to-work period of the Taft-Hartley Act, compulsory arbitration, even direct wage and price fixing.

But no one calls for the obvious solution—to revise or repeal all the Federal labor legislation since 1931 and return to the principles of the common law. Under these principles unions would no longer be privileged to resort to intimidation or coercion. Individual workers would be free to join or not to join unions, to strike or to stay on the job.

Wages, employment, production, peace, would all gain by the change.

**Deficits Solve Nothing**

December 31, 1962

President Kennedy’s speech before the Economic Club of New York was a mixture of the sound and the unsound. He said many good things and sometimes said them admirably. He warned that our balance-of-payments problem places limits on monetary inflation. He warned against the demoralizing effects of “increasing Federal expenditures more rapidly than necessary.” He recognized the need to reduce “the burden on private income and the deterrents to private initiative.” He pointed out how our present tax system constitutes “a drag on growth” because it “siphons out of the private economy too large a share of personal and business purchasing power” and reduces the “incentives for personal effort, investment, and risk-taking.”

The Federal government’s most useful role, Mr. Kennedy recognized, “is not to rush into a program of excessive increases in public expenditures, but to expand the incentives and opportunities for private expenditures.” He insisted that “corporate tax rates must also be cut to increase incentives and the availability of investment capital.”

The President also stated admirably the need for tax reform and some of the objectives of such reform. He pointed out how our present tax system distorts economic judgments and inhibits economic growth. He courageously urged reduction of “the oppressively
high rates in the upper brackets.” He emphasized the need of improving profit margins and increasing “the incentive to invest and the supply of internal funds for investment”; of arousing a “new interest in taking risks, in increasing productivity, in creating new jobs and . . . long-term economic growth.”

CUT SPENDING FIRST
But in spite of these correct perceptions, the President did not draw the correct conclusions for practical action, because he looked at only one side of the problem. We do need tax reform. We do need tax reduction. But we cannot afford to reduce taxes unless we are also willing to reduce the Federal spending that makes the taxes necessary. Yet the President holds out no prospect whatever that Federal spending will be reduced. On the contrary, “defense and space expenditures will necessarily rise.” The most the President promises is that “the total of all other expenditures combined will be held approximately at its current level.”

What does this mean? In the current fiscal year we are heading into a deficit already officially estimated at nearly $8 billion. This will be the 27th deficit in the last 33 years. The President’s advisers have been publicly recommending a tax cut in the neighborhood of $10 billion. This could mean a deficit in the next fiscal year of $18 billion. Add a couple of billion to expenditures, and you get a deficit around $20 billion.

A TEN-YEAR TRIAL
The President and his advisers seem to believe that deficits themselves, by increasing “purchasing power,” will increase prosperity, eliminate unused capacity, bring full employment, and thereby increase revenues and so restore a balanced budget. This beguiling fantasy has been floating around for 30 years. It is part of the reason why we have already had 27 deficits in 33 years. It is a complete delusion.

Deficit spending as an economic panacea has had a thorough trial. It got an uninterrupted test in the ten fiscal years from 1931 to 1940, inclusive, in which there was a deficit every year. The average annual deficit was $2.8 billion, or 3.6 percent of the gross national product of the period. The same percentage of the gross national product today would mean an average annual deficit of $19.7 billion. The average unemployment in that ten-year period was 9.9 million. This was 18.6 percent of the total labor force. The same percentage of unemployment today would mean 13.9 million jobless.

But though deficits brought about by cutting taxes would probably be futile in restoring full employment, they would not be harmless. On the contrary, they would undermine domestic and foreign confidence in the dollar. They would lead foreigners to drain us of our gold supply. And they would eventually let loose an uncontrollable inflation.
Who Gains by Strikes?

January 7, 1963

It is easy to point to those who do not gain by a strike. Let us look at the present newspaper strike in New York City.

1—Not the employers. Their losses are direct and heavy; some papers may not be able to sustain them. If they are forced to settle on the strikers’ terms, or even on terms higher than they offered to avoid the strike, they will be saddled with higher labor costs. If they try to compensate by raising the price of their papers or of their advertising, they will sell less of both. When, like the steel companies, employers are in foreign competition, they will lose business to their foreign competitors.

2—Not the public. The New York public loses by being deprived of the full daily information that only newspapers can supply. Department stores lose. Specialty stores lose. The owners of small newsstands and stationery stores lose. From every strike the public suffers at least inconvenience and sometimes serious hardship. It is deprived, while the strike lasts, of the particular product or service that the strikers helped to supply. And if the strike is settled by an excessive increase in wages, the public must pay a higher price for that product or service.

3—Not the whole body of workers. They constitute the overwhelming majority of consumers. They suffer the same inconvenience or hardship as the rest of the public during a strike. They also must pay higher prices afterward for the product or service supplied by the former strikers. This reduces the purchasing power of their wages. Workers in other industries often lose their jobs as a result of a strike. If some of them receive less pay at their jobs than the strikers did at theirs, they are not allowed to apply for the jobs that the strikers have voluntarily vacated. The “solidarity” in the interests of “all labor” is a myth. The wage gains of one group of workers as a result of a strike are nearly always at the expense of other workers through the higher prices that the others must pay.

4—Do even the strikers themselves gain from a strike? The truth is that they can do so only under very special and unusual conditions. Even when they “win” a strike they may lose—especially if the strike is prolonged, or if they win excessive gains. What labor is mainly suffering from today is too many victories.

In the New York newspaper strike, the printers were receiving a basic wage of $141 a week. The publishers offered an increase to $149 a week over a two-year period. The printers asked an increase to $160.

WHAT STRIKERS LOSE

For the first year the publishers offered an increase of $4.25 a week. The printers asked an increase of $10, or $5.75 more. By striking they lose $145.25 a week. Even if they win their full $10 demand, therefore, it will take them 25 weeks, or almost half a year of work, to make up for every week lost on strike. Even if they were to win their whole fantastic “package” demands, now estimated at an increase of $38 a week, they could win them only by throwing several newspapers out of business and thousands of employees out of work.

Anyone who thinks this prediction overdrawn should look at the record of the 1959 steel strike. This ran for 116 days, with an average wage loss of $2,100 per worker. If we compare the workers’ wage increase with what they would have got if they had accepted the steel companies’ last offer before the strike, we find that in the three years since the settlement they have made up less than half the losses they suffered. That is, those who have remained employed have done so. But as a result of the increased labor costs imposed on the steel companies, fewer have remained employed. Total nonagricultural employment in September 1962 was 63.1 million in 1958, an increase of 8.6 percent. But employment in steel mills dropped from 601,100 in 1958 to 565,900 in September 1962, a fall of 5.8 percent.

We may yet have to revise our labor laws, ceasing to force employers to bargain only with a specified union, and ceasing to permit intimidatory picket lines, if only to prevent shortsighted unions from committing economic suicide.

A Shortsighted Tax

January 14, 1963

Any tax cut that led to still another budget deficit—which means any tax cut not accompanied by an equal or more than equal cut in expenditures—would be a cruel deception of the American people. It could precipitate an inflation that would do immense harm. But this objection does not apply to proper tax reform. Our present system embodies rates and types of taxation that are not only inequitable, but actually reduce possible revenues at the same time as they retard economic growth.

An outstanding example is the capital-gains tax. This tax is cynically one-sided. It is a heads-I-win-tails-you-lose proposition of the government against the taxpayer. Short-term capital gains are taxed in full, to any amount, just as if they were added income. But capital losses can be deducted only against gains, if any, and
not against income, except to a maximum of $1,000 in any one year. Long-term capital gains (i.e., gains from assets held longer than six months) are treated similarly as compared with losses, though such capital gains are taxed at a maximum rate of 25 percent.

GAINS VS. LOSSES
Prior to the market collapse and depression of 1929–33, capital gains were taxed as income, and at the same rates. And capital losses were fully deductible against income. But when J.P. Morgan revealed that he had paid no income tax for the preceding year, because his capital losses exceeded his ordinary income, his statement made front-page headlines. Then Congress one-sidedly “rectified” matters by refusing to allow deduction of more than $1,000 a year of capital losses against income, though it continued to tax short-term capital gains in full as income.

Another gross injustice of the present capital-gains tax is that the “gains” it taxes are often nonexistent. Suppose a man bought stock or real estate for $10,000 in 1939 and sold it for $21,800 in 1962. He would be taxed on a long-term capital gain of $11,800. Actually, as the cost of living also rose 118 percent in that period, he would have achieved no capital gain at all. His $21,800 in 1962 could buy no more than $10,000 bought in 1939. If he had sold his real estate or stock for $19,000, he would be taxed on a capital gain of $9,000, but he would have suffered an actual loss in real terms. Under past and prospective inflation, the long-term capital gains tax amounts to a large extent to nothing else but capital confiscation and expropriation.

Its evils do not end there. By taxing gains in full, and short-term gains at sometimes confiscatory rates, with loss deductions only against gains (except for a token deduction against income), it discourages all investment, and particularly of risk capital. It “locks in” capital. It penalizes investors heavily for transferring investments into new ventures. It stunts economic growth.

It is hard to imagine any reform of the capital-gains tax that would not be an improvement. Here are some possible alternatives:

1—Segregate capital gains and losses from ordinary income. Tax these segregated capital gains at the same rates as ordinary income, or at a flat rate calculated to maximize revenue. Allow deduction of losses against gains, and an indefinite carry-forward of losses until absorbed.

2—Cut the rate on long-term capital gains from a maximum of 25 percent to a maximum of 10 percent.

3—Follow the example of Britain. Don’t tax long-term capital gains at all. Or adopt the Swedish policy of tapering the tax off. (The Swedish taxpayer pays straight income tax on 100 percent of capital gains on assets held for less than two years, on only 75 percent of the gain on assets held between two and three years, on only 50 percent of the gain if the assets are held one year longer on only 25 percent if held one year longer still, and no capital-gains tax at all if the asset is held more than five years.)

4—At least allow the taxpayer to deflate his alleged capital gain to allow for the rise in the consumer price index over the period involved.

5—Allow the taxpayer a tax-free transfer of capital from any investment to another (a right that now applies only to his residence).

6—Enact some variation or combination of these reforms.

Lopsided Labor Law
January 21, 1963

Congress is being urged to do many things that are not urgent and some things that ought not to be done at all. But aside from a few forlorn proposals by individual congressmen, it has no plans for dealing with the most urgent domestic problem now facing the country—that of paralyzing strikes.

This problem is being treated for the most part either as if there were no real solution to it, or as if that solution were merely to move into still further government control—“fact-finding,” compulsory arbitration, or outright wage- and price-fixing. Most politicians and publicists simply refuse to re-examine the Federal laws passed in the ’30s and ’40s (particularly the Norris-LaGuardia Act and the Wagner-Taft-Hartley Act), or to ask whether these were not, perhaps, steps in the wrong direction. Suppose we had today the Federal and state labor legislative situation that existed prior to 1932 (together with local law enforcement) and either the East and Gulf Coast dock strike or the New York printers’ strike had been called?

Each of the New York newspapers would probably have tried to continue publication. It would have offered permanent employment, say to any competent printer, at a basic wage of $145 a week. If the employers and the applicants were guaranteed adequate police protection, is there any doubt that the papers would get enough eligible applicants even from members of the union itself? And if mass picketing were again treated in law as what it is in fact—intimidation and
coercion—would members of non-striking unions abet the strike by “honoring” the picket lines?

TOWARD WAGE-FIXING

Of course if the members of the striking union were really underpaid, as they contend, it would be impossible for the employers to replace them permanently with suitable substitutes. It is precisely because they know that other and less privileged workers would be eager to take over their “underpaid” jobs that they set up picket lines. What is constantly forgotten is that the coercion unions exercise is primarily coercion of their fellow workers.

The crippling strike of the Atlantic and Gulf Coast dock workers would not have been possible without the intimidation unions are permitted to exercise through picket lines and violence. In the dock strike that favors remedy of so many employers and conservatives—the forced return to work under the “emergency” provisions of the Taft-Hartley Act for a “cooling-off” period of 80 days—has been exhausted. So leaders of the maritime industry, in despair, are calling for compulsory arbitration. No demand could be more shortsighted. If compulsory arbitration were imposed in the shipping industry, it would soon be imposed everywhere. Then demands for “equality of treatment” and “guidelines” would lead to outright wage- and price-fixing and a regimented and petrified economy.

OUR DOUBLE STANDARD

What is urgently needed is not more laws but revision or repeal of bad laws now on the books. Unless we want to be forced step by step into more and more government control and coercion, we must restore free competition in the labor market. This means first of all enforcement of the common law against coercion and violence. It means prohibiting all picketing in numbers. It means ceasing to give unions power to bargain for anyone but their own members. It means, in brief, restoring free collective bargaining.

Some will think that it also means prohibiting industrywide unions, or any union extending beyond a single plant or corporation, and otherwise making unions subject to the antitrust laws. Such measures are of dubious necessity and dubious enforceability. But certainly labor law must be made more balanced and two-sided. Either we should enact right-to-work laws, or illegalize the closed union. Either we should once more permit “yellow-dog” contracts, or prohibit compulsory union membership. The right not to join a union should be as clear as the right to union, and the right to work as clear as the right to strike.

Invitation to Inflation
January 28, 1963

President Kennedy’s State of the Union Message was a tour de force. It covered almost every conceivable project or dream. But it said not a word about the most urgent problem now facing the country—that of paralyzing strikes. We must assume either that the President does not consider the subject important, or that he is perfectly satisfied to give any labor union, big or little, power to silence a city’s newspapers, to halt its transportation, to immobilize the country’s shipping, or to shut down any industry whatever, until that union’s demands, no matter how unreasonable, are met.

Mr. Kennedy’s emphasis was on a tax cut of the huge amount of $13.5 billion, phased over three years. But this is not to be accompanied by any corresponding reduction in expenditures. On the contrary, these are to be increased. A strange recommendation in the face of an already officially predicted deficit of $8.8 billion in the current fiscal year. The President is frankly planning another deficit, even a series of deficits. His only restriction is that they are to be “manageable” and “temporary.”

BROKEN PROMISES

But what assurance can we have that they will be either? What is considered “manageable”? How long is “temporary”? We have been living on such promises now for 30 years. They have never been kept. I cited the sad record in a Newsweek column of Nov. 21, 1953. It began with Roosevelt’s pledge of March 10, 1933: “I give you assurance that . . . within a year the income of the government will be sufficient to cover the expenditures of the government.” (The budget was never balanced in any of the twelve years that FDR was in office.) It came down to Eisenhower’s pledge of Feb. 2, 1953: “The first order of business is the elimination of the annual deficit.” (There was a deficit for fiscal 1953, 1954, and 1955.)

The net outcome has been 27 deficits in the last 33 years. As I concluded my column of ten years ago: “Each President began with pious promises of a budget balance, but there were always reasons why this could be done only in some indefinite future, and not now. Meanwhile the national debt keeps mounting and the purchasing power of the dollar keeps shrinking.”

Is there any reason to suppose that the even vaguer promises of Mr. Kennedy are more likely to be kept? It is not found in his own record. Secretary of the Treasury Dillon said on Oct. 17, 1961: “Let me repeat so there will be mistake. The President intends to submit to Congress next January a balanced budget for fiscal 1963.” Mr. Kennedy did indeed, as promised, submit a budget in January 1962 ostensibly balanced for fiscal 1963.
1963, but now admits that there will be a deficit of $8.8 billion.

**CRUEL DECEPTION**

Nor does the present program of rising expenditures and huge tax cuts give any reason to hope for a budget balance within the foreseeable future. The tax cuts are not of a kind likely to stimulate increased revenues or maximum economic growth, but merely increased inflation.

And if the tax cut lets loose this inflation, it will be a cruel deception of the American people. Taxpayers will not be left with more purchasing power. It will be eaten up in higher prices. Inflation is itself a tax. If evenly spread, it would be equivalent to a flat-rate income tax and flat-rate capital levy without exemptions. But it is never evenly spread. It falls on the industrious and thrifty. It is escaped by nimble speculators.

It is true, as the President declares, that our Federal taxes are now oppressive and "too heavy a drag" on production and growth. But when such enormous sums must be raised, there is no magic reform that can make them unburdensome. The only cure is to slash our exorbitant expenditures. This would not be difficult. Our defense expenditures for the fiscal year 1964 are budgeted at $55.4 billion. This means that non-defense expenditures, including social security, farm-price support, and foreign aid, exceed $67 billion. All Congress needs is courage and a carving knife.

**Deficits as a Policy**

February 4, 1963

Mr. Kennedy is the first President who has ever openly advocated deficit-financing as a policy. He is planning a deficit of $11.9 billion for the fiscal year 1964 and expects deficits in succeeding years. He lumps them all together by calling them a “temporary deficit.” Eventually, because of the stimulus that a huge tax cut combined with increased expenditures is expected to give to the economy, these “transitional” deficits are expected to cure themselves and bring about a surplus.

Taxpayers will uneasily remember that they have heard all this before. They have been hearing it off and on, in fact, ever since the days of the New Deal. “It has taken courage for the Federal government to go into the red,” said Franklin D. Roosevelt on July 8, 1938, “but it has been worth it.” Somehow the promises that deficits would bring surpluses have never been kept. We have had 27 deficits in the last 33 years.

Is there any prospect that the theory will work better this time? Before we try to answer that question, let us see what is being proposed.

Mr. Kennedy is proposing that the Federal government spend in fiscal 1964 more than it has ever before spent in its history, in peace or war. He is asking for “administrative” expenditures of $98.8 billion. This tops even the $98.4 billion of the peak war year, 1945. In the cash budget (which includes old-age pensions, etc.) he proposes to spend the unparalleled sum of $122.5 billion.

**NON-DEFENSE SPENDING**

Throughout his Budget Message the President gives the impression that this record budget is brought about mainly by increased defense expenditures. That thesis cannot be maintained. True, he is proposing defense expenditures for 1964 of the record amount of $55.4 billion. But as total cash expenditures will reach $122.5 billion, this means non-defense expenditures of $67.1 billion.

And non-defense spending has risen faster than defense spending. If we compare 1964 with 1954, we find that while total defense expenditures have increased $8.4 billion, non-defense expenditures have increased $22.9 billion and, counting social security, etc., $42.2 billion.

If Congress is sincerely looking for places where it can cut the budget, it need not look far. It might look at the scheduled expenditures of $4.2 billion for space research connected with defense, at the $3.7 billion scheduled for foreign aid, at the $5.8 billion for farm programs, at the $6.7 billion for “commerce and transportation,” at the $1.1 billion for housing subsidies, at the $6 billion for veterans’ programs, and at the glorious $27.4 billion for “health, labor, and welfare.”

**NO FOURTH DIMENSION**

The President speaks of all these and many more programs as “a necessary payment on future progress.” He insists that others “are for activities which will promote increased productivity and economic growth, yielding substantial benefits in the future.” But this is to talk as if the money for these programs came out of some fourth dimension. It is to forget that it is taken away from the taxpayers. It does not “meet more national needs.” It causes every tax-paying family to meet fewer of its own needs. It leaves less for private persons and private business to invest in the future, in increased productivity or economic growth.

So far we have taken the budget estimates at face value. But suppose, as there are strong reasons for
thinking, that expenditures are even more than $98.8 (or in cash, $122.5) billion; that revenues are less than $86.9 billion, and that the deficit is more than $11.9 billion? This is more than possible. A year ago the President estimated a surplus for the current fiscal year of $500 million. This has now become an expected deficit of $8.8 billion, because expenditures are $1.8 billion more and revenues $7.5 billion less than he estimated.

The budget that Mr. Kennedy has submitted, in brief, is irresponsible. Even if the deficit is no greater than the $11.9 billion he estimates, the course he proposes of raising expenditures and cutting taxes can lead only to more inflation, and will undermine confidence in the world’s anchor currency, the dollar. ✿

A Dictated Settlement
February 11, 1963

While the attention of Congress is being diverted by fantastic proposals to slash taxes in the face of an already huge prospective deficit, ominous developments have taken place in the field of labor.

The Atlantic and Gulf coast dock strike, which had kept 100,000 people out of work for more than a month, tied up nearly 700 ships, caused untold spoilage of fruit and other cargoes, and total damage estimated at $700 million to $1 billion, has been “settled.” It remains to be seen whether the settlement doesn’t cause even more damage in the long run than the strike.

This settlement was dictated by the Kennedy Administration. The terms were heavily weighted in favor of the union against the industry. On the wage and “welfare” side they granted the union a 39-cent-an-hour package over two years—far in excess of any “guidepost” even the President’s Council of Economic Advisers had dared to propose. (Dock workers’ pay has averaged around $3.65 an hour.) But the chief issue involved was the outrageous featherbedding of the ILA union, which the employers had sought to mitigate. The President’s three-man board simply swept this issue under the rug by recommending that it be put off for a two year “study.”

SOME PROTESTS
This highhanded action has at least drawn a vigorous protest. The Wall Street Journal writes: “The same government which blew its top at a steel company for announcing modest price increases less than a year ago, and threw its full force into rolling back those increases . . . apparently thinks the dock settlement is just fine. President Kennedy says he is ‘gratified.’ In a sense the government should be gratified, for the government dictated the settlement; there is no other word for it . . . Senator Morse and his colleagues on the President’s three-man board took the bulk of the union’s demands and the government told the companies to knuckle under . . . The upshot is a settlement that settles nothing and therefore may well prepare the way for more vicious strikes later.”

The National Association of Manufacturers calls the settlement imposed by the Wayne Morse board “a bare-knuckled display of government power unsanctioned by law.”

The New York Journal of Commerce calls the settlement a “crushing victory over management,” and adds: “Mr. Kennedy might just as well have raised the tariff, imposed a tax on exports, or simply raised taxes on firms engaged in foreign commerce to the tune of $18 million to $26 million a year . . . It is the President himself who has finally given the answer to the question of whether he would crack down on excessive labor demands with the same ardor that he cracked down on steel price increases. It can be stated in three flat words: he will not.”

BUYING MORE STRIKES
Where will Mr. Kennedy go from here? When it was pointed out to him that if he dictated steel prices he might logically be asked to dictate all other prices, he disavowed such an aim and treated his crackdown as an isolated episode. But having dictated a thumping wage increase for a featherbedding union, how can he deny an equal award to other unions?

The Kennedy Administration has been toying for a long time with the idea of compulsory arbitration of labor disputes. This has been shown in the Council of Economic Advisers’ notion that it can set up wage-determining “guideposts,” in former Secretary Goldberg’s statements and interventions, and in present Federal interventions. But conservatives and liberals who rightly fear this outcome are confused and divided among themselves. Some ask for antistrike legislation. Others suggest putting the unions under the antitrust laws. But the real need is simply to restore freedom of bargaining. Bargaining cannot be free as long as employers are legally compelled to bargain solely with specified unions, or as long as the compulsory union shop is explicitly sanctioned by Federal law. ✿
The President’s special message to Congress on tax reduction and “reform” rests on a network of outworn economic fallacies. Its basic assumption is that the way to reduce unemployment and increase economic growth is to cut the tax rates on the lower income groups and to squirt more “purchasing power” into the economy through huge government spending and huge deficits.

The truth is that enactment of the President’s program would bring on inflation and imperil the dollar as a world currency. There is no reason to suppose that it would either reduce unemployment or promote economic growth. Unemployment is caused by discoord-ination of the wage-price system. As long as unions are granted their present powers to extort wage rates beyond the level of marginal labor productivity, they will perpetuate and increase unemployment in the very face of inflation. So far as economic growth is concerned, it can be promoted only by policies less hostile to profits, risk-taking, success, and investment. Only encouragement to investment can raise wages.

**PENALIZING SUCCESS**

Most of the tax cuts recommended by the President are not calculated to encourage business or employment to expand. They increase, rather than diminish, the incentive-stifling progression in the tax-rate schedule. As the President himself points out: “The overall savings are proportionately highest at the lower end of the income scale”—nearly 40 percent for those with incomes of less than $3,000, and less than 10 percent for those with incomes in excess of $50,000. And the so-called “reforms” largely take back whatever relief the tax-rate cuts do give to the middle and upper income level taxpayer.

As one investment house (Aubrey G. Lanston & Co., New York City) bitterly puts it: “As far as individuals are concerned, the plums in this tax package would go to the person who doesn’t own his own home; doesn’t save and provide capital to American industry through stock ownership; doesn’t carry his proportionate share of the support of our churches, hospitals, colleges, and charitable causes; doesn’t pay much in taxes to support city schools and other local services and to pay for state government; and doesn’t happen to fall into ill health. Nearly 1 million taxpayers would be removed from the tax rolls, in fact, to vote themselves greater future benefits without even the need to fill out and turn in a nominal tax return.”

**A 50 PERCENT TOP**

With a few exceptions the “reforms” recommended by the President would make income-tax paying more unfair as between different taxpayers rather than less. The exceptions are the proposal to allow an indefinite carryover of capital losses, the proposal to remove the present limit on deductions for catastrophic medical expenses, and the proposal to permit those who receive widely fluctuating amounts of income from year to year to average them out for tax-rate purposes. This last reform would be much less necessary if it were not for our steeply graduated tax-rate schedule—particularly the rates over 50 percent.

The proper course for Congress would be to con-centrate on slashing nondefense expenditures, to balance the budget at present tax levels, and to postpone the whole “tax reduction” program as such. It is true, as the President concedes, that our present tax burden “reduces the incentive for risk, investment, and effort thereby aborting our recoveries and stifling our national growth rate.” But the way to reduce it is to slash the spending that makes it necessary, not to invite deficits and inflation.

While waiting for the appropriation committees to do this, revenue-raising committees of Congress might well go ahead now with tax reforms but real reforms, designed to maintain revenues while reducing deter- rents to economic growth. There is room to mention only one such reform here. Slash all income-tax rates above 50 percent to that level. All these rates together bring in less than $1 billion a year, or less than 1 percent of what the government spends. Yet it is impossible to estimate how much they choke incentive and discour-age investment.

**Legalized Labor Chaos**

Some day, presumably, the New York newspaper strike will be settled. But it is unlikely that the terms of the settlement will be such as to promote the prosperity of the papers. Hence it is unlikely that the terms will be in the long-run interests of the employees themselves.

The precedent established in the month-long dock-ers’ strike is ominous. Wholly apart from the fact that the wage boost forced on the shipping industry by the extralegal Presidential board went far beyond the “guideposts” set even by the Council of Economic Advisers, the real issue of featherbedding was untouched. The settlement, therefore, tends to entrench make-work practices and to discourage all future efforts toward
efficiency. The real issue in the New York newspaper strike also is union insistence on bogus and featherbedding and preventing economies through modernization.

THE MUZZLED PRESS
There is mounting concern within the newspaper profession. James Reston, chief of the Washington bureau of *The New York Times*, wrote in a column intended for syndication:

“The present system is intolerable for the public, the unions and the publishers alike. The President of the U.S. cannot censor the New York papers. The Congress of the U.S. is specifically forbidden to abridge their freedom . . . but Bert Powers, the boss of the New York printers, cannot only censor them but shut them down. What is ‘free’ about a press that can be muzzled on the whim of a single citizen?

“This is anarchy. . . . The papers will have to be published, in New York if possible, elsewhere if not; in union shops if possible, in non-union shops if not. And they will have to be distributed through the mails if necessary. The present situation cannot be accepted in a democratic society. . . . Values and duties have become so confused that even the suggestion of publishing without the consent of the unions is now regarded as a declaration of war. How the old editors who founded our press would have hooted at that!”

The *Times*, by sending out an order to kill this column, showed how far intimidation has gone.

Why didn’t the New York papers continue publication, strike or no strike, instead of allowing themselves to be shut down and silenced for more than two months? Continued publication was not *prima facie* impossible. When, more than three years ago, a strike hit the two daily newspapers of Portland, Ore., the papers continued publication the next day, first combined, and later again as separate papers. They have continued publication, though the strike has never been settled.

WHY NO PUBLICATION

The Federal government is moving toward compulsory arbitration of labor disputes. Its dictated settlement of the dock strike reveals the pattern. It allows a situation to develop in which no other solution seems possible. It affects to be following a “hands-off” policy, but under existing laws it is intervening on the side of the unions, and even of union intimidation, every day.

The Norris-La Guardia Act encourages picket-line violence. It denies injunctive relief to employers who are suffering irreparable injury from clearly unlawful conduct. The Wagner-Taft-Hartley Act gives unions a privileged status enjoyed by no other private groups. It forces employers to bargain exclusively with them, even when their demands are beyond all reason. The law is hypocritical. It makes it “an unfair labor practice for an employer . . . by discrimination in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage membership in any labor organization” and then explicitly sanctions imposition of the compulsory union shop.

There will be labor chaos as long as such legislation remains. How long will it take for the President and Congress to recognize this? ✫

How to Help the Poor
March 4, 1963

On the argument that it will put zip in the economy and reduce or wipe out unemployment, the President and his advisers are planning to increase spending and cut taxes, and so bring about a budget deficit for the next fiscal year of some $12 billion. On the argument that it will help “the little fellow,” as well as increase “mass purchasing power,” the biggest tax slashes are to be made on incomes of $3,000 or less and the smallest percentage cuts on the largest incomes. As, in addition, nearly a million low-bracket taxpayers are to be removed from the tax rolls altogether, the net effect will be to increase tax discrimination against those who earn the higher incomes.

Let us assume that neither of these proposals is designed for mere vote-catching, but is made with perfect sincerity. It is nonetheless true that both of them rest on flagrant economic fallacies. Budget deficits would hurt, not help, workers and people with low incomes. Punitive taxation on people with higher incomes, and limitation or disallowance of honest deductions (stigmatized as “loopholes”) must also hurt, not help, workers with low incomes.

INFLATION IS A TAX
Cutting taxes on low incomes, at the cost of a huge budget deficit, will *not* increase the purchasing power of low-income groups. For if the deficit is financed by borrowing from the banks and increasing the money supply (as it almost inevitably will be), it will create inflation. It will drive up prices. And the higher prices will eat up any increase in nominal dollar purchasing power. The lower-income groups will not be able to buy
any more with their increased supply of depreciated dollars than they could with fewer but better dollars. Their “increased purchasing power” will fade away.

Equally fallacious is the idea that budget deficits create prosperity and increase employment. They do mean inflation. They do raise prices. But they can increase employment only to the extent that they lower real wages—i.e., only to the extent that the rise in prices is not offset by an equal or greater increase in wage rates. Any prosperity brought by inflation is at best evanescent. It can be kept going only by greater and greater doses of inflation.

The belief that deficits cure unemployment got a crushing refutation in the ’30s, when for ten years an average annual deficit equivalent to $19.7 billion today (as a percentage of GNP) was accompanied by average unemployment of 18.6 percent of the labor force.

DON’T PUNISH SUCCESS
Punitive taxation of corporations and of high-income earners also hurts workers and low-income earners. For whatever hurts profits and capital accumulation, whatever discourages saving and investment, means fewer jobs, makes labor less productive, and makes real wages lower than they otherwise would be. Again and again in the last year the Administration has deplored whatever hurts “initiative, risk-taking, and effort.” But its spending and tax recommendations bear little relation to this verbal concern.

A program that would truly help workers and other low-income groups would be almost the exact opposite of the one the Administration is proposing. It would slash spending enough to balance the budget at present revenue levels. For it would recognize that all expenditures have to be paid in one way or another; that a deficit is paid for by inflation; and that inflation is a peculiarly vicious form of tax, falling most heavily on workers.

A program truly designed to help wage-earners would terminate the punitive tax rates on high incomes. It would slash such rates immediately to a top level of 50 percent, on the ground that anything above that is prima facie confiscatory and a profound discouragement to initiative, effort, risk-taking, capital accumulation, saving, and the investment that increases employment, productivity, and real wages. For the same reason it would mitigate estate taxes, capital-gains taxes, and double taxation of dividends.

In brief, it would halt all punitive policies and approve a tax program to maximize production.

Hellerious Economics
March 11, 1963

What is the rationale behind Mr. Kennedy’s extraordinary proposal that, in the face of a huge deficit of nearly $9 billion in the current fiscal year, we should increase spending, drastically cut taxes, and bring about still another deficit of nearly $12 billion in fiscal 1964, plus an indefinite number of deficits thereafter? On its face, this program seems the height of fiscal irresponsibility. How can it be defended?

The most elaborate defense of it is to be found in the President’s annual Economic Report published on Jan. 21. The report consists of a twenty-page message to Congress signed by the President and a 268-page report of the Council of Economic Advisers (164 pages of text, 104 pages of tables) signed by Walter W. Heller as chairman. It is impossible to say how much Mr. Kennedy’s policies are based on chairman Heller’s economic theories, or how much the theories are an attempt to rationalize the policies that Mr. Kennedy has decided to adopt. In either case the outlook is ominous.

For the theories set forth in the full report, and summarized in the President’s message, are utterly fallacious. And if policies based on them are persisted in, they must imperil the dollar and ultimately lead to a disastrous inflation.

WAGE DISTORTIONS
Mr. Kennedy, laudably, wants to cure unemployment. But he never mentions, and the whole Economic Report never mentions, the main cause of unemployment, which is the excessive wage rates successfully insisted on by some unions in key lines. Practically all unemployment is attributed by the President to “insufficient demand.” And insufficient demand is always interpreted to mean insufficient money supply. So unemployment is always to be cured by more government spending and more money, while wage-rate distortions are systematically ignored.

The way to cure unemployment and give zip to the economy, on this theory, is to have huge and continuous deficits, to increase spending, and to cut taxes. “The main block to full employment,” says the President, “is an unrealistically heavy burden of taxation. The time has come to remove it.” The President speaks as if the burden of taxation had nothing to do with the amount of government spending. This spending, in fact, is to be increased. The question may well arise in the reader’s mind: why not abolish taxes altogether? Then there would be no block to full employment whatever.
‘DEFICITS FOR STRENGTH’

Indeed, Mr. Kennedy is not daunted by paradox. He tells us that if we fail to cut taxes, we will slide into recession, and then “the cash deficit for next year would be larger without the tax reduction than the estimated deficit with tax reduction.” We have entered the world of Alice in Wonderland, where the “prudent” and “responsible” thing is planned deficits, and where “if we were to try to force budget balance by drastic cuts in expenditures . . . we would not only endanger the security of the country, we would so depress demand, production, and employment that tax revenues would fall and leave the government budget still in deficit.”

But what if the Heller theory fails? What if heavy unemployment persists (as in the ’30s) even with constant huge deficits? What if the vague hope is not realized that some miraculous prosperity will balance the budget in spite of reduced taxes? Mr. Kennedy himself conceded that “if we were currently straining the limits of our productive capacity . . . tax reduction would be an open invitation to inflation, to a renewed price-wage spiral.” What if this inflation occurs (as is altogether probable) even under present conditions of more than 94 percent employment?

It would be flattering to call this Heller-Kennedy budget theory Keynesism. It carries the logic of deficits to lengths that would have appalled Keynes himself. For Keynes (as Per Jacobsson has just reminded us) at least recognized that excessive real wage rates make full employment impossible.

The Heller-Kennedy spend-more-and-tax-less theory can lead only toward fiscal and monetary chaos.

The Growth Mania

March 18, 1963

The American public, as H.L. Mencken used to point out, lives through a succession of crazes. In the economic field the last generation has lived through many. Once the great watchword was “full employment.” Now the supreme goal is “economic growth.” Even the American Bankers Association has just held “A Symposium on Economic Growth.”

If we took the word “growth” to be merely a shorthand expression for an improvement in economic conditions, this would be a vast improvement over previous catchwords. But the “growth” mania rests on a special set of assumptions and has taken a peculiar form. It assumes that there is something called “the gross national product,” or “GNP,” that can be precisely measured. Anyone who has seriously studied how these statistics are compiled knows that they are full of arbitrary and questionable assumptions. GNP is measured in a dollar that is itself constantly fluctuating in value. The GNP can be pushed up to any amount simply by inflating the currency enough.

Dollar fluctuations are only one of the dubious elements. Government expenditures are counted as part of GNP. So if the government seizes half of Peter’s income and pays it over to Paul, the GNP total counts the addition to Paul’s income but not the subtraction from Peter’s. GNP is built out of arbitrary decisions as to what activities are “productive” and what are “unproductive.” On the one hand it includes only goods and services that pass through the market. On the other hand it involves double counting at a hundred points.

WHY 4 PERCENT?

Every country measures its GNP in a different way. Every GNP figure is an arbitrary estimate subject to error. The estimate of Communist countries, with no free-market guides, is wholly unreliable. Yet the growth zealots assume that all these estimates can be precisely compared. They even assume they can precisely measure and compare annual percentage rates of growth. And for some reason they have made their goal a precise annual rate of growth. Thus President Kennedy, addressing the American Bankers Symposium, recommends “pushing our economy to 4 percent [annual rate of growth] instead of 3 percent.” This, he adds, “might total over the next ten years in today’s prices $400 billion more in output of goods and services.” But why just 4 percent? Why not 5 percent or 6 percent, which would mean many hundreds of billions more still in goods and services?

And why a fixed rate of growth at all? No individual sets such a goal for his own income. If Paul has an income of only $1,000 this year, he will hardly be satisfied with $1,040 next year. He wants to jump to $5,000 or $10,000 right away, or as soon as possible. If Peter already has an income of $25,000, he may not fight very hard for $26,000 next year, or any increase at all.

TELEVISION RECORD

Does a specific industry want or need to grow just 4 percent a year? In a Newsweek column (March 2, 1959) I pointed out that the output of TV sets increased 2,757 percent between 1946 and 1947, 387 percent between 1947 and 1948, 211 percent between 1948 and 1949, and 146 percent between 1949 and 1950. And then “growth” stopped entirely. So what? The U.S. has more and better TV sets than any country in the world.

What we need is not some fixed national “rate of growth” established by the fiat of government officials,
but freedom for each of us to improve his own economic condition as much as his energy and talents allow.

The true role of government is to protect life and property and to stop killing incentives. It will not promote growth by cutting taxes while maintaining or increasing huge government spending. That can only bring about deficits, inflation, and debasement of the dollar. It can best promote growth by preserving a sound currency, by ensuring free and fluid markets in goods and labor, and by encouraging saving and investment. It is above all investment, which puts more and better machines in the hands of the workers, that increases their productivity and wages and promotes "economic growth." ★

Inflation as Cure-All
March 25, 1963

Unemployment took a turn for the worse in February, rising to 6.1 percent of the labor force, the highest in fifteen months. On the day this was announced there came a chorus of demands for a quicker and bigger tax cut, more government spending, bigger deficits, more inflation.

President Kennedy, following Labor Secretary Wirtz and AFL-CIO president George Meany, warned that this “intolerable” unemployment would grow worse unless Congress quickly approved his tax-cut proposals. The Democrats on the House-Senate Economic Committee called for a $6 billion tax cut this year instead of the President’s own plan for a mere $3 billion.

These Democrats, under the leadership of Senator Douglas of Illinois, support the Administration’s goal of a $10.3 billion net tax reduction over three years, but feel that the amount allocated for 1963 is too small. “The largest doses should be given when the patient is the sickest,” they say. And they add: “The widespread demands for stimulative tax reductions are, by the same token, demands for stimulative monetary action. Monetary policy must now help fiscal policy to do the stimulative job which, unfortunately, the monetary authorities haven’t done.”

This is an unmistakable demand for outright and reckless inflation.

WHY UNEMPLOYMENT?
Before it allows itself to be stampeded, Congress should ask a few questions. Why has unemployment gone to the highest level in fifteen months? Why is it 24 percent higher than the average for the Eisenhower Administration? (In the eight years from 1952 through 1960 unemployment averaged 4.9 percent.) Is this the way the New Frontier economics has “got the country moving again”?

What is the trouble? Is the money supply too small? It has increased 15 percent since 1953, when unemployment was only 2.9 percent. Haven’t there been enough deficits? The deficits since the end of fiscal 1953 have averaged $3.2 billion a year. And we have recently been doing much better than that. The deficit for fiscal 1961 was $3.9 billion, and for 1962, $6.4 billion. For the present fiscal year we are promised a deficit of $8.8 billion, and for fiscal 1964 of about $12 billion. Why, with all this new “purchasing power” pouring into the economy, does unemployment increase?

Could it be that “insufficiency of purchasing power” is not the cause of the unemployment? Could it be that unemployment is the result of encouraging unions to gain excessive demands? Isn’t the unemployment a sign that, in the lines in which it occurs, wage rates and labor costs are too high? Are some unions pricing their members out of the market?

DOUGLAS VS. DOUGLAS

This is what economists contend. And Paul H. Douglas, when he was a professor of economics, and before he got Senatorial ambitions, was among them. In 1934 he wrote a massive book called The Theory of Wages, in which he arrived at the conclusion that “if wages are pushed up above the point of marginal productivity, the decrease in employment would normally be from three to four times as great as the increase in hourly rates so that the total income of the working class would be reduced.”

Applying this to the present situation, may not our unemployment of 6 percent indicate that wage rates are 2 percent higher than the productivity level that would permit full employment and maximum payrolls? (As 2 percent is an average figure, the assumption would be that most wage rates are not too high but that a few wage rates are much too high.)

Why is Senator Douglas, why is every member of the Kennedy Administration, completely silent on this possibility? Why does no one dare to ask whether full employment might not be restored by a little wage adjustment? Why is everyone shouting for tax reduction, spending increases, deficits, more inflation, all of which threaten the future of the dollar?

Of course we need tax cuts, particularly of the taxes on investment and production. But the only way to get them without courting a disastrous inflation is to slash intolerable government spending. ★
Less Coffee in the Cup  
April 1, 1963

In the summer of last year, at the United Nations, the representatives of 71 countries attended a conference on coffee. They drew up an elaborate agreement to “stabilize” (i.e., to hold up) the price of coffee. This involved fixing export quotas for 36 producing nations. This International Coffee Agreement was signed on behalf of the U.S. Government on Sept. 28. By the end of November, 54 governments had signed. But the agreement must still be ratified by the U.S. Senate. On March 12, Under Secretary of State George C. McGhee argued before the Senate Committee on Foreign Relations in favor of such ratification.

The argument in favor of the agreement, as stated by Secretary of State Dean Rusk, is that it “offers the best prospect of arresting any further decline in world coffee prices, thus helping to assure stability in foreign-exchange earnings of coffee producers in some 35 developing countries in Africa, Asia, and Latin America.” It is chiefly intended to help Latin American producers, particularly in Brazil and Colombia, which respectively account for 39.2 percent and 13.1 percent of total world exports. It would be chiefly at the expense of U.S. consumers, who import 51.7 percent of total world imports. Of the other 70 importing nations, the most important are France, with 9 percent of the total, and West Germany, with 8 percent.

Crops Destroyed
Will the agreement in fact help to “stabilize” coffee production and prices without excessive cost? Neither theory nor experience gives any reason for supposing that it will. Listen to the judgment of Karl Brandt, director of Stanford University’s Food Research Institute, in Challenge magazine (February 1963):

“Such price-fixing . . . while it might mitigate the violence of short-term price fluctuations, inevitably caused profound and serious dislocations for production, processing, stockholding, and consumption. . . . The ‘stabilization’ of cotton prices in the U.S. has not only frozen production in high-price locations, but it has spurred and accelerated cotton production in other countries. And 60 years of efforts to stabilize coffee prices have led to such extreme methods as destroying within a period of twelve years a quantity equivalent to three years’ total world coffee consumption. This did not appreciably help Brazil or Colombia, but instead spurred competitive production in other parts of the world, primarily in Africa. . . . International commodity agreements, at best, do not offer more than a temporary sedative that may give the political sensation of relief.”

Our Double Standard
Enormously complicated bureaucratic controls will have to be set up within each nation in order to carry out this international coffee agreement. It fixes export quotas for 36 countries. But in order to comply, each of these countries will have to fix production or acreage quotas for each of its thousands of individual producers. Thus the marginal producers, which a free market would eventually eliminate, will be frozen in. The inefficient producers will keep going. Costs as well as prices will be kept high. Such agreements not only eliminate competition between nations, but competition between individual producers within nations.

It is bad enough when the U.S. penalizes its own consumers in order to benefit its own marginal producers of wheat or cotton. It is more ironic when it proposes to penalize its own consumers in order to benefit the marginal coffee producers of other countries, and to do so by conspiring to forbid a free market. McGhee admits that the “international” coffee agreement “would collapse without our participation.”

But the most bitter irony of all is that the U.S. Government has signed a document proposing to resort, and to an enormously greater extent, to precisely the practices for which it puts American businessmen in jail. The double standard was never more flagrantly or cynically applied. Price-fixing in industrial products is condemned and punished as a crime. Price-fixing in labor, or in farm products, domestic or foreign, is lauded and enforced as desirable, benevolent, and imperative.

The Right to Publish  
April 8, 1963

Let us hope that the settlement of the New York newspaper strike will not be followed merely by a sigh of relief but by absorption of its elementary lessons and action to prevent similar calamities.

It has been a strike in which everybody lost. There will be no victors. Let us pass over the incalculable loss to the New York public in being deprived of the daily news for nearly four months; the losses of small newsstand owners, department stores, specialty stores, theaters; the staggering losses of the newspapers themselves, and the losses that their 20,000 employees, including the strikers, can never make up. Let us concentrate on one question: how was it possible for one private citizen, or at best a small handful of men, to do what Congress and the President are expressly forbidden to do in the Constitution—not only to abridge the
freedom of the press, but to shut it down entirely for nearly four months?

In the enormous discussion of the New York newspaper strike, the answer to this question was almost never frankly given. Yet that answer is clear. Partly this result was possible because Federal law gravely abridges the bargaining freedom of individual workers and of employers. It is so drawn as in effect to deny them injunctive relief from irreparable injury. The main reason the newspapers stayed closed was the simple fear of their managers that any attempt to publish would lead to violence and bloodshed.

FEAR OF VIOLENCE
It is greatly to be deplored that no one attempted to publish. Even if the fears had proved justified, at least the public would then have recognized clearly that what was keeping the newspapers shut down was the threat of union violence and vandalism, and the inability or unwillingness of the city authorities to protect the workers or the plants.

Those who are tempted to accuse the newspaper owners of timidity and cowardice, however, should seriously consider the risks they faced. Victor Riesel, in a recent syndicated column, gave details from unpublished accounts by Federal investigators of “shootings, slashing of tires, planting of nails on roadways, rubber truncheoning of opponents; beatings, breaking of arms and some really major assaults too numerous to list here.”

Yale & Towne’s Philadelphia plant, in late 1961, courageously and successfully stayed open during a stormy five-and-a-half-month strike, but had to organize its defense with the care of a military operation. To collect evidence it took 2,000 still photographs and 6,000 feet of motion-picture film during the strike. Its operations (I quote from the October issue of *Mill & Factory*) “included . . . a big magnetic broom to pick up nails thrown by strikers in the main driveway of the plant during the night hours. The broom picked up over a thousand nails in one day.”

THE KOHLER STRIKE
Those who want an illuminating case history, showing how even an “honest” union like the United Automobile Workers operates, should read *The Kohler Strike* by Prof. Sylvester Petro of the New York University School of Law (Regnery, 1961). There they will find described in detail the techniques of mass obstruction, violence, and vandalism, and how those who try to return to work can be frightened by vicious telephone calls in the night, by acid sprayed on their cars, by paint bombs hurled through their living-room windows.

The remedy? Mainly enforcement of the laws against violence. As Petro writes: “There are plenty of police. If hundreds are used to keep order when it is a question of protecting Communist bullies visiting the United Nations in New York City, it is not asking too much to have adequate police protection against union bullies.” It will help, too, if all picketing in numbers is outlawed. Among other measures Petro suggests: “The special privileges of compulsion granted unions by the NLRA must be repealed, and personal freedom must be restored to workingmen. . . . The duty to bargain must be repealed, for it cannot be enforced without reaching a result which nobody wants: namely, agreements, compelled by governments.”

For True Tax Reform
April 15, 1963

Opinion is beginning to clarify about the President’s tax cut and tax “reform” proposals, but a good deal of ambiguity remains.

Practically everybody favors a tax cut. But the tax cut advocates fall into at least five groups: those who want a tax cut (1) with increased expenditures; (2) with unchanged expenditures; (3) with a smaller cut in expenditures; (4) with an equal cut in expenditures, and (5) those who favor a tax cut only with a big enough cut in expenditures to balance the budget. The whole discussion would be clearer if everybody stated frankly to which of these five groups he belonged.

It is impossible to discuss taxes realistically in isolation from the level of expenditures. Too many people seem to have forgotten that the only reason we have to pay taxes at all is to meet government expenditures. And we do have to meet them. The planned $12 billion deficit for 1964 has been well described as a plan to borrow $12 billion from the American people to pay for their own tax cut.

But we can ask ourselves this hypothetical question: given the necessity of raising the same amount as existing taxes raise, could a better tax system be devised for doing it? This is the question of tax reform.

PUNITIVE RATES
True tax reform would be far more thoroughgoing than, and quite different from, the “reforms” the President has advocated. True reform would reconsider our balance between direct and indirect taxes. And it would re-examine the whole principle of the “progressive” income tax.
This device rests ostensibly on grounds of “social justice.” Yet it embodies the morally dubious assumption that a majority has a right to impose on a minority punitive tax rates that it would not dream of accepting for itself. The moral, legal, and economic harm done by the application of this discriminatory principle has been analyzed at length by F.A. Hayek, Milton Friedman, and other economists.

Our steeply graduated rates have not been successful even in raising revenue. It has been calculated that a flat income-tax rate of 23½ percent, with present exemptions, would raise as much revenue as the whole present scale of rates ranging from 20 to 91 percent. It has also been calculated that the basic rate of 20 percent yields 85 percent of the entire personal income-tax revenue, which means that the whole progression up to 91 percent yields only 15 percent. Finally, all the progressive rates above 50 percent yield less than $1 billion—i.e., less than 1 percent of our total revenues (including those from flat-rate social-security taxes) and enough to run the government for only four days.

DESTROYING INCENTIVES

Yet the harm that these punitive rates above 50 percent do in destroying incentives to effort, production, and investment, and in siphoning off the major part of the funds otherwise available for investment, is incalculable. Our present tax system is probably more responsible for our present slow rate of economic growth, of which the Administration is constantly complaining, than any other factor.

Public opinion is not yet prepared to accept a simple proportional income tax. But wiping out all tax rates above 50 percent would give an immense impetus to effort, risk-taking, and investment. The moral argument for such a ceiling is that any tax above 50 percent is prima facie confiscatory. As former Under Secretary of the Treasury Roswell Magill has put it, “a taxpayer’s interest in earning a dollar of additional income should at least equal the government’s.” The economic argument for such a ceiling is that it would do more in the long run to increase the real disposable income of workers and others in the lower income brackets than any temporary cut in their own tax rate.

Such a ceiling might possibly in the first year result in a trifling loss of revenue, but it would be certain in the long run to bring a substantial increase in revenues.

This 50 percent top, of course, apply not only to personal income taxes, but to corporate taxes and estate taxes.

Do Deficits Make Jobs?

April 22, 1963

The dominant argument of the Administration for tax cuts and bigger deficits is that these deficits are necessary to speed up “growth,” to reduce unemployment, and to save us from an economic tailspin.

This theory, now treated in Administration circles as an axiom, receives no support from experience. I have several times in this column referred to its crushing refutation in the ’30s. In the ten fiscal years from 1931 to 1940, inclusive, there was a deficit every year. The average annual deficit was 3.6 percent of the gross national product of the period, equivalent today to an annual deficit of $20 billion. Yet the average unemployment in that ten-year period persisted at 18.6 percent of the labor force. The same percentage today would mean nearly 14 million jobless.

Now the Machinery and Allied Products Institute, in testimony presented by its economist, George Terborgh, to the Joint Economic Committee of Congress, has made a careful and detailed statistical analysis of the relation of budget deficits and surpluses to changes in the GNP for the sixteen-year period from 1947 to 1962 inclusive. The comparisons are broken into three-month periods. Surpluses and deficits are measured in terms of the “national-accounts” budget, which the Administration favors, instead of the conventional “administrative” budget.

SIXTEEN-YEAR RECORD

What does the comparison show for these 64 quarters? “Of 51 quarters with a rising GNP, more than half (28) were associated with a Federal surplus, 23 with a deficit, while of 13 quarters with declining GNP, nearly all (12) were associated with a deficit.

“It may be objected that there is a lag between the budget position and the response of the economy, hence that we should ‘lead’ the former by a reasonable period. If we lead it by six months, the picture is not greatly altered. Of 51 quarters with rising GNP, 24 show budget surpluses in the second quarter preceding, 27 deficits. Of 13 with falling GNP, 7 show surpluses, 6 deficits.”

Let us interpret these comparisons. If Federal budget deficits really stimulated the economy, and surpluses depressed it, as the Administration assumes, we should expect to find expansion predominating during deficit periods and contraction predominant during periods of surplus. We find no such correlation. On the contrary, for simultaneous comparisons we find a slight positive correlation between surpluses and rising GNP (or deficits and declining GNP).
EFFECT OF WAGE RATES
But we did not need the statistical record of the '30s, or of the sixteen years from 1947 through 1962, to show us that the theory of growth by deficits or reducing unemployment by deficits was unsound. The only thing that deficits can produce is inflation. Inflation can temporarily stimulate an economy (at a high cost in the long run) only if, during the inflation, wages and other costs stand still, or at least rise less than prices. In that case the restoration of profits, or of the prospect for profits, can stimulate increased production and re-employment.

But this result is altogether unlikely today, when unions are encouraged to make ever-greater demands and when strikes are encouraged and even subsidized by legislation that takes the chief risks out of strikes and even pays unemployment insurance to strikers.

Unemployment could be sharply reduced, without deficits and without inflation, if unions ceased to be encouraged to make demands that price their members out of the market.

Unfortunately Terborgh, in spite of his own statistical results, comes to the wrong conclusion that what is really needed to stimulate the economy is to increase the money supply by monetizing “enough” of the deficit. This is an inflationary recommendation, particularly ill-advised in our present gold and balance-of-payments dilemma. But Terborgh is right in insisting that if there is to be tax reduction, “first priority should be given to two long-overdue reforms, a reduction in the corporate rate and a scale-down of high-bracket personal rates.”

Price Control by Warning
April 29, 1963

The President’s statement on the steel price increase this April was very moderate compared with that of last April. But even this year’s statement contained many ambiguities and left some crucial questions unanswered.

The first unanswered question was this: at what point would “selected” price rises, “prompted by changes in supply and demand,” which the President would tolerate, become “across-the-board” increases which he would not?

The total quantitative effect of the new steel prices on prices paid by the consuming public will probably be trifling. The price increases so far announced, which range from about 3 to 5 percent, apply to less than half the output of steel. The increase for all steel products appears to average about 1 percent. The industry’s output is in turn valued at 2½ percent of gross national product. A rise of less than 2 percent in a product that itself accounts for less than 3 percent of GNP hardly constitutes a national crisis.

Yet such a price rise can be very important to the steel industry itself. There has been no net steel price increase since 1958, though there have been five increases in steel wages raising wage-costs some 50 cents an hour. The industry’s dollar volume of net profits in 1962, at $567 million, was the lowest in ten years. Its profit margin on the sales dollar was 4.1 percent, the lowest since 1945. In its return on net assets it ranked 40th among 41 manufacturing industries. The three largest companies slashed their dividends. Five companies reported net losses. Employment in the industry dropped 13,000 compared with 1961 and 103,000 compared with 1957.

NO LEGAL BASIS
Yet the President declares that he is “interested in protecting the American public—and it is the American public which would suffer most from a general increase in steel prices.” How can the American public benefit, in either security or employment, from a sick steel industry?

And what does the President mean when he warns the steel industry that a price rise would “aggravate their competitive position” and be against “their own enlightened self-interest”? Is he implying that he knows better how and where to set prices than do the people in the industry?

The most ominous assumption in Mr. Kennedy’s statement and actions this year, as last, is that he has the legal and moral right to tell the steel industry, or any other, just when, where, and how to set its prices. The whole procedure is without sanction of law. It is government by whim, by personal displeasure, by vague threat of punitive action, a menace to the whole concept of the rule of law.

FREE MARKETS DECIDE
It is also selective and discriminatory price-fixing, without the explicit general standards that legal price-fixing would have to set. The President postpones a trip to Florida to issue a statement on a 2 percent increase in the price of steel, but is silent on a 100 percent increase in the price of two New York morning newspapers. Government officials last year announced “guideposts” which indicated that prices should be frozen where they were but wages could rise about 3 percent a year. Then the government this year stepped in and settled the East Coast dock strike by ordering a wage rise that knocked down even its own guideposts.

This does not mean that overall legal price- and wage-fixing would be preferable. All government price- and wage-fixing tends to reduce, distort, unbalance,
and disrupt production. The whole attempt to set up price- or wage-fixing “guideposts” is economically nonsensical. The only solution to this infinitely complicated problem is free competition and free markets.

The President’s expressed reason for his concern about steel prices is to head off “another inflationary spiral.” But the real threat of inflation today comes from the policies of the Administration itself—from unparalleled spending and planned deficits. As long as the government keeps pumping more dollar purchasing power into the economy, prices and wages must rise.

**The Web of Prices**

May 6, 1963

After his talk to the nation’s editors on April 19, President Kennedy was asked about his attitude toward both price increases and wage increases in the steel industry. “Now I know,” he remarked in replying, “that there are important editorial interests in this country who really don’t feel that this is the President’s business.” He went on to contend that it was.

A little further clarification on this point would be useful. The President has as much right as any other citizen to say whether in his personal opinion a certain price is “too high” or a certain wage is “too low.” But he has no moral right to use his office to try to impose a particular wage increase or veto a particular price increase by vague threats of punitive action, especially when Congress has not given him the legal right. Nor is it wise for Congress and the President combined to try to fix particular prices or wages in a private industry.

No one knows precisely how many prices there are in the American economy. The OPA once moderately estimated the number at 9 million. This implies trillions of interrelations. Prices and wages are interconnected and interdependent, in a web of inconceivable intricacy. To change any one may be to affect a thousand.

**DISCOURAGING STEEL**

What is the effect, for example, if the government, by intimidation or law, prevents a price increase in steel? The steel industry is already sick. Its dollar volume of net profits in 1962 was the lowest in ten years. Its profit margin of 4.1 cents on the sales dollar was the lowest in seventeen years. In its return on net assets it tied for last place among 41 manufacturing industries. Consolidated employment in the industry was down 11,000 compared with 1961, and 169,000 compared with 1957.

Yet it is precisely in this industry that a very small price increase (averaging about 1 percent) is followed by front-page headlines and a special statement from the President. The effect of governmental pressure to hold down steel prices below the level to which market forces would bring them could only be to make the industry still less profitable, to reduce employment in it still further, to discourage new investment and expansion, to keep it smaller and sicker than it would otherwise be. (The U.S. share of world steel production declined from 46 percent in 1950 to 25 percent in 1961.)

It is an error to suppose that by holding down steel prices below the market level the President or government could hold down “the price level.” The general price “level” depends upon the amount of money and credit in circulation. If steel prices are held down arbitrarily, while the amount of dollar purchasing power is unchanged, the tendency must be for more of other things to be bought or for their prices to be pushed up.

**DUTY OF GOVERNMENT**

It is often said that steel prices enter into many other prices, and that a price rise in steel will be “pyramided” by fixed percentage markups on finished goods. It is true that users of steel will try to “pass on” any price increase, but it does not follow that competition will allow them to. Again it is the total amount of money and credit that will determine the outcome.

What, then, is the function of the government, and the “business” of the President? It is to maintain freedom of competition, and to refrain from inflation.

But as regards competition, the Federal government has applied a flagrant double standard. It is constantly attacking the steel industry for “monopoly,” though there are more than 275 individual companies in the industry, and though the U.S. since 1959 has been a net importer of steel. Yet the single labor union covering the whole steel industry owes its immense monopolistic bargaining power to Federal law.

And so, far from refraining from inflation, Mr. Kennedy is planning a deficit for this fiscal year of about $9 billion, and another deficit for fiscal 1964 of nearly $12 billion, and is opposing any serious effort to reduce or eliminate these inflationary deficits, either by reducing expenditures or maintaining present taxes.

**‘Progressive’ Taxation**

May 13, 1963

In my column from Stockholm of Oct. 29 last year, I referred to the findings of the Swedish Taxpayers’ Association in a study shortly to be published. This study is now available, and it throws considerable
light not only on Sweden’s system but on “progressive” income taxation wherever it exists.

The Swedish system is somewhat more complicated than our own. After exemptions of only about $400 for single persons and $800 for a family (converting Swedish kronor at a rate of five to the dollar), individuals pay first a local proportional income tax averaging about 15 percent. Then they pay, on the rest of their income, national taxes ranging from 10 to 65 percent. Thus the marginal top rate not only can exceed 70 percent, but a person with a taxable income of only $4,000 may pay about 40 percent. The top rates above 70 percent apply to incomes above $30,000.

**SWEDISH EXPERIENCE**

Here are some of the findings of the Swedish study: the basic national income-tax rate of 10 percent brings in about 70 percent of total national income-tax revenue. If the maximum national rate stopped at 25 percent, the tax would bring in 90 percent of its present revenue. If the maximum rate stopped at 45 percent, the government would receive 99 percent of its present revenue. In short, the rates between 45 and 65 percent bring in only 1 percent of total national income-tax revenue. Swedes earning less than $6,000 a year pay 81 percent of all taxes; those with incomes above $6,000 pay 19 percent.

(It is instructive to notice how closely some of these figures parallel our own experience. The basic 20 percent rate yields 85 percent of the entire revenue from our personal income tax. Our whole progression up to 91 percent yields only 15 percent. And all the progressive rates above 50 percent yield less than 1 percent of total revenues.)

When most people hear such figures their first assumption is that “the rich” must be evading taxes. The Swedish study admits there may be some tax evasion, but estimates that the ratio is about the same at all income levels. The popular overestimate of the share of the tax burden that can be laid on the rich by progressive taxation, it points out, is “due to very exaggerated ideas as to the number of persons involved and their relative share of the income of the community.”

**DESTROYING INCENTIVE**

The total number of income-tax payers in Sweden in 1960, for example, was 3,478,254. The number of taxpayers with incomes over $20,000 was 4,350, or only one in 800, and their total income was only 1.6 percent of the total income reported. Even total confiscation of income in excess of $10,000, the study points out, would not add even 2 percent to total revenues.

This brings the taxpayer association’s study to the effect of these high taxes and harsh progressive rates on production and the creation of income. The study does not attempt any quantitative estimate, but contents itself with pointing out that “the inducement to work longer hours or to invest money in more or less venture-some enterprises declines at the same rate as the earnings of the taxpayers are reduced by taxes.”

The study does make, however, one interesting quantitative observation. Most Swedish taxes are levied for the purpose of redistributing income in the form of subsidies or social services, such as old-age pensions, free education, free school meals, free hospital care, etc. The study estimates that “if all redistributive measures were abolished, taxation would be reduced by about 65 percent.” But as two-thirds of this “redistributive” tax money returns in effect to the identical groups that paid it, one may ask whether this enormous monetary merry-go-round pays off.

Perhaps the most serious harm done by progressive taxation is not merely that it reduces incentives, production, investment, and growth, but that, by fostering the illusion that “the rich” are paying the bill, it contributes to the enormous growth in government expenditure.

---

**To Defend the Dollar**

May 20, 1963

If the Kennedy Administration continues the economic policies it has pursued since it came to office, if it reduces taxes while increasing expenditures, if it runs deficits in the current and next fiscal year of $9 billion to $12 billion, if it continues to press for easy-money policies, and the Federal Reserve continues to accede to them, what will be the consequences for the dollar?

Let us see how far we have come even over the last four years. At the end of 1958 our gold stock amounted to $20.6 billion. Net foreign short-term claims against this amounted to $13.6 billion. Today, however, our gold stock has fallen to $15.8 billion and net foreign short-term claims against it have risen to more than $20 billion. In other words, potential foreign claims exist to draw out our entire gold stock and $4 billion besides.

Our gold and creditor position continues to deteriorate. In 1958 the deficit in our national balance of payments was $3.5 billion; in 1959, $3.7 billion; in 1960, $3.9 billion; in 1961, $2.4 billion; in 1962, $2.2 billion. Administration spokesmen continually refer to the diminished rate at which we went into debt in 1961 and 1962 as an “improvement” or “reduction” of our balance-of-payments deficit. But this is wholly unwarranted. It is as if a man who went into debt $3,500 in 1958, $3,700 more in 1959, and $3,900 more in 1960 were to declare that his financial position was better.
now because he had only gone further into debt by $2,400 in 1961 and by $2,200 in 1962. The simple truth would be that a debt of $11,100 accumulated at the end of 1960 would have increased to $15,700 at the end of 1962. This is the real analogy.

**IF WE CONTINUE**

Moreover, even the rate of deficit accumulation is estimated to have increased again, in the first quarter of 1963, to $3 billion annually. We have been able to postpone gold losses by currency swaps and other expedients. But all of these deal merely with symptoms. We cannot permanently halt the deficit in our balance of payments or staunch the gold loss until we put our house in order.

If we continue our present fiscal and monetary policies, we must continue to lose gold. It is impossible to say at what point the loss of gold would precipitate a run on the remaining gold supply. If such a run starts, our government will be tempted—or feel forced—to resort to one of four main expedients:

1. Borrow heavily from the International Monetary Fund.
2. Try to get through the fund a general devaluation of world currencies.
3. Devalue the dollar alone.
4. Suspend gold exports.

**AN AVOIDABLE CRISIS**

Any one of these courses would be a blow to the prestige of the United States and to the prestige of the dollar. Other countries probably would not lend to us through IMF unless we agreed to put our house in order—to stop the deficits, stop increasing the money supply, allow interest rates to go up. But why wait until we are humiliatingly forced to do what it is in our interest to do now voluntarily?

Another general devaluation of world currencies would tremendously shock confidence. It would be a signal for renewed world inflation on a huge scale. Devaluation of the dollar alone—say to $70 an ounce for gold—would double prices of imports overnight, touch off a huge domestic inflation, and end the dollar as a key currency. Suspension of gold exports would put us on a pure paper basis. The dollar would plummet immediately in the foreign-exchange market. What happened to it eventually would depend on our monetary and budget policy from there on out.

Yet such a crisis is not inevitable. As John Exter of the First National City Bank of New York has pointed out, we might still end our balance-of-payments deficit overnight if we merely “turned off the faucet” of new money and credit and allowed interest rates to go up. All that is necessary is for the Administration to put its house in order and to abandon the specious idea that budget deficits and easy money are either necessary or sufficient to create prosperity and full employment. ✽

**Capital-Gain Tax Reform**

May 27, 1963

Instead of the Administration’s proposals for tax cuts and tax “reforms,” many businessmen and congressmen are advocating the cuts without any reforms. This attitude seems shortsighted. In the face of a huge prospective deficit, we cannot afford a heavy general tax cut. Yet tax reforms—of the proper type—are today not merely possible but urgent.

The most important of these reforms would be the abolition of all tax rates above 50 percent. Such rates are prima facie confiscatory. Their yield is negligible. On the personal income tax it amounts to less than 1 percent of total Federal revenues. But these rates have a profound effect in discouraging new risk investment and in slowing down the growth of employment and real wages.

If this rate reform were made, it would make other essential changes easier. One of these is reform of the capital-gains tax, today one of the most harmful of all our taxes.

Capital gains are not income. They cannot prudently be treated as income. This has been repeatedly emphasized by economists. We need not repeat their arguments here. It is sufficient to point out that the very people who are most insistent that capital gains be taxed at income-tax rates refuse to treat capital-value changes as equivalent to income changes. If a man has a short-term net capital gain of $1 million, they want to tax this at the same rate as added income. But if he has a net capital loss of $1 million, they will not permit this to be deducted from his ordinary income, but only $1,000 of it in any one year. On the part of the government this is a cynical heads-I-win-tails-you-lose tax.

**GAINS VS. INCOME**

Nor is the situation much improved by the lower maximum rate of 25 percent on long-term capital gains. Again there is no equivalent deduction against income tax for net long-term capital losses.

In *Newsweek* of Jan. 14 I pointed out not only the injustices but the harmfulness of the present capital-gains tax in “locking in” capital, in penalizing investors for transferring investments into new ventures, in discouraging investment of risk capital, and in stunting economic growth. I suggested half a dozen different ways in which the tax could be reformed. Here I should like to elaborate on one of these:
Segregate capital gains and losses from ordinary income. Have these capital gains or losses reported on a separate return. Tax these segregated net capital gains either at nominal flat rates or at the same rates as ordinary income. If ordinary income-tax rates are used, allow a reduction of, say, 2 percentage points of the capital gain for every month that the capital asset has been held. Thus if the capital asset has been held only one month, 98 percent of the gain would be taxed. If the capital asset has been held 24 months, 52 percent of the gain would be taxed. If it has been held for 50 months or more, there would be no tax. Deductions of losses would be allowed against gains, with an indefinite carry-forward of losses until absorbed.

TAPERING OFF
This would be similar to the tapering-off system used in Sweden. An individual would no longer be locked in with an investment indefinitely. After four years and two months, at least, he could sell or exchange it without tax penalty. In certain cases, for an investment held longer than six months, the tax might be steeper than today. But this could be avoided by the option of a shift to the present 25 percent maximum, and a tapering off each year to a 20, 15, 10, 5, and 0 percent flat rate respectively.

Some rate advantage might be gained from segregated capital-gain returns by a person whose income and short-term capital gains were about equal, but even this would seldom occur if the top income-tax rate were 50 percent. The great dispute about the “evasion” of income taxes through “turning income into capital gains” would practically disappear.

Such a system of taxing capital gains would be much less damaging to investment and growth than our present system. In Britain long-term capital gains are not taxed at all. In Sweden the tapering-off period is about the same as here proposed.

Shortsighted Taxes
June 3, 1963

Even present taxes do not raise enough revenues to cover present expenditures. The Administration is not planning to cut expenditures but to increase them. The proposal to cut taxes now, to bring a deficit of $11 billion or more in fiscal 1964 and an indefinite series of deficits thereafter, is fiscally irresponsible.

It amounts to saying to the American people: “We are making you a present right now of a big fat tax cut. But of course you will have to lend us the $11 billion needed to make up the shortage.”

Clearly this does not make sense. If we assume that the Federal government ever expects to repay its debts in an honest dollar, it will have to raise taxes again later, not only to the present revenue level, but much above it, in order to pay off next year’s increase in debt.

The proposed tax cut is shortsighted for another reason. The plan is to make the main revenue cuts in the lower brackets—to reduce the basic 20 percent rate eventually to 14 percent, and to take nearly a million people off the tax rolls. Some day, given reasonable economy in government, such a change may be possible. But not with present levels of expenditure. Once such cuts are made, it will be politically impossible to restore present rates in anything less than a clear national crisis.

All this does not mean that important tax reform is not possible now. Suppose the proposal was for a tax reform that would keep revenues at approximately the present level, with expenditures cut to balance the budget at this level. What reforms would be most desirable?

Here are six The first and third were discussed here last week.

1—Abolish all personal income-tax rates above 50 percent. Such rates are prima facie confiscatory. Their yield is negligible, amounting to less than 1 percent of total Federal revenues.

2—Keep the 20 percent basic income-tax rate, but abolish the first upward jump to 22 percent on taxable incomes between $2,000 and $4,000. Make this bracket subject to a tax of only 20 percent. These two reforms would reduce the number of tax-rate brackets from 24 to eight.

3—Segregate capital gains and losses from ordinary income. Have them reported on a separate return. Tax these segregated net capital gains either at nominal flat rates or at the same rates as ordinary income. If ordinary income-tax rates are used, allow a reduction of, say, 2 percentage points of the capital gain for every month that the capital asset has been held. Thus if the capital asset has been held only one month, 98 percent of the gain would be taxed. If the capital asset has been held 24 months, 52 percent of the gain would be taxed. If it has been held for 50 months or more, there would be no tax. Deductions of losses would be allowed against gains, with an indefinite carry-forward of losses until absorbed.

4—Make the maximum Federal tax on estates 50 percent, instead of the present maximum of 77 percent. And instead of demanding full payment of the tax
within fifteen months after death, allow it to be paid, without interest or other penalty, in up to ten annual installments, with a maximum tax equal to 5 percent of the value of the estate in any one year.

5—Reduce the corporation income tax from 52 percent to 50 percent. Impose this only on undistributed income. Tax income paid out as dividends only 47 or 48 percent.

6—Repeal the new “investment credit,” but allow much faster depreciation write-offs, or a substantial write-off (say 35 percent) in the first year.

All these reforms have a common purpose: to simplify our tax system; to start reducing the number and extent of punitive discriminations; to mitigate double taxation, and reduce the excessive deterrents to initiative, effort, risk-taking, capital accumulation, saving, and investment.

Our present tax system is above all shortsighted. When it discourages individual effort, penalizes the transfer of investments, forces the sale or liquidation of family businesses, discourages new corporate replacement and investment, it not only slows down our economic growth, but reduces tax revenues themselves.

Fear of Free Markets
June 10, 1963

The rejection by the wheat farmers of the Administration’s strict production control plan, in the national referendum of May 21, marked a turning point in the 30-year history of governmental crop controls and price supports in this country. For the first time the wheat growers turned down the offer of a higher price support at the cost of still more controls. For the first time they voted for less money in exchange for more freedom. For the first time they voted against Santa Claus. Under that benign white beard, he was beginning to look suspiciously like Big Brother.

When one considers the immediate monetary offer and the tremendous propaganda for it, the farmers’ decision was astonishing. If they voted for the government’s plan to control the wheat supply, they were promised a support price of $2 a bushel. If they voted against it, they were told by the Department of Agriculture and by the President that they could not expect more than $1 or $1.10 a bushel. Urging them to vote Yes were all the propaganda resources of the Agriculture Department (with its 100,000 employees), and the chief farm organizations with the exception of the American Farm Bureau Federation. On the day before the election President Kennedy personally appealed for a Yes vote.

DRACONIAN CONTROLS
What moved the farmers to turn all this down was the Draconian stringency of the controls they were asked to accept. They were not merely asked, as in the past, to withdraw a certain percentage of their acreage from wheat in order to be eligible for price supports. Every farmer would have been restricted to an exact maximum number of bushels, based on his “historic” production. He would have been subject to the tightest control of production and marketing ever seriously proposed in this country. The real issue, in the words of the Farm Bureau, was this: “Is government supply management going to be the future way of life for the American farmer? Who will manage your farm—you or the Federal government?”

Apparently, also the farmers did not take seriously the Department of Agriculture argument that they were choosing between $2 wheat and $1 wheat. The effective support prices under the certificate plan would have been a blend of two prices—$2 for certificate wheat and $1.30 for non-certificate wheat. Even if the growers disapproved the program, they knew that the Secretary of Agriculture, under existing law, would be required to support wheat for those staying within their acreage allotments at 50 percent of parity, or $1.25. And finally, they were apparently confident that the Administration and Congress would have to come forward with another plan.

SELL THE WHEAT BACK
The farm price support program has been a mess from the very beginning. The mess gets worse and more expensive year by year. It is often said that the crop restriction plan was defeated by the agricultural “revolution.” But this is at best a half-truth. The contrast most often cited now is that between the national average of 14.5 bushels of wheat per acre in 1947–49 and that of 25.1 bushels last year. But this result has been in large part brought about by the price support and acreage plans themselves. The farmers raised the average per acre yield (1) by taking their least productive acreage out of cultivation and (2) by pouring more fertilizer and labor into the remaining acres—a procedure that paid because of the support price itself.

The only solution to the farm problem is a return to the free market. This column suggested several years ago—and now renews the suggestion—that the government sell its surplus of more than a billion bushels of wheat back to the farmers themselves on a quota basis and below the average estimated cost of production—or say about 95 cents a bushel.

But this or any other extricating solution is now blocked by the folly of our government in renewing
the International Wheat Agreement last year. In practically every direction, in fact (e.g., sugar and coffee), the Administration has rejected the free market and plunges deeper into regimentation and controls.

**Capital Gain vs. Income**
June 17, 1963

The decision of the House Ways and Means Committee to tax long-term capital gains more leniently is a step in the right direction. But it once more raises the question whether there is any economic justification for a capital-gains tax at all.

Economists have long pointed out that capital gains are not income. Capital values are the result of income, the “capitalization” of income. Security values rise and fall with income (and dividend) fluctuations. Corporate income is already taxed twice. First, the whole amount is taxed directly (about 52 percent); then whatever part reaches the stockholders as dividends is taxed again at personal income-tax rates. Price changes cannot be regarded as income legitimately subject to income tax, since the physical asset itself is unchanged. A capital-gains tax on securities is not merely double taxation but triple taxation.

Since 1933 neither Congress nor the Treasury has honestly believed that capital gains are indistinguishable from other forms of income. Otherwise they would have allowed all capital losses to be deducted in full from other forms of income. How can they justify taxing even short-term gains at ordinary income-tax rates as long as they refuse to allow deduction of short-term losses in full not only against short-term gains but against all other forms of “income”? The allowance of a maximum deduction of $1,000 a year of capital losses against income is a token pretense of two-sidedness in a cynical heads-I-win-tails-you-lose tax.

**A TRANSFER TAX**
The “capital-gains” tax is a sort of haphazard capital levy. It is in reality a transfer tax. It penalizes anybody who transfers from an investment he considers less promising to one he considers more promising—or who is forced to raise cash. With these exceptions, the capital-gains tax is optional; the taxpayer can indefinitely postpone or avoid it by not selling. And when the penalty on selling is as heavy as it now is, he is better off not selling unless he is certain (which he can seldom be) that his eventual loss from holding an asset will be greater than his immediate loss from selling it.

The Ways and Means Committee has provisionally decided to make this tax a little less onerous and to encourage some investors to sell investments with which they are now “locked in.” While still taxing short-term capital gains (on assets held for less than six months) at ordinary income-tax rates, and while still taxing 50 percent of the capital gain on assets held between six months and three years (or at a maximum rate of 25 percent on the whole gain) the committee proposes taxing only 30 percent of the capital gain on assets held longer than three years.

**TAPERING OFF**
But as long as the committee is willing to go this far, why not carry out the logic of the change? If it keeps its present dual method of approach, it could tax 50 percent of the capital gain on assets held one year more than six months, 40 percent of the gain on assets held two years more, 30 percent of the gain on assets held three years more, 20 percent of the gain on assets held four years more, 10 percent of the gain on assets held five years more, and put no tax on assets held longer than six and a half years. It could accompany this schedule with maximum tax rates, respectively, of 25, 20, 15, 10, 5, and 0 percent of the whole gain.

And if this seems too complicated it could always, like Great Britain and other countries, refrain from taxing long-term capital gains at all.

It is excessive and discriminatory income taxes, in fact, that create the so-called problem of capital gains. When the government levies confiscatory rates up to 91 percent on high incomes, a corporation must pay an executive whose top income gets into higher brackets up to $10 more for every $1 more he can retain in net income. This is prohibitive, so the corporation substitutes a stock-purchase option. Then the government frowns on this as an evasion and a “loophole” and resorts to complicated tax provisions to stop it. But if it levied a proportional income-tax rate to begin with, or at least halted at a top rate of 50 percent, the “stock-option problem” would hardly exist.

**Who Provides Welfare?**
June 24, 1963

Many “liberals” are showing signs of disillusion with the welfare state that they once so ardently espoused. One such is Irving Kristol, co-founder of Encounter magazine in London and now senior editor and vice president of Basic Books in New York. In the June issue
private property—i.e., the right of the individual to keep the fruits of his labor. These institutions of freedom and private property maximize productive incentives. And as each of us spends the monetary rewards for his efforts on the things that he considers most likely to promote his or his family’s welfare, the free-enterprise system also tends to maximize welfare.

There is, of course, a certain area of collective needs—national defense, police and fire protection, sanitation, roads and streets—that must be paid for by coercive taxation. But this “public” sector is necessarily parasitic on the “private” or voluntary sector of the economy. The reason the “public sector” should be held to a minimum, the reason the burden of proof should be on every effort to extend it, is that the increased taxation that necessarily accompanies this extension reduces both productive incentives and the individual’s freedom to decide how to spend his own earnings.

The wastes and absurdities in bureaucracy that “drive people mad” are not accidental. They are an inevitable product of the welfare state itself—“the great fiction,” as Bastiat called it more than a century ago, “by which everybody tries to live at the expense of everybody else.”

Taxes: The Long View

July 1, 1963

At the basis of our present Federal tax system lies the so-called principle of “progression”—the principle that taxes should be levied not in any uniform proportion, but more and more steeply with an increase in a man’s income. Though our generation has come to accept this discriminatory principle, it is important to remember that it is still relatively new and still relatively rare. All local real-estate taxes (perhaps the oldest of existing taxes) are proportional. The man whose property is assessed at $20,000 is taxed only twice as much as the man whose property is assessed at $10,000—not three times as much or four times as much.

Nearly all city and state sales taxes are also proportional. There is, say, a flat 4 percent tax on a purchase of $1,000 as on a purchase of only $10. The proportional principle is applied even in most Federal taxes—import duties, corporation taxes (with only one extra “bracket”), and social-security taxes.

KILLING INCENTIVE

The big exception is the personal income tax. We have all come to accept this progressive principle, in the
Relief to the lower-income brackets could be more safely attained by keeping the basic 20 percent rate, but abolishing the first upward jump to 22 percent.

Progressive taxation, by fostering the illusion that “the rich” are paying the bill, has contributed as much as any factor to the enormous growth in government expenditure.  

The Foreign-Aid Folly
July 8, 1963

Though the United States has already poured more than $4 billion foreign aid into India, it is planning to pour in more, including nearly $1 billion for a government-owned steel mill.

The Clay Committee Report declared that “the U.S. should not aid a foreign government in projects establishing government-owned industrial and commercial enterprises which compete with existing private endeavors.” But the Administration seems determined to go ahead. India’s Minister of Steel and Heavy Industry warns us that India will build the plant “with or without United States aid.”

American officials who want our taxpayers’ funds to pay for this socialistic project argue that India “is starved for steel.” But even if we grant this, why can’t India simply import the steel? Why can’t she buy it from us? Our own steel industry is working far below capacity. Why should we further tax Americans, including our own steel industry, to subsidize more foreign competition?

Buying Steel Abroad

Would a subsidized government steel industry be good for India itself? It is doubtful. Writing in the Indian magazine Swarajya, the American economist Milton Friedman declares: “The Achilles heel of the Indian economy at the moment is the artificial and unrealistic exchange rate. . . . So long as the exchange rate is as far as it currently is from a realistic rate, foreign assistance will simply be poured down a bottomless well.” He adds: “India has become a protected economy in which items are produced domestically at a multiple of the cost at which they could be obtained from abroad.”

India wants a subsidized steel mill largely because a new privately financed mill at Bokaro simply would not pay.

Aid for such a steel mill would be a direct American subsidy for foreign socialism. But it does not follow that our foreign-aid program would be desirable even if it abstained from such follies. The principal reform
needed in our foreign economic aid program is to abolish it.

Let us see what some of the beneficent results would be. The governments of the underdeveloped nations would want to continue their policies of government planning, socialism, wage-boosting, inflation, and “economic expansion.” They would let loose a propaganda barrage saying they had been betrayed, and if they could no longer get aid from us they would go to Russia. But it would soon occur to the more sober-minded among them—recalling Cuba, for instance—that this was not the most promising route to prosperity and freedom. A few of their statesmen would point out that some countries, like Canada and those of Western Europe, had done very well by attracting private American investments. So they would send officials here to consult with American corporations and investment bankers.

**INVESTMENT CLIMATE**

The bankers would tell them that American investors would be interested only if a climate were created attractive to investment. Asked what would bring such a climate, they would suggest that the borrowing government balance its budget, stop inflating its currency, stop “land reforms” that destroy property rights, stop excessive taxation, stop discriminating against foreign investments, stop expropriation and nationalization—in brief, stop socialism and try free enterprise.

“But this is dictating our internal policies!” some of the underdeveloped diplomats would protest. “Not at all,” the private bankers would reply, “this is merely telling you the conditions likely to attract investors.”

And if these reforms were adopted, the governments of the backward countries would be amazed to find not only that private foreign capital was attracted, but that their private domestic capital, instead of fleeing abroad for safety, was being invested at home, and that rapid progress was beginning as the result of increased domestic confidence.

Most of the sponsors of government-to-government foreign aid, alas, are socialists at heart, and have still to learn that the secret of prosperity is free enterprise.

---

**Keynesian Inflation**

July 15, 1963

Four years ago the present writer published a book called *The Failure of the 'New Economies'*: It was an analysis of the fallacies in Lord Keynes's book *The General Theory of Employment, Interest, and Money*, which had been published in 1936. That book had become not only the dominant influence on the kind of “economics” taught in the colleges and universities, but the dominant influence on the economic policies being pursued by most Western governments. The Keynesian doctrines have encouraged a constant race between increasing wage demands by the labor unions and monetary inflation in order to make ever-higher wage rates payable.

It is amazing how long it has taken for a reaction against these doctrines to gather force and to find adequate expression. After the appearance of Keynes's *General Theory* a score or more of brilliant attacks on his ideas appeared as articles or as chapters in books. I brought some of these together, in 1960, in a symposium, “The Critics of Keynesian Economics.” Among them was an article by W.H. Hutt, professor of commerce and dean of the Faculty of Commerce at the University of Cape Town, on “The Significance of Price Flexibility.” This had appeared in 1954.

**DEMOlIsHEs TO BuIlD**

Hutt had, in fact, been troubled by the Keynesian obfuscations for many years, and as early as 1939 had published his *Theory of Idle Resources*, which brilliantly dissected one of them. But the practical unanimity with which his academic colleagues embraced the Keynesian revelation, and ignored or waved aside his privately communicated criticisms, caused him to lose his own intellectual confidence and to delay or withhold any major publication.

Now at last he has published a full-length book, *Keynesianism—Retrospect and Prospect* (Regnery, $7.50), which analyzes and demolishes not only the fallacies of Keynes himself but of the whole school of Keynesians and post-Keynesians. It is not merely destructive. Though, as Hutt himself puts it, “it sets out to restate some of the essentials of ‘orthodox’ or ‘classical’ economic teachings in a form . . . more appropriate for contemporary controversies,” it does much more than this. It throws new light on a score of unsettled economic problems. Hutt has made a major positive contribution. He has written, in fact, one of the most penetrating and important economic books of the last 25 years.

**AN ACT OF GOVERNMENT**

There is not space here to discuss adequately his exposures of Keynesian errors and misconceptions or his contributions to positive understanding—his discussion of the nature of economic coordination through the price system, of the nature of money, of income and how it is “generated,” of the consumption fallacy, the multiplier fallacy, the acceleration fallacy, the capital-saturation fallacy, and of the validity of “Say’s Law.”
Nor is there room to discuss his final chapter on the amusing attempts of the “Keynesians of the Right” to grope their way back to orthodoxy while still trying to cling to the obfuscating Keynesian concepts and vocabulary.

I have space only to call attention to Hutt’s brilliant and powerful chapter on the chief practical consequence of Keynesianism—the almost universal policy of inflation. Since the appearance of the General Theory, “there has been a sort of race between inflation and the unions. . . . What a deterioration since the pre-1914 era Simply because no one ever doubted then that governments would honor convertibility obligations there were no balance of payments difficulties, no hot money flights, no devaluation scares, no complaints of world liquidity shortage, no restraints on international settlements, no blocking of foreign balances, and no quantitative trade restrictions for payment-balancing purposes. World discoordination is the product of the continuous misdirection of expectations which the Keynesian technique necessitates. . . . [Yet] people are very slowly awaking to the truth that inflation is an act of government, and that it is almost always (in these days) the consequence of calculated, even if reluctant action.”

Doubts about the EEC
July 22, 1963

It seems only yesterday that everyone was hailing the Common Market as an epoch-making step toward world freedom of trade, and a great new force to which the rest of us would have to adjust. Our own government gave it moral and political support. We frowned on the efforts of Britain and other countries to form a countervailing Free Trade Area, and urged them to seek admission to the Common Market, or (as it is officially called) the European Economic Community. Finally, the U.S. decided that its own most important step in the field of foreign trade should be to negotiate reciprocal tariff reductions with the Common Market, and enacted a law specifically designed to do that.

Then came a series of blows, delivered chiefly by President de Gaulle. When Britain, after many misgivings, applied for admission to the Common Market, her application was peremptorily rejected. Our own efforts to get the Common Market to reduce its high tariffs against imports of our poultry met with failure.

The shock was not only to Britain and the U.S., but to the Common Market countries themselves. Suddenly they realized that in France’s (or at least de Gaulle’s) opinion, they were at best junior partners, and that the Common Market was to be a union under French hegemony.

RECONSIDERATION

These political shocks have led to reconsideration of the economic consequences of the Common Market. From a dispatch by Edwin L. Dale, Jr. in The New York Times, we learn that “Doubts about the economic impact and benefits of the Common Market are being expressed both inside and outside the community.”

Economic analysts in several countries, it seems, have been putting together figures designed to show that the Common Market has had very little, if any-thing, to do with the general economic performance of the six member countries. Among their conclusions are the following:

1—“Economic growth of the member countries—France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg—has actually been slower since the Common Market began than before. It is not argued that the Common Market has held back growth, only that it has not affected growth much either way since coming into being on Jan. 1, 1958.”

2—“The rate of investment in new plant and equipment also appears to have been unaffected.”

3—“Trade among the member countries has grown rapidly, but no more rapidly than before the Common Market began to dismantle tariff barriers. Recently this trade has been growing more slowly.”

TREATING ALL ALIKE

We need not take these new statistical studies as necessarily proving anything either way. There are always such a multitude of economic forces and factors at work that a net statistical change cannot safely be ascribed to any one of them. But it is time to ask whether the Common Market, looked at economically, was really such a good idea in the first place. Is it in fact a move toward greater freedom of world trade, or is it a move toward great protectionist blocs? It has tended to split Europe into two camps rather than unite it. If Britain were admitted, it would be at the cost of breaking up the “common market” long established as the British Commonwealth.

The Free Trade Area, which our government discouraged, was actually far more promising as a step toward freer world trade than the Common Market. For the “Outer Seven” agreed to lower tariffs vis-à-vis each other without necessarily imposing a high uniform tariff wall against non-members, as the Common Market requires.

But there is a policy far better than either of these, to which no serious attention is paid in the present world. It is the policy of each nation, without joining blocs or...
The Risk Takers  
July 29, 1963

The politicians and planners in Washington are as sincerely eager to eliminate unemployment as anybody. But if they are really to solve the problem, they need to understand how jobs come into being, and who brings them into being. It is not merely some impersonal and automatic thing called “consumer purchasing power.” Jobs exist because employers provide them. And employers start new ventures, or expand old ones, only when they see a prospect of profit commensurate with the risks.

The interests of “Labor” and “Business” are not antagonistic. On the contrary, in the long run they are practically identical. Employees can have well-paying jobs and maximum employment only if employers and risk takers have adequate incentives. As President Kennedy once put it: “Our primary challenge is not how to divide the economic pie, but how to enlarge it.”

But maximum output and full employment are often blocked because politicians and planners have a grossly oversimplified idea of who constitutes “Business.” They think of “Business” as made up of a few giant corporations or the heads of such corporations. They lecture these imaginary few on their “social responsibilities” and duties. And when “Business” is hesitant they chide the businessmen for their lack of confidence and for their “neurotic search for unending reassurance.”

3 MILLION EMPLOYERS

The picture of business as consisting of or dominated by a few giant corporations is quite false. Let us look at the situation concerning corporations alone. In 1959 more than a million of them—1,074,120, to be exact—filed income-tax returns. True, there were giants among them. As many as 2,319 had assets of more than $50 million each. But 590,000, or more than half, had assets of less than $100,000 each.

In addition to these million corporations there were 949,000 active partnerships, and 9,142,000 businesses and farms under a sole proprietor! Nor were the contributions of these unincorporated enterprises negligible. Where corporations reported a net income of $47 billion in 1959, unincorporated enterprises reported $46 billion.

Nor do small businesses, whether incorporated or not, make a negligible contribution to employment. In 1959, there were, in fact, more than 3.3 million separate employers reporting under the Social Security Act. Of these, only 54,000 employed 100 or more persons each. More than 1.9 million employed only three or fewer each. About 3 million employed fewer than twenty persons each, yet these small firms provided more than a fourth of total employment in commerce and industry.

NEED FOR CONFIDENCE

This is how American business is made up. It consists of literally millions of employers, literally millions of risk takers. Who are these millions of small risk takers? They are people who, having saved a little money, start a hot-dog stand or a roadside diner or a filling station; or open a bakery or a paperback-book store or a dress shop or a TV repair service; or install a new “laundry-mat” or a new bowling alley; or build a house in the suburbs for resale, or remodel a building for doctors, or develop a new shopping center. What they do, and how many of them do it, depends on the risk climate in which they operate.

These small risk takers have no automatic assurance of success. At the beginning of 1961, a fairly typical year, there were 4.7 million firms in operation; but during the year 398,000, or nearly one in every twelve, were discontinued. Fortunately the ranks were filled by 437,000 new businesses.

The extent to which these millions of small risk takers start new ventures and create new jobs depends on their estimate of the chances of making and keeping a profit compared with the risk of losing their whole capital.

These are the people the politicians and planners should keep in mind, and not only the heads of a few giant corporations, in order to recognize the need of maintaining a climate of “business confidence.”

No Help to the Dollar  
August 5, 1963

The Administration’s proposal to tax foreign securities is unfortunate from every angle. It is a further abridgment of the economic liberties of American citizens. It is another roadblock to free markets. It is a clearly protectionist measure. It is a beggar-my-neighbor policy. It seeks to cure our balance-of-payment problems at
the cost not only of increasing such problems for other nations but of disrupting their economies.

There were so many leaks in the proposal, even before the President announced the Canadian exemptions, as to make it futile in accomplishing its intended purpose of “helping the balance of payments.” The attempts to plug these leaks would lead inevitably to exchange controls. The proposal to give the President discretionary powers to discriminate as among securities and countries would substitute uncertainty and administrative favoritism for a rule of law.

The tax would, of course, do nothing to cure the balance of payments. On the contrary, its mere proposal has undermined confidence in the dollar. And the irony is that all punitive measures of this kind would be entirely unnecessary if the Administration had the courage and understanding to take the proper measures.

HURTING OUR CUSTOMERS

The proposal to impose a so-called “interest equalization tax” of 2.75 to 15 percent on foreign securities offered in the American market had all the earmarks of a panicky idea that no one had thought through. Immediately after the President’s message, stocks collapsed on the Canadian and Japanese markets. Within three days the President announced that “new” Canadian security issues would be exempt from the tax. The Canadians had meanwhile pointed out that while $457 million in new Canadian issues were purchased by U.S. citizens last year, Canada still had a $565 million deficit in her trade with the U.S.

In other words, Canada was buying from us more than she was selling to us—and our loans and investments made part of this excess buying possible. But this also applies to Japan, which also buys from us more than she sells to us, and also partly because of our loans to her. And this applies to still other countries.

When one contemplates all its loopholes and exemptions—all direct investment, all securities or loans of less than three years, loans of commercial banks, securities of “less developed” countries—it is hard to understand what compensation even the Administration expects from its disruptive proposal.

INFLATION CONTINUES

And all such measures are quite unnecessary. The deficit in the balance of payments could be stopped over night if the government would halt the inflation. It took a timid step in this direction when the Federal Reserve increased the discount rate from 3 percent to 3½ percent. But this move was too little, too late, and too isolated. In such a situation the raise should have been at least one full percentage point. It should not have been accompanied by assurances that long-term interest rates were going to be kept down. It should not have been preceded and contradicted by the Federal Reserve’s inflationary policy of buying Federal securities and so increasing the paper money supply. (The Federal Reserve held $31.7 billion of government securities on July 17, an increase of $2.7 billion in twelve months. In the same period the money supply has increased about $4 billion.)

In the same week that the Federal Reserve raised the discount rate, moreover, the world learned that our Federal budget deficit in the fiscal year ended June 30 was $6.2 billion, with the prospect of a deficit twice as big in the new fiscal year. Yet on top of all this the Administration is recommending increased expenditures and has renewed its suggestion for a substantial tax cut.

It is continuing this policy of inflation, which is the basic cause of the dwindling confidence in the dollar, as the result of the quite false Keynesian idea that inflation is the cure for unemployment. Because it will not accept the only real cure, it is plunging deeper and deeper into dangerous and disruptive expedients.

Inflation Is the Cause

August 12, 1963

The Administration would be well advised if it dropped entirely its unfortunate proposal for a tax of up to 15 percent on foreign securities sold in this market. If it nonetheless persists, Congress should certainly not enact it in any form. It is already so riddled with exemptions that it has become “more holes than cloth,” but though this means that it could have at best a negligible effect in “saving dollars,” even if it worked the way the Administration expects, it does not mean that it cannot do great harm.

It is a misfortune that it was ever proposed. For it has convinced both Americans and foreigners that a dollar emergency must exist to make such an emergency measure necessary. And it has raised fears both at home and abroad that still more drastic controls will be resorted to if this one does not work—which few expect it to do.

SOURCE OF STRENGTH

The President’s message asking for this control was, in fact, full of inconsistencies and contradictions. At the very moment when he was asking for a barrier to trade and to capital movements he announced: “This nation will continue to adhere to its historic advocacy of freer trade and capital movements.” And in the very message
in which he asked for a tax intended to discourage or inhibit further long-term foreign investment in order to protect our balance of payments, he was explaining how lucky it was that we had made precisely such foreign investments in the past:

“Our payments deficits, measured in terms of our loss of gold and the increase in our short-term liquid liabilities to foreigners, have consistently been equaled or exceeded by the growth of our long-term high-yielding foreign assets—assets which have been and will continue to be an increasing source of strength to our balance of payments. Today, Americans hold more than $60 billion of private investments abroad, and dollar loans repayable to the U.S. Government total over $11 billion. At the end of 1962, all of these assets exceeded our liabilities to foreigners by an estimated $27 billion. And they have shown an increasing strength over the years: our total income from these sources in 1959 was $3 billion; in 1962 it had risen to $4.3 billion, and we expect further substantial increases in the coming years.”

What the President is proposing is that a prohibitive tax now be put on voluntary private foreign investments, likely to bring in such future dollar income in interest and dividends, in order that the government may continue to tax this money away and pour it into “underdeveloped” countries—from which it is highly unlikely that we will ever get a dividend or interest return.

**EXCHANGE CONTROLS?**
The tax on foreign securities would not work; but the danger is that in trying to make it work the government would move deeper and deeper into exchange controls. We have already gone far. Under Republican and Democratic administrations, the government first made it a crime for Americans to buy or hold gold at home. Then to buy or hold it abroad. Then Americans traveling abroad were only allowed to bring in $100 of duty-free goods. Now we are to tax foreign security purchases. Will the next step be to limit the amount of money our tourists and businessmen may spend abroad? (This has already been suggested by Senator Javits.)

The whole compartmentalized item-by-item approach to the balance of payments is fallacious. In his message the President had to confess, at the same time he was estimating that the $100 limit on duty-free goods “achieved a saving” last year “of more than $100 million,” that our “total tourist spending in foreign countries rose another 10 percent . . . to nearly $2.5 billion.” And overlooked by the sponsors of the tax on foreign investments is that these investments have made possible a large part of our export surplus.

We can solve the balance-of-payments problem only by dealing with its basic cause—our domestic inflation. If we were to halt this inflation—by stopping budget deficits and cheap money—we could cure the balance-of-payments deficit overnight. But this is the one course that the Administration will not take. ✺

**Double Taxation**

August 19, 1963

In spite of the growing seriousness of the balance-of-payments problem, and an already ominous prospective budget deficit, the Administration is renewing its pressure for tax reduction. Its argument is that such a tax cut will stimulate the economy. This argument might have some validity if taxes were reduced on investors and on productive enterprises. But these are the very groups on which taxes are to be increased—on the ground that more revenues must be raised to compensate for those lost by reducing taxes on those who are already, proportionately, being taxed least.

Specifically, the Administration has recommended not only that stockholders no longer be permitted to exclude from their taxable income $50 of the dividends they receive each year, but be disallowed the 4 percent credit they may now take on the rest. In June the House Ways and Means Committee tentatively rejected both recommendations. But now a compromise is being considered to increase the dividend exclusion to $100 a person and disallow the 4 percent credit entirely.

**52 PERCENT TO START**

This is precisely the opposite of what ought to be done. There is no more justification for the exclusion of the first $50 of dividend income from taxation than there would be for the exclusion (on top of existing exemptions and deductions) of the first $50 of wages or any other form of income. This exclusion ought no longer to be allowed. But the 4 percent dividend credit is an entirely different matter. It is not only justifiable; it is a mere token mitigation of a flagrantly oppressive double taxation.

Suppose a married man is a one-tenth partner in a business that earns $200,000. His share is $20,000. Assuming for simplicity that this is his total net taxable income above exemptions, he pays income tax on this amount of $5,280. Then he is through. He can keep the remaining $14,720 for his family (at least before state and other taxes).
But suppose he owns, instead, 2 percent of the shares of a corporation that earns $1 million. His share is again $20,000. But the corporation must pay about 52 percent of this in income taxes, or $10,290, before the taxpayer ever sees it. (This is no different in principle from a withholding tax paid at the source.) Suppose, now, the entire remaining $9,710 is paid to him in dividends. Though he already has been taxed much more heavily than the man who received $20,000 from a partnership, his taxes have only begun. His remaining $9,710 is considered his taxable income to start. Out of it, on the same assumption that this is his full taxable income, he would pay on this (with his 4 percent credit but without a $50 exclusion) a tax of $2,023, leaving him only $7,687—or just about half of what he would have had from a partnership. Disallowing the 4 percent credit would raise his tax to $2,124, leaving him only $7,586.

IN BRITAIN AND CANADA
Thus investment in corporations (upon which we mainly depend for industrial employment) is already heavily penalized. Our tax system reflects the delusion that a corporation’s income is something in addition to that of its individual stockholders. The tax on corporation income is, in fact, a tax on income of the individual stockholders. Other countries recognize this. Canada allows a 20 percent credit on dividends. The British levy two taxes on the net profits of corporations: a tax of 15 percent, and in addition an “income” tax of 38¼ percent, bringing the total to 53¾ percent. But when a shareholder receives dividends, he is credited with having already paid his “standard rate” (38¼ percent) of personal income tax on these dividends.

So in the interests of promoting investment and economic growth our income-tax credit on dividends should gradually be increased rather than diminished. To protect it against misunderstanding or demagogic attack, however, it might be changed in form. Instead of allowing the individual dividend receiver a tax credit, a differential tax might be placed on corporation income itself—say, for a start, a 52 percent tax on undistributed profits, but only a 50 percent tax on profits paid out as dividends. ✱

Let the Dollar Drift?
August 26, 1963

The 290-page report of the Brookings Institution on “The United States Balance of Payments in 1968” can only tend further to undermine confidence in the dollar. Its diagnosis of the disease is false. Its analysis of causes constantly puts the cart before the horse. Its forecasts are mere guesses. Its proposed remedies would aggravate the disease. If persisted in they would destroy the dollar as an international currency.

We cannot, unfortunately, dismiss this report as merely reflecting the opinions of a private institution, or even merely the opinions of its particular authors. For the institution was explicitly asked by Walter Heller, acting on behalf of the Council of Economic Advisers and the Treasury, to make this report. The American taxpayers paid for it. Though it is called an “independent” study, it comes to the same conclusions on leading economic problems as the Council of Economic Advisers, and often in the same phraseology. It is, in brief, a quasi-official document. That is why it is so disturbing.

CRYSTAL GAZING
The report rests on basic misunderstandings. It predicts “substantial improvement in the U.S. balance of payments by 1968” and even suggests that “the basic deficit will be eliminated by 1968, and that there will be pressures toward a basic surplus.” The truth is that everything depends on what the government does. If it were to stop the budget deficits, stop printing more money through the Federal Reserve, stop holding down interest rates, it could halt the balance-of-payments deficit overnight. What it will be doing five years from now nobody knows, and therefore nobody knows, what the balance of payments will be in 1968. But it doesn’t take a year, a big staff, and 290 pages to find that out.

The report, like the reports of the Council of Economic Advisers, is based throughout on ultra-Keynesian assumptions. It talks as if solving the balance-of-payments problem were an alternative to achieving sound prosperity, growth, and long-run employment, instead of being, as it is, a necessary means of achieving these goals. It believes that it is huge government spending and cheap money that create jobs. The effect of excessive wage rates on increasing unemployment is never mentioned. On the contrary, the report suggests (in true Keynesian style) that any reduction in money wage rates increases unemployment—though it inconsistently recommends that a country with a balance-of-payments deficit might wisely prevent “the general level of its money wage rates from increasing as fast as output per man-hour.”

FOR WORLD INFLATION
The report’s implied cure for our economic ills, in brief, is unrestrained inflation. Of course it never uses that phrase candidly. It recommends “expansionary fiscal policy” and “lowering of interest rates” (which is
Keynesian for budget deficits and monetary inflation), and deplores the “undesirable constraints” that balance-of-payment worries put on these policies. It says “the classical means of improving the balance of payments” are “deflationary measures” that “cut employment and real incomes.” It even pretends that efforts to improve the net balance of payments would require “very substantial declines in total production and income.”

So the report’s remedy for the dollar problem is not for our government to halt its inflation, but for everybody to embark on a world inflation so that nobody will run short of money. This, of course, is not said in these blunt words. We are to set up a new “international monetary system” which “must provide enough liquidity,” (“Liquidity” is Keynesianese for cash.) “Substantial amounts [of credit] should be obtainable automatically by deficit countries” (i.e., us). These countries must be given “enough time” to “restore equilibrium.” The report does not say what happens if they use the time and credit to continue their inflationary spree. The legal requirement for a 25 percent gold reserve is “irrational.” It “long ago ceased to serve any useful purpose” and “should be abolished.”

I have only one question. Is this report likely to restore international confidence in the dollar? 

**Sham Tax Cut**

September 2, 1963

Neither the Treasury nor the House Ways and Means Committee that adopted its proposed tax cuts has any reason to feel proud of what it did.

Let us recall some elementary principles that everyone seems to want to forget. Taxes are imposed, not out of pure cussedness, but to raise revenues. Their function is to raise enough revenues to pay for the government’s expenditures. Taxes, in other words, are a purely derivative problem. The real problem is to cut expenditures. But nobody wants to face this. So everybody can be a cheap Santa Claus by voting for tax cuts while voting for more expenditures.

When taxes fall short of meeting expenditures, the tax cut is not real. Either visible taxes must be correspondingly increased in subsequent years (if there is any honest intention of ever having even a “cyclically” balanced budget or ever paying off any of the national debt), or the deficit must be paid for by the hidden tax of inflation, i.e., of higher prices and cheaper dollars. If inflation worked out evenly, it would be a proportional income tax and capital levy on rich and poor alike. It never works out evenly, but falls most heavily on those least able to protect themselves. In brief, any tax cut that leaves a deficit is a deception and a sham.

**HUGE DEFICITS**

On Aug. 13, Secretary Dillon predicted a deficit of $9.1 billion for the current fiscal year 1964, compared with his estimate in January of $11.9 billion. But he also forecast still another deficit of $9.4 billion for fiscal 1965. The day after the Secretary announced these tremendous deficits, the Ways and Means Committee adopted tax cuts, starting in the election year that begins next January, that will amount when fully effective, according to Treasury estimates, to $11.9 billion annually. How much of this cut was allowed for in Secretary Dillon’s estimates of the day before was not clear. In any case the Treasury, this far ahead, has persistently underestimated the deficit. For the fiscal year ended June 30 last, it originally estimated a surplus. There was actually a deficit of $6.2 billion.

The same thing happened in the preceding fiscal year, which ended with a deficit of $6.3 billion.

If a tax cut were justified at all with present spending programs, it would not be the kind of tax cut that the Treasury has recommended and the Ways and Means Committee adopted. There would be an argument for a tax cut that ended confiscatory rates, that made the scale of progression less steep, that mitigated the taxes that do most to discourage effort, production, and growth. Such reforms would make possible greater revenues in spite of lower rates.

**MASSIVE REVENUE LOSS**

But the new tax bill does the opposite. For the present personal income tax scale ranging from 20 to 91 percent, it substitutes a scale ranging from 14 to 70 percent. The result is that the tax cut at the bottom of the scale amounts to 30 percent and at the upper end of the scale varies from about 15 to 23 percent. Moreover, owing to a new “minimum standard deduction” gimmick, 1.5 million taxpayers would be taken off the tax rolls entirely.

The result is that 1.5 million fewer people will give a hoot how high government spending goes. The loss of revenue will be massive. It will be politically almost impossible to put these people back on the rolls or to restore the 20 percent basic rate. If, as Congressman Bruce Alger of Texas proposed, there had been simply a flat tax cut of 20 percent all down the line, the political problem of restoration would not be so serious. If the top rates had been slashed to a maximum of 50 percent, there would have been a maximum revenue loss of $1 billion in the first year and probably increased revenues in succeeding years because of the incentives that would have been restored. Instead, the penalization
of investment was made even steeper by the proposed
termination of the 4 percent dividend credit.

True, the new tax bill has a few good features. But in the context of planned deficits of more than $9 billion a year, its tax reductions are a fraud that will
deceive only the shortsighted.

Exporting Inflation
September 9, 1963

One of the great economic puzzles of the last half dozen years is that, though we have been inflating our money-
and-credit supply at a disquieting rate, this has not been correspondingly reflected in our price level. Since the
end of 1957 our nominal “money supply” (currency out-
side of banks plus demand deposits) has risen from $136
billion to $150 billion, an increase of about 10 percent.
If we include time deposits in the total, the increase has been from $193.4 billion to $254.4 billion, or 31 percent. The Federal Reserve System has engineered
this inflation by increasing its purchases and holdings
of U.S. Government securities from $23,982,000,000
at the end of 1957 to $32,237,000,000, an increase of
$8,255,000,000, or 34 percent.

Yet when we turn to the official price indexes, we
find that consumer prices have risen only a little more
than 9 percent since the end of 1957, and wholesale
prices a bare 1½ percent. Those who measure inflation
not by money-and-credit supply but by price levels have
therefore argued that there has been no real inflation
in the last six years and that the fears of it have been
unfounded.

They are wrong. What has happened is that most of
our inflation has been exported. Broadly speaking, we
have paid the cost of it, and Western Europe and the
rest of the world have had the advantage of it.

EASY-MONEY FUITLE

Why and how has this happened? One apparently obvi-
ous answer is the $36 billion or so that our govern-
ment has given in foreign aid and military assistance
since the end of 1957. But this is only an indirect cause.
The direct reason is that we have not only inflated, but
inflated faster than the rest of the world.

More than 200 years ago the British philosopher
David Hume pointed out that if a country with a gold
currency tried to increase its money supply by bank
credit or by added paper money, even if convertible, the
only effect, other things unchanged, would be to drive
out an equal quantity of gold. Now since the end of
1957 the U.S. has lost a little more than $7 billion gold
(which it is interesting to compare with the $8 billion
increase in the Federal Reserve’s holdings of govern-
ment securities). In addition, our short-term dollar lia-
bilities held by foreigners have increased more than $10
billion. In brief, our inflation has been futile. We have,
without intending so, inflated mainly for the benefit of
foreigners. We have increased our nominal money sup-
ply since the end of 1957 by $14 billion. But foreigners
now hold $7 billion more in gold, and $13 billion more
in liquid dollar assets, or $20 billion more. Our infla-
tion has caused our cumulative balance-of-payments
deficit of $22 billion since the end of 1957.

SYMPTOMS VS. CAUSE

All this seems to have escaped the attention not only
of our government economists and monetary manag-
ers, but of almost our entire banking community. But
at least one man, John Exter, vice president of the First
National City Bank of New York, for the last two years
has been trying to tell his banking colleagues, govern-
ment economists, and all Keynesian expansionists that
it is our easy-money policy that produces our balance-
of-payments deficits; that these deficits are a drag on our
economy; that our easy money has been in vain; that its
economic consequences have been a massive movement
of reserves to other countries from our own, where they
increase foreign money supplies, not our own; stimulate
foreign economies, not our own; employ foreign labor,
not our own.

He has also been pointing out that our efforts to
plug up specific channels of gold and dollar outflow—
such as prohibiting Americans from holding gold,
reducing the customs-free tourist allowance, tying our
foreign aid to purchases in the United States, bringing
or keeping military dependents home, taxing foreign
investment are all futile, because they attack the symp-
toms of the disease and not its cause.

It is our inflation, created through budget deficits,
easy money, and Federal Reserve money creation, that
is the cause of our balance-of-payments problem. Until
it is stopped, the dollar must continue to weaken.

History of a Law
September 16, 1963

When Congress, in the last week of August, under
the threat of a nationwide railway strike, passed a
law imposing compulsory arbitration, and when the
President, on the afternoon of Aug. 28, signed the bill
with the threatened strike less than six hours away, a
few oldsters may have recalled another ominous day 47
called the Presidential boards have nearly always decided heavily in the unions’ favor—leading, among other things, to the present fantastic featherbedding rules. In November 1941, a Presidential board awarded the operating unions a wage increase of 7½ percent, and the non-operating unions an average increase of 13½ percent. The awards were rejected by both groups. Thereupon President Roosevelt reconvened the board and ordered it to try again because of (unspecified) “new evidence.” The board took the hint, and obligingly revised its awards upward by about 10 percent. The new awards were accepted.

On April 25, 1946, the engineers and trainmen turned down an award of a Presidential board for a wage increase of 16 cents an hour. On May 22, President Truman proposed that the 16 cents an hour be hiked to 18½ cents. The unions still demurred, and struck on May 23. President Truman had seized the roads on May 17. He asked Congress for temporary authority to induct strikers into the army, to take out anti-strike injunctions, and to cancel strikers’ seniority rights.

Isn’t it about time we re-examined the Railway Labor Act?

‘Balance of Payments’
September 23, 1963

It is unfortunate that even most of the professional economists who discuss our “balance-of-payments” problem seem never to have heard of, or have completely forgotten, what their predecessors of the eighteenth century wrote on the matter. In a famous essay “Of the Balance of Trade,” written about 25 years even before the appearance of Adam Smith’s Wealth of Nations in 1776, the British philosopher David Hume showed that in a world of free trade and metallic money the problem of an “adverse” balance of payments could hardly arise.

“There still prevails,” he wrote, “even in nations well acquainted with commerce, a strong jealousy with regard to the balance of trade, and a fear that all their gold and silver may be leaving them. This seems to me, almost in every case, a groundless apprehension; and I should as soon dread that all our springs and rivers should be exhausted, as that money should abandon a kingdom where there are people and industry.”

MONEY SEeks A LEVEL

After showing that fears of this kind had proved unfounded, he went on to demonstrate why such fears were groundless. Suppose, he asked, that four-fifths of all the money in Britain were annihilated in one night. What would be the consequence?
Hume pointed out that there would be such a fall in prices, because of the scarcity of money, that Britain would be a wonderful market for foreigners to buy from and an impossible market to sell to. In very little time, therefore, Britain would get back the money it had lost. If, on the other hand, all the money in Britain were multiplied fivefold in a night, the contrary effect would follow. British labor and commodities would “rise to such an exorbitant height, that no neighboring nations could afford to buy from us; while their commodities, on the other hand, became comparatively so cheap that . . . they would be run in upon us, and our money would flow out.”

In a free market, in other words, and with a metallic currency, the precious metals will tend to distribute themselves among countries in proportion to goods so as to equalize prices (allowing for transportation costs) of goods in different countries. Money will seek its international level for much the same reasons as “all water, wherever it communicates, remains always at a level.”

**HOW TO LOSE GOLD**

Has all this been invalidated by the development of bank credit and paper money? On the contrary, though bank credit was then only in its infancy (1752), Hume correctly diagnosed its effects: “I scarcely know any method of sinking money below its level, but those institutions of banks, funds, and paper credit which are so much practiced in this kingdom. These render paper equivalent to money, circulate it throughout the whole state, make it supply the place of gold and silver, raise proportionably the price of labor and commodities, and by that means either banish a great part of those precious metals, or prevent their farther increase. What can be more shortsighted than our reasonings on this head? We fancy, because an individual would be much richer were his stock of money doubled, that the same good effect would follow were the money of everyone increased; not considering that this would raise as much the price of every commodity, and reduce every man in time to the same condition as before.”

In brief, Hume saw clearly what our monetary authorities have either failed to see or have seen only belatedly and inadequately—that the certain way for a country to lose gold is to inflate faster than other countries. This is the cause of our balance-of-payments problem.

But poor Hume, our “new” economists may reply, did not see that inflation can have a stimulative effect. He did see it, and he also saw through it: “Money when increasing, gives encouragement to industry, during the intervals between the increase of money and the rise of prices. A good effect of this nature may follow too from paper credit; but it is dangerous to precipitate matters, at the risk of losing all by the failing of that credit, as must happen upon any violent shock in public affairs.”

**Books for Americans**

September 30, 1963

Strange are the ways of committees that select books. Take, for example, the first definitive list of books assembled for the White House Library as made public in mid-August. This was chosen under the leadership of James T. Babb, the librarian of Yale University. He had the assistance of what one report called “the best brains of the Library of Congress . . . and a host of distinguished scholars, librarians, publishers, and experts in many fields throughout the nation.” The authors had to be United States citizens except for creators of “a very few classics.” After more than a year of “agonizing” weighing and sifting, the selectors finally settled on 1,780 titles in almost 2,600 volumes.

What was the result? I will confine my comments to the 96 books on economics. The selection is haphazard so far as quality is concerned, and with a pronounced leaning to the left. One is glad to see in it John Bates Clark’s epoch-making work, _The Distribution of Wealth_ (1890), and to find Irving Fisher represented by his admirable _Theory of Interest_. But after a handful of books, the puzzles begin.

**SOME PUZZLES**

Why, for example, is Frank Knight represented by _The Ethics of Competition_ (a collection of miscellaneous essays brought together by former students), while by far his most important and original work, _Risk, Uncertainty and Profit_, is omitted? Why is F.W. Taussig represented by his specialized “Tariff History of the United States,” while his _Principles of Economics_, the most famous, lucid, and long-lived college textbook ever published in America, is unmentioned? Why are not such outstanding free-enterprise economists as Frank A. Fetter, Benjamin M. Anderson, H.J. Davenport, and T.N. Carver not represented by a single book? And why, finally, is the greatest contribution to economic theory in the present generation, Ludwig von Mises’s _Human Action_, simply left out?

There are plenty of anti-capitalist books on the list. Emerson P. Schmidt, chief economist of the United States Chamber of Commerce, has pointed out that books supporting the inflationist-controllist philosophy of the late Lord Keynes outnumber the Keynes opponents three to one. J.K. Galbraith, with his pro-bureaucratic tax-and-spend philosophy, is represented
by no fewer than three books. The list is loaded with many a dull, pedantic compilation, and some pure junk.

AN INSPIRING STORY
But there are still greater puzzles. The American Booksellers Association, in collaboration with Robert Kennedy, the U.S. Information Agency, and the International White House Libraries Project, has assembled about 100 books to be presented to each of 100 heads of state. The declared purpose is “to help tell the story of the American way of life to the people of one hundred nations in all parts of the world.”

Yet one looks in vain for a single book on the list that does tell the inspiring story of American industry and American enterprise. The compilers had as possible choices John Chamberlain’s *The Enterprising Americans*, which tells this fascinating history in both human and technical terms, and H.F. Williamson’s *Growth of the American Economy* and J.W. Oliver’s *History of American Technology*.

Instead of complaining of bad choices, it is a much more grateful task to recommend good books that have not yet received the attention they deserve. I have been meaning for a number of weeks to write about two economics books that appeared earlier this year. The first is a primer, *Essentials of Economics* (Van Nostrand, $4), by a Mexican author, the late Faustino Ballvé. It is an admirable introduction, brief, simple, authoritative, and lively. The second is *Economics of the Free Society*, by Wilhelm Röpke (Regnery, $4.95), which, though it occasionally concedes too much to Keynesian theories for my taste, is on the whole, because of its humanity, erudition, penetration, and its felicitous and luminous exposition, the most satisfactory intermediate and medium length text available.

One World or Many?
October 7, 1963

VIENNA—In the seventeen years since 1946 I have made ten trips to Europe, and like other visitors I have been struck each time by the steady and often accelerative increase in prosperity. Each year Europe seems more like America; the people are better fed, better dressed, better housed, and above all better automobiled. For example, in Austria, from which I am writing, the number of automobiles has increased ten times in the last ten years, and there is now one passenger vehicle for every fourteen people. Of course this growth has its bad side; and traffic jams in European cities, with their narrow winding streets, are often worse than in the U.S. But this increasing prosperity has now become an old story.

In Germany, at Wiesbaden, I attended a “German-American conference” of which the host organization was the German Institute for the Study of Middle and East European Problems, and the guest organization, the Foundation for Foreign Affairs of Chicago, which had been host to the German group in Chicago a year and a half ago. Among the speakers from the United States were Gen. Frank L. Howley, formerly in command of the American sector in Berlin, Stefan Possony of Stanford University, and Strausz-Hupé of the Foreign Policy Research Institute at the University of Pennsylvania. There were also some representatives from half a dozen European countries. Because so much difference of opinion was expressed, even between nationals from the same country, it would be impossible to present a consensus; so I yield to the temptation to quote only an epigram from journalist Robert Ingrim, who remarked that “Mr. Kennedy seems to fear nuclear bombs more in the hands of his friends [his European allies] than in the hands of his enemies.”

AUSTRIAN DILEMMA
From the end of the war, and until 1961, the Austrian economy showed almost the highest growth rate in Western Europe—an average of 12 percent a year from 1945 to 1961 and an average of 6 percent calculated from 1953 to 1961. For the last year and a half, however, the expansion has slowed down to a rate of only 2½ percent.

In fact Austria, which is heavily dependent on foreign trade (about a third of its entire production is exported), has arrived at a crossroads; either it must integrate its economy with that of the Common Market or it will be inescapably driven into the sphere of Soviet power and influence. Until now roughly half of Austria’s exports have gone to the Common Market and more than 60 percent of her imports have come from there. Already 17.5 percent of Austrian exports go to the Communist bloc. Some Austrian economists (notably Prof. Franz Nemschak, head of a semiofficial research organization) point out that unless association can be achieved with the Common Market, Austria will be forced into more bilateral trade with the Communist bloc, increased governmental planning, loss of productivity, and eventually complete loss of political freedom and independence.

FOREIGN ISSUES TAX
Most European bankers, businessmen, and economists with whom I have talked are appalled by our Administration’s proposed “equalization” tax on sales of foreign securities in our market. Of course they are
concerned about the increased difficulty of meeting Europe’s capital needs. But they also quite honestly think the proposed action self-defeating from our own point of view. The proposal, they say, has undermined confidence in the dollar. Before the President’s proposal was made, an American underwriting group had almost finished arrangements for a $20 million loan to Austria. Based on previous experience, Europe itself would have bought 60 to 80 percent of this loan. Negotiations, however, had to be suspended in favor of short-term bank credits. So this could mean a net outflow of $20 million instead of only $4 million to $8 million.

But most of all Europeans are baffled by this move, on the part of the previous “banner-carrier” for free capital movements and international integration, back toward economic isolationism and restrictionism.

Farm Program Fiasco
October 14, 1963

Our crop price support program is now some 30 years old. Its evils have been cumulative—so much so, that the problem of extricating ourselves seems all but insoluble.

In the summer issue of Modern Age, a quarterly review, Karl Brandt, formerly one of the three members of the President’s Council of Economic Advisers, and now director of the Food Research Institute at Stanford University, admitting the difficulty of auditing the full amount of the social and economic costs of the price-fixing policy, tries to list its “worst features”:

1—“The gigantic amount—over 80 million tons—of excess grain stocks which represent a misinvestment of many billions of dollars, a physical bulk which must be transported, stored, and handled at enormous expense, equivalent ... to two solid lines of freight trains from New York to San Francisco.

2—“A price level set high above equilibrium, which is continually menaced by the existence of the giant surplus stocks: grain ‘in jail’ is still grain.

3—“The effected socialization of the holding of stocks of the price-fixed commodities.

4—“The impossibility of returning to a non-manipulated free market provided only with disaster insurance so long as these huge government stocks exist without a solid official commitment that they will not be returned to commercial markets.

5—“The gradual attrition of one of the most refined market mechanisms of the capitalistic economy—the future trading in commodities.

6—“The capitalization of the value of the allotments in the land values, and the boosting of farm real-estate values by the price-fixing.

7—“The loss of commercial export sales that could be made at lower, more realistic export prices.

8—“The encouragement of price-fixing for farm products in the European Common Market, in Japan, and other importing countries.

9—“The serious weakening of the bargaining power of the United States in its efforts to free the flow of agricultural products in world trade over import barriers, export subsidies, and bilateralism.”

All of these distortions, as Brandt points out, are merely by-products of the decision to protect the farmers’ income from disastrous declines by fixing prices.

But how do we ever end the program? Brandt’s own opinion is that “a sudden change of policy could put thousands of farmers through the wringer of foreclosure.” His own remedy would be a gradual restoration of free markets, a gradual lowering of support prices to a market level at which crops would move freely. But first of all we would have to abolish the enormous excess stocks of grain. “The proper way would be to reduce them by conversion to meat over some six years, outside market demands, and by a gradual liquidation that writes them off at a loss.” Not until these nuisance stocks are lifted from the market “can we disengage farm products from government buying and price-fixing.” Meanwhile, Brandt thinks, there might have to be an aid program that would “undoubtedly cost several billion dollars a year for several years.”

SELL IT BACK
The trouble with such a “gradual” disengagement program is that as long as the government sets any support price at all above the level of a free market it will go on piling up still more surplus stocks.

I have several times suggested in this column that the government sell its surplus of more than a billion bushels of wheat back to the farmers themselves on a quota basis and below the average estimated cost production. A farmer could either pay for and take his quota, or order it sold on the market and receive a check for the difference. There would be some objections, I admit, to this course also. And even this solution is now blocked by our government’s folly last year in renewing the International Wheat Agreement for another three years. This commits the U.S. to conduct all trade in wheat at a minimum price of $1.62½ a bushel. The government has not only walled itself as regards wheat, but by its sugar import quotas and its involvement in an international coffee agreement it is driving deeper and deeper into a centrally directed economy.
World Monetary Reform
October 21, 1963

Representatives of ten leading industrial nations announced on Oct. 2 that they would start the first major negotiation and study of the world’s monetary system since the Bretton Woods Conference twenty years ago.

The project suggests misgivings concerning the workings of the system set up at that time. But the prospect of reform in the direction of a sounder system is not bright. For the basic assumption of all governments today is that they have not only the right but the duty to tamper constantly with the national money. This is known as “monetary management.”

The general lines along which the study and negotiations are likely to proceed are indicated in an article in the October issue of Foreign Affairs by Under Secretary of the Treasury Robert V. Roosa. This article may fairly be taken as reflecting present official U.S. policy.

Unfortunately Roosa begins by rejecting out of hand the only real solution—a return to a full international gold standard. He repeats the old charge that this was precisely the ‘system which broke down after World War I and led to the currency chaos of the ’30s.” The gold standard did not “break down.” It was deliberately abandoned and destroyed by monetary “managers” who wanted to dilute and inflate their national currencies, and rightly recognized the gold standard as the great barrier to their plans. The reason governments are now implacably opposed to a return to the full gold standard is that it would deprive them of their present powers to “manage” and “expand”—in brief, to inflate.

WORDS VS. REALITIES
Roosa, of course, puts this in more euphemistic words: “National policies for incomes, as well as for interest rates and credit availabilities, seem to be, or to be becoming, a normal part of the responsibilities which all governments now acknowledge in varying degrees for promoting growth, avoiding instability, and achieving external balance.” Compare these words with today’s realities. It is precisely these income and interest-rate “policies” that have retarded growth, created instability, and destroyed external balance. The dominant cause of the deficit in our balance of payments, and of our loss of gold, is our domestic inflation.

The monetary “reforms” that Roosa thinks will be considered all contemplate continuance of “the present gold-dollar-sterling-IMF system as the means of providing reserves,” as well as enlargement of currency swaps and other “cooperative credit arrangements,” enlarging the resources of the IMF and the drawing rights of its members, and even “endowing it with the capacity to create credit and the power to allocate such credit among members.”

All such proposals are ways of continuing and increasing credit expansion and currency inflation.

DEPRECIATION RECORD
In Roosa’s whole article there is not a word about the dreadful record of world currencies under the IMF system. On the contrary, we are told that “the Bretton Woods system is nearing the end of its second decade, a decade of remarkable achievement.” Remarkable indeed. The last two decades show the worst record of international inflation, depreciation, devaluation, and repudiation ever achieved in peacetime if not in war.

Let us skip over the devaluation of the British pound and scores of other currencies in 1949 and take the record of the last decade alone, as presented, say, in the July letter of the First National City Bank of New York. A table of 43 national currencies shows depreciation (in domestic purchasing power) in all of them over the 1952–62 decade, ranging from 1.3 percent annually for the U.S., to 2.9 percent for Britain, 3.5 percent for France, and 21.5, 25, and 35.2 percent annually for Brazil, Chile, and Bolivia respectively.

The only reason the system has “worked” until now is that the dollar, to which all the other currencies are tied, has been anchored to gold. But with the anchor itself in danger of drifting from its present gold base, the only “reform” the world’s monetary managers have to suggest is to increase the facilities for U.S. and world inflation.

A Shortsighted Tariff
October 28, 1963

The mere proposal by the President on July 18 of a retroactive tax on American purchases of foreign securities has already done great harm. It has brought about paralysis in such investment, created world uncertainty, and undermined confidence in the dollar. If the Administration does not withdraw the proposal, Congress should reject it promptly.

The proposal has now received impressive criticism from many quarters, but the most thorough analysis I have seen was in the Congressional testimony on Aug. 21 on behalf of the Investment Bankers Association of America by Amyas Ames, its president, and by Andrew N. Overby, chairman of its foreign-investment committee and former Assistant Secretary of the Treasury.
and deputy managing director of the International Monetary Fund. Let me summarize the chief points:

1—The proposed tax will adversely affect the U.S. balance of payments in the long run and will not significantly improve it in the short run.

Private foreign investment is an asset-creating expenditure. Current net capital outflows are offset by income from previous investments. From 1958 through 1962, income from all private foreign investment amounted to $15.4 billion compared with an aggregate net outflow for new investment of $16.6 billion. Moreover, in 1962 alone income amounted to $3.8 billion as compared with a net outflow of $3.3 billion.

Trade follows credit. With the dollars they obtain from U.S. purchases of their securities, foreigners buy our goods and services. Often the connection is direct. The Japanese Telephone Co. (KDD) raised $25 million through sale of securities in this country to lay a 3,000-mile submarine telephone cable from Tokyo to Hawaii. All of the money raised is being spent in America making jobs for American workmen. Apart from such examples of direct connection, our foreign investments provide foreigners with the necessary dollars to purchase our exports. If other things remain unchanged, our exports will tend to be reduced by the same amount as we reduce our foreign investments.

2—The proposed law is not addressed to the fundamental causes of the balance-of-payments deficit. The great “leakage” comes from foreign aid and other government programs totaling $4 billion in 1962 and overseas military expenditures reaching some $3 billion. There is little hope of correcting our balance-of-payments deficit unless we reduce these expenditures substantially, improve our cost position in relation to our competitors abroad, and increase the attractiveness of foreign investment in the United States.

3—The proposed tax would be more accurately described not as a tax at all but rather as a new protective tariff to limit the importation of foreign securities. So viewed, the so-called “tax” represents a retreat from our long-standing policy of freedom for capital movements.

4—The United States capital market, and foreign economies dependent upon it, may be seriously damaged. The U.S. is now the only free capital market in which the amount and terms on which an issuer can sell its securities are limited only by the marketplace. This is a precious national asset. It should not be dissipated without convincing reasons of national interest.

5—The proposed tax may create fears of further restrictions. We must not impair the value of the dollar as the key currency of the world. Diminished confidence in the dollar can only have an adverse impact on our balance of payments.

6—The proposed tax is discriminatory. It selects only one aspect of private expenditure abroad—private portfolio investment—for restriction through a special tariff while leaving unaffected private expenditures abroad for tourism, direct foreign investment, and commercial bank loans.

7—The proposed tax is administratively complex.

I have only one serious reservation to this admirable analysis. I wish it had recognized more clearly that the basic cause of our so-called balance-of-payments problem is our domestic inflation, reflected through our huge past and prospective budget deficits and our cheap-money policies. We are driving dollars and investment abroad as much by holding down long-term interest rates as by holding down short-term interest rates.

**Undo the IMF System**

November 11, 1963

Representatives of the governments of the ten most powerful industrial nations (outside the Communist bloc) have begun a study of the world’s monetary systems. Such a study is long overdue. Yet the prospects that it will result in a real improvement are not bright. On the contrary, the most influential governments are pushing for an increase in world “reserves” and international “liquidity.” In plain English, they are pushing for more world inflation.

The real problem is how to bring this inflation to a halt. The real solution is to dismantle the International Monetary Fund system. This system has proved, in practice, a gigantic machine for world inflation. In the nearly twenty years of its existence, more and greater devaluations have occurred in national currencies than in any comparable period.

In *Newsweek* of Oct. 21, I called attention to this record, beginning with the scores of devaluations in 1949 touched off by the overnight devaluation of the British pound from $4.03 to $2.80. In the decade from the end of 1952 to the end of 1962, 43 leading currencies depreciated. The U.S. dollar showed a loss in internal purchasing power of 12 percent, the British pound of 25 percent, the French franc of 30 percent. The currencies of Argentina, Brazil, Chile, and Bolivia lost, respectively, 89, 91, 94, and 99 percent of their purchasing power.
INFLATION BUILT IN
This result was not accidental. It was made possible, if not in effect caused, by the IMF system.

It is amazing that this system, jerrybuilt at Bretton Woods in 1944, is not only still tolerated, but regarded as practically sacrosanct. Its paternity was not auspicious. Its two fathers were Harry Dexter White of the U.S. and Lord Keynes of England. White, who later served as U.S. executive director of the IMF, was reported by the FBI in 1945 (as revealed in an announcement by Attorney General Brownell in 1953) to be a Russian spy.

Keynes urged Britain to adopt the plan precisely because he regarded it as inflationist. It would provide, he argued in the House of Lords (May 23, 1944), “a great addition to the world’s stock of monetary reserves. . . . We are determined that, in future, the external value of sterling shall conform to its internal value as set by our own domestic policies, and not the other way round. . . . We intend to retain control of our domestic rate of interest, so that we can keep it as low as suits our purpose, without interference from the ebb and flow of international capital movements or flights of hot money.” Finally, Keynes assured his hearers, “If I have any authority to pronounce on what is and what is not the essence of a gold standard, I should say that this plan is the exact opposite of it.”

TIED TO THE DOLLAR
If there were no IMF, governments whose currencies were shaky as a result of their reckless fiscal and monetary policies would be forced to go to private bankers or investors to extricate them, and private investors would insist on guarantees of fiscal and monetary discipline as a condition of such help. But Keynes insured that a nation’s “domestic” inflationary policies “shall be immune from criticism by the Fund.” He provided for automatic borrowing rights, and left any aid conditions to the necessarily political decisions of other governments through their representatives on the IMF.

Other countries have been able to devalue freely. But because all other currencies are anchored by the system to the American dollar, this freedom is denied to the United States, which cannot devalue without creating world monetary chaos. Our government has, nevertheless, continued to follow irresponsible fiscal, monetary, and interest-rate policies calculated to make this result inevitable. And this is what makes the IMF system dangerous for every other member nation. For the future value of their own currencies, and their own economic stability, have become dependent on the uncertain “domestic” fiscal and monetary policies of the United States.

Why not take another look at the possible virtues of a return to a world gold standard? ❓

The Jobless, and Why
November 18, 1963

The Department of Labor has announced that unemployment in October amounted to 5.5 percent of the labor force. It has been above 5 percent since late 1957.

These figures puzzle Europeans, whose official unemployment estimates are much lower. When I was in Europe in September, I was repeatedly asked for an explanation. My answer ran something like this:

1—It’s hard to tell whether the contrast is really as great as official estimates indicate. We count our unemployment differently from you. You usually count only the registered unemployed on the insurance rolls. We count in addition estimates based on a census sampling.

These additional unemployed are very generously estimated. Let me quote the Labor Department’s own words (from its September monthly report): “The unemployed total from the household survey includes all jobless persons who were looking for work, regardless of whether or not they were eligible for unemployment insurance. Also counted as unemployed are persons waiting to be called back to jobs from which they had been laid off; those scheduled to start new wage or salary jobs within 30 days (except students); and those who would have been looking for work except that they were temporarily ill or believed no work was available in their line of work in the community.”

Of course if we count as unemployed everybody who says he wants job, but is not even bothering to look for one, we can get a high total.

And the wider our inclusions in the “labor force” the higher our estimates of “unemployment.”

2—The crucial question is how much of our statistical unemployment represents real economic distress. We get some light on this when we break the unemployed into categories. Then we find that (in September) the unemployment rate of males 16 to 19 years old was 14.7 percent, but that of males 25 to 34 years old was only 3.3 percent. For single men the unemployment rate was 10.5 percent, but for married men (“wife present”) the rate was only 2.3 percent. Most unemployed youths are probably supported by their parents. Those who really need jobs most, tend to have them most.

We also get instructive results when we ask how long the unemployed have been unemployed. We find that 47.8 percent, or nearly half, have been unemployed less than five weeks. Only 25.2 percent have
been unemployed more than fifteen weeks, and only 14.3 percent more than 27 weeks (when unemployment insurance normally runs out). Stated another way, only 1.5 percent of the labor force are unemployed for more than fifteen weeks.

3—American legislation raises the unemployment rate. Our constantly rising legal minimum wage rate tends especially to cause unemployment among the lowest-paid workers. This is one reason why the jobless rate among colored workers averages 9.2 percent, compared with 4.2 percent among white workers.

4—Unemployment is also increased in the U.S. by high and long unemployment-insurance payments. We even subsidize strikes by unemployment insurance if the strike, say in New York, goes on for more than seven weeks. The extent of unemployment is not unrelated, also, to the size of relief payments.

5—Finally, of course, and perhaps most importantly, our Federal labor legislation is so drawn (and applied by the NLRB) that employers are almost impotent to resist excessive union demands. This encourages many unions to press demands that price a large percentage of their members out of the market, and even drive some employers out of business.

When I finished my answer, my European questioner would often ask: “But why don’t the American authorities correct the situation?” I replied that the causes I had emphasized were almost never publicly mentioned. Unemployment in the U.S. is officially attributed to two factors: (1) “insufficient aggregate demand” and (2) “automation.” Both explanations are fallacious; both lead to harmful policies. The “insufficient demand” theory causes pressure for constant deficit spending. And if automation throws people out of jobs on net balance, how can we explain why American employment this year is at the highest level on record? ✖

**Does Foreign Aid Aid?**

November 25, 1963

It remained for Senator Morse, of all people, to blurt out the truth: “If foreign aid were submitted to a referendum of the American people, it would be overwhelmingly defeated.” Certainly it would be defeated in its present prodigal and promiscuous form.

But whenever Congress grows restive and attempts to curb at least some of the more flagrant items in the program, the executive branch shouts that it is “threatening world security.” President Kennedy even questions the good faith of opponents of the program. They “find it politically convenient,” he says, “to denounce foreign aid with one breath and the Communist menace with another.”

This begs the whole question. Has foreign aid reduced the Communist menace (especially as compared with alternative programs)?

The military assistance program, in such places as Formosa and Vietnam, has prevented or slowed up direct Communism aggression or conquest. But has our economic aid, scattered over nearly a hundred countries, done anything appreciably to arrest the spread of Communism? The argument that it has done so rests on the assumption that all these countries live in “poverty and despair,” and will turn in desperation to Communism unless their standard of living is substantially raised.

**POVERTY, OR IDEAS?**

There is in fact no evidence that the Communist ideology increases in proportion to poverty. Hungary and Rumania, Poland and East Germany are Communist today not because they were poor but because they conquered. Cuba is Communist, not because it was any poorer than other Latin American lands, but because armed revolutionists seized power. Italy is more prosperous—and more people vote Communist—than at any time in the past.

In brief, if countries voluntarily go socialist or Communist, it is because of ideology, not because of their economic level. If people are led to believe that socialism or Communism is the quickest way to raise their economic condition, they will adopt it. If they recognize, however, that the surest way to improve their economic condition is by adopting the principles of capitalism and free enterprise, that is what they will do.

The Administration has ignored this. Czarist Russia chronically exported a surplus of grain; Communist Russia cannot even feed its own people. Yet instead of exploiting this fact, our government rushes to relieve the Communist plight. It does not point to the failure of Khrushchev’s production boasts, because it accepted them. Lastly, Secretary Freeman was praising the “real progress” achieved by the Russians in the last five years in the production of grain.

**NO CORRELATION**

Has foreign aid appreciably raised income and living standards in the recipient countries? In the last fifteen years, of course, living standards have improved in nearly all countries. But no correlation is detectable between the rate of growth in each country and the amount or percentage of American foreign aid. The President belittles its cost to us. It is only “seven-tenths of 1 percent of our gross national output.” But then it
must be similarly minute percentage of the total GNP of the hundred or so nations among which it has been scattered. How, then, could it substantially increase their living levels? Especially as it is offered to Latin American countries on condition that they embark on “national planning” and “land reform”—i.e., on still more socialism and welfare-statism.

Has our foreign aid improved our own economic conditions? The President contends that it has. “A cut of $1 billion in our total foreign-aid program may save $100 million in our balance of payments—but it costs us $900 million in exports.” He forgets that such “exports” are given away. They are paid for by our own taxpayers, who would otherwise have had the $900 million to buy things for themselves. The $100 billion total we have paid out in foreign aid set back our own capital development, our own economic growth, by $100 billion.

If our foreign aid finally destroys the dollar as the world’s anchor currency, whom will it have helped?

The Vice Presidency
December 2, 1963

Though the assassination of President Kennedy came as an incredible shock, it did not bring the uncertainty and chaos that might have followed in a country under different institutions. The nation was not left in doubt for an hour concerning Mr. Kennedy’s successor. It knew almost immediately that it would be the Vice President, Lyndon Johnson. Yet the incident once more raises the question whether the constitutional and statutory arrangements for the succession to the Presidency, when the incumbent dies or is killed in office, are adequate or even reasonably satisfactory.

It is, of course, a gain for the orderly transition of power, and for the reduction of uncertainty, that the name of the successor should be known. But even the institution of a hereditary monarchy provides this kind of transition and certainty. What remains in doubt when a Vice President succeeds to the Presidency through the accident of death is not only what changes in policy he will attempt, but what support he will get from Congress, and whether he would in fact have been the choice of the country for President. The succession of Andrew Johnson following Lincoln’s assassination, and the bitter struggle with Congress that followed, culminating in the attempt to impeach him (which failed only by a single vote), dramatized all these doubts and misgivings.

ABOLISH THE OFFICE?

No one expects a repetition of anything approaching this now that another President Johnson has been brought into office by an assassin’s bullet. Because of Lyndon Johnson’s long and brilliantly successful experience as Majority Leader of the Senate and because he represents more nearly the center of his own party, it is probable, indeed, that he will gain more cooperation from Congress than President Kennedy did, and may even succeed in reconciling the Northern and Southern wings of the Democratic Party. But if this turns out to be so, it will be a lucky accident and a result hardly attributable to our institutional provisions.

Should the U.S. Constitution be amended to abolish the office of Vice President? When there is a Vice President in office it is difficult to discuss this abstract institutional question without being suspected of a personal bias for or against the incumbent. But when, as now, the office falls vacant, it seems opportune to consider it with the seriousness it deserves. I should like to take the liberty of quoting from a book I wrote more than twenty years ago, A New Constitution Now (1942).

CHOICE BY CONGRESS

“If the aim of a constitution is either to clarify the expression of the popular will or to bring the ablest men of a country into leadership, the institution of the Vice Presidency achieves neither purpose. On the contrary, the institution beclouds campaign issues. It forces many voters to choose a man they do not like in order to elect a man they do like. It would be an obvious improvement in our democratic machinery if only candidates for President were nominated and elected, and if the Constitution were amended to provide, following the precedent in a number of other countries, that in the event of the death of the President the successor to fill his unexpired term would be chosen by the House and Senate sitting as a single body. A President so chosen would be certain to be an outstanding man, who would receive the willing cooperation of Congress, and would represent the sentiment of the country at the time he came into office.

“Such a man could not fail to be a better choice, on the average, than a man who comes to the Presidency accidentally through the death of the President. Congress, in making its own choice of a successor, would be forced to act with the utmost seriousness and responsibility. Compare this with the irresponsible and frivolous attitude of a party nominating convention that chooses a Vice Presidential candidate to ‘balance the ticket’ with little real belief that he will ever become

December 2, 1963

Though the assassination of President Kennedy came as an incredible shock, it did not bring the uncertainty and chaos that might have followed in a country under different institutions. The nation was not left in doubt for an hour concerning Mr. Kennedy’s successor. It knew almost immediately that it would be the Vice President, Lyndon Johnson. Yet the incident once more raises the question whether the constitutional and statutory arrangements for the succession to the Presidency, when the incumbent dies or is killed in office, are adequate or even reasonably satisfactory.

It is, of course, a gain for the orderly transition of power, and for the reduction of uncertainty, that the name of the successor should be known. But even the institution of a hereditary monarchy provides this kind of transition and certainty. What remains in doubt when a Vice President succeeds to the Presidency through the accident of death is not only what changes in policy he will attempt, but what support he will get from Congress, and whether he would in fact have been the choice of the country for President. The succession of Andrew Johnson following Lincoln’s assassination, and the bitter struggle with Congress that followed, culminating in the attempt to impeach him (which failed only by a single vote), dramatized all these doubts and misgivings.
As such a change would itself require a constitutional amendment, Congress should in the same amendment provide for the contingency of a successor to the President when there is, as now, no Vice President in office. In place of the present somewhat makeshift Succession Act, adopted in 1947, it should provide that Congress itself, sitting as a single body, choose the new President to fill the unexpired term. The amendment could direct the Speaker of the House, in the event that Congress was not in session, to act as President pro tem and call a special joint session for the purpose.

A NEEDLESS OFFICE

Finally, in such an amendment, Congress could abolish the needless office of Vice President, and provide, in the event of the President's death, for the above procedure to choose his successor for the unexpired term. Such an amendment would solve many problems at once. The new President so chosen would be certain to be a man of outstanding ability. He would have the confidence of the majority of Congress and would therefore be more likely to secure its cooperation than any other man.

If at the time of President Kennedy's election there had been no Vice Presidential candidate, and Mr. Johnson had still been Senator Johnson and the Senate's Majority Leader, it is altogether probable that he would still have been today the choice of Congress as President Kennedy's successor. But Mr. Johnson's position is in this respect unique. In no other case of a President's death or assassination in office does it seem probable that his successor would have been the one chosen by Congress as the new President had he not been Vice President.

President Johnson, therefore, is in a unique position to ask for such a reform. We may not always be able to prevent some madman from killing a President in office, but we can and must prevent him from, in effect, selecting a new President for us.

Aid—or Investment?

December 16, 1963

Some bewildering contradictions have developed in our foreign economic policy. The government wishes to continue to give away, for example, some $4 billion a year in taxpayers' money to aid foreign countries. It insists that this aid is having only a negligible adverse effect on our balance of payments. At the same time it is opposed to American citizens *investing* their own
money at their own risk in foreign countries. It contends that such investments are a serious threat to our balance of payments. So it has proposed an almost prohibitive tax on them.

The government's theory is fallacious and the facts are against it. In the long run the outflow of American capital to foreign countries is more than balanced by the inflow of income earned by that capital. From 1958 through 1962, income from all private foreign investment amounted to $15.4 billion compared with an aggregate net outflow of new investment of $16.6 billion. In 1962 alone income amounted to $3.8 billion compared with a net outflow of $3.3 billion.

In a message to Congress last summer, President Kennedy called attention to this. “Our payments deficits,” he pointed out, “measured in terms of our loss of gold and the increase in our short-term liquid liabilities to foreigners, have consistently been equaled or exceeded by the growth of our long-term high-yielding foreign assets—assets which have been and will continue to be an increasing source of strength to our balance of payments.”

**SHORTSIGHTED TAX**

Isn’t it shortsighted, then, to stop the further growth of these assets? Isn’t it obvious that, regardless of any immediate result, the proposed tax must adversely affect our balance of payments in the long run?

It is clear from the very nature of the transaction that a large part of our exports are made possible by foreign investment. With the dollars they obtain from American purchases of their securities, foreigners buy our goods. Our exports must tend to be reduced by the same amount as we reduce our foreign investment.

But though the government objects to private foreign investment, for fear it will hurt our balance of payments, it insists upon continuing to give away some $4 billion a year in foreign aid. And it argues that this will not substantially hurt our balance of payments. A cut of $1 billion in our total foreign-aid program, government officials maintain, could save only $100 million in our balance of payments, but would cost us $900 million in exports.

It is hard to see just how the government could go about proving this statistically. But to the extent that it is true, why doesn’t the same logic apply to our foreign investments? Why are they a threat to our balance of payments while foreign aid is not? Why wouldn’t cutting off $1 billion in foreign investments also cost us $900 million in exports?

**LOANS CREATE EXPORTS**

The truth is that it would. In the long run, in fact, cutting off $1 billion in foreign investment must cost us, other things remaining unchanged, $1 billion in exports. The real difference is that the exports made possible by foreign investment are real exports. Foreigners pay for them. The exports resulting from foreign aid are sham exports. We pay for them. Sound foreign investments build American economic strength. Foreign giveaway sets back our own capital development and economic growth.

The truth is the exact opposite of what our foreign economic policy assumes. Foreign investment creates exports and so creates jobs for Americans. It creates assets, and in future years must benefit our balance of payments through payments of interest, dividends, and return of capital.

Private foreign investment, also, really develops the countries into which it is put. For them it is wealth-creating and income-creating. It is, in fact, by far the quickest and most efficient means to their economic progress. And if a government, as in Argentina, is shortsighted enough to think it can seize past foreign investments in its country without killing off future investments, or even losing our foreign aid, it ought to be promptly taught the opposite.

**Investment as Scapegoat**

December 23, 1963

It was a sad day when the House Ways and Means Committee approved the Administration’s proposed penalty tax on purchases by Americans of foreign securities. Such a tax is shortsighted and ill-conceived in every way. In the long run it will not help, but hurt, our balance of payments. In the long run it will reduce our own foreign-asset holdings. It will seriously damage our international capital market, and the foreign economies dependent on it. It will not increase, but further undermine, international faith in the integrity of the dollar.

Last week I pointed out here a glaring inconsistency in the Treasury’s argument. It holds that foreign-aid handouts have only a negligible adverse effect on our balance of payments, but that private American foreign investments are a serious threat to our balance of payments. The truth is, if anything, the exact opposite. As President Kennedy, in his message to Congress of July 18 last, pointed out: “Our payments deficits . . . have
consistently been equaled or exceeded by the growth of our long-term high-yielding foreign assets—assets which have been and will continue to be an increasing source of strength to our balance of payments."

The immediate adverse effect of foreign investments on our balance of payments is minor. They provide the funds with which foreigners buy our goods. They thereby increase our exports. And future receipts from these investments (in the form of interest, dividends, and return of capital) must benefit the balance of payments in future years.

PROMOTE WORLD GROWTH
But in addition to increasing the asset-strength of the United States, private foreign investment (as contrasted with government giveaway) does most to promote the fastest economic growth in the rest of the world. For private foreign investment goes to the places that promise the safest and biggest returns. This means that such investment goes to the places where property is respected and least liable to seizure, nationalization, prohibitive taxation, or other forms of harassment. It means that such investment goes where it seems likely to earn the highest returns—which means where it will be most productive—which means where it will do most to raise living standards.

The proposed penalty tax on purchases of foreign securities violates basic legal as well as basic economic principles. In its retroactivity it ignores the constitutional prohibition of *ex post facto* laws. It is discriminatory. Not only does it select for penalty only one form of private expenditure or investment abroad, while exempting others, but it discriminates *by name* against 22 countries—which happen to be the countries that manage their affairs best and where investment is safest—in the hope of deflecting investment into countries that have so mismanaged their affairs as to frighten off investment (as in South America) or to get themselves a chronic balance-of-payments deficit (as in India).

WHO IS TO BLAME?
What the tax proposal does, in effect, is to say: "You, you private investors, are causing our balance-of-payments deficit." But the cause of that deficit is clearly the government’s own policies—not merely foreign aid, not merely huge and chronic budget deficits, but arbitrarily holding down interest rates, both short-term and long-term. When the government holds down long-term rates, it drives more American investment abroad and discourages foreign investment here. If the Federal Reserve stopped inflating, and allowed domestic interest rates to be determined by market forces, there would automatically be less American investment abroad and more foreign investment here. But the government prefers to keep this market interference and try to offset its evil results with still another market interference—and so carry us still deeper into a centrally mismanaged economy.

As the late President Kennedy wrote in his letter to David Rockefeller of July 6, 1962: "Private foreign investment . . . should not be subject to restrictions. . . . Government must confine its restrictive influences to its own expenditures.”

Tax Cut Regardless?
December 30, 1963

So the stage is all set for a tax cut of $11 billion in the calendar year 1964, and everyone seems delighted. No one in official circles any longer mentions the obsolete idea that the budget ought to be balanced. No one has so far indicated, in fact, that the deficit will be any less than the $9.2 billion that Secretary Dillon estimated about two months ago for the 1964 fiscal year, or the $9.2 billion that he estimated for the 1965 fiscal year.

So, at best, we are borrowing money to cut taxes. This does not look like a very farsighted operation. But the situation is graver than this. If the government proposed to finance its planned deficits by borrowing real savings, at least it would not be resorting to inflation. But the most vociferous proponents of a tax cut want it precisely because they do want it financed by inflation—i.e., through the creation of new money. And the Federal Reserve authorities have already begun to supply this inflation. The nation’s “money supply” in the official sense (demand deposits and currency outside banks) increased $6 billion between October 1962 and October this year. In a broader sense (including time deposits) the money supply increased $20.7 billion in that period, or 8.6 percent. This is an extraordinary increase for a single year. This, rather than the mere anticipation of a tax cut, has triggered the boom in the stock market and business.

WHY IT IS A SHAM
If Federal expenditures are allowed to run $9 billion beyond revenues, the difference must somehow be paid for. And if it is made up by inflation—i.e., by the government’s creating more money—this means that it is being paid for by a hidden tax, an iniquitous tax paid
through higher prices. A tax cut at the cost of a deficit is a fraud.

Apart from the question whether there should be a tax cut at all at this time (without an even greater cut in expenditures to balance the budget), the kind of tax cut now proposed is far from the most likely to increase incentives and promote growth. What is most necessary to this end is to reduce the near-confiscatory rates on the higher incomes, and penalization of effort and success. But the tax bill as it passed the House does the reverse. By establishing a minimum standard deduction, it frees 1.5 million taxpayers from all tax liability. This must tend to remove the interest of that many more people in prudent fiscal management by the government, and increase the pressure for benefits they do not directly pay for.

**TO RESTORE INCENTIVE**

The House version of the new tax bill would make our income-tax structure even more steeply graduated than it already is. The percentage of reduction in the aggregate tax liability of various income brackets (as pointed out in the illuminating testimony before the Senate Finance Committee by Roger A. Freeman of the Hoover Institute at Stanford University) would run like this:

<table>
<thead>
<tr>
<th>Adjusted gross-income class</th>
<th>Percentage Reduction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to $3,000</td>
<td>-38.3%</td>
</tr>
<tr>
<td>$3,000 to 5,000</td>
<td>-26.2</td>
</tr>
<tr>
<td>5,000 to 10,000</td>
<td>-19.9</td>
</tr>
<tr>
<td>10,000 to 20,000</td>
<td>-16.4</td>
</tr>
<tr>
<td>20,000 to 50,000</td>
<td>-15.1</td>
</tr>
<tr>
<td>50,000 and over</td>
<td>-12.6</td>
</tr>
<tr>
<td>Overall</td>
<td>-18.8</td>
</tr>
</tbody>
</table>

But what is needed to increase what President Kennedy called “the financial incentives for personal effort, investment, and risk-taking” is, most of all, reduction of the near-confiscatory rates on the higher incomes. As Roger Freeman rightly declares: “Government should not hold a majority interest in anybody’s income, and the top rate of the personal income tax should not exceed 50 percent.” The vote of the Senate Finance Committee to give a few taxpayers in unusual situations (it is estimated it would affect only 14,000) the option of limiting their maximum tax rate on personal incomes to 50 percent, is a debatable step toward this goal; but it is at least an encouraging recognition that present confiscatory rates have been destroying effort and incentives without producing revenue. ✽
Succession and Business
January 6, 1964

The shocking assassination of President Kennedy was followed by hours of panic on the markets of the world. The reminder once again that sudden death—whether through violence, accident, or natural causes—can come to a President in office, and the recognition that our statutory provisions for succession when there is no Vice President are unsatisfactory to many, and that the provisions for the event of “disability” are vague and inadequate, led to considerable discussion of possible remedies.

Because these have a vital bearing also on the question of maintaining business confidence, or at least minimizing business uncertainty, in the event of the recurrence of such a tragedy, I felt justified in discussing the problem in two successive columns (Dec. 2 and 9). I expected to drop the matter there. But to my astonishment more letters have poured into this office on these two columns than on any I have written in years. And at least half of these letters have been based on a misunderstanding of what I proposed. I can only assume that I failed to make myself clear, and that the misunderstanding of my correspondents is shared by others who did not write. So I should like to take up two of these proposals again.

Disability
The first concerns the problem of Presidential disability. The Constitution provides: “In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President, and Vice President, declaring what officer shall then act as President, and such officer shall act accordingly until the disability be removed or a President shall be elected.”

The defect of this provision is that it neglects to define “inability” or “disability”; or to specify who is to certify it if the President himself is unable or unwilling to do so; or to declare who has the authority to say whether or when the disability has been removed. It would be highly embarrassing, at best, to put such decisions on the Vice President or the person next in statutory line of succession. I suggested that the most satisfactory solution of this problem would probably be to empower Congress itself to make these decisions, if a President were unable or unwilling to do so, and to appoint, in the absence of a Vice President, an Acting President to discharge the powers and duties of the office until Congress declared the President’s disability to be removed. Such an amendment, it seems to me, would reflect the intention of the existing constitutional provision, but make explicit what is now obscure.

No Interregnum
As such a change would itself require a constitutional amendment, I went on to suggest that Congress should in the same amendment provide for the contingency of a successor to the President when there is, as now, no Vice President in office. I proposed that such an amendment should provide that Congress itself, sitting as a single body, choose the new President to fill the unexpired term. It was this proposal that was so widely misunderstood. Many correspondents assumed that while Congress was voting the nation would be left without a head. They overlooked the next sentence, in which I suggested that “the amendment could direct the Speaker of the House . . . to act as President pro tem, etc.” Until Congress’s decision on a new President was reached, in brief (even though that would probably not take more than a few days), the Speaker would exercise full Presidential powers. There would be no interregnum.

On one point, however, my wording was clearly to blame. In an unwise effort at compression I referred to the bitter struggle between President Andrew Johnson and Congress as “culminating in the attempt to impeach him (which failed only by a single vote).” Many correspondents have written to point out, quite correctly, that Andrew Johnson was impeached by the House, and that it was his conviction by the Senate which failed only by a single vote.

Looking for Scapegoats
January 13, 1964

For 30 years, with minor intermissions, our government has been following a policy of monetary inflation. The cost of living has more than doubled. Since the end of 1939, the money supply (demand deposits and currency outside banks) has been more than quadrupled—from $36 billion to $152 billion.

Since the end of 1957, the government has been worrying about a “deficit” in the balance of payments. Measured from that date, this deficit has reached a total of nearly $19 billion—an annual rate of more than $3 billion.

During this period government policy has increased the active money supply from $136 billion to $152 billion, or nearly 12 percent. It has increased total money supply (including time deposits) from $193 billion to $261 billion, or 35 percent. During this period, also, it
not put a prohibitive tariff on all of these things, and solve our “balance-of-payments problem” once for all? But, someone may say: “This is mercantilism. This is madness. It would be, moreover, completely futile, because our exports depend upon our imports. It is only through selling to us that foreigners can get the dollars to buy from us. If we cut down our imports we must in the long run cut down our exports by the same amount.” Precisely so. And in the same way we must cut down our exports by as much as we cut down our foreign investments.

The government’s proposed remedy is not only immediately harmful but in the long run futile. But it will not adopt the only solution, which is to halt its own inflation.

A Tax-Cut Proposal
January 20, 1964

An $11 billion tax cut is being proposed in the face of a combined deficit for the fiscal years 1964 and 1965 until now officially estimated at $18.4 billion, and placed even by the new budget estimates at some $15 billion. We are borrowing money to cut taxes. The proposed tax cut is a fraud. Unless we are willing to slash expenditures we simply cannot afford at this time a tax cut in the sense of a tax reduction that would reduce revenues. But we can afford tax reform. We can and should cut tax rates wherever these rates are so high that they actually diminish revenues. It is enormously probable that this applies to all personal-income-tax rates above 50 percent. All these rates together bring in about $1 billion, or less than 1 percent of our total annual Federal expenditures.

But if these rates were eliminated, and present tax progression stopped at 50 percent, the government would not lose this $1 billion. On the contrary (though, of course, no exact estimate is possible) there would probably be an increase in revenues from this change even in the first full year, and a much greater increase in succeeding years.

The reason is, of course, that taxpayers allowed to keep at least half of every additional dollar they earned (instead of only 47 cents or only 9 cents) would once more want to earn extra dollars that they now have no incentive to earn. Their production would increase. They would have not only a restored incentive to invest; they would have the funds to invest that are now siphoned
into nonproductive government expenditure. And these increased investments would mean increased jobs, more productive and hence higher-paying jobs, and an increased rate of economic growth. Our frequently deplored slow rate of growth is mainly owing to our tax system—our excessive penalties on high incomes, profits, and capital gains.

Any tax rate above 50 percent is prima facie confiscatory. To abolish the confiscatory rates is, of course, politically the hardest thing to do. Politically the easiest thing to do is to cut the lowest rates still further—say from 20 percent down to 14 percent. But this would mean a tremendous loss of revenue, which with existing expenditures the government could not afford.

What would be possible, however, with only slight loss of revenue, would be to abolish the jump from 20 to 22 percent in the rate on taxable incomes (for single persons) between $2,000 and $4,000. This would not only reduce the overall average rate on incomes in this bracket, but on all incomes in brackets above it.

**THE GREAT ILLUSION**

There are now altogether 24 different tax rates in our graduated income tax. Halting the progression at 50 percent would wipe out fifteen of these discriminatory rates, reducing them to a total of nine. If, in addition, the new tax law were to abolish the 22 percent bracket (and extend the 20 percent bracket) in the first year, and then in the next six years abolish successively the 26, 30, 34, 38, 43 and 47 percent brackets, with the government meanwhile keeping expenditures under control, the country at the end of that time would be left with only two tax brackets—of 20 and 50 percent respectively. It could then decide whether it wanted to keep the higher penalty rate.

Perhaps the greatest harm done by the progressive income tax, particularly the existing steep graduation, has been to create the illusion that a rich minority of “fat cats” are paying the bill. That this is an illusion should be plain. The basic 20 percent rate brings in 87 percent of the entire revenue from the present income tax. It has been calculated, in fact, that a flat income tax of 23½ percent, with present exemptions, would bring in all the revenue now brought in by the whole scale of graduated levies from 20 up to 91 percent.

If there were a flat proportionate tax, each of us would realize that he, and not “the other fellow,” was paying his share of our huge Federal expenditures. Not until enough of us recognize this truth will there be any hope of holding those expenditures within reasonable bounds. ✽

---

**How to Cure Poverty**

January 27, 1964

President Johnson has declared an “all-out war on human poverty.” It is a laudable aim. It has, in fact, been the aim of rulers, statesmen, economists, reformers, religious leaders—of every man of goodwill—from time immemorial. It is an aim shared by all free-enterprise economists since the time of Adam Smith and by all socialists and Communists since the time of Karl Marx. The problem does not concern the end but the means. What is the best way to abolish poverty?

Unfortunately the means Mr. Johnson recommends are dubious. He proposes more and bigger government-spending programs—to build more homes and more schools and more libraries and more hospitals than any single session of Congress in the history of our republic,” and to “budget the most Federal support in history for education, for health, for retraining the unemployed, and for helping the economically and the physically handicapped.”

**NOT BY INFLATION**

Whether it is possible to do all this and still cut the total of Federal spending may be reserved for later consideration. But even on the face of his own budget projections this program will involve a combined deficit in the current and next fiscal year of $15 billion. This gap will probably be financed by inflation—i.e., by printing more money, by lowering the purchasing power of the dollar and so raising prices. This cannot help the poor. Regardless of the immediate result, the long-run result of inflation must be to distort the structure of production, and hence to slow down the rate of balanced economic growth. This cannot help the poor. For the government to borrow $15 billion now to reduce taxes $11 billion means that taxes must later be raised to a still higher level to pay off the new debt. This must discourage production and employment, and cannot help the poor.

The economic proposal by Mr. Johnson that would do most harm of all would be to impose a still higher legal penalty for overtime even than the present stiff penalty rate of 50 percent. This could only raise costs of production, lift prices, reduce sales and output, and hence reduce employment. It could not help the poor. Mr. Johnson proposes to give Federal funds to “the chronically distressed areas of Appalachia,” to expand “area redevelopment,” to “distribute more food to the needy through a broader stamp program.” All these are merely new forms of the age-old proposal to take from the rich and give to the poor, to take from the more productive to give to the less productive. What
the reformers who back such proposals forget is that you cannot “redistribute” the fruits of production without drastically reducing production itself.

For this “redistribution” reduces incentives at both ends of the economic scale. As the productive have more of their income taxed away from them, they have less incentive to exert themselves to earn it. As the poor get increased handouts and subsidies, they too have less incentive to improve their condition through their own efforts. The problem of curing poverty is difficult and two-sided. It is to mitigate the penalties of misfortune and failure without undermining the incentives to effort and success.

RESTORE INCENTIVES
The way to cure poverty is not through inflation, “share-the-wealth” schemes, and socialism, but by precisely the opposite policies—by the adoption of a system of private property, freer trade, free markets, and free enterprise. It was largely because we adopted this system more fully than any other country that we became the most productive and hence the richest nation on the face of the globe. Through this system more has been done to wipe out poverty in the last two centuries than in all previous history.

The way to combat the remaining pockets of poverty is to keep this system; to reduce government intervention instead of increasing it; to reduce government spending and punitive taxation—in brief, to increase the incentives to the initiative, effort, risk-taking, saving, and investment that increase employment, productivity, and real wages. ⚫

Must We Push Up Costs?
February 3, 1964

In his State of the Union Message, President Johnson made a recommendation that, if adopted, could do immense harm. He proposed “legislation authorizing the creation of a tripartite industry committee to determine on an industry-by-industry basis as to where a higher penalty rate for overtime would increase job openings without unduly increasing “costs, and authorizing the establishment of such higher rates.”

Employers are already compelled by Federal law to pay a premium rate of 50 percent above the regular wage rate for all overtime in excess of 40 hours a week. This legal compulsion of course benefits specific workers under special conditions. But it is doubtful whether even stiffer penalty rates would help the whole body of workers, particularly when we consider them in their role as consumers as well as workers. Compulsory overtime rates increase marginal labor costs of production. In one way or another this increase in costs must reduce both production and employment below what they otherwise would be.

A firm that is subject to stiff competition, especially foreign competition, will not be able to pass on its increased costs in higher prices for its product. It may therefore have to abandon the idea of increased production and overtime employment. If firms in a given industry do not have to fear foreign competition, they may be able to add most of their increased costs to their prices. But with higher prices, sales will fall off, and both output and employment will be reduced.

ABILITY TO COMPETE
Oddly enough, President Johnson, when he is talking about a compulsory 35-hour week instead of a 40-hour week, recognizes this effect. In a paragraph preceding his overtime recommendation, he said: “I believe the enactment of a 35-hour week would sharply increase costs, would invite inflation, would impair our ability to compete and merely share instead of creating employment.”

What bothers Mr. Johnson is that some firms are employing workers overtime, instead of hiring additional workers, in spite of the 50 percent premium rate. He assumes that an even heavier overtime penalty would force the employment of more workers. But would it? It is a striking fact that, in November, when the seasonally adjusted rate of unemployment was 5.9 percent of the working force, 7.2 percent of all hours in manufacturing were overtime hours, paid for at premium rates. This seems to imply that industry could have employed the whole working force at regular hours. Why didn’t it? Since managers always try to keep costs down, and would avoid a 50 percent penalty rate if they could, it seems probable that among the job seekers they did not find enough with the necessary competence or skill to be worth employing at regular rates.

THE NEED OF PROFIT
Whatever the explanation, a still further increase in the legal overtime rate could only make the situation worse by increasing costs. Mr. Johnson’s proposal is even more disturbing from a legal than from an economic point of view. It would be discriminatory as between industries. It would subject each industry to the arbitrary decision of a board on which the government members would cast the deciding vote.

The solution of the problem of unemployment lies in a different direction. As even J.M. Keynes wrote in 1932: “Unemployment, I must repeat, exists because
employers have been deprived of profit. The loss of profit may be due to all sorts of causes. But, short of going over to Communism, there is no possible means of curing unemployment except by restoring to employers a proper margin of profit.

How long will it take for the world to learn this? How long will it take for us to learn that profits and employment go hand in hand, go up and down together, and that the first is indispensable to the second? Thanks to the initiative of the American Economic Foundation there will be a Hall of Free Enterprise at the coming New York World's Fair devoted to teaching this lesson. It deserves the support not only of big- and little-business men, but of every worker.

**Estimates vs. Reality**
February 10, 1964

On paper, President Johnson's first budget has some merits which should be stated at the very beginning. It gives at least lip service to economy. And it estimates administrative budget expenditures in fiscal 1965 at $97.9 billion, which is half a billion less than the 1964 estimate.

But how probable is it that these estimates will be realized? Here a score of doubts arise. The new obligatory authority asked for by the President for 1965 is $103.8 billion. This is $1.2 billion higher than 1964, and a new high record.

How reliable, then, are the new budget estimates? Let us begin on the spending side. The estimated reduction of $500 million compared with 1964 is achieved by an estimated reduction of $1.3 billion in national defense and of $1.1 billion in other expenditures. This is partly offset by an estimated increase of $1 billion in expenditures for “space” and interest, and of $900 million for the “attack on poverty.”

Yet many of the estimated reductions in other expenditures are very doubtful. For example, farm subsidies are estimated at $5.1 billion, down $1.3 billion from 1964. But this reduction seems to rest merely on a pious hope. The estimate for new obligatory authority for foreign aid is surprisingly low at $2.4 billion (compared with $2.5 billion in 1964). But the President adds: “The 1965 budget does not allow for sudden opportunities that sometimes present themselves in international economic affairs.” By this he refers to opportunities “to provide any additional funds needed,” for which he promises to send in special requests.

**A NEW HIGH RECORD?**

Finally, a score of welfare programs are to be expanded, and the President adds a half dozen more “to attack poverty.” It is unlikely that all these together will add less than $1 billion to spending. In brief, it is highly improbable that total spending in 1965 will actually be less than in the current fiscal year. It is much more likely to hit a new high record. On the revenue side of the budget, we are asked to believe in a paradox. The budget assumes that taxes are being cut $11 billion a year, fully effective in fiscal 1965. Yet estimates of receipts from personal income, corporate, and other taxes are all higher than in either 1963 or 1964. They are $93 billion for 1965, up $4.6 billion over 1964 and $6.6 billion over 1963. The argument is that lower tax rates will create so much prosperity that they will actually increase tax revenues.

**RATES VS. REVENUES**

To judge how plausible this argument is, let us look at it in detail. The greatest percentage cuts in tax rates are in the lowest incomes. For adjusted gross incomes of $3,000 and under, the reduction in aggregate tax liability is 38.3 percent; for incomes from $3,000 to $5,000, 26.2 percent; for incomes from $5,000 to $10,000, 19.9 percent, etc. This means that for the new income-tax rate brackets to yield as much revenue as their corresponding old rate brackets, taxable incomes in the less-than-$3,000 bracket would have to rise 60 percent; in the $3,000 to $5,000 bracket 35 percent; in the $5,000 to $10,000 bracket nearly 25 percent, etc. Of course as personal incomes increase they get into higher tax brackets. But even so, is the new revenue estimate plausible?

The probabilities are very high that spending in 1965 will be higher and revenues lower than guessed at in the budget, and that the deficit in 1965 will be much bigger than the $4.9 billion estimate.

In view of the past record, this would not be surprising. For the fiscal year ended June 30 last, for example, President Kennedy originally forecast a surplus of $463 million; there was a deficit of $6.3 billion.

But even on its face, the new budget is fiscally irresponsible. It will be the 29th deficit in 35 years. It is unconvincing for Mr. Johnson to call it a “giant step toward the achievement of a balanced budget.” It is larger than the majority of the preceding 28 deficits. And it is based on the fallacious theory that a big deficit is necessary and sufficient for full employment. The one result it does guarantee is inflation and a further loss of confidence in the dollar.
Investment No, Aid Yes?
February 17, 1964

The Jan. 27 issue of the Investment Dealers’ Digest reprints a letter from Secretary Dillon under the following prefatory note:

“Concerned about the effects of the proposed Interest Equalization Tax on foreign securities, the editors of the Digest were especially impressed by an article on the subject which appeared Dec. 16 in Newsweek. Written by Henry Hazlitt . . . it seemed to sum up succinctly the negatives of the proposal. We wrote to Secretary of the Treasury Douglas Dillon for his comments on the legislation and on Mr. Hazlitt’s article. The Secretary’s Jan. 8 response is published below in full.”

In his reply the Secretary begins with a concession: “It is true that in the long run the outflow of American capital to foreign countries is more than balanced by the inflow of income earned by that capital.” But this is my main point.

The Secretary goes on to argue, however, that this does not meet the immediate problem in our balance of payments. This, he insists, can only be met by his proposed “temporary” tax on foreign securities. But if this immediate problem is so urgent, why do we continue to give away billions of dollars in foreign aid? The crucial difference between foreign investment and foreign aid is that, when we invest in foreign countries, we in the long run get our money back, with interest. But when we give away foreign aid we get no money back. Anyone who opposes foreign investment on the ground that it hurts our “balance of payments” should doubly oppose foreign aid.

‘EXPORTS’ GIVEN AWAY
Secretary Dillon contends that foreign aid is “increasingly in the form of U.S. goods and services and hence has a limited adverse effect on our balance of payments. In fiscal 1963, 80 percent of the foreign assistance commitments by the Agency for International Development was tied directly to U.S. goods and services.” This figure has been often used by the Treasury, but without detailed evidence. Congressman Thomas B. Curtis has complained that AID has put out this figure with “no working papers to establish it at all.” And Dillon himself testified in the House hearing on Aug. 20 that only “about half” of foreign economic assistance in calendar 1962 was in the form of U.S. goods and services.

But suppose the 80 percent figure were correct. What would it prove? As Melchior Palyi and other economists have pointed out, “tied” exports for foreign aid generate no payments from abroad. Such “unrequited” exports cannot offset imports for which we have to pay. It is misleading to include them, as we do, with commercial exports for which we get paid.

WILL TAX BACKFIRE?
Secretary Dillon contends that we must levy this tax “only as a temporary measure to meet our problem pending more fundamental solutions,” which, “however, require time.” Yet no fundamental solutions have been adopted. Nor are they even being seriously considered.

The deficit in our balance of payments began in 1958. It has since averaged nearly $3.5 billion a year. It is in the main the result of our own inflationary policies. Since 1957 we have piled up a cumulative budget deficit of $40.5 billion. We are planning another $5 billion deficit for 1965. Our government has also discouraged domestic investment and encouraged foreign investment by holding down interest rates. Yet as one of the “fundamental solutions” for the balance-of-payments problem Dillon astonishingly lists the $11 billion tax cut, which can only make the problem worse by encouraging more inflation and more imports.

The proposed foreign-investment tax may well have exactly the opposite effect from what its sponsors desire. As Allan Sproul, former president of the Federal Reserve Bank of New York, declared in a lecture last November: “We need to avoid experimenting with direct controls, whatever they may be called, which in times of strain may be interpreted as a forerunner of stronger controls of capital outflow, or even of all dealings in foreign exchange, which in turn would heighten the danger of anticipatory withdrawals of foreign funds from our market.”

Phony Tax Cut
February 24, 1964

By a vote of 77 to 21 the Senate has passed substantially the same tax-cut bill as that passed by the House in September. So the country is certain to have a new tax law, bad in almost every respect.

A tax cut of $11 billion, accompanied by a sufficient slash in spending to ensure a balanced budget, would have been a genuine stimulus to long-run economic growth. But the present tax cut is a fraud on its face. It is enacted in a fiscal year when the Treasury already expects a deficit of $10 billion, and looks forward to another deficit in the next year of $5 billion. So we are borrowing to cut taxes.

The tax cut may turn out to be deceptive in a double sense. It is called a tax cut of more than $11 billion. Yet in the face of this, the Treasury blandly estimates that tax revenues will be $4.6 billion greater in fiscal 1965,
when the cut is fully effective, than in 1964, and $6.6 billion greater than in fiscal 1963.

The theory is that the tax cut itself will make us so prosperous that even the revenues will increase. This would no doubt have been possible if the confiscatory and unproductive tax rates above 50 percent in the higher brackets had been cut down to that level. But the slash is mainly in the lower tax brackets. It reduces the aggregate tax liability by an average of 19 percent. It reduces the tax liability of persons in the lowest bracket by 38 percent.

**IMPLAUSIBLE ESTIMATE**

It would take an average increase in taxable incomes of more than 20 percent to realize the Treasury’s estimate of higher income-tax revenues. That is just not plausible. If it were achieved in dollar terms through inflation, government spending would increase correspondingly. The 1965 deficit may be nearer to $10 billion than to $5 billion.

There would have been some compensation if the tax cut had been accompanied by real tax reform—if the burdens on production had been lightened; if the punitive income-tax rates above 50 percent had been abolished; if the one-sided capital-gains tax and the double taxation of corporate dividends had been mitigated. Instead, by reducing the already lower rates much more percentagewise than the higher rates, the scale of graduation has been made even steeper. Even the mere token dividend credit of 4 percent (far lower than that of Canada or Great Britain) has been abolished. Though corporation tax rates have been reduced, the reduction is offset by advanced collections.

**SOAK THE RICH**

Thus a shortsighted soak-the-rich and penalize-the-productive philosophy has prevailed, even though it will stunt our economic growth, and slow down the increase in capital accumulation and investment upon which a nation must depend for all improvement in economic conditions, for any increase in real wages, and for any permanent success in a war against poverty.

In so far as there is any theory behind the tax cut except how to win the coming election, it is an extreme and discredited Keynesianism. It is the theory that the way to increase prosperity and employment is to increase “consumer spending.” If you cut taxes, so the theory goes, consumers will have more to spend, and business, selling more, will provide more jobs. What this overlooks is that our unemployment is the result of excessive wage rates and labor costs in some lines as compared with productivity. So if wage demands go up as much as prices, the unemployment will remain.

When government expenditures are higher than revenues, the difference must somehow be paid for. If the deficit is met by selling bonds to savers, the government will absorb the investment funds that would normally be used by business. What the advocates of the tax cut are really depending on, therefore, is that the difference will be paid for by newly printed paper money. This will further raise prices, lower the purchasing power of the taxpayers’ remaining money, reduce world confidence in the dollar, and increase the “balance of payments” crisis about which the Administration professes to be so concerned.

### Inflation and Statism

March 2, 1964

From time to time I have contended in this column that there is no need for a Council of Economic Advisers, and no excuse for an annual Economic Report. I wrote on Jan. 28, 1952, for instance, that the report “consists mainly of giving ‘scientific’ and ‘economic’ reasons for what the President has done or wants to do for political reasons. . . . [It] is Administration propaganda paid for by the taxpayers.”

This year’s Economic Report is just one more example. It is an out-and-out campaign document. We learn from it that the Eisenhower Administration just couldn’t do anything right. For instance: “Federal outlays leveled off early in 1957 and then declined, just at a time when expansionary policy was needed to avoid a downturn.” Then, again, between 1958 and 1960: “Federal policy was restrictive and wholly inappropriate to a period of insufficient demand.” And so on.

**CAMPAIGN DOCUMENT**

All the comparisons in President Johnson’s own eighteen-page economic report (summarizing the council’s 283-page report) boast of the progress since “early 1961”—i.e., since the Kennedy-Johnson Administration came in. “Our record $100 billion expansion since early 1961 has carried us past important milestones in the march toward a better life. . . . In the nearly three years of unbroken expansion since early 1961: GNP is up 16 percent, measured in constant dollars,” etc. And remember: “An expansion as long, strong, and free of excesses as the one we are now experiencing does not ‘just happen’. . . . Government has steadily pursued fiscal and monetary policies designed to promote recovery, accelerate expansion, and encourage business and consumer
confidence: in 1961, when the Administration’s quick anti-recession program got recovery off to a flying start,” etc.

I shall not here attempt to check back on the validity of the comparisons that the Economic Report makes with conditions in the Eisenhower Administration. I shall merely mention one comparison that it does not cite: in the eight Eisenhower years, unemployment averaged 4.9 percent; in the three Kennedy-Johnson years, it has been 6.0 percent.

Yet the new Economic Report concedes that, “by all odds, the country’s No. 1 economic problem is persistent unemployment.” How does the Administration propose to solve this? It proposes to solve it by the method that has persistently failed in the past—more monetary inflation.

TAX CUT AS PANACEA

Its great reliance is on the $11 billion tax cut. “Speedy passage of the tax cut . . . will provide a net fiscal stimulus, taking both expenditures and tax cut into account, that will be three times as great in 1964 as in any of the years 1961, 1962, and 1963—will, in fact, provide a greater net stimulus to the economy in 1964—to jobs, production, income, and profits—than in any other peacetime year in history . . . The tax cut will give a sustained lift, year-in and year-out, to the American economy. When fully effective in 1965, it will send well over $11 billion annually coursing through the arteries of the private economy.”

It is clear that this $11 billion is to consist entirely of deficit spending—that it is to be created by issuing $11 billion of new money and credit. To make this quite plain, Mr. Johnson says: “It would be self-defeating to cancel the stimulus of tax reduction by tightening money.”

Not once does the report suggest that any part of our unemployment may be caused by wage rates or labor costs already above marginal productivity levels, or that any adjustment may be needed. Instead it proposes remedies—e.g., “higher overtime penalty [wage] rates”—calculated to make the unemployment worse.

The remedies that the Economic Report prescribes for all our economic ills, in brief, are more deficits, more inflation, more controls, more statism. Not once does it dawn on the authors of the report that the government has caused our chronic unemployment, caused the balance-of-payments deficit, and caused our slow rate of economic growth, by precisely the nostrums it is advocating as a sure cure for these maladies.

---

**Tax-Cut Fallacies**

March 9, 1964

The Administration’s pressure for the $11.5 billion tax cut just enacted may be cynically ascribed to an effort to win the coming election. But it is also supported by an economic theory, a theory now widely and sincerely held, that is set forth in some detail in the recent Economic Report of the Council of Economic Advisers.

It is a pure “demand” theory. It assumes that, whenever there is recession or unemployment, the reason must be “insufficient demand.” “Excessive unemployment is the most obvious symptom and one of the worst consequences of a level of demand that falls short of the nation’s potential output.”

Therefore, the report concludes, “the Federal government must adjust its programs to complement private demand . . . The budget must counterbalance private demand.” “Inadequate” private demand “can be corrected either by expanding government purchases to employ idle resources . . . or by expanding private business and personal after-tax incomes through reduced tax rates.” In other words, the government can deliberately resort to deficits.

But this last word is still unpopular. It arouses distrust, so the council shies away from it. Instead, it invents a new concept—“the full-employment budget.” This is a purely hypothetical budget, with no relation to the real one. It is what the relation of government expenditures and revenues ought to have been, according to the council’s theory, to bring about full employment (or rather, to prevent unemployment from going above 4 percent).

**DREAM-WORLD SURPLUS**

Let’s see some of the consequences of this new concept. We have had 28 actual deficits in the last 34 years. But when we start talking of “full-employment budgets” most of these turn out to be “surpluses.” In the fourth quarter of 1963 the Treasury was estimating the actual deficit at a rate of $9 billion a year, but it turns out from the new calculations of the Council of Economic Advisers that at the time there was a “full-employment” surplus of $9 billion. In fact, by this new method of hypothetical figuring there couldn’t be a deficit in the “full-employment budget,” no matter what the actual figures showed, as long as there was any unemployment!

The fallacies in this theory should be clear. It is a stale Keynesianism. It takes it for granted that any “idle resources” or unemployment anywhere must be the result of “deficiency of aggregate demand.” By “demand” it means, of course, monetary demand. So this demand is to be increased either by more government spending...
or lower taxes, and the bigger deficit is to be paid for by printing more money—i.e., by inflation. “When aggregate demand is generally deficient and investment and consumption are expanding too slowly to provide jobs for all those seeking employment, expansionary monetary policy normally can and should accompany expansionary fiscal policy.”

**DEMAND AND PRICE**

Nowhere does the council recognize that “demand” is merely relative to price. When goods are priced too high some of them must remain unsold. When labor is priced too high some of it must remain unemployed. Unemployment is the result of maladjustment of wages and prices. Given wage-price coordination, supply creates its own demand.

The only way to cure unemployment is to permit, through free-market competition, the necessary adjustments and coordinations throughout the wage-price system, and to encourage saving, investment, and profits. As Keynes himself conceded in 1932: “There is no possible means of curing unemployment except by restoring to employers a proper margin of profit.”

Given workable wage-price relationships, full employment is possible without deficits and without inflation. But even huge deficits and inflation cannot bring full employment if wage rates are encouraged to rise faster than prices and productivity.

To cut taxes and increase our inflationary deficit may give us an overheated economy till election time, but it is a reckless and ominous policy for the longer future. ✿

**The Missing $11 Billion**

March 16, 1964

The House passed the $11.5 billion tax cut by the overwhelming vote of 326 to 83, and the Senate by 74 to 19. The President hailed the cut as “the single most important step that we have taken to strengthen our economy since World War II. . . . It will immediately increase the income of millions of our citizens,” he continued, “by reducing the amount of taxes that you must pay. . . . By releasing millions of dollars into the private economy it will encourage the growth and prosperity of this land that we love. . . .”

But if it’s as easy as all that, a question that may occur to some is: why did we stop at an $11.5 billion cut? Why not omit taxes altogether?

But let’s confine our attention to the situation as the government presents it. It estimates that in the “administrative” budget there will be a combined deficit in the current fiscal year and in 1965 of $15 billion, and that in the “consolidated” budget (reflecting the entire receipts from and payments to the public) there will be a combined deficit for the two fiscal years of $11.2 billion. In other words, for these two fiscal years combined, the government will take in from the public a total of $234.2 billion, but in the same period it will spend a total of $245.4 billion, or $11.2 billion more.

**FROM WHERE?**

Where do the people who are so jubilant about the tax cut imagine that this $11.2 billion is going to come from?

As the government won’t get it from taxes, there are only two other ways in which it can get it. First, it can sell bonds to the public that the public can pay for out of its real savings. But to the extent that it does this: (1) There will be no increase in “purchasing power,” because the people that buy the bonds will lose that amount of purchasing power for other things, just as if they had turned it over in taxes. (2) If the government takes $11 billion out of the funds available for investment, either private business will be able to borrow just that much less for its own expansion and investment, or everybody will have to offer higher interest rates to tempt more lending and investment.

But the net effect of this might be deflationary. And the President has declared: “It would be self-defeating to cancel the stimulus of tax reduction by tightening money.” We must conclude, then, that the government intends to get the missing $11 billion by, in effect, printing it.

**WILL IT BE PRINTED?**

The process is indirect. The government sells its I.O.U.’s—bonds, certificates, notes, bills—to the banks. The banks “pay” for these by creating deposit credits on their books against which the government can draw checks. The people to whom it makes payments—defense contractors, veterans, farmers, or its own military or civilian employees—then transfer these credits to their own accounts or ask for cash, and the required amount of new (Federal Reserve note) cash is printed.

But how can printing more paper money increase production and employment? It may do so temporarily wherever wage rates have been too high to permit workable profit margins or where labor costs have forced prices higher than the existing supply of monetary purchasing power can support. In either case, however, a readjustment of price-wage relationships could restore full employment just as well. And if labor costs are allowed to rise as fast as or even faster than prices,
But under no condition will the Administration admit that the deficit in our balance of payments is the result of its own policies. It is determined to blame something or someone else. So it has decided to blame foreign investment and to penalize Americans for buying foreign securities.

Its decision to pick on the purchase of foreign securities as the scapegoat is purely arbitrary. If foreign lending and investment must be the villain, why not tax or forbid short-term bank loans abroad, or direct investments in new plants? Out of scores of major items in the international balance sheet that cause a net outflow of funds the most obvious is foreign aid, which has been running at some $4 billion a year compared with the total annual payments deficit of only $3 billion. The next most likely candidates are “luxury” imports of all sorts, from French perfumes to German cars. Or foreign pleasure travel by Americans.

Instead, the Administration has pounced on the least plausible item. In the five years 1958 to 1962 the aggregate net outflow of $16.6 billion for new foreign investment was offset by $15.4 billion of income from previous investment. Even Secretary Dillon concedes: “In the long run the outflow of American capital to foreign countries is more than balanced by the inflow of income earned by that capital.” At best, then, the tax is shortsighted. When we give away foreign aid we get no money back. In the long run reducing foreign investments must mean a corresponding reduction in our exports.

We have succeeded only in the last 30 years in making the U.S. the financial center of the world. Why kick this national asset away?

The proposed tax is being officially urged “only as a temporary measure to meet our problem pending more fundamental solutions.” But no fundamental solutions are being considered. Such solutions would be to balance our budget, to halt our inflation, and to permit our interest rates to go to levels that would halt or even reverse the pressure for lending or investment abroad. Instead the Administration is cutting taxes, planning continued huge deficits, and insisting that money be kept cheap.

The proposed tax, therefore, will not cure anything. If the situation grows worse, the Administration will look for other scapegoats—for example, foreign travel—to blame, tax, and control. And if foreigners suspect this intention, the foreign-investment tax will have exactly the opposite of its desired effect.
World of Inflation
March 30, 1964

The billion-dollar line of credit just extended to Italy, chiefly by the United States, but with the help of a few European banks, is another dramatic illustration of the inflation epidemic now sweeping most countries in the world today, and of the intergovernmental cooperation that seems much more likely to prolong that inflation than to bring it to a halt.

The credit was extended, as dispatches put it, “to help Italy cope with a huge deficit in her balance of payments.” But what caused this “deficit” was the Italian Government’s own inflation. Since 1958, Italy’s official money supply has been increased 90 percent. In addition, the government has encouraged a huge creation of private promissory notes, popularly known as “butterflies,” that serve as a substitute for money. There is a budget deficit.

The inevitable long-run result of such policies is to raise internal prices in Italy above world levels. This tends to make Italy a poorer place to buy from and a better place to sell to. Hence it discourages exports and encourages imports. Hence it brings a “deficit” in the balance of payments and gives rise to fears concerning the stability of the lira.

RESULT OF IMF SYSTEM
It is instructive to notice that such consequences are brought about by the world monetary system set up at Bretton Woods in 1944—the IMF (International Monetary Fund) system. They could not happen under an orthodox gold standard. The loss of gold from any country would force that country to reduce its outstanding currency and deposits to bring prices once more in equilibrium with those in the outside world. It could not happen even in a world of paper currencies with free exchange rates, because at the same time as prices rose in the inflating country its currency would fall correspondingly in the foreign-exchange market, and so restore its “balance of payments.”

Prolonged and chronic deficits in the balance of payments, such as we have been witnessing over the last two decades, can occur only when one country inflates faster than its neighbors but still tries to peg its currency in the foreign-exchange market at a fixed ratio with other currencies. Then the discrepancy of prices in that country with prices elsewhere continues. Exports shrink, imports rise. The currency can be kept at the official parity only by huge currency swaps or borrowing from abroad.

ITALIAN EXAMPLE
Unless the U.S. Government got the strictest guarantees out of the Italian Government this billion-dollar credit was unwise, for the lira crisis could probably be halted overnight if the Italian Government stopped inflation and sufficiently raised its discount rate. It is ironic that the principal rescuer, the U.S. Government, has itself been suffering from a balance-of-payments crisis for six years and is taking no effective steps to halt the inflation that causes it.

The Italian crisis is merely the most recent. Two years ago it was Canada. A few years before that it was Britain. India is suffering from a huge balance-of-payments problem because it is trying to combine inflation and socialism with an overvalued rupee. Our Latin American neighbors have had payments crises whenever they failed to devalue enough to offset their internal inflations.

Of the original 44 currencies represented in the fund (in 1946) nearly all have been devalued (following the British action in September 1949), some of them several times. Most of the 89 currencies now in the fund have had checkered careers.

It is instructive to notice that such consequences are brought about by the world monetary system set up at Bretton Woods in 1944—the IMF (International Monetary Fund) system. They could not happen under an orthodox gold standard. The loss of gold from any country would force that country to reduce its outstanding currency and deposits to bring prices once more in equilibrium with those in the outside world. It could not happen even in a world of paper currencies with free exchange rates, because at the same time as prices rose in the inflating country its currency would fall correspondingly in the foreign-exchange market, and so restore its “balance of payments.”

Prolonged and chronic deficits in the balance of payments, such as we have been witnessing over the last two decades, can occur only when one country inflates faster than its neighbors but still tries to peg its currency in the foreign-exchange market at a fixed ratio with other currencies. Then the discrepancy of prices in that country with prices elsewhere continues. Exports shrink, imports rise. The currency can be kept at the official parity only by huge currency swaps or borrowing from abroad.

The War on Poverty
April 6, 1964

President Johnson’s call for “a national war on poverty,” with the objective of “total victory,” is going to be hard for the Republicans to combat Who isn’t against poverty?

There is an air of moderation about the President’s proposals that adds to Republican difficulties. He asks for an added expenditure in the first fiscal year of less than $1 billion—only, as he points out, 1 percent of our national budget.

Then again, he assures us that “The war on poverty is not a struggle simply to support people, to make them dependent on the generosity of others. It is a struggle to give people a chance.” And he follows this with
proposals for government job-training and employment programs.

But soon the thoughtful reader becomes aware that what the President is proposing is a set of more government interventions to try to cure evils brought about by previous government interventions. It is not a coincidence that so much of the unemployment that exists today in this country is among the unskilled. One of the chief reasons is the Federal minimum-wage law. Hundreds of thousands who could otherwise find work are kept out of the labor market altogether if their earning power is less than $1.25 an hour.

THE CAMEL’S HEAD

A generation or two ago a young beginner might work for nothing until he learned the business. His father might even pay an employer for his training. Today minimum-wage laws and union restrictions make such apprenticeship on an adequate scale practically impossible. So, under the poverty program, workers are to be trained at taxpayers’ expense. But we may be sure that each union will oppose this free job-training by government.

Another doubt likely to occur to the thoughtful observer is whether Mr. Johnson can achieve “total victory” over poverty with an expenditure of only $970 million a year. This comparatively tiny price tag for such a vaultingly ambitious goal, one suspects, is merely a way of getting the camel’s head in the tent. If the history of social security is any guide, we can expect the price tag to increase geometrically as the years go on.

In fact, we may not have to wait long. On the very day that the President’s program was announced, the head of the National Farmers’ Union declared that it represented “only an infinitesimal fraction of what needs to be done to wipe out poverty in America. . . . We should be talking about tens of billions of dollars.” This, of course, would lead to a wild inflation that in the long run would only multiply the poverty problem.

WAGE WITHOUT WORK

A few days after that, a 32-member group calling itself the Ad Hoc Committee on the Triple Revolution declared that every American should be guaranteed an adequate income as a matter of right whether he works or not. This fantastic proposal would destroy all incentive to work, not only on the part of those who expected to be supported, but on the part of those who would be asked to support them out of their own earnings. There could be no faster way to impoverish the nation.

The only real cure for poverty is capitalism—the system of private property, free markets, and free enterprise. This system has made us the most productive and richest nation in the world. It has continued to achieve its miracles even in the last generation. It has raised the average weekly factory wage from less than $17 in 1933 to $102 today. Even after the rise in prices is allowed for, it has more than doubled our real per capita disposable income—from $923 in 1933 to $2,127 in 1963.

As some commentators have already pointed out, the state known as poverty is relative, not absolute. What we call poverty in the U.S. would be regarded as affluence in Africa, Asia, or Latin America. And in any system that allots its rewards in proportion to skill and output there will always be a bottom fifth, no matter how high average income goes. But impatient efforts to wipe out poverty by severing the connection between effort and reward can only lead to the growth of the Leviathan state and destroy the progress this country has so dearly bought.

Foreign Scapegoats

April 13, 1964

Will we recognize in time that it is our own unsound policies that have been causing the deficit in our balance of payments (with our loss of gold) in thirteen of the past fourteen years? Will we adopt corrective measures before it is too late? The outlook is not promising. In fact, nothing more disheartening has occurred in this regard than the publication (on March 19) of a report on the U.S. balance of payments by the Congressional Joint Economic Committee.

The report puts all the blame on foreigners. The U.S. has been altogether virtuous. “The main factors contributing to this unfavorable payments position have been substantial currency devaluations by other countries, the rebuilding, with American help, of the war-damaged economies of Europe and Japan, and heavy commitments abroad for private investment, economic and military assistance, and defense programs.” Not a word (except for a few Republican footnotes) about the 28 deficits in the Federal budget in the last 34 years, nor about the multiplication in our issue of paper dollars, nor about our cheap-money policies.

It appears that our deficit has been caused by the bad policies of the countries that have a surplus. For these wicked countries “counter inflation with tight-money policies and high interest rates.” This embarrasses our own inflation by encouraging capital export and dollar export. The committee suggests that these countries either follow inflationary cheap-money policies so that we can keep our own going, or revalue their currencies upward.
BEAM IN OUR OWN EYE
The committee self-righteously accuses the surplus countries of imposing “quantitative restrictions on imports, controls on capital exports . . . [and] export subsidies. These measures are inconsistent with free market economic principles and have contributed substantially to the U.S. balance-of-payments deficits.” This blandly ignores that our government itself imposes quantitative restrictions on imports (e.g., sugar and oil), has asked for a punitive tax on the purchase of foreign securities, and pays export subsidies on farm products.

But the committee’s recommendations are even worse than its diagnosis. Because, at the end of 1963, only $2.6 billion of the total U.S. gold stock of $15.6 billion was “free” gold available to “defend the dollar,” because this “free” gold reserve has declined by an average of nearly $1.4 billion a year since 1957 and might be “eliminated within two or three years,” the committee recommends that “The U.S. gold stock should be freed immediately of its domestic reserve function and made fully available for international monetary purposes.”

THE LAST BARRIER
This recommendation can only shake confidence in the dollar. The reasoning behind it is ironic: “For many years U.S. residents have not been permitted to redeem their dollars in gold. The only remaining domestic function of gold is to place limits on the expansion of the domestic money supply. But this expansion can be limited equally well without requiring a gold reserve against Federal Reserve liabilities.”

Now the chief function of a minimum legal gold reserve has always been precisely to place limits on the expansion of the money supply. If even the 25 percent legal gold reserve had been combined with the requirement of domestic as well as foreign convertibility, the enormous expansion of the U.S. money supply in the last 30 years could not possibly have taken place; the Treasury would have been long since drained of its gold.

The official argument at the time American citizens were deprived of their right to convert to gold was that all that was really necessary was to maintain convertibility for foreigners. But now that we have issued so many paper dollars as to threaten even our ability to do that a Congressional committee is asking for the repeal of even that 25 percent requirement—i.e., of the last legal barrier to more inflation.

The last recommendation of the committee, to “expand international liquidity,” means that its proposed ultimate cure for our own monetary ills is a worldwide inflation.

Dilemma of Foreign Aid
April 20, 1964

In 1947, when the foreign-aid program was first launched under the name of the Marshall Plan, I wrote a critical book on it called Will Dollars Save the World? In it I pointed out, among other things, that intergovernmental grants raised an insoluble problem regarding conditions:

“Intergovernmental loans are on the horns of this dilemma. If on the one hand they are made without conditions, the funds are squandered and dissipated and fail to accomplish their purpose. They may even be used for the precise opposite of the purpose that the lender had in mind. But if the lending government attempts to impose conditions, its attempt causes immediate resentment. It is called ‘dollar diplomacy’; or ‘American imperialism’; or ‘interfering in the internal affairs’ of the borrowing nation.”

In the original debates on the foreign-aid program this dilemma was simply ignored. Even in the seventeen years since then it has been only dimly and occasionally suspected. Thus our government has alternated between one policy and the other. For a time it would try to attach conditions. When this gave rise to outcries of “Yankee domination” our government would hasten to assure the recipients that the aid was offered “without strings.” Then when the aid was shockingly abused we would return to a halfhearted insistence on some conditions.

SUBSIDIZING SOCIALISM
Today we seem to be following the worst policy of all. We have been imposing conditions, but exactly the wrong conditions. We tell our neighbors in Latin America that they will get aid in proportion to their commitment to “programs of economic and social progress.” But we have been interpreting this phrase to mean “land reform,” subsidized housing, bigger social-security payments, i.e., programs of government planning and socialization. (The Johnson Administration, however, has recently given signs of recognizing the dangers in this policy.)

What we have to recognize (as I pointed out in my 1947 book) is that the dilemma of conditions “is, in fact, inherent. It lies in the attempt of one government to bribe another into following economic policies which that other government does not believe in sincerely enough to follow without the bribe. The dictation must be resented even if accepted. The people in the borrowing nation are led to feel that they have sold their economic birthright for a mess of pottage. Everything that goes wrong is blamed on the conditions [of the aid].
The ill will caused by this is in itself enough to offset any good will [the aid] might have brought.

TO MAXIMIZE GROWTH
This dilemma of conditions does not arise in private foreign investment. Such investment, in the first place, is usually in private firms. If a business in Ruritania, say, seeks a loan from American investment bankers, the conditions suggested by the American bankers are not essentially different from those that would be suggested by Ruritanian domestic investors. The American private investors would ask whether the proposed new plant promised to be profitable, what guarantees were offered, etc. If the applicant for a loan were the Ruritania government itself, foreign investors would not be interested unless the government seemed likely to balance its budget, to refrain from printing more money, from exchange control, and so on.

In short, the loans would not be politicalized. They would encourage free enterprise, instead of socialism, in the borrowing countries. They would tend to go into the most profitable enterprises—i.e., into the enterprises that promised to maximize real wealth creation. They would tend to promote maximum economic growth.

Government-to-government foreign aid has the opposite effect. It tends to discourage or drive away private foreign investment, because the recipient nations get this aid without making the necessary fiscal or monetary reforms. Worse, the American Government, in order to continue to make it possible to give away foreign aid that is wasted and abused, has asked for a punitive tax on the very private foreign investment that tends to maximize world economic growth.

World Monetary Order
April 27, 1964

In a recent speech delivered in Johannesburg before the South African Institute of International Affairs, the eminent European economist, Wilhelm Röpke, called attention to the dangers both of our present “world without a world monetary order” and of American domestic policies that are weakening the dollar and “exporting inflation” to the rest of the world.

The prevailing impression is that the International Monetary Fund has given us a kind of world monetary order. Professor Röpke admits that this represents some improvement over the situation only ten years ago, which still deserved no better name than that of international economic disintegration. But he does not see the IMF system as one that provides any reassurance for the future. The present international monetary system, he declares, “has become an enormous world machinery for breeding and transmitting inflation.”

The United States, for example, because of inflationary policies, has a deficit in its balance of payments. This means that gold and dollars have been flowing abroad, where they become reserves against which Europe creates its own additional currency and bank deposits. But while these countries thus “import” inflation, the U.S. not only refuses to deflate but even to stop inflating.

U.S. WAGE INFLATION
“The root cause of the balance-of-payments difficulties of the United States is the internal wage and fiscal inflation which has been allowed to develop in that country during the last decade. The official assurances that these sources have been stopped carry little conviction because both wage inflation and budget deficits financed by bank reserves rather than by genuine savings have increased without interruption. It is not sufficient in the American case merely to hold wage increases within the limits which the government has designated as . . . socially desirable.”

Röpke goes on to quote in support of this judgment the words of Dr. Holtrop, the president of the Dutch central bank, in his annual report: “In the private sector the exports of both goods and capital would without doubt be favorably affected by a lowering of American production costs. To this cost aspect, however, too little attention is as yet being paid. Most of those who discuss wage policy at all confine themselves to saying that wages must not rise more than the improvement of per capita productivity permits. But in the case of countries with an obstinate balance-of-payments deficit that standard is inadequate. Countries in that position can perhaps stand some raising of real wages, but hardly a rise of nominal wages.”

A RETURN TO GOLD
Professor Röpke continues: “Since the American monetary authorities, however, dare neither to let the unemployment caused by trade-union power take its course nor to neutralize it altogether by a correspondingly full measure of inflation, the sad result is that the United States is that country which, in the midst of all its incomparable wealth, has managed to have both some measure of inflation and a large volume of unemployment, in other words, the worst of two worlds. The intemperance of the American unions is, in turn, bolstered up both by the Administration’s policy of deliberately favoring organized labor and by its overall economic philosophy. The latter is based for the most part on monetary expansionism of a rather extreme
kind. . . . In the meantime, no stone is left unturned to mobilize foreign help for supporting the sick dollar.”

But as Professor Röpke points out, this cannot cure the real illness. The immediate solution is a reform of American policies, and the ultimate solution is a world return to a full gold standard.

Readers of this column will not be unfamiliar either with the diagnosis of the defects of the IMF system, the criticism of American fiscal, monetary, and labor policies, or the proposed cure of a return to the full gold standard that Professor Röpke recommends. But I report his views in the hope that Washington will be more impressed by this testimony from one of the outstanding authorities in Europe.

**Inflation vs. Growth**

May 4, 1964

In practically every country of the world today the great fetish is an increase in the rate of “economic growth.” And the almost universal assumption is that that can best be promoted by inflation.

This policy, however, is almost never recommended under that name. The growth planners simply argue that growth has been slow because of an “insufficiency of aggregate demand.” They think this can be rectified by more government spending. Some of them are candid enough openly to advocate government deficits and the creation of more money, i.e., inflation.

Those who propose the inflationary solution for unemployment usually forget to ask what has caused the unemployment. The cause is nearly always some discoordination of prices and wages. An injection of new money can, it is true, at least temporarily increase employment if it restores wage-price coordination if, for example, it leads to increased demand or higher prices for products without leading to higher wage rates.

Yet any price-wage adjustment brought about by inflation is likely to be only temporary. For unions, encouraged by demand for more workers, or trying to “catch up” with higher living costs, will demand still higher wages, with the result that the discoordination of wages and prices may occur all over again, and the situation can be cured once more only by a still fresh dose of inflation. On the other hand, if governments follow sound labor policies, inflation is unnecessary.

**ILLUSORY PROFITS**

Inflation is not only unnecessary for economic growth. It is the enemy of growth. It distorts and falsifies economic calculation. An economy grows and functions at its maximum rate, and the production of thousands of different commodities and services can be kept in optimum balance when producers, on the basis of current prices and wages, can make reasonably correct anticipations of supply and demand, of costs, profits, or losses.

But when inflation forces up prices, prices do not all rise in the same proportion or at the same rate.

Businessmen cannot distinguish between what is lasting and what is merely temporary, or know what the future demands of consumers will be or what the real costs of their own operations are. Depreciation and replacement allowances will be inadequate. Profits will be overestimated. Businessmen everywhere will be deceived. They will be using up their real capital when they think they are increasing it. They will think they have profits or capital gains when they really have losses.

By distorting economic calculation and creating illusory profits, inflation destroys the function of the free market in penalizing inefficiency and misjudgment and rewarding efficiency and good judgment. Because nearly everything seems to prosper, there are all sorts of maladjustments and investments in the wrong lines. Solid work tends to give way to speculation and gambling.

**EFFECT OF CONTROLS**

The price and wage rises brought about by inflation will lead to demands for price and wage controls. But such controls will reduce and distort production, and do far more harm even than the inflation itself.

What is likely even before price controls is some sort of exchange control, to prevent the quotation of the home currency from falling in terms of other currencies. But the effect of such exchange controls will be to bring about a deficit in the balance of payments. It will discourage exports, because they will be overpriced compared with foreign goods. It will encourage imports. The exchange authorities, to prevent this, will institute quota and licensing systems. But these will disrupt foreign trade and domestic production.

Thus the long-run effect of inflation can only be to distort production and to retard economic growth. Of course, this effect can be concealed from many people for a long time. For prices and wages and incomes will all be constantly going higher in dollar terms. The official gross national product figures will be constantly soaring. The euphoria can temporarily lull all misgivings. But eventually the bitter moment of truth must arrive.
Argentine's Problems
May 11, 1964

BUENOS AIRES—My chief impression after a three-week lecture tour in Latin America (one week in Guatemala, two in the Argentine) is that the two countries I visited would be immensely better off if their respective governments, as well as a flock of international agencies, would only let them alone for a while, and stop trying to “aid” them, to “stabilize” them, or to speed up their “economic growth.” But then, I suspect, this conclusion would apply to many other countries as well.

The Argentine is still suffering from the consequences of Perónism. Before Perón came into full power in 1946, the country was prosperous and progressive. The economy was comparatively free, the currency stable. The peso was 4 to the dollar. As I write, the peso is 136 to the dollar—one thirty-fourth of its former value. Since 1940 the money supply has been increased 50 times, the cost of living 65 times.

Not all of this happened under Perón. The inflation still goes on. Perón was forced out in 1955. Yet the cost of living in the Argentine is nearly six times as high today as it was in 1958. And no one seems to know how the inflation can be brought to an end. The deficit is out of control. In the first five months of the current fiscal year, revenues covered only 37 percent of expenditures. The cash deficit is running at an annual rate of 169 billion pesos. Yet the government shows no disposition either to cut expenditures or to raise taxes. A large part of the budget deficit consists of deficits in government-owned and government-managed industries, particularly the railroads. It is estimated that on railways alone (loaded with excess employees) the deficit for the current year will reach 60 billion pesos.

DOLLAR RESTRICTIONS

The government blames the depreciation of the peso on “speculation.” On the very weekend of my arrival (April 12), it promulgated a set of currency restrictions forbidding the transfer of gold, currency, and securities out of the country, severely limiting travel allowances, restricting dollar and other foreign-exchange purchases, and ordering the exchange of dollar export earnings into pesos within five days after receipt.

Of course the effect of these measures can only be the opposite of that intended. When dollars are not free to go out they will not come in. When Argentine businessmen and others are restricted in the amount of dollars they can buy or send out each month they will use this permission to the limit—and look for other ways to send out more. On the first business day following the new controls an international black peso-dollar market started up with its center in Montevideo, in which the peso went to a further discount in dollars.

HERITAGE FROM PERÓN

One reason for the alarm was that too many people remembered the graft and disruption that followed the imposition of exchange controls under Perón. Practically the whole press, with the exception of the extreme left and the Perónistas, opposed the new measures—for the most part with remarkably well-reasoned arguments. A particularly brilliant analysis of their probable effect was published by Rodolpho Katz in his Economic Survey.

I had an interview with President Arturo Illia, who has been in office since last July. I was impressed by his ease and informality, his courtesy, modesty, and openness, and his sincerity. He believes that the new exchange restrictions are temporary, and that there will be no need to broaden them. But many Argentines wonder about his understanding of economic affairs and deeply distrust some of the economic advisers around him.

As for Guatemala, I have left myself room only to remark upon the complex system of price controls and production quotas that the United States has forced upon Guatemala through the International Coffee Agreement which we sponsored. Our government has promoted nationwide union monopolies, nationwide crop-price supports and acreage controls, and compulsory world price-fixing and quotas in coffee and other commodities. But when American businessmen attempt the same thing on a comparatively tiny scale, it puts them in jail for it.

Inflation in Europe
May 18, 1964

Even economists who originally favored a tax cut as an economic stimulus are beginning to express fears that the recent one was excessive and may touch off an inflationary boom in the current year. Many of them had assumed that the tax cut in the first year would be between $4 billion and $5 billion. The cut of $11.5 billion (or even $13 billion as estimated by some economists) may, they fear, be so large as to “introduce a destabilizing force.”

These misgivings are not unjustified, and could be based on more than the tax cut itself. It is obvious that the government intends to finance the deficit by borrowing from the banks, i.e., by inflation. In fact, the
One incidental result has been to make our own balance-of-payments problem less than it would have been.

But it would be folly to assume that the problems brought about by our own inflation can be solved by European inflation. These inflations may help to encourage and prolong each other; but the prospects of international long-term stability and growth are only hurt by them. ✡

### Industrialitis

May 25, 1964

In government circles in nearly every “underdeveloped” nation today there is a fixed idea that the economic salvation of the country lies in industrialization.

Among outstanding examples are Egypt with its zeal for dams and India with its mania for a government steel mill. But examples can be found everywhere. I met a typical one in a recent visit to the Argentine. Argentina has now imposed a practical prohibition on the import of foreign cars in order to create a home automobile industry that not only assembles cars but makes the parts for them. Some of the chief American and foreign producers have established plants there. But it is estimated that it costs today about two-and-a-half times as much to make a car in the Argentine as it would to import one. Argentine officials are apparently not worried about this. They argue that a local automobile industry “provides jobs,” and also that it sets the Argentine on the road to industrialization.

Is this really in the interest of the Argentine people? It is certainly not in the interest of the Argentine car buyer. He must pay, say, about 150 percent more for a car than if he were permitted to import one without duty (or by paying a merely nominal revenue-raising
It is the great superstition of economic planners everywhere that only they know exactly what commodities their country should produce and just how much of each. Their arrogance prevents them from recognizing that a system of free markets and free competition, in which everyone is free to invest his labor or capital in the direction that seems to him most profitable, must solve this problem infinitely better.

Testing by Results
June 1, 1964

It is doubtful whether any other type of public regulation of economic activity has been so widely admired as the regulation of the securities markets by the Securities and Exchange Commission. The purpose of the regulation is to compel full disclosure of the facts about a security and to prevent or punish fraud. No one can defend ignorance or fraud. But have the SEC and the complex regulations it enforces in fact achieved their intended purpose of protecting the investor? And did they pay their cost?

This is the question that Prof. George J. Stigler of the University of Chicago set himself in the April issue of the Journal of Business published by that university. He assumed it might be capable of statistical answer. So with the help of an associate he compared the fate of new issues of securities in the period of 1923 to 1928, inclusive, before the SEC, with the fate of new issues of securities in 1949 to 1955, inclusive, after the SEC. He examined what happened to the market prices of new issues, in each period, in each of the five years after they came out. To eliminate the effects of general market conditions, he compared these market prices, not absolutely, but relative to the market average.

His results were negative. That is, his comparisons “suggest that the investors in common stocks in the 1950s did little better than in the 1920s, indeed clearly no better if they held the securities only one or two years,” and “that the SEC registration requirements had no important effect on the quality of new securities sold to the public.” He arrived at “two main conclusions: (1) it is possible to study the effects of public policies, and not merely to assume that they exist and are beneficial, and (2) grave doubts exist whether, if account is taken of costs of regulation, the SEC has saved the purchasers of new issues one dollar.” In a footnote he adds: “The costs of the program, that is, probably exceed even a reasonably optimistic estimate of benefits.” Allowing for “costs of
the delays imposed . . . as well as costs of operating the SEC, the full costs of registration for new stock issues could be 5 percent of their value.”

Stigler’s statistical results are of course not conclusive. In a matter of this nature, no statistical result could be conclusive. For the question to be answered is: what would have happened if there had been no SEC regulations? And might-have-beens can never be proved. But Stigler’s statistical results from comparisons of the pre-SEC with the post-SEC at least raise a strong presumption. There is no evidence that investors fared any better after the SEC was given control over the registration of securities than they did before.

DID CONSUMERS SAVE?
Earlier, Stigler and an associate undertook a study of the effects of state regulatory commissions on the electric-utility industry. They came to the tentative conclusion that these effects had been quite small: “It is very doubtful whether consumers have been saved as much by public regulation of the electrical utilities as they have had to pay, directly and indirectly, for regulation.”

Yet historically, regulation of the electric utilities tends to increase rather than diminish; and since the SEC was established it has increased year by year the scope and complexity of its regulations and requirements and asked for increased powers. As Stigler puts it:

“One great invention of private enterprise . . . is bankruptcy, an institution for putting an eventual stop to costly failure. No such institution has yet been conceived of in the political process, and an unsuccessful policy has no inherent termination. Indeed, political rewards are more closely proportioned to failure than to success, for failure demonstrates the need for larger appropriations and more power."

The prevalent economic ideology has entirely forgotten the function of the free market. It assumes that the solution of every problem must be more government intervention, more government control, and more government spending. It is being carried along by its own momentum, and disdains the application of any factual tests to its results. ✤

Will We Ever Pay Off?
June 8, 1964

In 1930, the national debt was $16 billion. In 1945, at the end of World War II, it was $260 billion. During the war, while the debt was piling up, the general assumption was that this borrowing was proper and even unavoidable in a time of crisis, but that once the war was over the debt would be gradually reduced or paid off. Instead, in the eighteen years since the end of the war, the national debt has been increased to $308 billion, or an average of $6,500 for every family in the United States.

Today interest on the debt alone amounts to $11 billion a year, or more than three times as much as the government spent annually for all purposes in the years 1926 to 1930.

There is curiously little concern about this. On the contrary, every once in a while some writer emerges to ridicule what little concern there is. J. David Stern did this in the January Atlantic. Even academic economists belittle the problem.

Stern’s argument was summed up in the statement that “the nation is growing faster than its debt.” One academic economist, trying to prove the same point, epitomized his argument in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>National debt</th>
<th>Gross national product</th>
</tr>
</thead>
<tbody>
<tr>
<td>1945</td>
<td>$260</td>
<td>214</td>
</tr>
<tr>
<td>1963</td>
<td>$305</td>
<td>585</td>
</tr>
</tbody>
</table>

The triumphant conclusion the professor drew from this table was that “the national debt, when viewed as a burden to a year’s production, has been more than cut in two.”

DEBT VS. GNP
The figures are official, and the conclusion is technically correct. The complacency of the conclusion is unjustified.

The reason the national debt is less of a burden is that, through inflation, the purchasing power of the dollar has been steadily reduced. It has been reduced 63 percent since 1933 and 43 percent since 1945. Let us state this another way. By failing to balance its budget, by borrowing, by monetizing the debt, by printing more dollars, by steadily diluting the dollar’s purchasing power, the government has in effect repudiated 63 cents of every dollar it borrowed in 1933 and 43 cents of every dollar it borrowed in 1945.

To put it bluntly, the creditors, the holders of U.S. Government bonds, have been cheated.

Let’s make this even clearer by an illustration from another country. At the end of 1923, the purchasing power of the German paper mark fell to less than one-trillionth of its 1913 value. This meant that prices rose more than a trillion times. Therefore Germany’s “GNP,” measured in paper marks, rose more than a trillion times. As a result, its accumulated debt, represented by borrowings of marks of a much higher purchasing price level, rose more than a trillion times.

Let’s look at the figures. In 1923, the national debt was 55 billion marks. In 1949, when the government of Germany finally paid it off, the national debt was 432 billion marks. So the government of Germany increased its own national debt 7.8 times. Since the purchasing power of the German mark fell from 450 to 0.045, the real increase of the national debt was only 20 times.

Stern’s argument was summed up in the statement that “the nation is growing faster than its debt.” One academic economist, trying to prove the same point, epitomized his argument in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>National debt</th>
<th>Gross national product</th>
</tr>
</thead>
<tbody>
<tr>
<td>1945</td>
<td>$260</td>
<td>214</td>
</tr>
<tr>
<td>1963</td>
<td>$305</td>
<td>585</td>
</tr>
</tbody>
</table>

The triumphant conclusion the professor drew from this table was that “the national debt, when viewed as a burden to a year’s production, has been more than cut in two.”
power, was reduced to practically no burden on the economy at all. Though Germany was the extreme case, the situation did not differ in principle from what happened in France (where the franc eventually fell to less than one-one-hundredth of its 1913 value) and a score of other European countries.

*A PRETENDED PAYMENT*
Adam Smith, writing in 1776, was perfectly familiar with this method of disguised repudiation. “When national debts have once been accumulated to a certain degree,” he wrote, “there is scarce, I believe, a single instance of their having been fairly and completely paid.” But governments usually covered “the disgrace of a real bankruptcy” by the “juggling trick” of “a pretended payment” in depreciated currency.

So the relationship that seems to give some present-day writers so much satisfaction—that the national debt, in dollar terms, has been falling in relation to the gross national product in dollar terms, is simply the outcome of the steady depreciation of the dollar. The more inflation we have, and the more the purchasing power of the dollar is depreciated, the more the national debt will “fall” in relation to the GNP, because the GNP, measured in rising prices, will rise in relation to the debt, and so these writers will have increasing reasons for statistical satisfaction.

Do we have any serious intention of ever paying off our national debt in dollars of at least present purchasing power? If so, isn’t it about time we balanced the budget and made an honest start? ❄️

**When Inflation Sours**
June 15, 1964

Italy in recent years has been Europe’s fastest growing economy. In the ten years ended in 1963 its total statistical output of goods and services more than doubled. But now it has been suddenly plunged into what the Wall Street Journal calls “the worst economic distress to hit any member of the European Common Market since shortly after the Market’s 1958 birth.”

Italy’s apparent economic miracle was at least partly the result of its inflation. This inflation was also the greatest in any European country in the last three years. In those three years prices in Italy increased 14.7 percent, wages 23.8 percent, and the money supply 57.7 percent. But Italy’s imports have soared. It suffered a balance-of-payments deficit last year of more than $1 billion, draining its reserves of dollars and other foreign exchange. The Italian Government has been forced to tighten credit. Unemployment has reappeared. Stock prices on the Milan exchange have fallen to the lowest level in four years.

Italy is merely the latest illustration of the truth of the warning issued recently by Robert Marjolin, vice president of the Common Market’s Commission: “Sooner or later, continuing inflation will lead to a halt in expansion or even to a recession, touched off by automatic factors . . . and also by government action. This action will have to be more drastic the longer it is deferred.”

**THE EUROPEAN RECORD**
Yet inflation in other European countries, in France, Belgium, Holland, Germany, Switzerland (discussed in this column of May 18), has been only slightly less in extent than that in Italy. Both wages and prices have been rising faster in Europe than here. According to the figures of the International Monetary Fund, wages in the U.S. and Britain rose only 3.5 percent last year, but in Germany 7, in Belgium 7.6, in Holland 7.8, in France 8.8, and in Italy 10.2 percent. Similarly, consumer prices in the U.S. rose only 1.2 percent last year, but in Belgium 1.9, in Britain and Germany 2.8, in Switzerland 3.7, in Holland 3.8, in France 5, and in Italy 7.3 percent.

As a result of this situation, there has been a shift in the balance of payments. Our situation has improved. In the first five months of the present year the deficit in the U.S. balance of payments shrank to a seasonally adjusted annual rate of about $1.5 billion, compared with $3.3 billion in the calendar year 1963 and $3.9 billion in 1960.

**THE U.S. RECORD**
Yet this should not be a reason for American complacency. We are still running a deficit in our balance of payments, not a surplus. And though the rate at which this deficit is piling up has slowed down, we should not forget that this deficit is cumulative. In the six years from the end of 1957 to the end of 1963 it has amounted to $19 billion. Foreigners now hold $25.9 billion of our short-term liabilities, and our gold stock is down to $15.7 billion.

We cannot count on being bailed out by European inflation. We too are still inflating. Since the end of 1962 we have increased our money supply by 5 percent, and, including time deposits, by 10 percent. In April our consumer price index went to the highest level on record.

Yet our government officials, instead of trying to halt our inflation, criticize European countries for
trying to halt theirs. Secretary Dillon told a Vienna conference that raising interest rates to discourage an inflationary expansion of credit was not an “appropriate” way to fight inflation. Is that because higher interest rates abroad cause capital to flow out of the U.S.? Instead of allowing higher compensatory interest rates here, our Treasury prefers to hold interest rates down and to tax American investments abroad. Yet while it discourages sound private foreign investment, our government contributes most of a $1 billion credit to prop up the inflated Italian lira.

In various ways the Indian Government has been throttling what is left of private industry, and diverting production into uneconomic channels. Government-imposed price controls have driven scarce funds from areas where they are most needed. Under selective and arbitrary price ceilings, investment in coal mining, cement manufacturing, and fertilizer production has lagged. Private steel mills have been starved of funds and unable to expand their facilities.

Though heavy government spending and deficits have led to inflation and rising domestic prices, the official value of the Indian rupee has remained unchanged since World War II. The result is a gross overvaluation of the rupee. Its official quotation is kept up only by exchange control. This overvaluation has penalized and discouraged exports, subsidized and encouraged imports, led to a startling increase in India's external debt, depleted its currency reserves, and caused acute shortages of foreign exchange. It is estimated that without foreign aid, India’s balance-of-payments deficits would have averaged more than $800 million annually in recent years.

**What Happens to Aid**

June 22, 1964

When Nehru died, a number of newspapers pointed out that whatever his merits may have been, he had failed to solve India's economic problems. Millions of Indians still live in abject poverty. Ninety percent of the houses in the country are one-room hovels, with no facilities whatever. Food consumption by the masses continues below acceptable standards. The use of cloth has steadily declined. India’s national income rises only about 2 percent a year, roughly the same as population growth. Industry is stagnant. Unemployment has risen.

And all this is in spite of massive foreign aid. Since 1948, the United States has spent $5.3 billion in all sorts of aid to India, from outright grants to loans and sales of surplus farm commodities for rupees. The week before Nehru's death a consortium composed of the World Bank and ten nations pledged more than $1 billion for the fourth year of India's current Five-Year Plan.

India’s poverty is immemorial. But the failure of conditions to improve in the seventeen years of Nehru’s rule, even with these massive doses of foreign aid, is not mysterious. India’s economic growth has been choked by the economic, fiscal, and monetary policies that Nehru and his party imposed on the country.

**DOCTRINAIRE SOCIALISM**

Nehru was a doctrinaire socialist. The establishment of a socialist society was, in fact, the principal goal of Indian economic planning. This objective was formally accepted by the Indian Parliament in 1954. In the words of the second Five-Year Plan: “The adoption of the socialist pattern of society as the national objective, as well as the need for planned and rapid development, require that all industries of basic and strategic importance, or in the nature of public utility services, should be in the public sector.”

In various ways the Indian Government has been throttling what is left of private industry, and diverting production into uneconomic channels. Government-imposed price controls have driven scarce funds from areas where they are most needed. Under selective and arbitrary price ceilings, investment in coal mining, cement manufacturing, and fertilizer production has lagged. Private steel mills have been starved of funds and unable to expand their facilities.

Though heavy government spending and deficits have led to inflation and rising domestic prices, the official value of the Indian rupee has remained unchanged since World War II. The result is a gross overvaluation of the rupee. Its official quotation is kept up only by exchange control. This overvaluation has penalized and discouraged exports, subsidized and encouraged imports, led to a startling increase in India's external debt, depleted its currency reserves, and caused acute shortages of foreign exchange. It is estimated that without foreign aid, India’s balance-of-payments deficits would have averaged more than $800 million annually in recent years.

**DISSERVICE TO INDIA**

So our aid to India has gone mainly to subsidize and prolong socialism, price controls, and an artificial value for the rupee. As the eminent Indian economist B.R. Shenoy wrote in the May 21 issue of *The Wall Street Journal*: “Foreign aid actually is doing a disservice to the Indian economy. . . . Aside from helping to perpetuate industrial white elephants, foreign aid . . . provides the foreign exchange needed for illicit export of capital; for illegal imports of gold . . . for speculative accumulation of inventories; for the construction of urban property as a hedge against inflation; and for luxury living for those few who succeed in manipulating the nation’s economic controls to their own advantage.”

In brief, aid to India, in so far as it has not been merely a futile effort to fill a leaking tub, has been encouraging and prolonging socialism, controls, inflation, and an overvalued currency. And what is happening in India is typical of what is happening in other “underdeveloped” countries into which we have been pouring taxpayers’ dollars.

When, if ever, are we going to use foreign aid to encourage sound currencies, balanced budgets, private property, free enterprise, and increased productivity?
**Income without Work**  
June 29, 1964

About three months ago (March 22), a group calling itself the Ad Hoc Committee on the Triple Revolution (not a gag) came out with a manifesto, which made the front pages, declaring that:

“The traditional link between jobs and incomes is being broken. The economy of abundance can sustain all citizens in comfort and economic security whether or not they engage in what is commonly reckoned as work. . . . We urge, therefore, that society, through its appropriate legal and governmental institutions, undertake an unqualified commitment to provide every individual and every family with an adequate income as a matter of right.”

The manifesto ran to 29 typewritten pages. It carried among its 26 signers such names as W.H. Ferry of the Fund for the Republic, Gunnar Myrdal, the Swedish economist, and Linus Pauling, the ban-the-bomb scientist. It seemed too obviously crackpot, at the time, to be worth serious analysis. But lo! on June 7 the Sunday magazine section of *The New York Times* carried an article by Michael D. Reagan, one of the manifesto’s signers, seriously explaining why the government should provide, say, $3,000 a year “without question to any jobless applicant.”

So perhaps the proposal is worth a second look.

**PERMANENT JOBLESS?**

The first thing we may ask is whether there is any reason to accept the revolutionists’ statement of facts. According to them, there is a “cybernation revolution” going on, “brought about by the combination of the computer and the automated self-regulating machine. This results in a system of almost unlimited productive capacity which requires progressively less human labor.” “A permanent impoverished and jobless class” is being established. “Fewer and fewer people are involved in production of goods and services.”

These statements are based mainly on the fact that “the official rate of unemployment has remained at or above 5.5 percent during the ‘60s.” But the triple revolutionists never mention in their 29-page statement that the number of employed persons over the last twelve months, at around 69 million, is at the highest level in our history.

And they treat the unemployed as if they were a static army, though three-quarters of them are unemployed for less than fifteen weeks. Less than 1 percent of the total working force is unemployed for more than six months. This hardly suggests that the “permanent jobless class” is very large, or that “the underlying cause of excessive unemployment” is “cybernation,” or “machines taking over production from men.”

**HOW MANY WOULD WORK?**

Now about the remedy of a guaranteed income without work. Reagan makes the mistake of going into details that the Ad Hoc Revolutionists wisely slurred over. He would guarantee every family $3,000 a year, but doesn’t think it would cost much. For example, in 1962, 9.3 million families were earning less than $3,000 a year. They earned an average of $1,795. “If they are to be brought above the poverty level, they will need an additional $1,205 per family”—or a total of only $11.2 billion.

I suggest that there may be a few problems. This $1,795 income is an average figure. Many families earned less, others more. But as the $3,000 total is guaranteed anyhow, why still bother to work for their present income? And what about families earning, say, $3,100 a year? They would get nothing from the government. Why work all year for only $100? Wouldn’t they either quit, or demand a basic $3,000? Wouldn’t every family demand a basic $3,000 handout—just as old-age pensions are a flat amount regardless of one’s other income? How many of us would work to support the rest?

To cut the connection between work and income is to cut the connection between production and income. The scheme would lead to diminishing production and universal impoverishment. But it is no accident that the newspapers are beginning to be filled with such utopian schemes and dreams. When President Johnson tells us he can solve the immemorial problem of poverty in his Administration he is going to encourage others to tell us that they can do it overnight.

**Training for Jobs**  
July 6, 1964

Almost everybody knows that if a commodity is overpriced some of it will remain unsold. But hardly anyone except a few economists—certainly no union leader or politician—seems willing to recognize that wherever labor is overpriced some of it will remain unemployed.

Because this basic cause of unemployment is unrecognized or unacknowledged, union leaders and politicians blame the bulk of it on other alleged causes. The two most popular scapegoats today are “automation” and lack of training.

The automation scapegoat is by far the more frequent. We are constantly being told that it has created
Apprenticeship has been well defined as “a contractual relationship between an employer and a worker under which the employer is obliged to instruct the worker, and the worker is to serve the employer, on stated terms.” It is learning by doing; it is on-the-job training; it is learning to swim in the water. Government training programs are no substitute for this. They are a burden on the taxpayer and far less helpful to the worker.

Apprenticeship can be encouraged mainly by removing the legal and union obstacles that have been put in its way. Minimum-wage requirements could be removed entirely from bona fide apprentices. And it may be pointed out that even government subsidies for on-the-job apprentices (though I do not necessarily advocate such subsidies) would be far less expensive, far more effective, and add to production more than relief or than present government work-training programs and those proposed in the anti-poverty bill.

Rigging Interest Rates
July 13, 1964

In the issue of June 15 I referred briefly to the disturbing speech of Secretary Dillon in Vienna on May 21, in which he chided European governments for keeping their long-term interest rates too high, and told them that this was not an appropriate way to fight inflation. That speech calls for further examination.

The reason for Dillon’s concern is not mysterious. If long-term interest rates in Europe average around 6 percent, while they range here between 4 and 5 percent, then foreign and even American investors will want to invest in Europe, where they can get a higher return, rather than here. The result, as Secretary Dillon and his advisers see it, is that this will prolong and increase that “deficit in the balance of payments” about which the Administration is so concerned. “Europe’s” incon siderateness in pushing its interest rates so high “left us,” according to the Secretary, “no recourse but direct government action.” That action was to recommend a stiff tax penalty on American purchases of foreign securities.

Let us look at some of the dubious assumptions behind this reasoning.

A PRICE PREMIUM
Dillon talks as if “Europe” is intentionally keeping long-term interest rates high. But European governments and private borrowers certainly don’t want to pay any higher interest rates than they have to. What has happened is simply this. European governments had already
been following for the last few years the inflationary policies that Dillon assumes to be needed. (He declares that “the prevention of inflation remains vitally necessary,” but the policies he has been carrying out increase inflation.)

European inflation over the three years 1961 to the end of 1963 led to average price rises of 9.8 percent in Germany, 10.9 percent in Britain, 13.6 percent in France, and 14.7 percent in Italy. (See this column May 18.) European long-term interest rates are high because they contain a “price premium” which reflects a fear of further inflation. Even Dillon concedes that “relatively recent experience with inflation has discouraged post-war European investors from the purchase of bonds.”

It is not Europe that has been artificially holding long-term interest rates up, but our government that has been artificially holding them down. We have done this by increasing the money supply. Since the end of 1957 the money supply, including time deposits, has been increased $79 billion, or 40 percent. One of the chief ways in which it has been increased is by the purchase and monetization, by the Federal Reserve System, of $34.5 billion of U.S. Government securities—$10.5 billion more than at the end of 1957, $3 billion more than a year ago.

‘INCOME POLICIES’

It is our money-creation, bond-buying, low-interest-rate, budget-deficit policy—in brief, our inflation—that has caused the very deficit in the balance of payments that the Administration wants to cure. And as long as these inflationary policies continue, any tax penalty or prohibition on foreign investment, “temporary” or permanent, is not going to cure the balance-of-payments deficit. In the long run any reduction in our foreign investment will tend to reduce our exports by a corresponding amount. It will reduce the dollars available to foreigners to buy our goods.

If the Administration persists in its inflationary policies, and tries to offset them with direct controls on foreign investment, it will only plunge deeper and deeper into controls. Dillon’s own words foreshadow this. He advocates “income policies to restrain upward pushes on the cost-price structure” caused by inflation. “Income policies,” a phrase ominously familiar in Europe, means controls of wages, salaries, profits, rents, interest, and other forms of income. It means moving toward a regimented economy.

And all because the Administration clings to the exploded Keynesian assumption that a perpetual creeping inflation—caused by chronic budget deficits, ever-increasing money supplies, and perpetual low interest rates—is necessary to full employment. It is neither necessary nor sufficient. What is indispensable, however, is a coordination of wages, costs, and prices achieved through a restoration of real freedom of markets.

---

**Dread of a Surplus**

**July 20, 1964**

The last fiscal year ended on June 30 with a deficit of about $8.8 billion. This was more than the entire amount spent by Franklin D. Roosevelt in any fiscal year till 1939. It will be followed by a deficit in the current fiscal year officially estimated at $5.8 billion (and it will probably be much larger). The two deficits taken together will be the biggest for any two-year period in peacetime.

Yet no one showed any particular concern about this. The New York Times report hailed it as a great achievement. “The deficits in the last three years, while believed to have spurred the economy, have clearly not been inflationary.”

Most of the comment, indeed, has been to the effect that the deficit has not merely been harmless, but beneficial. And this reflects the present Administration’s own underlying fiscal philosophy, which is that a budget balance should be attempted only when the economy is at the level of “full employment.” This it defines as unemployment of 4 percent or less of the labor force. The President’s economic advisers have often expressed their conviction that previous efforts to balance the budget when the economy was operating with idle plant and idle labor only prolonged and increased unemployment.

Because of this fiscal philosophy the present Administration does not expect to see the budget balanced until the fiscal year 1967, which ends three years from now.

**WHY BALANCE EVER?**

But if the Administration’s economic assumptions are correct, why balance the budget even then—or at any time? If the country is enjoying full employment, why needlessly endanger that prosperity by returning to a budget balance?

We can be sure that, if ever the blessed full-employment goal were achieved, this argument would be put forward. And it is hard to see how it could be politically resisted. In fact, there are already commentators who contend that the government cannot afford ever again to run a surplus, and that balanced budgets are “economic suicide.”
It is instructive to recall the series of rationalizations that have brought us to this point. At first it was argued that a balanced budget was harmful only in “bad” years. The necessity of balancing the budget was accepted, but it should be only a “cyclical balance” over a series of years. But the cyclical theorists never revealed how long their cycle was, or how they or anyone else could know at any time just where we were in a cycle. If an average cycle is six years, say, then to offset the expected cumulative three-year budget deficit of $21 billion at the end of this fiscal year there would have to be an average $7 billion surplus in each of the next three years. The professed cyclical balancers would be appalled at such a prospect.

**34 YEARS, 28 DEFICITS**

So their theory is now that we should always run a budget deficit as long as there is any unemployment. And though we have already run 28 deficits in the last 34 years, they deplore only the six surpluses.

What will be the result if their theories continue to be followed? It was crushingly demonstrated in the ’30s that even heavy uninterrupted deficits cannot cure mass unemployment. But more deficits can and must lead to further increase in the national debt, further increase in the money supply, a further rise of prices, and a further depreciation of the dollar. The purchasing power of the dollar has already been reduced 63 percent since 1933 and 43 percent since 1945.

It is true that in the last ten years the dollar has depreciated “only” 12 percent. But this result looks good only in comparison with the dreadful international record. The New York First National City Bank’s annual review of comparative rates of depreciation shows that in the last ten years the German mark has lost 18 percent of its purchasing power, the British pound 23 percent, the Italian lira 25 percent, the French franc 34 percent, and the Argentine, Brazilian, Chilean, and Bolivian currencies respectively 91, 94, 95, and 97 percent.

Whether the deficits are “planned” or unplanned, the result is always the same.

---

**The Issue of Statism**

July 27, 1964

In the preface to his new book, *The Republican Opportunity in 1964* (Duell, Sloan and Pearce, 148 pages, 95 cents), my colleague Raymond Moley, after explaining how in recent years the terms *conservative* and *liberal* have both been torn from their original meaning to describe the precise opposite of what they meant to our forefathers, offers his own description of the present American “liberal” in the modern sense:

“The liberal favors a generous extension of Federal power in areas that have hitherto been the responsibility of the states, the communities, and private organized effort; he believes in and supports more intervention of governments, especially the Federal government, in economic life, even to the extent of setting up government-owned and government-operated businesses; he favors a huge expansion of federally supported personal-welfare programs; he would undertake Federal expenditures on national-resource development, urban reconstruction, and area development. And he justifies the great enlargement of Federal expenditures involved in these programs on the ground that such expenditures promote economic growth. In the face of large deficits there has been added to the liberal’s economic philosophy the concept of deliberately planned deficits in anticipation of larger revenues in future years.”

---

It struck me how accurately this describes the philosophy and attitude of President Johnson and the Democratic “liberals” in the present Congress. This was illustrated a couple of weeks ago when it was disclosed that the President, in the belief that the passage of the Civil Rights Act had “opened the way to a new creative period” (as one news dispatch put it) in which the government can tackle new domestic problems, had convened a group of special committees, drawn largely from the academic community, to draft recommendations for future legislative and governmental action.

In other words, the President is sure we need still more laws, and if he doesn’t know exactly what they ought to be, he appoints committees to think them up. And these new laws are to be piled on the 800 or so laws that each Congress passes. It passed 4,399 public laws in the last ten years.

What are new laws? They fall into two main categories. First are those that revise previous laws. This implies that Congress made mistakes in the previous laws that the new laws supplant. If, at a moderate estimate, each new or old law contains an average of ten provisions, this means that in every hundred such new laws Congress passes in a session, it may be correcting as many as a thousand previous mistakes. It also implies that it is constantly changing the rules under which people act, so that they cannot launch on new businesses or other long-term enterprises with any assurance that the rules are not going to be changed on them.
A CLEAR CHOICE
The second category of new laws are those that deal with activities not previously covered by law. This means that the government is compelling people to do something or refrain from doing something that they were not previously compelled to do or refrain from doing. In other words, the individual’s liberties are restricted in still another direction.

Congress has become a mass-production factory for legislation, turning out an average of 440 new laws every year. And yet it is continually being prodded by Presidents and in the press for “do-nothing-ism.” “Progress” and a “creative period,” we are given to understand, consist in the passage of still more hundreds of new laws, or the appropriation of still greater sums to be taken from A and handed to B.

Raymond Moley defines “conservatism” in his book as meaning “a halt in the expansion of government in domestic life and, above all, a reduction in size and scope of the Federal establishment.”

This is what Barry Goldwater stands for, and it is, in the main (with some exceptions), the philosophy that the new Republican platform expounds. For the first time in many years we may witness a Presidential election offering the voters a clear choice of contrasting governmental philosophies.

Words against Words
August 3, 1964

Barry Goldwater made a tactical blunder in his acceptance speech, but it is not difficult to see how he fell into it. His opponents, both in the Democratic and the Republican parties, have been calling him and his supporters “extremists,” and calling themselves—especially those that represented the extreme left wing of the Republican Party—“moderates.” Goldwater, in an unthinking moment, accepted these labels and tried to turn them against his opponents: “I would remind you that extremism in the defense of liberty is no vice . . . [and] moderation in the pursuit of justice is no virtue!” The storm broke; and Rockefeller revenged his defeat by instantly finding these words “dangerous, irresponsible, and frightening.”

Now “extremist” and “moderate” are both rhetorical labels, and Goldwater would have been justified in pointing out that the former is not necessarily synonymous with evil or the latter with good. Is it necessarily wrong to be extremely honest or extremely fair? Is it necessarily praiseworthy to be only a moderate liar or a moderate embezzler?

THE ART OF POLITICS
But linguistic analysis does not pay off politically. Politics is conducted with emotionally loaded catchwords. The trick is to apply the approbatory ones to your own side and the derogatory ones to your opponents. Thus the “liberals” are having a field day with “extremist” and “moderate.” A columnist on an outstanding newspaper, for example, solemnly praises Mr. Johnson’s $8.3 billion deficit for 1964 and his planned future deficits as “moderate” fiscal policy, and dismisses the advocates of balanced budgets as “extremists”!

Goldwater’s appropriate response would have been to repudiate the label of “extremist” as applied to his own position and “moderate” as conferred by his opponents on themselves, and insist that his position is the moderate one and theirs the extreme one.

The art of politics consists in large part in taking over for oneself any label that has acquired prestige and pinning disparaging labels on one’s opponents. This sometimes results in a reversal of traditional labels, and as words are the counters of thought, it has deeply confused and perverted political and economic thinking. In the United States today, for example, the word “liberal” has been torn from its original meaning and designates exactly the opposite of what it meant in nineteenth-century France and England and still means on the European continent.

TRUE LIBERALISM
The true liberal tradition is the tradition founded and developed by such figures as Hume, Adam Smith, Jefferson, de Tocqueville, Cobden, Mill, Macaulay, Gladstone, and Lord Acton. They stood for limited government, decentralization, checks and balances; freedom of trade, production, and markets; low taxes with low spending and balanced budgets; the integrity of the currency, and non-inflation. They were against excessive government intervention; against statism and paternalism; against the piling up of new laws, compulsions, prohibitions. In brief, they believed in personal liberty. Liberal and liberty come from the same root.

When the statists and paternalists appropriated the word “liberal” for themselves, the original liberals allowed them to do it, and so were forced to call themselves first “libertarians” and then “conservatives.”

Years earlier, they allowed Karl Marx to pull a similar trick on them. About six years after the publication of The Communist Manifesto, Marx and his followers coined the smear word “capitalism” to convey the implication that the system of free markets, private property, and economic liberty was a system imposed on the world by the capitalists and for the capitalists. That implication still sticks to the word. It explains why
years from 1931 to 1940 inclusive, the Federal government ran a deficit averaging 3.6 percent of the gross national product. During those ten years there was average unemployment of 18.6 percent of the labor force. The same percentage of GNP and of the labor force today would mean deficits averaging $21 billion a year combined with more than 14 million annual unemployed.

All prolonged unemployment is the result of some discoordination in prices and wages. The champions of planned deficits assume that it is impossible to resist excessive union wage demands, and that the only way to restore or maintain full employment is to keep injecting more monetary “purchasing power” into the economy to make the higher wages payable. Under certain conditions, such as those that have been prevailing in recent months, a deficit increased or continued by tax reduction can temporarily bring prosperity and more employment.

**SHORTSIGHTED**

But advocacy of prosperity through deficits is advocacy of a shortrun policy—one might also say, of a shortsighted policy. The advocates do not ask themselves how long this policy can be kept up and what its long-run consequences must be. These long-run consequences are plain to anyone who cares to look for them. We can see them in the inflations in Europe today, especially in the inflationary crisis in Italy. We can find an extreme example in Brazil, where the new regime is in trouble because of the 40 percent rise in living costs in the first six months of this year (on top of an 80 percent rise last year), accompanied by signs of a recession and rising unemployment. The new regime, dispatches report, is trying “to reduce the government’s operating deficit, regarded as the main cause of the inflation.”

No doubt our present deficit prosperity can be kept going quite successfully until the election and even beyond. But anyone who thinks that there will be no unpleasant aftereffects should recall: (1) that our cost of living has gone up 72 percent since the end of World War II in 1945; and (2) that our cumulative balance-of-payments deficit has been wholly the result of our government deficits and inflation since 1957, and that further inflation can only make the problem worse.

---

**That ‘Fiscal Revolution’**

**August 10, 1964**

The Republican Platform points out that the Democratic Administration has “burdened this nation with four unbalanced budgets in a row, creating deficits totaling $26 billion, with still more debt to come, reflecting a rate of sustained deficit spending unmatched in peacetime.” And the platform goes on to pledge a reduction of not less than $5 billion in Federal spending and “an end to chronic financing, proudly reaffirming our belief in a balanced budget.”

It is true that this does not go as far as the Democratic Platform on which Franklin D. Roosevelt was elected in 1932, which promised “a budget annually balanced,” but some people are alarmed because the Republicans mentioned a balanced budget at all. In doing so, Edwin L. Dale, Jr. contends in The New York Times (July 14), they “have rejected the fiscal revolution of the 1960s. They have done so even though, so far at least, the revolution seems to be proving a smashing success.”

“The revolution,” Dale goes on, “is quite simply a rejection of the desirability of a balanced budget until such a time as the economic boom achieves full employment.” And though the Administration has not “trumpeted” this “revolution,” it has in fact “begun to use the Federal budget as an economic weapon in the spirit of the late Lord Keynes, with a result that budget balance has been purposely postponed.”

To describe planned deficits as revolutionary is like describing intentional profligacy or irresponsibility as revolutionary. In the history of government, deficits are older than surpluses, and probably more frequent.

**OLD AS JOHN LAW**

The only thing that could conceivably be called new is the praise and glorification of deficits and paper money, but even this can be traced back two and a half centuries to the days of John Law.

The records of the past do not support the theory that deficits cure unemployment. In each of the ten years from 1931 to 1940 inclusive, the Federal government ran a deficit averaging 3.6 percent of the gross national product. During those ten years there was average unemployment of 18.6 percent of the labor force. The same percentage of GNP and of the labor force today would mean deficits averaging $21 billion a year combined with more than 14 million annual unemployed.

All prolonged unemployment is the result of some discoordination in prices and wages. The champions of planned deficits assume that it is impossible to resist excessive union wage demands, and that the only way to restore or maintain full employment is to keep injecting more monetary “purchasing power” into the economy to make the higher wages payable. Under certain conditions, such as those that have been prevailing in recent months, a deficit increased or continued by tax reduction can temporarily bring prosperity and more employment.

**SHORTSIGHTED**

But advocacy of prosperity through deficits is advocacy of a shortrun policy—one might also say, of a shortsighted policy. The advocates do not ask themselves how long this policy can be kept up and what its long-run consequences must be. These long-run consequences are plain to anyone who cares to look for them. ---

**Hoover as Scapegoat**

**August 17, 1964**

In his brilliant and absorbing biography of Herbert Hoover, published on Aug. 10 to celebrate the former
wages, and increasing capital outlay. When there has been a collapse in confidence, in demand, and in the money-and-credit supply, there must be some downward adjustment in prices and wages if sales, output, and employment are to be sustained. When, under such circumstances, prices and wages are inflexible in a downward direction, the result can only be spreading unemployment.

But the doctrine of maintaining or even increasing money wage rates, to “increase purchasing power,” has now become New Deal, Fair Deal, Keynesian, Hellerious gospel.

But the great “error” for which the New Dealers, Keynesians, Hellerites, and Fiscal Revolutionists blame Hoover is trying (unsuccessfully) to balance the budget. I doubt that this was an error. In any case none of Hoover’s opponents at the time thought so. On the contrary, it was the deficits and the “spending” that Franklin Roosevelt denounced. The Democratic platform pledged a budget “annually balanced.”

It is constantly forgotten that the worst disasters in the Hoover Administration came in the last four months, after his election defeat and before FDR took office, when Hoover was powerless and FDR refused to deny rumors that he meant to take the country off the gold standard.

The final myth is that Roosevelt stopped the Depression. In his first two terms, chronic deficits were combined with massive unemployment. Only our entrance into World War II “solved” the problem.

The Poverty Package
August 24, 1964

The anti-poverty law—or the Economic Opportunity Act of 1964, to use its official title—is primarily a Democratic campaign document and a vote-buying device. It is designed to give the impression that for the first time in our history the Federal government has become aware of the existence of poverty and is doing something about it. Actually we have been piling one “anti-poverty” program on top of another since the New Deal began 30 years ago.

The excellent Republican minority report on the bill to the House listed 42 individual programs “designed to combat and overcome the causes of poverty” already in existence. These programs cost a total of $31.8 billion in the fiscal year 1964. According to the Social Security Bulletin for November 1963, a total of $66.5 billion was spent by all levels of government for “social
In terms of a “war against poverty,” the whole history of America has been a history of sustained and spectacular accomplishment. In 1929 (using 1962 dollars as a standard), more than 50 percent of American families had an annual income of less than $3,000. By 1947 this figure had fallen to 30 percent, and by 1962 to 21 percent. In this same period, American families having an annual income of $6,000 or more rose from 15 percent to 48 percent. Americans earn more, own more, consume more, and live better than any other people on earth.

And we have achieved this result, not by government “anti-poverty” programs, of which we have had proportionately less than most nations, but by our system of free, private, competitive enterprise, which provides maximum incentives to production.

Socialism and Famine
August 31, 1964

India is suffering from high prices and a food shortage. Both have been brought about by the government’s own policies. For years it has indulged in monetary inflation, controls, state planning, socialism, and a forced industrialization that diverts capital and labor away from farming.

Alarmed by the food riots, the government is taking drastic measures. Most of them are exactly the wrong measures. It has put ceilings on the price of rice, and announced, price controls on matches, oil, kerosene, sugar, and vegetable oils. This is precisely the step that will do most to discourage production of these necessities. When there is a shortage of any product the cure is high prices, not low prices. In a free market, without controls, relatively high prices for a product signal a shortage of that product, and give maximum incentives to producers and importers to relieve the shortage.

The Indian Government, looking for scapegoats, has blamed “speculators” and “hoarders,” and announced the imposition of strict controls on the purchase, sale, storage, and transportation of grains. But speculators and hoarders, when they really act intelligently in their own interest, perform a public service. If they are right in thinking that if they hold back now they will get a higher price later, this means that they are conserving supplies now to relieve an even greater future scarcity. Unless they sell at the point of maximum scarcity, they miss their best market and merely defeat themselves.
World Money Reform

September 7, 1964

After ten months of study, the monetary experts of the ten leading industrial nations of the free world have come up with their report on what should be done about the world’s currencies. At the same time, the International Monetary Fund, with 102 national members, has brought out its own recommendations.

The two reports, in substantial agreement, are what might have been expected. They reject all “extreme” proposals, such as the creation of a new international paper money issued by the IMF, or turning the IMF into a super-central bank that could create reserves internationally much as the Federal Reserve does domestically. Nevertheless, they propose that the IMF be beefed up substantially and quickly, and that this be done in some way that won’t cause a heavy drain on the U.S. gold stock.

The main proposal is that the resources of the Monetary Fund be raised by a “moderate general increase”—say, 20 to 30 percent—in the quotas of the member nations. If this boost is adopted, it will be on top of a 50 percent increase in 1959.

What lies behind this proposal (and behind the far more inflationary proposals that the “group of ten” rejected) is the fear of a “shortage of international liquidity”—the fear that, unless the new gold produced annually is progressively supplemented by new money and credit, there will not be enough to keep pace with and to finance the growing volume of world trade, and that a shortage of “liquidity” would force the world into deflation and unemployment.

RUSSIA VS. INDIA

But the Indian Government, distrusting the whole private-market mechanism, is setting up a government grain corporation to do the food importing and trading. The supreme irony is that just as the Indian Government has announced this new imitation of Russia, Russia has decided to move in precisely the opposite direction. Early in August, Premier Khrushchev proposed that potato and vegetable farms sell their produce directly through their own city stores instead of marketing it through the government trade network. The advantage of such a system, he explained, is that the consumer would be able to reject poor quality produce in one store in favor of higher-quality produce offered by another store's store. Because of the unreliable supply system of the state trade channels, and the low quality of the produce offered, Soviet city workers as well as peasants in recent years have been cultivating their own garden plots. In 1962, 70 percent of the nation’s potato crop and 42 percent of the vegetables were produced on these private plots.

PRIVATE PROPERTY

Until now, the net income of the collective farms has been divided among the members on the basis of the work done, computed in workday units. This is to be replaced by a system of payments linked directly to quantity and quality of output. As Khrushchev summed it up in a question he asked a tractor driver in a wheat field: “How would you like it if you were assigned a given plot of land where you would be responsible for all operations, plowing, planting, cultivating, and harvesting, and you would be paid on the basis of the crop produced?”

Marvelous idea! The equivalent of a private lease! It is, in fact, a third of the way back—or forward—to private property. Only two more steps would be necessary to complete the reform. The next would be to allow the individual farmer permanent rights to a plot. This would give him the incentive to conserve and build up the soil to improve the buildings, etc. The final step would be to give each farmer the right to buy or sell plots. The successful farmers would then acquire more plots from the unsuccessful, and production would drift more and more into the hands of the most efficient and productive—thus constantly increasing efficiency and production.

The Chinese Communists are quite right when they accuse Khrushchev of flirting with capitalism. If he continues in this direction, while we continue our drift into socialism, Russia may indeed one day outproduce us. Meanwhile socialist India and Communist Russia must import food from capitalist America to pull them through.
Everyone seems to have forgotten that balanced economic growth can take place quite successfully even with moderately falling prices. An outstanding example of prosperity with falling prices occurred between 1925 and 1929, when full industrial activity was maintained with an average drop in wholesale prices of more than 2 percent a year.

**THE DANGER IS INFLATION**

The real monetary danger that this country and the world face today is not “shortage of liquidity” or deflation, but a continuance and acceleration of the inflation that has been raging since the end of World War II. This world inflation has coexisted with the life of the Monetary Fund. Of the 48 or so members of the IMF in 1949, practically all except the United States devalued their currencies that year following the devaluation of the British pound. Of the 102 present members of the IMF, the great majority have either devalued since they joined, or allowed their currencies to fall in value since then as compared with the dollar. And the dollar itself, since 1945, has lost 42 percent in purchasing power. In the last ten years alone the German mark has lost 18 percent of its purchasing power, the British pound 23 percent, the Italian lira 25 percent, the French franc 34 percent, and leading South American currencies from 91 to 97 percent.

This is no mere coincidence. It is largely the result of the IMF system itself, which was set up at Bretton Woods by Lord Keynes and Harry Dexter White expressly to allow nations to escape from the discipline of a real gold standard. And all the ingenuity of today’s monetary “reformers” goes into concocting still more devices to enable world inflation to go on without any government having to allow its citizens to convert its depreciating money into hard gold.

**Big Brother State**

September 14, 1964

Throughout the Democratic platform runs the assumption that practically all earthly problems can be solved by more laws, more government spending, and more government power. The preamble lists the “achievements” of the Kennedy-Johnson Administration—i.e., the new laws passed, the new appropriations made, and the new Federal agencies, bureaus, and divisions created on top of the 2,000 or more already in existence.

The list is formidable: the Area Redevelopment Administration; the Economic Opportunity Act of 1964; the Appalachian Redevelopment Act; the Equal Pay Act of 1963; the Manpower Development and Training Act of 1962; the 1961 amendments to the Fair Labor Standards Act; $1 billion of new loans made by the Rural Electrification Administration; more than $1 billion in new loans made since January 1961 by the Small Business Administration; the Community Health Services and Facilities Act of 1961; the Mental Retardation Facilities and Community Mental Health Construction Act of 1963; the Social Security Act amendments of 1961 (still further broadening benefits); the 1961 public-assistance increases; the Higher Education Facilities Act of 1963; the Health Professions Educational Assistance Act of 1963; the Vocational Education Act of 1963; 1963 legislation increasing authorization for loans to college students; the Housing Act of 1961; the Kefauver-Harris drug amendments of 1962; higher disability payments to veterans. And more.

**GOVERNMENT UNLIMITED**

Practically all these measures, whatever their individual merits, mean still more spending, still more controls over the economy, a still bigger entrenched bureaucracy, still further steps toward almost unlimited government intervention and government power. And what the Democratic platform promises is still more of the same: compulsory medicare, a bigger social-security program, still more unemployment insurance, government training and retraining programs, still more “commodity programs to strengthen the farm-income structure,” a bigger housing program, more handouts for urban renewal and for “Appalachia.” Finally, the platform promises “to carry the war on poverty forward as a total war.”

The spending programs are to be combined with still greater government controls. The minimum-wage level and coverage are to be increased. Compulsory overtime payments are to be increased. The one-sided immunities and special privileges now enjoyed by labor unions are to be increased.

**THE NEW MAGIC**

The motto of the Democratic platform, in brief, is “Let us continue.” Let us continue to pile up more laws, more compulsions, more agencies, more bureaucrats, more power, more spending, and we will bring you ever closer to an earthly paradise. Or to the Orwellian nightmare of 1984? The platform blandly forgets that government creates nothing, makes nothing, adds nothing, but can merely deflect production from one channel to another, or seize more from Peter to pay more to Paul.

But the Johnson Administration and its fiscal advisers and apologists are trying to convince us that they have discovered a new magic that enables us to
eat our cake and still have it—to pay more and more to Paul while taking less and less from Peter. On top of this year’s tax cut there will be more tax cuts. We will continue to pile more deficits on top of the 28 deficits, in the last 34 years. But this time they will be planned deficits, “purposeful” deficits, and will bring us the full employment that they have failed to bring in the past.

This is a complete abandonment of even the pretense of fiscal responsibility. In 1960, the Democratic platform said: “Responsible fiscal policy requires surpluses in good times to more than offset the deficits which may occur in recessions, in order to reduce the national debt over the long run.” But all this is now forgotten, and all we are now promised is “a balanced budget in a balanced economy.” This means a budget balanced only in years of “full employment.” We have had only nine such years (six of them wartime years) in the last 35. The platform pledge is a pledge to continue inflation.

Results of Antitrust
September 21, 1964

For three-quarters of a century the great majority of lawyers, politicians, and economists have praised our antitrust laws. But in recent years these laws, and especially Federal prosecutions under them, have greatly increased in number. Their ambiguities, vagueness, contradictions, and possibly sweeping application have become clearer, and responsible commentators have begun to question their wisdom and probable effects.

The August Survey of the Morgan Guaranty Trust Co. of New York bluntly asks whether the present jumble of antitrust laws, and particularly recent Supreme Court decisions, will in fact promote free competitive enterprise in the United States. “In one momentous year,” it declared—“from June 17, 1963, to June 22, 1964—the Supreme Court of the United States rewrote the rule book governing mergers and acquisitions in American business. Six key decisions were handed down. . . . They either invalidated or cast a shadow of illegality upon mergers that previously had been approved by lower courts and, in some instances, by regulatory agencies as well.”

A FLAT GAMBLE

After analyzing these six key decisions, and the five leading antitrust acts under which they were made, the bank concludes: “The ‘do’s’ and ‘don’ts’ of antitrust are largely what the Supreme Court says they are. The latitude the Court assumes in interpreting and applying the antitrust laws is immense. The provisions of the Sherman Act, for example, have been characterized as having the breadth and generality of the Constitution itself. Oversimplified, this means that the law can be applied or interpreted in different ways as the Court’s rationale in a given case may demand.”

As a result, any decision “to proceed with a significant merger involves a flat gamble on whether the government will sue. In weighing the odds, a company’s owners or directors will hardly fail to recognize an implication inherent in recent antitrust history. This is that really sound mergers from the businessman’s point of view—those that will strengthen his company in its competitive struggle and enlarge its base of operations—are the very ones most likely to be contested by the Justice Department and outlawed by the courts. In consequence, it is likely that fewer and fewer major mergers will be undertaken.”

Sylvester Petro, professor of law at New York University School of Law, discussed the problem in an article in the July Freeman magazine (published at Irvington, N.Y.). He showed that, if current antitrust policies had been applied consistently in the past 75 years, such firms as General Motors, Chrysler, U.S. Steel, and General Electric would probably not be in existence today.

DOUBLE STANDARD

What struck him was the contrast between the way the Federal government treats businessmen under the antitrust laws and the way it treats other groups for doing the same thing. “While sending some people to jail for agreeing on prices, it considers nationwide price-fixing agreements laudable if exacted by trade unions; it visits penalties on farmers for departing from the prodigious price-fixing schemes known as our agricultural policy; it forces uniform prices on airlines and other participants in the transport industry; and finally, as we have seen, it forbids individual businesses to vary their prices downward at will.” He might have added: it conspires in international price-boosting through fixation of export quotas on coffee.

It is hardly necessary to point out that if the antitrust laws and decisions were strictly applied to the labor unions they could not function. Collective bargaining itself would have to be considered unlawful as a combination in restraint of trade. It involves “collective” price-setting.

Professor Petro believes in the equal application of the same law to all. But rather than apply the anti trust laws to unions, which he thinks both impractical and undesirable, he suggests that our antitrust laws themselves need to be seriously re-examined to see whether
they are not, in fact, an actual threat to the vigorous growth of a free competitive enterprise system.

How to Beat Inflation
September 28, 1964

I am frequently asked by correspondents what they can do personally to protect themselves against inflation. The question is difficult to answer, either specifically, by giving tips on individual stocks (which I would not dare to do), or even in general terms.

The nub of the problem is that inflation forces everyone to become a gambler. If a man puts his money in a savings bank or in a “safe” bond, and the inflation continues, he is a certain loser. He gets back the face value of his savings or his bonds in dollars, but the dollar will not buy as much as the dollars he saved or invested. Even since the end of World War II, in 1945, consumer prices have risen 72 percent, which means the purchasing power of the dollar has shrunk 42 percent since then.

The problem for the individual is that he can never be certain how much further the inflation is going to go or at what rate. Many people assume that the rate of future inflation can be calculated from the past rate of inflation. Even if this assumption were sound, which it is not, endless disputes are possible even about the rate of past inflation.

THE TAKE-OFF DATE
The rate since when? The take-off date has to be arbitrarily selected. As compared with ten years ago (1954), consumer prices have gone up 15 percent, which makes the rate of inflation, as measured by price changes, 1.5 percentage points a year. As compared with 1944, or twenty years ago, consumer prices have gone up 76 percent, or 3.8 percentage points a year. As compared with 1934, or thirty years ago, consumer prices have gone up 132 percent, or 4.4 percentage points a year.

Even if, by some amazing clairvoyance, you knew what the average rate of inflation was going to be in the next year or decade—i.e., how much the consumer index was going to rise—you would not necessarily know how this was going to affect the particular asset you held or were thinking of buying, whether General Motors shares, a house, or a Picasso.

A further problem would be to know how much the past inflation, or the expected future inflation, had already been reflected in, or “discounted” by, the present price of the asset you held or thought of buying.

And this brings us to the centrally important point that it is impossible for everyone to protect himself against the ravages of inflation. Those who gain must do so at the expense of others who lose. Those who are shrewd enough or lucky enough to buy stocks or other assets before they have risen in price to reflect the inflation, must gain at the expense of those who buy later, and still more at the expense of those who do not buy at all, but hold only money; and still more at the expense of those who buy at the top, when past or further inflation has been overdiscounted.

UNEVEN IMPACT
Every day during an inflation, schemes are put forward designed to protect everybody against it. All of them rest on delusion. The most popular is that of insisting that all wages and salaries be raised in direct proportion with the rise in the cost-of-living index. If this could work, it would benefit wage and salary receivers at the expense of all those dependent on other types of income. But it cannot work except on a limited and selective scale.

For inflation, if it operates in a free or relatively free market, always affects the prices of different commodities and services unequally. Let us assume, for simplification, that it sends up the prices of half of all commodities 20 percent and the rest not at all. Then the average price rise is 10 percent. The workers in the favored industries might be able to secure wage rises much greater than this. But if the unfavored industries were forced to pay a wage increase of 10 percent, most of them could not afford it. The result would be wholesale unemployment in those industries. If, in order to make the higher wage rates payable, the government increased the money-and-credit supply still further, the inflation would soon be off to an accelerating spiral. This is exactly how this device worked in the German inflation of 1923.

There is only one way to stop the injustices of an inflation. Stop the inflation itself.

The Consumptionists
October 5, 1964

The Italian economist Maffeo Pantaleoni (1857–1924) used to maintain that there were really only two schools of economists—the good ones and the bad ones. The division was valid enough but unhelpful on specific issues. A young American economist, George Reisman, has now come up with another division of economists into just two groups, but one that throws real light on the chief economic controversies of our time.
In the October issue of *The Freeman*, published by the Foundation for Economic Education, Inc., at Irvington, N.Y., he divides all present-day economists into Productionists and Consumptionists.

With the exception of a few isolated mavericks, nearly all economists since the days of Adam Smith until say, 1929, identified the fundamental problem of economic life as production. Man needed wealth. He needed goods and services not only for the amenities of life but to keep alive at all. His problem was how to produce the goods and services to satisfy these needs and desires. The classical economists, therefore, took the desire to consume for granted, and focused on the means by which production might be increased.

**NO PROBLEM OF ‘JOBS’**

In the twentieth century, economists have returned to the directly opposite view—which happens to be the view that was held by the Mercantilists of the seventeenth century. Instead of the problem being how to keep expanding production in the face of a limitless desire for wealth resulting from the limitless possibilities of improvement in the satisfaction of man’s needs, the problem is imagined to be how to expand the desire to consume so that consumption can keep up with production. The dominant theory today takes production for granted and focuses on the ways and means by which consumption may be increased. It proceeds as though the problem of economic life were not the production of wealth, but the production of consumption.

The “classical” economist, or productionist, realizes that there is no such thing as a problem of “creating jobs.” There is a problem of creating remunerative jobs, but not just jobs.

At all times, the productionist holds, there is as much work to be done, as many potential jobs to be filled, as there are unsatisfied human desires which could be satisfied with a greater production of wealth. The use of more and better machinery does not cause unemployment. It merely allows men, to the extent that they do not prefer leisure, to produce more and so meet their needs more fully and with less effort.

**FEAR OF PRODUCTION**

The consumptionist, on the other hand, regards every expansion of production as a threat to some portion of what is already being produced. He imagines that production is limited by the desire to consume. He fears that this desire may be deficient, and, therefore, that an expansion of production in any one segment of the economy must force a contraction of production elsewhere. He fears that the work performed by machines leaves less work to be performed by people, that the work performed by women leaves less work to be performed by men, that the work performed by Negroes leaves less to be performed by whites, and that those who work overtime leave fewer jobs available for others.

The consumptionist, Reisman goes on to show, is driven by his basic premise into one fallacy after another. Because he imagines production to be limited by the desire to consume, rather than consumption being limited by the ability to produce, the consumptionist does not value wealth, but the absence of wealth. He is happy to find a scarcity of anything because to him it represents a large supply of unused consumer desire. He lives in constant dread of an absence of “investment outlets” or “investment opportunities.” He dreads “hoarding.” He regards everyone as a potential miser whose consumption demand has to be constantly whipped up. He is busy devising new schemes for the government “to supplement private demand” by spending more money—the increased expenditure to be financed by bigger deficits.

He is, in brief, a Keynesian, a New Dealer, a Fiscal Revolutionist, a self-styled “liberal” and, *mirabile dictu*, a “moderate.” *

---

**The Irreversible State**

October 12, 1964

LONDON—Whatever the outcome of its current election, Britain will continue to be at least a semisocialist state. In the event of a Labor victory, this is of course beyond dispute. The Labor Party’s manifesto insists on the panacea of “socialist planning.” It is openly contemptuous of the free market: “At the root of Tory failure lies an outdated philosophy—their nostalgic belief that it is possible in the second half of the twentieth century to hark back to a nineteenth-century free-enterprise economy and a nineteenth-century unplanned society. . . . The role of government must inevitably increase.”

The Labor manifesto goes on to explain how the party will plan practically every aspect of everybody’s economic life. The national economic plan will decide how much each industry will be expected to produce, export, and invest and how many men it will be expected to employ. The government will “establish new industries. “Private monopoly in steel will be replaced by public ownership and control.” A “national incomes policy” will decide who gets how much. All the social services—education, public housing, health care, old-age pensions—will be increased. Rents will be recontrolled. Interest rates for housing will be
lowered. Labor will increase the building of new houses. Unemployment benefits will be upped.

SUBSIDIZED LEISURE
There is one concession to personal freedom: “It is not the job of the government to tell people how leisure should be used.” But lest this sound too permissive, the manifesto insists that “the government has a duty to ensure that leisure facilities are provided.” It will “give much more generous support to the Arts Council, the theatre, orchestras, concert halls, museums, and art galleries.” It will even “encourage and support independent filmmakers both for the cinema and television.”

Those Britons who would like a somewhat less paternalistic state get little comfort from the Liberals. The Liberal Party manifesto insists that “economic growth must become a major aim.” To give that aim “top priority” a “Ministry of Expansion” must be set up. While both Laborites and Conservatives seem to agree that a 4 percent annual rate of growth would be the right target, the Liberals “would weigh up the implications and decide on a 4, 5, or 6 percent rate of growth.” The Liberals too would have an “incomes policy,” which would “make allowances for groups that have been left behind.” They would “set up Meat and Grain Commissions to manage the market for both home and imported produce,” boost the existing government building program “to at least 500,000 homes a year,” and increase social-security payments.

LIP SERVICE
When one turns to the Conservative manifesto, one gets at least lip service, and sometimes even eloquent lip service, to the free market. “Competition and free choice are the customers’ most effective safeguards.” “Conservatives believe,” says Sir Alec Douglas-Home, “that a centralized system of direction cramps the style of the British people. Only by trusting the individual with freedom and responsibility shall we gain the vitality to keep our country great.” Ringing words. But how seriously do the Conservatives take them? True, they declare themselves “utterly opposed to any extension of nationalization, whether outright or piecemeal. We propose to complete the denationalization of steel.” But there they stop. They do not propose to denationalize the railroads, or coal, or other industries under public ownership. They long ago lost their nerve on complete repeal of rent control. Now they make the positive pledge: “In the next Parliament we shall take no further steps to remove rent control.” They too will boost unemployment benefits and old-age pensions. They too will have “an effective and fair incomes policy.” They too will “give first priority to our policy of economic growth” of 4 percent a year. They too have now embraced government economic planning.

Does the welfare state, once embarked upon, set up such powerful vested interests for its own preservation that it passes a point of no return? Does it become irreversible? ♦

How New Is Inflation?
October 19, 1964

When the 88th Congress finally adjourned, a section of the press broke out in paeans of praise for its accomplishments. Typical was a “news” story on the front page of The New York Times, announcing that what was “likely to earn high ranking in history’s catalogue of achievements” was the expiring Congress’s action in “approving an $11.5 billion tax cut despite rising budget deficits.”

This, it seems, is precisely what is called for by “modern economic theory.” This requires tax cuts, even in the face of huge deficits, “in times of sluggish economic activity and high unemployment.” It has suddenly been discovered by economists, it appears, that “a tax cut, by giving families and business more money to spend, would stimulate demand for goods and services, thus increasing production and creating jobs . . . If the theory is valid, Congress has now embarked on a course that may be of vast importance in improving the country’s living standards, both immediately and in the long run.”

FOLLY OF PRUDENCE
If the theory is valid, indeed, then all statesmen of the past, who thought they were acting prudently and responsibly in trying to avoid bankruptcy or inflation by keeping expenditures within revenues, were merely fools. For by withholding handouts from pressure groups, and insisting on keeping taxes high enough to pay for necessary expenditures, these people were not only creating unemployment and depression, but imperiling their own re-election. If the theory is true, then the politicians who vote huge handouts to pressure groups, and refuse to impose the taxes to pay for them, are not, as previously assumed, irresponsible demagogues, but public benefactors. The same actions that buy elections also confer economic blessings on the whole community.

If the theory is true, does it have any limits? And what are they? What would be wrong, for example, with doubling the amount of Federal expenditures and abolishing taxes entirely? Wouldn’t this give families
and business still more money to spend, still further stimulate demand for goods and services, and still further increase production and jobs?

Alas, the practice is not new and the theory is neither new nor true. Budget deficits go back to time immemorial. The theory of deficits, paid for by printing more paper money, can be traced back to the very beginning of our history as a nation. The Continental Congress began its disastrous issues of paper money in 1775, because it was afraid to levy taxes. Peletiah Webster, writing in 1790, quotes a member of that Congress as saying: “Do you think, gentlemen, that I will consent to load my constituents with taxes, when we can send to our printer and get a wagon-load of money, one quire of which will pay for the whole?”

**PAST FAILURES**

If the theory of the beneficence of deficits is new this year, why have we had 28 deficits in the last 34 years?

That deficits do not cure unemployment has been shown over and over again in the last half century. In each of the years from 1931 to 1940 inclusive, the Federal government ran a deficit averaging 3.6 percent of the gross national product. During those ten years there was average unemployment of 18.6 percent of the labor force. The same percentage of GNP and of the labor force today would mean that even deficits averaging $22 billion a year could be accompanied by more than 14 million annually unemployed.

The inflation brought about by “planned” deficits (either through increased spending or tax cuts) can under special conditions, it is true, bring about a temporary increase in prosperity. There is no doubt that our present prosperity and reduction in unemployment owe a lot to recent tax reduction. (The employment record is nothing to brag about, however. Unemployment is still above 5 percent, compared with an average of 4.9 percent in the eight Eisenhower years.) But as soon as the new money in circulation begins to reflect itself in higher prices, and as soon as wage rates, under the stimulus of the automobile settlement, take off on a new round of rises, the present euphoria may give place to sober second thoughts about the unadulterated magic of deficit spending.

**Why He Is Losing**

October 26, 1964

On the basis of the polls, Barry Goldwater will not only be defeated by a landslide popular vote on Nov. 3 but the Republican representation in Congress will be cut down substantially even from its present minority level.

It is instructive to look at the reasons why this result is probable.

1—The country is enjoying a period of unparalleled prosperity, which heavily favors the party in power.

2—Enormous prestige always surrounds the man who holds the office and title of President. His every word and action command publicity. In addition, President Johnson enjoys an almost unique advantage. In office less than a year, he has become the beneficiary of the Kennedy achievements without getting any blame for the Kennedy errors—in the Bay of Pigs, Berlin, Vietnam, or the steel-price episode.

3—In addition to the prestige of the office, there is the unparalleled power that the Presidency now commands, particularly when combined with party Congressional control. Unwelcome investigations into corruption can be blocked or broken off. A tremendous bureaucracy that owes its appointment or continuance in office to the President can be drawn upon to denounce all criticism. Part of this bureaucracy—e.g., the State and Defense Departments—has access to information unavailable to the opposition. These departments can say that the truth is so-and-so; that the opposition’s charges are “irresponsible,” and that it is not in the public interest that the issue raised should be publicly discussed at all. The challenger is seldom in position to make a convincing reply.

4—The greatest means of mass communication today, the radio and television, which depend on the Federal government for their licenses and their continuance, will tend, with whatever technical “neutrality,” to be overwhelmingly on the side of the President and party in power.

5—When any party has been in power for four years, its flood of messages, speeches, press conferences, and laws establish an ideology that puts the main burden of proof on any opposing ideology. Vested interests are built up in all directions, from war contracts to social security.

6—There is a deep split in the Republican Party, partly caused by Governor Rockefeller’s frustrated ambitions but mainly the result of a profound division of opinion between “conservatives” and “liberals.”

7—Finally we come to the conduct of the campaign itself. Mr. Johnson is a political master, with an uncanny sense of the most effective act or phrase. At least until the Jenkins episode, he had not made a single major political error. Senator Goldwater, on the other hand, has been inept both in choosing issues and in stating
The Economic Issues

November 2, 1964

The economic issues are not the sole issues in this campaign, but they may in the long run prove far the most important.

Let us suppose that the polls are right and that the Johnson-Humphrey ticket is elected by a landslide. The result is sure to be interpreted as an endorsement of all the Johnson-Humphrey economic policies.

It will, of course, be considered an endorsement of the recent $11.5 billion tax cut. But more than that, it will be interpreted as endorsing the policy of huge cuts in taxes even when the country is already facing a huge deficit and has experienced chronic deficits in the past. For the present tax cut, in connection with the spending program, will mean our 29th deficit in 35 years.

Businessmen who endorse the tax cut are taking a superficial and shortsighted view. A tax cut is sound and desirable only when it still brings in enough revenue to meet expenditures. The present tax cut is deliberately inflationary. In the last half of this year the Federal government is pumping in $12 billion more cash payments to the public than it is taking out in taxes. Of course this can bring about a temporary prosperity and "increase of purchasing power"—at the cost of overstimulating the economy and letting loose more inflation.

Deficit-financing and other inflationary policies can temporarily increase employment as long as wage costs do not rise as fast as demand or commodity prices. But the recent automobile wage settlements, far exceeding even the Administration's own wage "guideposts," seem likely to set off another round of wage rises that in turn threaten a profit-squeeze and unemployment or a further dose of inflation to keep employment up.

The Administration has favored increased welfare spending in all directions— expanded social security with medicare, high farm supports, high foreign aid, and a "war on poverty" that in its first year will add still another $1 billion to the $45 billion already being spent annually by cities, states, and the Federal government on various welfare programs. All this is going to make it more and more difficult to bring the budget under control.

Obviously the whole program must tend to prolong the deficit in the balance of payments and the international pressure on the dollar. But the Administration has shown no interest in removing the causes of this, but only in suppressing symptoms by imposing an interest-equalization tax on foreign securities and otherwise moving toward exchange controls.

The danger toward which we are drifting, in fact, is that the policies being followed by the Administration will lead to a runaway inflationary boom, that the Administration will not dare to halt these policies, but in desperation will impose an ever-widening network of economic controls which will strangle healthy economic growth.

As against this outlook, Senator Goldwater has consistently expressed his adherence to a system of reduced expenditures, balanced budgets, and free enterprise.

HERBERT HOOVER

If any man was entitled to be called the greatest living American, it was Herbert Hoover. In Newsweek of Aug. 17, taking off from Eugene Lyons's brilliant biography, I discussed the incredible smear campaign that made him the "author" of the great Depression. Because recent praise of him has come so largely from conservatives, it is instructive to recall the early judgment of an outstanding "liberal." In 1919, in "The Economic Consequences of the Peace," John Maynard Keynes.
It is possible and even probable that the Common Market countries and others will retaliate against the British move by raising their own tariff wall or subsidizing their own exports. The whole policy, in that case, will become self-defeating, and postpone still further the hope for any return to sanity in international trade.

The British excuse for this move was that there is a heavy deficit in their balance of payments and that, as one dispatch put it, they were “bleeding to death” financially. But they had brought this on themselves chiefly by the policy of continuous monetary expansion combined with cheap money. The sure way for a country to get a deficit in its balance of payments is to combine excessive monetary inflation with a pegged rate for its currency. What makes the British case even more serious than ours is that the equipment or methods in many of its industries are antiquated and inefficient.

The first and chief cure for the British balance-of-payments crisis would have been to halt its monetary expansion and its cheap-money policies. But, like ourselves, it is afraid to do this partly through political timidity and partly because of the now fashionable idea that cheap money and continuous monetary expansion are necessary to maintain full employment. The Labor government even gave “assurances” that Britain has “no intention” of raising its bank rate. This means that it considers interest rates purely a political decision.

As long, however, as monetary expansion and cheap-money policies are continued, the import surtax and export subsidies will have at best a short-run effect. On May 2, 1962 Canada dropped its dollar value to 92½ cents, compared with 95¼ cents the day before and $1.05 in 1959. This meant that overnight its imports were more expensive and its exports cheaper. Yet within two months Canada had a hemorrhage in its balance of payments and lost a third of its reserves. Its continued monetary expansion had brought on a flight of capital.

The United States is in no position to criticize the British action. We wanted them to keep money cheap to help us keep our own inflation going. Their import surcharge is the equivalent of our own “interest equalization” tax. Both are reactionary protectionist steps based on mercantilist fallacies exploded two centuries ago. Both are accompanied by hypocritical lip service to international cooperation and freedom of trade and capital movements. Both, ironically, are done by self-styled “liberal” and “labor” governments.

wrote: “The ungrateful Governments of Europe owe much more to the statesmanship and insight of Mr. Hoover and his band of American workers than they have yet appreciated or will ever acknowledge. . . . This complex personality, with his habitual air of weary Titan . . . his eyes steadily fixed on the true and essential facts of the European situation, imported into the Councils of Paris, when he took part in them, precisely that atmosphere of reality, knowledge, magnanimity, and disinterestedness which, if they had been found in other quarters also, would have given us the Good Peace.”

‘Back to Mercantilism’
November 9, 1964

The imposition by the new Labor government of a “temporary” 15 percent surcharge on imports and tax incentives for exports is a disruptive and reactionary step. In the long run it can have only harmful consequences for Britain and the world.

The first effect must be to increase the cost of living for Britons. They will pay some 15 percent more for all the goods they buy from abroad (except foodstuffs, industrial raw materials, and unprocessed tobacco, which are exempt from the surtax). The very purpose of this measure is to discourage and cut down imports. But this means that it will adversely affect all the manufactured exports to Britain of all other countries. To that extent it must hurt and disrupt the export trade and export industries of these countries.

It will of course hurt our own export industries. It will hurt the export industries of the Common Market countries—France, West Germany, Belgium, Holland, Luxembourg, and Italy. It will hurt the export industries even of Britain’s partners in the European Free Trade Association (how ironic that name now sounds)—Austria, Denmark, Norway, Portugal, Sweden, and Switzerland.

SELF-DEFEATING
Immediately after imposing the import surcharge, the Labor government blandly proposed to these partners that they all start speeding up their reciprocal tariff cuts. The British even generously added that they would speed up tariff cuts on the EFTA products even if other members failed to follow suit. But it is estimated that the import surcharges, in effect, double Britain’s tariff walls. Why didn’t the new government simply exempt its EFTA partners from the surcharge in the first place?
The Problems Ahead
November 16, 1964

Three weeks ago, in a column called “Why He Is Losing” (Newsweek, Oct. 26), I listed eight major reasons why it seemed probable not only that President Johnson would win a victory of landslide proportions over Senator Goldwater but why even the Republican minority in Congress would be cut down. These reasons ranged from the prosperity of the country and the power and prestige of a Presidential incumbent to Goldwater’s inept campaign, his ambiguities and belated qualifications, his failure to support his vague generalities with specific and documented statements, and his nearly complete failure to make the economic case at all.

On Election Day, the Republican label on most candidates might as well have read “poison.” It seems altogether probable that the great majority of votes were cast more against Goldwater and everyone associated with him than for Mr. Johnson. Probably the major reasons for Goldwater’s defeat had to do with his personal image rather than with his stated conservative philosophy—the fear, justified or unjustified, that he was “trigger happy,” not only about the nuclear bomb, but about other matters—that he was rash and unpredictable. The saddest aspect of the whole matter is that the election will be interpreted as a defeat for economic conservatism, and yet that the case for economic conservatism was never really made.

MONETARY EXPANSION
Mr. Johnson and the Democrats have won a great victory. But it is easier to win an election than to solve the grave problems with which the country is still confronted. It is outside the province of this column to discuss Vietnam, Cuba, Russia, Communist China, NATO, or the bomb; but the economic problems are no less troublesome.

It is true that through the $11.5 billion tax cut, leading us to the 29th deficit in 35 years, and through policies calculated to hold down interest rates, the Administration has helped to keep going a remarkable period of prosperity. But this has not been done without risks, and these risks are growing.

To keep interest rates down, the Federal Reserve System has bought $8 billion of marketable securities since 1960. This has overstimulated borrowing and expanded the money supply. Between the end of 1960 and September 1964, total commercial bank credit increased at an average annual rate of 8.2 percent. Since the beginning of the current economic expansion in February 1961, the nation’s money supply (demand deposits plus currency) has risen at a 3.3 percent annual rate. Since June it has risen at a 6.4 percent rate. Since February 1961, money plus time deposits have increased 8.2 percent per year. Since last June they have risen at an 8.4 percent rate.

FALSE REMEDIES
The first effect of this abnormal expansion of money and credit has been to take up the slack in various sectors of the economy. But as this is done, the effect must be more and more to push up prices. Living costs have reached the highest monthly level on record. Industrial raw materials rose 15 percent in the twelve months ending in September.

The inflation has been most clearly reflected in the cumulatively mounting deficits in our balance of payments. This has been the direct outcome of our policy of holding down interest rates and increasing the money supply. Instead of halting these inflationary policies, we have imposed a shortsighted tax on purchases of foreign securities. This hurts borrowing countries, obstructs free international movement of capital, and in the long run only hurts our export trade and does nothing to solve the balance of payments.

Another false cure is to try to hold down the price of steel and other commodities by extralegal intimidation. This discriminatory treatment can only hurt the steel industry and therefore steel labor. If our so-called “wage guidelines” were taken seriously they would be dangerous economic nonsense. In practice they are mere pious government talk, though unions are encouraged to regard them as floors rather than ceilings.

This inflation is the great domestic problem that the new Johnson Administration now faces.

Market Is Color-Blind
November 23, 1964

With all the agitation in recent years for equal civil and economic rights for Negroes, it is strange that so little analysis has been directed to the economic delusions and measures that have encouraged discrimination and the economic reforms that might remove or mitigate it.

A book just published in London by the Institute of Economic Affairs and Andre Deutsch—The Economics of the Colour Bar” (15 shillings)—goes a long way to make up this deficiency. It is written by an eminent South African economist, Prof. W.H. Hutt. While it is chiefly devoted to the racial situation in South Africa, the author tells us that it simply uses the experience of that country in an attempt “to expose the ultimate origins of colour injustices generally.”
On July 8, 1944, however, the company posted notices in its barns stating that it was accepting all qualified applicants for employment. Shortly afterward eight maintenance workers, all Negroes, began training as motor-men. On Aug. 1, a strike broke out, accompanied by rioting. It quickly spread to all 6,000 employees. The city’s 1,982 streetcars, 369 subway and elevated cars, and 564 buses were brought to a halt. The strikers voted against returning to work, even under Army control, unless given guarantees against the employment of Negro operators. The strike lasted a week, and was brought to an end only when the Federal government issued an ultimatum that strikers that did not return to work would be drafted into the Army.

Federal law cannot continue explicitly to sanction the compulsory union shop and at the same time to tolerate the closed union. y

Labels vs. Policies
November 30, 1964

The Republican defeat is causing considerable soul-searching within the party. What went wrong? How can the party be put together again? So far the leading conciliator is Richard M. Nixon, who doesn’t want either the “conservatives” or the “liberals” purged from the party. Each “deserves a party voice, but neither can dominate or dictate—the center must lead.”

It all sounds very reassuring. But what does it mean in terms of specific policies? Just where is the “center”? Why is it superior to either the “right” or the “left”? Why is a “moderate” admirable and an “extremist” dreadful? By what criteria do you identify either? What, in brief, do the terms mean?

What Nixon seems to be looking for is the winning catchwords rather than the right policies. In politics, unfortunately, catchwords and slogans are tremendously important. A large part of the explanation of Goldwater’s defeat was that he got pinned on him, and even embraced, the wrong catchwords. The Rockefeller wing smeared him as an “extremist,” and with calm effrontery called themselves “moderates.” Goldwater’s cue was to insist that he was the moderate and they the extremists. But he made the fatal mistake of defiantly accepting both labels as pinned.

‘EXTREMISM’ UNDEFINED
By far the best analysis of this whole battle of the catchwords was made by Ayn Rand in her Objectivist Newsletter of September. The “moderates” were demanding a repudiation of “extremism,” as she pointed out,
The Coinage Crisis
December 7, 1964

The U.S. Government is faced with a coin shortage and a very awkward problem in relieving it. A few months ago the Treasury doubled its coin-volume goals for this year and 1965. Congress approved construction of a new mint, but it won’t be ready before 1967. Since spring, both U.S. mints, in Philadelphia and Denver, have been working around the clock seven days a week. All twelve Federal Reserve Banks now ration coins to their member banks. In late August, Congress passed a bill indefinitely extending the 1964 date on all coins into 1965—and possibly thereafter—to discourage hoarding or speculation by collectors.

But the problem goes much deeper than the past failure of the government to do sufficient minting. It lies in the rise in the consumption and in the price of silver. The demand for coins has increased because of the constantly rising volume of business as well as of prices—and also because of the increase in vending machines and in coin collecting. But the industrial demand for silver has been rapidly increasing, not merely for its older uses in plate and jewelry, but for photography (for which no present substitute exists), for electronics, and for space technology.

In 1963 world consumption of silver in industry and coinage was estimated at 422 million ounces, whereas new mine production was only about 238 million ounces. This imbalance between production and consumption largely explains the rise in silver prices.

BOOM IN SILVER
Why hasn’t the increased demand and price led to the production of more silver? The answer is that two-thirds of current output is merely a by-product in the mining for other nonferrous metals. Mining activity is mainly determined by the market for these metals rather than for silver. The difference between current production and the much greater current consumption is made up partly by purchases from government stocks.

The price of silver went up to $1.29 an ounce in July 1963. It has not gone higher, in spite of increased demand since, because this is the official price at which the government redeems its silver certificates. As long as it stands ready to do this, $1.29 will remain the ceiling price. But if the government stopped “selling” silver at this price, or if its monetary stock of 1,387,000,000...
murmurs of retaliation everywhere. Worse, the action was accompanied by “assurances” that Britain had “no intention” of raising its bank rate—in other words, that it had no intention of taking the first indispensable action toward curing its balance-of-payments problem.

Of course this provoked distrust of sterling, and a rescue operation had to be undertaken. So on Nov. 7 ten of the world’s leading financial powers agreed through the International Monetary Fund to extend $1 billion in aid to Britain. But Wilson shook confidence further by announcing his determination to renationalize the steel industry. He hinted at new punitive taxes against corporations and investors, including a capital-gains tax. He increased pension and other social-welfare benefits.

The ‘Speculators’
Sterling weakened again. Wilson gave new reassurances. Central banks and others thought there would at last be an increase in the British bank rate at the regular weekly meeting on Thursday, Nov. 19. It didn’t occur. The run on sterling started. Hurriedly, over the weekend, the British Government raised the discount rate from 5 percent to the crisis level of 7 percent. A Swiss banker made the premature declaration that “7 percent will drag money from the moon.” He forgot that it won’t do this if lenders are afraid they won’t get their principal back. The run continued, and wasn’t stopped until Nov. 25 when eleven nations announced that they had put together a record $3 billion rescue package of currencies to defend the pound.

So the pound, once more, is rescued, and is presumably safe for at least the next three months. But what then? The notion so widely circulated in the press that the whole crisis was caused by a group of wicked speculators, “the gnomes in Zurich,” is simply childish. It is hard to imagine any group of speculators foolish enough to imagine that they could permanently depress sterling by their own short sales. The “speculators” in sterling were the holders of sterling all over the world—central banks, commercial banks, exporters, importers, and investors everywhere. They were scared by the Wilson blunders. They wanted to get out. They wanted to protect themselves against being swindled as the holders of sterling were swindled by the devaluation of the pound from $4.03 to $2.80 in September 1949.

Three Choices
The total $4 billion or so of credit at best gives the British Government a breathing spell. Otherwise it solves nothing. The future of the pound depends on the policies that the British Government follows.

It has three possible courses. First, it may try to save the pound by more of the same kind of controls as the
15 percent import surcharge and the export subsidy. It may resort to exchange controls, investment controls, import quotas and licenses, compulsory exports, price and wage controls at home, and all the rest. But the world, and particularly the British, have become disenchanted with these methods. They would mean a return to inconvertibility, and at least two prices for sterling.

Secondly, the British could devalue the pound or, through the IMF, try to get a world devaluation of currencies in terms of gold.

Finally, Wilson could stand by tight money, and stop the printing presses that have been turning out a glut of paper pounds. But this might lead to credit contraction and, particularly if the British unions continue with their usual demands, to a slump and unemployment. This violates all the policies that the Labor Party has been preaching for the last twenty years.

The problems of the dollar are different in urgency, but not in nature, from the problems of the pound. The fool’s paradise of budget deficits, cheap money, and printing-press currency cannot go on forever.

Cheap-Money Mania
December 21, 1964

The crisis in the British pound, brought about basically because the Bank of England had been glutting the market with too many pounds, should have been a grim warning to our own government on the ultimate consequences of its similar policies with the dollar. Instead, Washington decided to embark on still more credit inflation.

Addressing the Business Council, President Johnson on Dec. 2 warned the nation’s 14,000 banks that in spite of the increase in the discount rate to 4 percent, he did not think “any general increase in the rates which banks charge their customers” was justified. Immediately one of the four banks that had announced a rise in their “prime” lending rate from 4½ to 4¾ percent canceled the increase.

The President’s warning was tantamount to an extralegal form of selective price control. By itself, it might have been ineffective. But it was accompanied by a still more extraordinary action on the part of the Federal Reserve authorities. In the same week they bought nearly $1.1 billion of Federal securities. In other words, they poured that amount of high-powered money into the commercial-banking system, and flooded the short-term loan market with funds.

Pouring in Funds
Let us look at a few comparisons. From the end of 1957 to the end of 1963, the Fed’s holdings of government securities rose from $24.2 billion to $33.6 billion. This meant that in those six years the Fed was buying government securities, and monetizing them, at a rate of $1.6 billion a year. This monetary inflation has been the major cause of the deficit in the U.S. balance of payments that began in 1958. But here was an increase in monetized security holdings of $1.1 billion in a single week.

This cannot be dismissed as a merely “seasonal” increase. It brought the Fed’s total holdings of government securities to $37.4 billion, an increase of $3.4 billion over the corresponding week of the year before. The Fed’s action directly contradicted the small increase in the discount rate.

The President’s interest-rate warning must tend to shake confidence. Like his steel-price warning, it was a sort of extralegal price-fixing. It was unnecessary, because the competition among 14,000 banks assures a free market rate. The course the President suggested, moreover, is the opposite of what now needs to be taken. He asked the bankers to “consider the long-term interest of the nation.” But it is precisely the long-term interest of the nation that now calls for tighter credit rather than easier credit, for a halt instead of an increase in new money-and-credit creation, in brief, for a halt in inflation. This is above all necessary to halt the deficit in our balance of payments, about which the President is so rightly concerned.

Crisis to Crisis
Behind the President’s warning, behind the Fed’s debt monetization, behind the crisis in the British pound, and leading to it, is the fashionable fallacy that constant easy money and constant credit expansion are necessary to prosperity and “economic growth.” But this international inflation game is leading the world from crisis to crisis. It led to the devaluation of the pound from $4.03 to $2.80, and the corresponding devaluation of nearly every other major currency, in 1949. It forced the U.S., with the help of a few European banks, to extend a billion-dollar line of credit to save the Italian lira last March. It forced leading nations first to extend $1 billion aid to save the British pound early in November and then $3 billion more credit a few weeks later to save it again.

How long can these melodramatic rescue operations, in increasing amounts, go on? And what makes them necessary? They are necessary because the world, having thrown away the discipline of the gold standard, has found nothing to take its place. Under the old gold standard, when a country found itself losing gold it
quickly had to raise its interest rates and halt its credit expansion to stop the outflow. Now it appeals to other central banks to bail it out by swapping paper currencies and maintaining a synchronized world inflation. That house of cards must some day tumble.

The Paper-Work Jungle
December 28, 1964

On Oct. 30, 1963, the Federal Power Commission sent out to 114 natural-gas producers a mammoth questionnaire weighing an average of 10 pounds. The questionnaire contained some 428 data sheets calling for data going back to 1955. One company estimated that completion of the forms would require 17,000 man-hours and cost it $85,000 in salaries.

This incident is not exceptional. Almost everyone who files an income tax, particularly if his income does not all come from a single source, is obliged to become a part-time accountant, or to hire one.

Ten years ago (when the Federal government, as measured by expenditures, was only two-thirds as big as it is today) a task force of the Hoover commission studied both the volume of government paper work and the paper work that the government imposed upon private industry and the private citizen. The task force found that each year the Federal government handled 25 billion pieces of paper, not including pamphlets and books. The government employed more than 750,000 full-time workers to handle them and spent more than $4 billion yearly. (That sum would have paid the entire cost of the Federal government as late as 1932.)

Each year the bureaucracy made out 3 million purchase orders to buy supplies. Each year government bureaus wrote a billion letters, at a cost to the taxpayer of $1 each. Compared with 40 years before, each employee was writing about ten times as many letters. As the number of employees had increased sevenfold in that time, the total of government letters had increased 70 times.

DUMPED ON THE FLOOR
As to the burden of paper work laid by the government on private citizens, the task force found it impossible to estimate the total. But here are a few examples: there were 4,700 requirements by the Federal government on private industry to report statistical data. Before a utility company made an addition to an existing plant, no matter how small, it had to obtain a certificate from the Federal Power Commission to prove its original cost. The FPC’s request for such data covered 82 pages, and the utility company’s average report often ran to 1,000 pages with supporting schedules, took 7,500 man-hours, and cost more than $25,000 to prepare.

It was estimated that the 4 million small business concerns of the country spent at least 5 percent, and in some instances as high as 29 percent, of their time on government paper work. Often there was no time limit on how long business had to keep these records. Yet one bureaucrat reported that copies of the payrolls that the government had demanded were so little used that he dumped them in barrels on the bare floor of empty storage rooms.

So much for the situation as officially reported ten years ago. In spite of the recommendations of the Hoover commission, is the situation any better today? On net balance it is far worse. A Congressional subcommittee headed by Rep. Arnold Olsen has so far published 752 pages of testimony on the subject. I can refer only haphazardly to some of it.

ONE WORKER, 29 FORMS
Testifying on behalf of the National Association of Manufacturers, Dr. Lewis E. Lloyd estimated that many individual companies are filing reports to the government numbering in the hundreds of thousands each year. Their number and complexity constantly grow. “There can be little doubt that government-induced paper work has been an important factor in causing small-owner businesses to go out of business or sell out to larger firms.” Another major reporting burden recently placed on industry is the requirement to report to the government and the payee information on dividend and interest payments.

As for the small-business man, one example is the testimony of Stuart Finley of Falls Church, Va., who has to fill out a total of 29 Federal tax-reporting forms because he has one salaried employee.

In sum, the Olsen subcommittee report will show that there are about a billion Federal reports a year from the public (including business, industry, social security, internal revenue, etc.). This is over five for every man, woman, and child in the United States.
1965
Abridging Free Speech  
January 4, 1965

The National Labor Relations Board, in a 4-to-1 decision, has held that the General Electric Co. did not bargain in good faith with the International Union of Electrical Workers.

It would take a full recital of the record to show just how fantastic this decision is, but two aspects of it deserve special consideration.

The board majority argues that the company was not bargaining in good faith because it purportedly made an offer with a “take-it-or-leave-it’ attitude.” What did the board expect the company to do? Did it expect it to keep on making further concessions indefinitely, after it had already conceded as much as it felt it could afford? Or did it (as the company asks) expect General Electric to hold back from its initial offer, for last minute settlement, some substantial item that the IUE had demanded, so as to allow the union to create the appearance of having forced this item from the company against its will? Does the board expect sham and ritualistic play-acting at the bargaining table, or protracted oriental haggling?

As the NLRB itself decided in the Philip Carey case in 1963: “That the respondent considered its offer as final is a matter of its own judgment. One need not listen to argument endlessly. There comes a point in any negotiations where the positions of the parties are set and beyond which they will not go.”

DOUBLE STANDARD

But in the eyes of the NLRB majority, General Electric was guilty of other crimes. It sought “to create the impression that the employer rather than the union is the true protector of the employees’ interests.” Many economists would say that this is the simple truth. It is, after all, the employer who provides their jobs and their wages or salaries; they might get these without the union, but not without the employer. But, whether this is true or not, is the employer to be forbidden to say it?

The NLRB majority held the company guilty of “the purpose of disparaging and discrediting” the union officials in the eyes of the union members. Its decision said nothing whatever about the disparagement of the company by the union leader, James B. Carey, though the board’s own trial examiner referred to Carey’s “explosive temperament (several times to the point of threatening physical violence)” and to his “uninhibited” talk and “invective.”

But what is most amazing is the board’s ruling that it was an unfair labor practice even for General Electric to try to influence or communicate directly with its own employees. Is an employer to be denied the right to keep its employees and the public informed regarding the facts or his point of view on issues under negotiation? Are the rights of union members to know what is going on to be limited solely to what the union officials want to tell them?

REMEDIES

The NLRB’s decision is in effect a denial to employers of the right of free speech guaranteed by the Constitution and even by Section 8 (c) of the Taft-Hartley Act: “The expressing of any views, argument, or opinion, or the dissemination thereof, whether in written, printed, graphic, or visual form, shall not constitute or be evidence of an unfair labor practice under any of the provisions of this act, if such expression contains no threat of reprisal or force or promise of benefit.”

All anti-employer laws and rulings are, in the long run, anti-labor laws and rulings. Whatever penalties, uncertainties, and harassments cause investors to hesitate in starting new businesses or new plants must retard more employment or better wages.

What can be done? There is no point in arguing that the NLRB ought to make less one-sided and fantastic decisions. Recently it has been making more and more one-sided and fantastic decisions. A salutary step might be to abolish the NLRB and give the regular constitutional courts full jurisdiction, in law and equity, in all cases arising under the Taft-Hartley Act. A minimum reform would be to strike the “good faith” provision from the act, which enables the NLRB to find employers guilty of not making enough concessions. Has the Taft-Hartley Act become, in effect, a one-sided legal compulsion on employers to make concessions?

Paradise by Deficit  
January 18, 1965

The history of liberty is the history of the limitation of governmental power, not the increase of it.” So wrote Woodrow Wilson. Yet in his terms as President he presided over an enormous increase in the power and size of government. And every President since Herbert Hoover has presided over a still further increase in the power and size of government.

Each President has insisted on giving his program a new label—the New Deal, the Fair Deal, the New Frontier, the Great Society—and yet each program has been essentially an expansion of the previous program—a further boost in spending, a bigger bureaucracy, an aggrandizement of governmental power, an
increased intervention in the daily life of the private citizen.

It would use up all the rest of this space even to list the new Federal programs or expansions of old programs—for education, housing, health, conservation, the “war on poverty”—that Mr. Johnson proposed in his State of the Union Message. Ten years ago, when the Federal government was spending only two-thirds as much as it is today, the Hoover commission found that it embraced 2,133 different functioning agencies, bureaus, departments, and divisions. How many does it embrace now? How many more will it embrace if the President’s new program is enacted?

THE GREAT FICTION
The Federal government is spending 167 times as much in a single year as it was in the year before we entered World War I. Will every President, every year, be expected to think up more and more functions for the Federal government to take over from the private sector to the “public sector,” until there is no private sector or initiative left?

The great miracle about all the wonderful new things that the government is going to do for us under the Johnson program is that they are not going to cost anybody anything. Instead of asking for an increase in taxes to meet all his recommended increases in expenditure, the President promises “a substantial cut in excise taxes” so that “more money will be left in the hands of the consumer.” He even assures us that the increased spending and tax cuts will carry us “along the path toward a balanced budget.” Once we cut the annoying connection between expenditures and taxes, all other miracles become easy.

Mr. Johnson’s State of the Union speech is a perfect illustration of the French economist Bastiat’s definition more than a century ago: “The state is the great fiction by which everyone tries to live at the expense of everyone else.” Nobody will pay for the education of his own children, but everybody will pay for the education of everybody else’s children. Nobody will provide for his own old age, but everybody will provide for everybody else’s old age. No one will pay his own medical bills, but everyone will pay everyone else’s medical bills.

DOLLAR ENDANGERED
What is overlooked is that the government cannot pay anything to anybody without ultimately taking the money from someone else. All production, and all real income, must come from private initiative and private enterprise. The government does not add to production; all it can do is to change the particular goods or services produced. What it encourages in one direction it must discourage in another. Every subsidy or handout to A, B, or C must be paid for by an added tax on M, N, or O (and probably on A, B, and C as well). Increased government expenditures, instead of meeting more human needs, may meet fewer, because more taxes tend to deter production more than government expenditures tend to increase it.

The great miracle is supposed to be brought about by deficits. But deficits mean inflation, which is a disguised tax that reduces the purchasing power of everybody’s money. Our inflation has done that comparatively little in recent years because so much of our increased money supply has flowed abroad through a deficit in our balance of payments. But this cumulative deficit has been undermining the strength of the dollar. Once confidence in the dollar goes, it will be impossible to measure the extent of national and world calamity. Our first order of business is to see that this does not happen. ✽

No Gold at All?
February 1, 1965

Since the end of 1957, our official gold stock has fallen from $22.8 billion to $15.4 billion. In the same seven years the country’s money supply (demand deposits and currency) has risen from $136 billion to $161 billion. If we also include time deposits, our money supply has increased from $193 billion to $285 billion. So against our active money there is now less than a 10 percent gold reserve, and against our money supply including time deposits there is only a 5 percent gold reserve.

All this is nowadays considered academic because our own citizens can no longer demand gold for their paper money. But vis-à-vis foreigners our position is increasingly embarrassing. Against our active money there is now less than a 10 percent gold reserve, and against our money supply including time deposits there is only a 5 percent gold reserve.

All this is nowadays considered academic because our own citizens can no longer demand gold for their paper money. But vis-à-vis foreigners our position is increasingly embarrassing. Against our gold supply we now have short-term liabilities to foreigners of $28 billion (against only $15 billion at the end of 1957).

25 PERCENT RESERVE
We are obliged to keep by law a 25 percent gold reserve against the combined note and deposit liabilities of the Federal Reserve banks. This requires as of now a legal gold reserve of a little more than $13 billion. This means, it is being said, that we can legally let only about $2 billion gold move abroad in response to demands by foreigners.

So many people are asking that the 25 percent gold-reserve requirement be abolished entirely as “meaningless.” This, they tell us, will “free” all our gold reserves for foreigners who want to convert their dollars into gold; and once foreigners know that this huge supply is available, they will not want to convert; our gold
hemorrhage will be stopped, and confidence in the dollar will be restored. The President has let it be known that he will either ask for such a change in the law, or at least removal of the gold-reserve requirement against deposits if not against notes, so “releasing” nearly $5 billion more of gold.

There are serious factual misconceptions as well as economic fallacies behind these proposals. Though it will of course be necessary, if gold convertibility is to be maintained, to let gold be drawn out even if our gold reserve falls below 25 percent, this is already provided for in the law as it stands. But the law also provides for progressive tax penalties and rises in interest rates as the gold reserve is allowed to fall. Are the advocates of reducing or wiping out the 25 percent gold reserve asking for the abolition of these penalties—and of any other restriction on the expansion of credit? How can the removal of such penalties or restrictions on monetary expansion increase foreign confidence in the dollar?

**NEED FOR DISCIPLINE**
It is, in fact, a little difficult to see the basis for the belief that making our whole $15.4 billion of gold legally free to leave the country will completely reassure foreigners. Our total short-term liabilities to foreigners now reach $28 billion (of which $24.6 billion are to banks and official institutions). Against these we have only $6.9 billion short-term claims on foreigners. Whatever way we figure it, our gold falls short.

Abolishing the last vestige of a legal gold reserve against our money would not solve anything. It would further shake confidence of Americans in their own currency, and would give at best a short-run reassurance to foreigners.

Only one thing will cure the deficit in the balance of payments and assure confidence in the dollar. That is monetary discipline. And the government does not intend to have any.

If the government really means to maintain dollar convertibility at $35 an ounce in gold, it must immediately stop further expansion of the money-and-credit supply. In today’s ideological atmosphere such a proposition will be regarded with blank incredulity. For it is the fixed (but fallacious) belief of our government authorities that it is necessary to have cheap money and a continuous expansion of the money-and-credit supply to maintain “economic growth” and “full employment.” So the authorities are systematically blind to the effect of this cheap money and inflationary expansion in causing the deficit in the balance of payments and the declining confidence in the dollar. Instead of stopping the policies that are causing the disease, they plan to extend the penalties on Americans who lend or invest abroad.

### The Cult of Deficits
February 15, 1965

In 1932 the Hoover Administration was spending at the rate of $4.6 billion a year. “Stop the spending!” candidate Roosevelt demanded. The majority of voters agreed, and elected him President. Today the Federal government is spending $121.4 billion a year, and planning to spend $127.4 billion in 1966, a new record, 28 times as much as in 1932. The increase alone in next year’s spending will be greater than the whole amount spent in 1932. But the Johnson Administration insists that this is “not extravagant,” and Congress probably will agree. Such is fiscal progress.

“For three long years,” warned President Roosevelt on March 10, 1933, “the Federal government has been on the road to bankruptcy. . . . [By the end of the fiscal year 1934] we shall have piled up an accumulated deficit of $5 billion. . . . Too often in recent history liberal governments have been wrecked on the rocks of loose fiscal policy.” The deficit that President Johnson is deliberately planning for fiscal 1966 will be the 30th in 36 years. It will bring the accumulated deficit since the end of 1930 not to $5 billion, but to $306 billion. Yet the concern most frequently voiced today is not over whether we may suffer the consequences of loose fiscal policy, but whether our deficits and spending are big enough to assure “growth” and “full employment.”

### $6 BILLION INCREASE
Mr. Johnson was able to squeeze at least his “administrative budget” spending below $100 billion to the Macy’s bargain figure of $99.7 billion. Practically all the newspapers headlined that figure alone. The true spending of more than $127 billion (whether as measured by the “total cash payments” budget or the “national income account” budget) barely got a mention in most of the news stories.

There is not space here to analyze in detail the various bookkeeping gimmicks by which even the “administrative” spending figure was kept below $100 billion. (Those interested may consult articles in *The Wall Street Journal* of Jan. 26 and 27.) But one major point must be made. The new budget increases real spending over the present fiscal year, not by a mere $2.2 billion, but by at least $6 billion (as shown both by the full-cash and the accrual-basis budgets).
The theory of the new fiscal policy is that we must plan big budget deficits to prevent even bigger budget deficits. Nevertheless, on the argument that the “1966 administrative budget deficit of $5.3 billion is $1 billion lower than the 1965 deficit,” Mr. Johnson concludes that we are making “continued progress toward a balanced budget.” The argument is unconvincing. True, his estimated 1966 deficit is $1 billion lower than his revised estimate of the 1965 deficit. But it is $400 million more than his original estimate last year for the 1965 deficit. And if he has underestimated the 1966 deficit by the same amount, it will be $6.7 billion—or more than the $6.3 billion now estimated for 1965. Mr. Johnson’s assurance may prove to be as much a will-o’-the-wisp as Roosevelt’s of Nov. 29, 1935: “We can look forward with assurance to a decreasing deficit.”

**Employment Record**

But now nearly everybody is placidly accepting deficits as normal practice, in bad times and good. They are necessary, it is said, to assure “full employment.” But in the past they have notoriously failed to do so. In each of the years from 1931 to 1940 inclusive, the Federal government ran a deficit averaging 3.6 percent of the gross national product. During those ten years there was average unemployment of 18.81 percent of the labor force. The same percentage of GNP and of the labor force today would mean that even deficits averaging $22 billion a year could be accompanied by more than 14 million annually unemployed.

But isn’t the deficit policy a smashing success today, as its champions contend? President Johnson in his Economic Report boasts that “unemployment dropped from 5.7 percent in 1963 to 5.2 percent in 1964 and was down to 5 percent at year’s end.” He neglects to compare the record. In the four Kennedy-Johnson years (1961–64) unemployment averaged 5.5 percent; in the eight benighted Eisenhower years (1953–60) it averaged only 4.9 percent.

---

**Surprising Scapegoat**

March 1, 1965

The deficit in our balance of payments, and our continued loss of gold, are the direct result of our government’s own fiscal and monetary policies, and of nothing else. As long as the Federal government continues these inflationary policies, the dollar crisis will continue. But if the government returns to monetary discipline, and stops trying to push down interest rates or to “pump more purchasing power into the economy,” none of the tax penalties, quotas, and controls that the President proposed in his balance-of-payments message of Feb. 10 will be needed.

Let us recall some of the policies that have led to the present dollar crisis. The government has been inflating the money supply for 30 years. Since the end of 1939 the supply of money has been more than quadrupled. For 1966 the President is deliberately planning to run the 30th deficit in 36 years.

Since the end of 1957 the deficit in our balance of payments has reached a total of $25 billion, an annual rate of $3.5 billion a year. During this period the government authorities have professed to be greatly concerned about that deficit. Yet during these same seven years they have increased the active money supply (demand deposits plus currency outside banks) by 17 percent, and the total money supply (including time deposits) by 48 percent.

During this period, also, the government has handed out some $28 billion, or $4 billion a year, in foreign aid. It is instructive to notice that this aid alone exceeds the cumulative balance-of-payments deficit of $25 billion and its annual average of $3.5 billion in the same period.

**Investment Villain**

But the government ignores all this and looks outside of itself to “the private sector” to find the villain that is causing the balance-of-payments deficit. And the scapegoat it picks is private foreign investment. This is not only arbitrary but surprising, because private foreign investment is the one outlay of money that is made with the very purpose of eventually bringing in more money than is laid out.

In the six years 1958 to 1963, for example, the aggregate net outflow of $20.9 billion for new foreign investment was offset by $19.4 billion of income from previous investment. Even Secretary Dillon has conceded that “in the long run the outflow of American capital to foreign countries is more than balanced by the inflow of income earned by that capital.” So the government’s attempt to discourage America’s foreign investment is at best shortsighted.

**End Cheap Money**

Instead of trying to make up nearly all of our $3 billion deficit by penalizing our $6.5 billion investment abroad, why didn’t the government pitch on some other major item in the total of nearly $35 billion that we annually spend or give abroad? Since we are abandoning all liberal trade principles anyway, why not put prohibitive duties on luxuries, on perfumes, and liquor and foreign sports cars, and crack down on foreign pleasure travel?
Or if foreign investment really is the culprit, why not simply let interest rates go up here to levels where they would keep investment at home and even attract foreign investment? The cure is not more government interference with markets, but less.

Unless the President, the Congress, and the Federal Reserve curb deficit spending, slash foreign aid, stop pushing down interest rates, short-term or long-term, and stop printing more paper money, the extended tax and other penalty measures that the President has asked for against foreign investment will be simply futile. In the long run they will neither halt the balance-of-payments deficit nor stanch the outflow of gold. On the contrary, the misgivings that the stricter controls themselves arouse may increase both.

But if the government authorities adopt a self-imposed monetary discipline, if they stop the deficits, cut the foreign giveaway, stop flooding the market with more paper dollars, and allow interest rates to rise to free-market levels, the deficit in the balance of payments will stop overnight, and the elaborate tax penalties, quotas, surveillance, and “voluntary” controls of foreign investment will be entirely unnecessary.

**Manipulating Interest**

March 15, 1965

Since the end of 1957, the government has become increasingly involved in economic policies that must have increasingly harmful results.

On the one hand it has been undermining the value of the dollar by progressively expanding the money supply to hold down interest rates. This has made it less attractive for either Americans or foreigners to lend or invest in the United States, and comparatively more attractive for them to lend or invest abroad.

But then the government, ignoring its own clear responsibility for this result, is determined to find the culprits among American private citizens. It has chosen for its chief whipping boys those American individuals, banks, or corporations attracted by the higher interest rates abroad.

In brief, in order to maintain its own cheap-money policy at home, the government has launched a series of what must be progressively tighter controls on investment, lending, and the foreign exchanges. As long as the government maintains its cheap-money policies, these penalty taxes and surveillance of loans and investments will be futile in their intended purpose of curing the balance-of-payments deficit. These “remedies” will prove, at best, short-lived. In the long run they can only restrict our export trade, and set back both American and world development.

**HIGH-POWERED MONEY**

Let us examine this process in detail. Since the end of 1957 the country’s active money supply (currency plus demand bank deposits) has been increased by 17 percent. Total money supply (including time deposits) has been increased by 48 percent. But if we direct our attention to the way in which the Federal Reserve authorities, egged on by the politicians, have been increasing the high-powered reserve money supply on which the inverted pyramid of our total money and credit supply is built, we get an even more striking set of comparisons.

The Federal Reserve banks, which are bankers’ banks, can create reserves for the member banks (the banks with which the public deals) against which the latter can in turn, by making loans and investments, create about six times as much deposit “money.” The Fed creates these reserves mainly by buying government securities from the member banks or the open market, and then “monetizing” them.

At the end of 1957 the amount of Federal Reserve credit outstanding was $26.2 billion ($1.1 billion less than at the end of 1952). In 1958 this outstanding credit was increased by $2.2 billion, and in 1959 by another $1 billion. In 1960 it was reduced by $375 million. Then the Fed, under the new Democratic regime, began to inflate in earnest. In 1961 it increased Federal Reserve Bank credit by $2.2 billion; in 1962 by $2 billion more; in 1963 by $3.4 billion more; and in 1964 by $3.3 billion more. At the end of 1964 the total stood at $39.9 billion, an increase in seven years of 52 percent. (Federal Reserve credit went up $13.7 billion though our gold stocks went down $7.4 billion.)

**RATES LOWEST HERE**

The intention and effect of this increase of credit was to hold down U.S. interest rates. In its February letter the First National City Bank of New York presents a table comparing short-term lending rates in some 60 countries. (“The interest rates compared are “the lowest at which business firms of the highest standing can obtain credit on an unsecured, single-name basis.”) The comparisons show that U.S. rates at 4½ percent are lower than in any leading country. The Canadian rate is 5¼ percent. The rates in France, Germany, Belgium, and Japan are above 6 percent. The range in Sweden, Italy, and Britain is around 7 and 8 percent. International comparisons of long-term rates would show a similar difference.

The situation, in brief, is this. The government, by its monetary policies, has brought about artificially low interest rates here. The result has been to divert lending
and investment into foreign countries. The government then picks on this foreign investment as the marginal culprit causing the deficit in our balance of payments. But instead of abandoning its own cheap-money policies, it starts lecturing, penalizing, and policing private investors.

Antitrust Chaos
March 29, 1965

Nothing more clearly reveals the contradictions and absurdities in our antitrust laws and their current interpretation than the decision of Federal District Judge Lloyd F. MacMahon that the 1961 merger creating the Manufacturers Hanover Trust Co. of New York violated the Sherman and Clayton Antitrust acts.

The court held that the merger violated the Sherman Act of 1890 because it was a “combination in unreasonable restraint of trade.” Just how unreasonable? At the end of 1960, before the merger, the combined assets of the Manufacturers and the Hanover were 14.3 percent of the assets of all New York City banks. On June 30, 1964, the Manufacturers Hanover assets were only 12.3 percent of the total. The largest New York City bank, the Chase Manhattan, represented 21.7 percent of the total; the second largest, the First National City, represented 19.8 percent. Not counting nearly 1,000 branches, there are now 70 commercial banks in the metropolitan area. Would it noticeably affect the competitive situation if there were 71?

One of the gravest aspects of Judge MacMahon’s decision is the uncertainty it creates for all large firms. The bankers who arranged the merger assumed they were doing a perfectly legal thing. They had got the explicit approval of both the New York State Banking Department and of the Federal Reserve Board. But a third branch of government, the Justice Department, filed suit after the merger was effected. Now, three and a half years later, the bank is asked to unscramble itself back into its former two shells.

UNCERTAINTIES

Obviously the court’s decision will unsettle not only the bank concerned but business generally. Laws should be reasonably certain in their application. If in the future a small bank or other business cannot adequately compete and wants to sell out, what existing larger firm (uncertain about future decisions) will have the courage to buy it? Such a prospect can discourage new ventures.

But there is no use arguing even that the merger of the Manufacturers and Hanover actually had beneficial results, because Judge MacMahon says this doesn’t matter. He agreed with the bank’s lawyers that “the general public and small businesses have benefited” from bank mergers in the city. Nevertheless, he said, “practices harmless in themselves, or even those conferring benefits upon the community, cannot be tolerated when they tend to create a monopoly; those which restrict competition are unlawful no matter how beneficent they may be.” It doesn’t even matter if mergers promote efficiency and reduce costs, “for it is the theory of the antitrust laws that the long-run advantage to the community depends upon the removal of restraints upon competition.”

DOUBLE STANDARD

This brings us squarely to the economic question: do the courts, the Justice Department, or our lawmakers know what practices really restrict competition? Or which are in the long run harmful or beneficial? Obviously the merger of the Manufacturers and Hanover ended any competition with each other. But its purpose was to enable them to offer stiffer competition than before to their bigger rivals, the Chase and First National City. There is no evidence that this merger has caused poorer service to depositors or borrowers. The number of bank offices in New York City has increased since the merger from 645 to 698.

The truth is that the courts, the Justice Department, and Congress have shown no consistency whatever in opposition to “monopoly” per se. A bank that does one-eighth of the banking business of New York City is ordered to bust itself up. But a labor union can be industrywide and nationwide, and employers are legally compelled to bargain exclusively with it. The country’s farmers are not only permitted but compelled to restrict plantings, so that consumers can be forced to pay higher food prices. The international coffee agreement, to which this country is a signatory, enforces quotas on export and hence on production, to keep prices up under the euphemism of “stabilizing” them. Why doesn’t the Justice Department sue every senator who voted for that agreement?

Do We Need More Money?
April 12, 1965

With either mild or violent inflation taking place year by year in nearly every country, with a currency crisis breaking out somewhere every week, it is obvious that the world monetary system set up at Bretton Woods in 1944 is breaking down. Monetary economists realize
that it is breaking down. Almost daily someone puts forward a new plan for world monetary reform.

But the irony is that, though the disease is chronic inflation, nine tenths of the proposed “reforms” are based on the fear that this inflation may suddenly come to a halt, and plunge the world into a deflationary crisis. Therefore all these plans provide for a constant increase in “liquidity”—i.e., a further increase in the volume of credit and of paper money.

It is important to distinguish two schools of currency expansionists. The first are the extreme expansionists who believe that it is necessary to maintain a constant “full employment” boom by constant injections of “new purchasing power” into the economy. But employment does not depend upon the amount of money in existence. What it depends on is a proper coordination of prices with costs and wage rates. If this coordination exists, full employment and production will follow. If this coordination does not exist, if wage rates in key lines race ahead faster than prices and marginal labor productivity, there will be unemployment no matter how much new money is printed.

‘KEEPING PACE’

Yet there is a more subtle and more widespread form of inflationism. It consists in the belief that a constant increase in the money supply is necessary to “keep pace” with the increase in domestic production or the volume of world trade. Hence the chronic fears of a future “shortage of liquidity.” Hence the belief that “there isn’t enough gold in the world to carry on international trade.” Practically all the “world monetary reform” plans are therefore plans for more and more credit expansion and paper money.

Now there is one germ of truth in this belief. If the money supply remains constant, while production and trade expand, there will be a fall in prices. The error in the theory consists in assuming that such a fall in prices will imperil or wipe out profit margins and therefore create stagnation and unemployment. But this assumption overlooks that real costs, and therefore money costs also, will be falling along with final prices. Real profit margins will be retained. The living standards of the workers will be constantly bettered, not primarily through higher money wages, but through a higher purchasing power of their money wages. It is a serious fallacy to assume that a constant money supply would have the same kind of results as a suddenly contracted money supply, combined with inflexible prices and wages.

INVERTED PYRAMIDS

Expansion of the paper-money supply cannot go on forever. Our authorities now think that even a 25 percent gold reserve is an excessive requirement. Yet this 25 percent reserve was only required against Federal Reserve notes and deposits. On top of these notes and deposits (themselves liabilities) we have built another inverted pyramid of commercial bank deposits. Twenty paper dollars are now outstanding against every gold dollar. Foreign central banks count such paper dollars as “reserves,” and have built still another inverted pyramid of money and credit on top of them. Of course under this setup the world’s monetary system is drifting toward a crisis. And this cannot be averted by printing still more paper money.

For an increase of the money supply, in order to increase “liquidity,” is in the end always self-defeating. If a country doubles the amount of its paper money, for example, it merely cuts in half the purchasing power of its monetary unit compared with what it would otherwise have been. It merely does business on a higher price level. But excessive printing of new money discourages saving, unbalances production, and creates instability and uncertainty.

As long as the superstition prevails that the amount of money needs to be constantly increased, the world will never get back to a sound and stable monetary system. Inflation must someday have a stop.

Monster Government

April 26, 1965

If any two government programs have proved themselves to be enormously expensive failures, they are the price-support program in agriculture and the foreign-aid program. Both were adopted ostensibly as “emergency” schemes. Both were originally supposed to serve their purpose in four years at most. Yet both are still in existence, and look as if they will be with us forever. No one any longer talks of a termination date.

The crop-subsidy program began some 30 years ago. It now costs $4.6 billion a year. This is what the whole Federal government and all its programs cost to run in 1933. The purpose of the program is to reward farmers for producing less. Its effect has been to raise the cost of food to our own poor, to pile up huge unsold farm surpluses in government warehouses, and to stimulate food giveaways or cut-rate “sales” to foreign (including Communist) countries.

President Johnson has nothing to propose but a continuation of the program with slight modifications. The government will spend a little less, but in compensation Americans will pay more for wheat and rice.
May this not also be part of the explanation for the growth of the programs of the Department of Health, Education, and Welfare, with its 85,000 employees? Everywhere the full-time experts on these programs are also the people with the greatest interest in expanding the programs. Congress is forced to depend on their figures and arguments, and the programs become self-perpetuating and self-accelerating.

The Rueff Proposal
May 10, 1965

When President de Gaulle insisted on drawing more gold out of the United States in exchange for dollars, his action was interpreted here chiefly as more evidence of his anti-Americanism. And when he called for a return to the gold standard, people here and in England said he was asking for a world that was lost forever.

But then they became belatedly aware that the eminent economist Jacques Rueff, the author of the French monetary reform of 1958 (and the newest member of the French Academy), had been advocating these ideas for a long time. In fact his book, The Age of Inflation, published in paperback by Henry Regnery last year, reveals that he has been publicly asking for the abolition of the “gold-exchange standard,” and a return to a world gold standard, at least since 1932.

He has recently been advocating this reform with increased urgency. Among the proposals for world monetary reform that have attracted recent attention, his stands out for one great merit: instead of proposing new gadgets to continue world inflation, it proposes to put an end to inflation.

‘GOLD EXCHANGE’
The “gold-exchange standard” was formally adopted at an international monetary conference at Genoa in 1922. This meant that central banks were allowed to count as part of their reserves not merely gold, as previously, but foreign currencies that could be exchanged for gold, that is, sterling and dollars. The purpose was to “economize the use of gold” and to allow credit and currency expansion.

Rueff holds that the gold-exchange standard did harm from the very beginning. It “unquestionably triggered the disaster of 1929–1933.” And today it is “chiefly to blame for the balance-of-payments deficit of the United States.”

The evil of the system, as Rueff sees it, is this. Under the old gold standard, when a country lost gold it had to contract its credit and currency correspondingly. But under the gold-exchange standard, when the United States .
States has a deficit in its balance of payments, instead of paying gold to a creditor country, it pays dollars. These end up in the creditor country’s central bank. “But the dollars are of no use in Bonn, or in Tokyo or in Paris. The very same day, they are re-lent to the New York money market, so that they return to the place of origin. Thus the debtor country does not lose what the creditor country has gained. So the key currency country never feels the effect of a deficit in its balance of payments.” The result is that both debtor and creditor expand credit on the same base.

$70 AN OUNCE?
There is no doubt that this gold-exchange system—which might better be called the dollar-exchange system—is a major and almost inevitable cause of world inflation. As a minimum reform the central banks should no longer permit their dollar holdings to increase; and they should work out some provision for their gradual repatriation over a period of years.

But Rueff wants to make the reform at one stroke. He therefore suggests that the “world” price of gold be doubled from its present $35 an ounce to $70. This would automatically double the present $14 billion remaining U.S. gold reserves to $28 billion. The world’s central banks could then convert their $13 billion of dollar holdings into American gold, leaving the U.S. still with $15 billion of higher-priced gold. Rueff argues that the U.S. and other countries would then have substantially the same reserves as before, therefore this reform would be neither inflationary nor deflationary. And the world would be back once more on a real gold basis.

But would it happen that way? Would not doubling the price of gold—i.e., cutting in half the legal gold content of every currency unit—not lead to an immediate rise in world prices? Would not most countries, finding their gold reserves suddenly almost doubled, set off on a new inflationary spree? What about the shock to the dollar and to our moral prestige if we broke our often repeated pledge to keep the dollar “immutable” at $35 an ounce?

But whatever the remedy, Jacques Rueff has correctly identified one major monetary disease—the gold-exchange standard. ✭

Steel as Scapegoat
May 24, 1965

Instead of keeping hands off the wage negotiations in the steel industry, the Administration has in effect said what it thinks the settlement ought to be. On May 4 President Johnson and the Council of Economic Advisers implied that in their opinion the steel industry could give its workers a 3 percent increase in wages this year and still not need to raise its prices. Their action can only encourage the steel union to raise its demands. The Administration has set a mischievous precedent.

Both the statistical comparisons and the economic reasoning in the council’s report on the steel industry are highly questionable. The steel industry has been arguing that since 1957 its labor costs have increased more than 4 percent a year while productivity has increased only 2 percent a year. The council, by not counting periods when strikes occurred (a method it has not applied to other industries), has figured that the steel industry’s productivity has really risen 3 percent a year.

A number of questions arise concerning the government’s “guidepost” calculations. There can be no doubt that hourly labor costs have risen faster in the steel industry than prices. Since 1959 steel prices have risen on the average about half of 1 percent. (Consumer prices have gone up more than 7 percent.) Hourly steel wages have risen 11 percent. Total hourly employment costs have risen 15.6 percent. The government holds, however, that “labor productivity” has gone up by 3 percent a year and therefore hourly wages should go up 3 percent a year.

LABOR PLUS CAPITAL

Even if we accept the 3 percent figure, there are several things wrong with this reasoning. What the government is talking about is not in fact “labor” productivity; it is labor-capital productivity. This has been going up each year not because workers constantly work harder, but because more and better plant and equipment are constantly being supplied. If the whole gain in productivity that results is given to labor, then the incentive to further investment will be destroyed, and economic growth will slow to a halt. In a free market, wages depend on marginal labor productivity. This is a very different thing from average labor-capital productivity.

This is only one of the confusions of thought on which the CEA’s “guideposts” are based. Another is the council’s use of averages. Hourly wages in all manufacturing industries average $2.60. But in the steel industry hourly wages average $3.41 (and with fringe benefits, $4.39). Should wages in every industry go up just 3 percent a year, no more no less, regardless of existing differences, or of changing demand, prices, and profits in each industry?

PROFITS MODERATE

The council deplores the rise in steel prices, especially during the 1950s, but ignores the rise in wage costs that made price increases necessary. If steel price rises were
disproportionate, they would be reflected in high profit margins. But the compilations of the First National City Bank of New York show that in 1964 the steel industry's profit margin per dollar of sales was 6 cents, compared with an average of 6.1 cents in all manufacturing. In 1964, the steel industry earned only 9.2 percent on net worth compared with an average of 12.7 percent in all industry.

The total market value in 1964 of the nation's steel output was only 2.6 percent of the gross national product. The whole attempt to pick on steel prices as the scapegoat for inflation is not only absurd in itself but draws attention away from the real cause of inflation, which is the constant increase in the money and credit supply brought about by the government's own policies.

If the steel industry could really grant a 3 percent rise in wages without increasing prices, it would be equally true that if it did not raise wages it could lower its prices. And lower prices are needed to enable it to compete more effectively with foreign steel.

The assumption of government officials that they know just how much every wage and price should or should not go up can only lead to constant meddling and finally to totalitarian wage and price controls that could halt the growth of the economy. ✽

The Right to Choose
June 7, 1965

The Taft-Hartley Act was in origin an amendment of the Wagner Act. It modified a few of that law's worst provisions, but it kept some of the most harmful. It gives labor unions a privileged status enjoyed by no other private group. It forces employers to bargain exclusively with them, even when their demands are beyond all reason. It is hypocritical. It makes it “an unfair labor practice for an employer . . . by discrimination in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage membership in any labor organization.” And then, notwithstanding, it explicitly sanctions imposition of the compulsory union shop.

But it does, in Section 14(B), make one indirect concession to the individual worker's right to freedom of choice. That section provides: “Nothing in this Act shall be construed as authorizing the execution or application of agreements requiring membership in a labor organization as a condition of employment in any State or Territory in which such execution or application is prohibited by State or Territorial Law.”

Nineteen states have taken advantage of this to enact laws against making it compulsory for a man to join a union in order to hold his job.

COMPULSORY UNIONISM

Union leaders have fought an unceasing war against Section 14(B). So President Johnson, though as a congressman he voted for Taft-Hartley, and as a senator voted against repealing 14(B), and in 1960 supported Texas's right-to-work law, is now paying his 1964 election debt to the union leaders. He is asking for the repeal of 14(B).

He gives no argument for his request, except the vague “hope of reducing conflicts in our national labor policy,” and he does not point out frankly that the effect of this repeal may be to force workers everywhere to join a union in order to hold a job.

The effect of compulsory union membership is to relieve unions of any need to make membership attractive to workers. As Prof. Sylvester Petro remarked in his book Power Unlimited (1959), which described in detail the abuses of union power revealed before the McClellan subcommittee of the Senate: “The McClellan record reveals . . . that compulsory unionism is the principal cause of corruption and maladministration of unions; it draws into unions the kind of men who abuse union members, and takes from the members any real power to rid themselves of the looters.”

FREE DECISION

The argument for keeping Section 14(B) is elementary. As former Rep. Fred A. Hartley, one of the sponsors of the Taft-Hartley Act, put it: right-to-work laws “guarantee a worker's right to join a union”; but also “his right to stay out of a union if he wants to—and I say what's wrong with that?” As the Committee for Economic Development also recently summarized the case: “The controlling principle should be the right of an individual to decide freely to belong or not to belong to a union.”

The proposed repeal of Section 14(B) is a naked grab for more power by the union bosses. There is only one argument for it that deserves intellectual respect. This is the argument for “freedom of contract.” That argument holds that the law ought not to prohibit a “voluntary” agreement between a union and an employer requiring compulsory union membership; that union membership as a basis of continued employment should be neither required by law nor forbidden by law.

But in the mouths of union leaders this argument is insincere and hypocritical. They insist on the retention in the Taft-Hartley Act of the prohibition of the so-called “yellow-dog” contract—a contract in which
a worker agrees as a condition of employment that he will not join a union. Union leaders who insist on legalizing compulsory union membership should be willing to legalize compulsory non-union membership. But as long as they are not willing to do that, they have no right to use the freedom-of-contract argument. Meanwhile, also, opponents of compulsory unionism do have a right to demand the repeal in the Taft-Hartley Act of the provisions sanctioning imposition of the compulsory union shop.

The New Orthodoxy
June 21, 1965

It is a typical Galbraith performance. It hails “the Keynesian revolution” as “one of the great modern accomplishments in social design,” and reveals for the first time that “it brought Marxism in the advanced countries to a total halt.” Those who believe from reading their daily papers that there has been an unparalleled spread rather than a halt in socialistic thinking and policy in the last 29 years are apparently the victims of a persistent illusion.

Though Galbraith talks of the “fascinating obscurity” and “unique un-readability” of Keynes’s General Theory, he proceeds to interpret its message with the utmost confidence. He assures us that Keynes’s unintelligibility is a handicap, not to his disciples, but only to his critics. In fact, he scoffs at the very idea that there could be or has been any intelligent criticism of the General Theory: “Those who objected to Keynes were also invariably [my italics] handicapped by the fact that they hadn’t (and couldn’t) read the book.”

REFUTATIONS
I am very happy to assure the reader, nevertheless, that there have been some intelligent refutations of Keynesian doctrine. It would be immodest for me to refer to my own Failure of the “New Economics” (1959). But I can mention with much better grace the anthology I compiled in 1960, The Critics of Keynesian Economics, containing answers by more than twenty eminent economists. And I can point with complete disinterest to the brilliant demolition by Prof. W.H. Hutt, Keynesianism—Retrospect and Prospect, which appeared in 1963.

Keynes initiated no “revolution” whatever in economics. What is original in his book is not true, and what is true is not original. Keynes merely developed a complicated rationale and a novel vocabulary to resurrect seventeenth-century mercantilism and the age-old nostrum of inflation.

Galbraith admits as much. The essence of the Keynesian remedy, he tells us, is to assure sufficient “aggregate purchasing power” at all times by “incurring a deficit.” He even deplores the “double-talk” of those who say we can have both Keynesian policies and balanced budgets.

PRINTING MONEY
Galbraith’s candor stops only in failure to make clear (or even to understand?) that the increases in “purchasing power” brought about by deficits are merely increases in the number of paper dollars. But this must mean that each dollar will soon have a correspondingly lower purchasing power. If real purchasing power could be increased simply by printing more money, India and Africa would have nothing to worry about.

Galbraith does make one indisputable statement: “Keynesian policies are the new orthodoxy.” They are practiced today by nearly every government.

What has been the result? There has been an almost continuous worldwide inflation. In the last ten years alone the German mark has lost 19 percent of its purchasing power, the British pound 26 percent, the Italian lira 27 percent, the French franc 36 percent and leading South American currencies from 92 to 95 percent.

In the United States we have had 29 deficits in the last 35 years. The dollar has lost 43 percent of its purchasing power even since 1945. Statistical studies show no correlation over the last 35 years between deficits and percentage of unemployment.

Meanwhile, Keynesian deficits, inflation and cheap-money policies have brought about a chronic deficit in the U.S. balance of payments. Government officials blame this not on their own policies but on American private business. Refusing to abandon those policies, the government imposes “guidelines” on wages and prices, and controls on tourists and investors. It is government addiction to Keynesian policies that made Federal Reserve chairman Martin’s brave warning of June 1 so necessary.
One-Sided Compulsion
July 5, 1965

If Section 14(B) of the Taft-Hartley Act is repealed, it will be at least partly because most of the proponents of state right-to-work laws have been too timid. They have compromised their own principle. They have not fought compulsory unionism consistently. They have merely pleaded for the right of states to be allowed to enact or retain laws forbidding compulsory unionism. But they have tacitly accepted the Federal Taft-Hartley Act’s explicit sanction of compulsory unionism.

This sanction flatly contradicts other provisions of the Taft-Hartley Act. In fact, it contradicts the professed purpose of the act. For the Taft-Hartley law makes it “an unfair labor practice for an employer . . . by discrimination in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage membership in any labor organization.”

As Prof. Sylvester Petro has written in his book *Power Unlimited* (1959):

“The fundamental principle of the Taft-Hartley Act is the principle of free employee choice. Employees are expressly declared to have the right to join or not to join unions, free of economic or physical coercion by either employers or trade unions. Naturally, all forms of compulsory unionism are inconsistent with that principle. If a man must join a union in order to hold his job, he is being subjected to the kind of economic coercion which the act generally makes an unfair practice. Yet, compromising this fundamental principle, Congress explicitly permitted unions to impose union-shop contracts upon employers and employees, at least in states where such contracts were not prohibited. From that compromise, together with the denial of direct access to the courts, the lethargy of the NLRB, and the Supreme Court’s pre-emption theory, all the abuses associated with the nationwide prevalence of compulsory-unionism conditions have developed.”

It follows that if Section 14(B) is now repealed, the opponents of compulsory unionism, instead of merely pleading for its restoration, should take the offensive and launch a campaign for repeal of the clause in Section 8(A3) in the Taft-Hartley Act which sanctions agreements imposing compulsory union membership as a condition of employment.

If the opponents of compulsory unionism take this course, they will be adhering to their principle consistently. They have weakened their position by accepting this clause and fighting a mere rear-guard action to keep in the act the 14(B) provision that implies the dubious doctrine of pre-emption. “A proper reading of the U.S. Constitution,” as Petro writes, “would suggest that the power of the states to prohibit all forms of compulsory unionism does not depend upon a specific grant by the Federal legislature. That power is, rather, inherent in the sovereign power of the states to protect their citizens from corrupt and criminal abuse.”

FREEDOM OF CONTRACT

Those government and union officials who want to repeal Section 14(B) on the ground of “freedom of contract” are insincerely using an argument that may boomerang on them. The principle of freedom of contract, they contend, requires that union membership as a basis of continued employment should be neither required nor forbidden by law. But if the principle does require that, it equally requires that non-union membership as a basis of employment should be neither required nor forbidden by law. Yet every union official insists on retaining the Taft-Hartley prohibition of the “yellow-dog” contract—a contract under which a worker agrees as a condition of employment that he will not join a union.

If union leaders insist on and get a completely one-sided law, which prohibits compulsory non-unionism while imposing compulsory unionism, they will arouse demands for the entire repeal of that law, and a restoration of the two-sided “freedom of contract” that prevailed before the Wagner Act of 1935, of which the Taft-Hartley Act of 1947 was an amendment.

Those who do not want such a restoration must in consistency agree to outlaw compulsory unionism everywhere as well as compulsory non-unionism.

Fallible Forecasting
July 19, 1965

There has long been a need for someone to keep score on the errors of the business forecasters. This is at last being done, systematically and on a broad scale, by the nonprofit National Bureau of Economic Research.

The task has been subdivided among several staff members. One of them is trying to find out how good have been the predictions of turning points in business. He is finding these “often difficult to interpret or evaluate because of vagueness or hedging.” But another staff member, Victor Zarnowitz, had the easier task of comparing numerical predictions of the nation’s gross national product (GNP) with what the official figures turned out to be.

He presents a tabulation on the results of eight sets of annual forecasts. Four of these are company forecasts,
another set groups those of 50 business economists. Altogether, the table records the efforts of 300 or 400 individual forecasters.

The errors in these eight sets of forecasts averaged nearly $10 billion a year, up or down, from the actual figures for the eleven years 1953–1963 inclusive. The errors appear small—about 2 percent—when compared with the average level of actual GNP. But, as Zarnowitz points out, they are big enough to make the difference between a good and a bad business year.

**HOW TO COUNT ERROR**

The average actual year-to-year change in GNP over the period was $22 billion. Thus, as the study notes, the errors were not quite one-half the size of those that would have occurred by assuming that each year’s GNP would be the same as the year before. Furthermore, the errors were almost as large as those that would have occurred by merely assuming that each year would show the same gain in GNP as the average gain in preceding years. Such an assumption would have gone wrong by an average of less than $12 billion—only $2 billion worse than the forecasts.

This, I think, is the valid way to count the percentage of error in a prediction. The predicted GNP should not be compared merely with the actual GNP, but also with the “automatic” prediction. By the automatic prediction I mean the figure that would result from taking the average percentage increase in GNP for, say, the last five to ten years, giving a little extra weight to later compared with earlier years, and making some allowance for the observed economic trend in the three months preceding the prediction. These are the kinds of figures that could be fed into an automatic computer. Then only if a prediction came nearer to the actual figure than did this automatic extrapolation would it deserve a compliment for insight.

**MISSING THE TURNS**

As Zarnowitz puts it, though the simplest measure of error is obtained by comparing predicted with actual levels, it is more important to compare predicted with actual changes.

And the forecasts have persistently underestimated changes. They have turned out best in “normal” years, worst in abnormal years. They have also turned out worse for longer periods ahead than for shorter. To cite one example: in a semiannual forecast of GNP for 1955–63 by a large group of business economists, the mean errors of change were, for a six-month span, $6.7 billion; for a twelve-month span, $12.3 billion.

In brief, business forecasting is not yet an exact science. Nor will it ever be. We can’t foresee the future by simply extrapolating from any number of figures or trends in the past. There are too many “outside” factors that cannot be foreseen—droughts, floods, tornadoes, wars, revolutions, political decisions, sudden strikes. Estimates of the effects of other factors—monetary policy, deficits, tax changes, economic controls, labor-union demands—must involve a large element of guesswork. Most important of all, economic forecasts themselves affect the future they predict.

Yet to guide our decisions, we must all try to forecast. By intelligent study we may all hope to reduce the extent by and frequency with which our forecasts go wrong.

The aim of every speculator and businessman, however, is not merely to be right, but to be right sooner than his competitors. And that result no science can provide.

---

**Do We Need More Money?**

August 2, 1965

Secretary Fowler wants an international conference on money. His proposal is based on the fear that unless the world develops “a new and assured source of growing liquidity”—i.e., more money and credit—there may not be enough “to support increasing world trade and investment.” Nearly all the proposals now being put forward for an “improved” international monetary system are based on the same fear—that we are running out of money.

There is nothing new about such fears. In 1875, the British economist Jevons was writing: “In almost every country great complaints have from time to time been made as to the scarcity of the circulating medium, and the urgent need of more. All the evils of the day, the slackness of trade, falling prices, declining revenue, poverty of the people, want of employment, political discontent, bankruptcy and panic, have been attributed to the want of money, the remedy suggested being...the issue of paper money.”

The truth is that, except in a deflationary crisis, the existing amount of money is always enough to conduct the business of the country—for the simple reason that it is the existing amount of money that has determined the existing level of prices. If, with other conditions remaining unchanged, we increase the supply of money, each unit of money will be worth less than before. This means that prices will rise.

**NOT ENOUGH GOLD?**

It is certainly true that, if the money supply is not increased while the economy is expanding, prices...
tend to fall. But a gradual fall of prices for this reason is to be welcomed rather than feared. Prices would be falling because the supply of goods was increasing. And real costs as well as money costs of production would be falling along with them. So profit margins (and therefore incentives to production and employment) would tend to remain relatively unchanged.

This situation has often existed historically. Wholesale commodity prices dropped from an index number of 84.7 in 1880, the year after this country returned to the gold standard, to as low as 60.5 in 1896. They had recovered to 73 by 1900 and in 1911 were still only 84.4 (1939=100). Yet this whole 30-year period, though marked by both depression and prosperity, was a period of continuous and strong economic growth.

The opponents of the gold standard argue that there simply isn’t enough gold in the world to finance production and trade. So they want to supplement gold reserves with paper dollars or even with a new “composite reserve unit” of ten or eleven leading paper currencies. But if there isn’t enough gold for reserves and money, why not use silver? Or if we can’t spare silver at present, why not use copper? Or if there isn’t enough copper, how about iron?

**SCARCITY GIVES VALUE**

Of course each unit of currency would then buy less. It is precisely because gold is scarce that it is valuable as money. It is precisely because its scarcity, unlike that of paper money, cannot be relieved by the mere whim or ukase of political managers that gold holds its value.

Increasing the supply of money is chasing a will-o’-the-wisp. Every increase in supply lowers the value of the monetary unit and raises prices. In the end, the bigger supply of money doesn’t buy any more than, the smaller supply.

There is a shortage of gold in the world today only in one sense—that too much paper money has been issued against it, so that this paper money cannot be made freely convertible into gold at the old ratio. That is why so many people are asking for devaluation. But this would at best provide only temporary relief if the policy of currency and credit expansion continued.

In the twenty years of the International Monetary Fund system, the world has piled up a shameful record of inflation, depreciation and devaluation. Yet instead of demanding a return to balanced budgets and a true gold standard, everybody seems to be devising schemes to support still further inflation, under the Keynesian delusion that only constantly “increased purchasing power” through constant monetary expansion can assure prosperity.

---

**Chaotic Anti-Trust**

**August 16, 1965**

On July 23 a Federal judge fined eight of the nation’s largest steel companies $50,000 each on charges of conspiring to fix prices of carbon-sheet steel between 1955 and 1961. The judge also set Sept. 21 as the date of sentencing two of the steel executives—with possible penalties running up to a year in prison and $50,000 personal fine. A few days later four steel companies and a trade association were fined a total of $150,000 on charges of conspiring to fix prices on steel forgings.

Both cases were uneasy reminders of the fines and jail sentences imposed in 1961 on some officers of the biggest electrical-equipment companies in the nation.

These men were treated as common criminals. And for doing what? For doing precisely what millions of workers are not only permitted but sometimes compelled to do under the law—for setting noncompetitive prices on what they have to sell.

Let us suppose that the charges against the steel companies are true. (They pleaded “no contest”—which means that they were willing to accept punishment without admitting guilt.) How can the government or anyone else prove that on net balance economic damage was done? And how can anyone determine the extent of the excess costs to the steel companies’ customers? (This is legally important, because any firm that felt it had paid too much for steel because of the alleged price-fixing could bring suit, and, if it won, would be entitled under the antitrust laws to treble damages.) But how can anyone determine how much the fixed price exceeded, if at all, what a “competitive” price would have been?

**‘RESTRAINT OF TRADE’**

Opening a broader issue, how can the amateur economists who sit as judges in the courts—or, for that matter, how can professional economists—determine whether there has been “restraint of trade,” not to speak of determining how much restraint, when there has been no physical coercion or intimidation?

An extremely efficient firm, perhaps by discovering some improved product or cost-cutting method, may undersell all its competitors and drive them out of business, thus substituting at least a temporary monopoly for previous competition. Has it “restrained” trade? Has it made conditions worse—by offering consumers a better product at a cheaper price or better?

Such questions apply particularly to recent court decisions against mergers. Thus a Federal district court a few months ago ordered the dissolution of the three-and-a-half-year-old merger of the Manufacturers and Hanover banks as a “combination in unreasonable
can be done immediately, is to reduce wasteful consumption of water. New York has issued a series of emergency orders. Shut down all fountains. Don't flush streets. Don't refill swimming pools. Don't sprinkle your lawn. Don't wash your car. Don't even serve a glass of water in a restaurant unless it is asked for. The latest orders severely cut down on the hours for using air-conditioning units.

**EXHORTATION**

Such rules are (to some extent unavoidably) arbitrary, inflexible and procrustean. They are creating conflicts. New York City's water supply department accuses its parks department of illegally watering its public golf courses at night. Parks Commissioner Morris retorts: “We shouldn't throw 20,000 players off the courses just because of a little bit of water. . . . I flush my toilet only about once a day now and I take a bath only every other day. If you figure up the water I save by giving up these things, you've got almost enough for the greens.” And people who work in a round-the-clock business in a modern building without openable windows wonder how many hours they will be expected to sweat or suffocate.

Of course there can be exhortation to the citizens to save water. There has been no lack of it. It is repeated every day. But there is a certain futility about it, and the reason is clear. The individual citizen knows that there is a water shortage. But he may reason: what I personally save will affect less than a millionth of the total consumption. What difference will that make? Moreover, he may darkly suspect that others are cheating—taking long showers, neglecting leaky plumbing, maybe letting the cold water run all night just to cool the room.

**EFFECT OF METERS**

Yet while New York City officials are toying with all sorts of far-off, far-out schemes for increasing the water supply, they have until now ignored or rejected the simplest way to cut down the consumption—to charge everybody in proportion to the water he uses. Mayor Wagner admits that he has “always opposed universal metering in New York City,” but now his own study panel recommends it.

To install meters, as far as practicable, for every consuming family, would merely apply for water the same market principle and price system that applies nearly everywhere else. When anything—water, or food, or housing, or doctors’ services or hospital care—is provided “free,” or below real cost, it is bound to be wastefully used.

Do New Yorkers waste water? Well, 8 million of them consume 1 billion gallons of water a day—about 125 gallons a person. As each person drinks less than a
gallon, there must be immense opportunities for saving in the other 124 gallons.

The knowledge that there was a meter ticking the pennies away would give a constant incentive for economy. Then each person could save water at the points where he himself thought he could best spare it. When water became scarce the rates could be doubled. Or a penalty surcharge could be put on anything above a basic allowance per person.

Ten years ago, 73 percent of Philadelphia’s water was delivered through meters and the city consumed 400 million gallons a day. Today, with 100 percent metering, Philadelphia uses only 325 million gallons a day.

The moral is obvious. People economize on what they pay for.

**Rule by Guideline**

September 13, 1965

A few months ago, George Champion, chairman of the Chase Manhattan Bank of New York, expressed his alarm over the trend in Washington toward what he called “government-by-guideline.” There are guidelines for wages and prices, guidelines for antitrust enforcement, for labor-management behavior and for television advertising. And bankers have been given a special set of guidelines for the balance of payments and for lending rates.

This trend operates behind a façade of friendliness and partnership between government and business, accompanied by much talk of “reasoning together” and “voluntary restraint.” “But always in the background,” said Champion, “is the subtle threat that failure to comply with the guidelines voluntarily will bring sternly coercive measures—measures applied, for the most part, without public debate in the halls of Congress or legal appeal in the courts.”

Most of these guidelines are misconception economically. Yet the whole trend toward government by guideline is based on the assumption that bureaucrats know more than the market. This trend, Champion concluded, “is one of the most insidious and dangerous on the national scene today.”

**ANOTHER ‘REQUEST’**

Since he made his speech, government-by-guideline has shown, unfortunately, no signs of slowing down. On Aug. 18, for example, the White House reported that whereas consumers had received the benefit of about three-fourths of the $1,750,000,000 excise tax reduction enacted two months earlier, some manufacturers (e.g., of phonograph records, pens, pencils and matches) had failed to pass along the reduction. This failure, added the White House press secretary, “bears closer examination.” Meanwhile the government would “request these manufacturers to keep faith with the hope of the Administration and Congress in passing this legislation and to pass on the benefits.”

Here is a perfect specimen of the government-by-guideline technique. Everything is to be “voluntary”; manufacturers are “requested,” not ordered. But if they fail to do what the White House wants, there is a thinly veiled threat that something unpleasant will happen to them, even though the government has no legal right to force any price-tag reduction.

Apart from its disturbing legal implications, the White House statement is economically naïve. Manufacturers do not, as the statement implies, pass along a tax cut in full because they are public-spirited fellows, or fail to do so because they are selfish profiteers. In both cases it is costs, consumer demand and competition that decide final prices, just as they did before the tax was reduced. In the lines that failed to “pass on” the full tax cut, an upward price adjustment may have been overdue. The White House statement implies that prices and profit margins in each line were just what they should have been before tax cuts.

**POWER CREATES POWER**

How does the government come to have the power to impose guidelines over business decisions that it has no explicit legal authority to control? The answer is simple, and may be stated in the form of a political law: when a government has too much power in any direction, it can easily use it to usurp more power in other directions.

For example, the Federal government now spends one dollar out of every five now spent in the United States. Many business executives fear to oppose even unauthorized government “guidelines” for fear that they will lose government contracts, or have existing ones adversely renegotiated. Or they fear that they may suddenly be prosecuted for violating one of the vague and contradictory antitrust laws. Or they fear that their income tax may be hostilely examined. Or they fear that they may be cited for violating Federal labor laws.

In all these cases enormous discretionary powers rest in the hands of government officials. Even if an Administration never abuses these powers, and never uses them for economic reprisal, the mere fear that it may do so is enough to intimidate most businessmen. A government can usurp still more power precisely when it already has too much power.
The Effort of Every Man
September 27, 1965

“No ordinary misfortune, no ordinary misgovernment, will do so much to make a nation wretched as the constant progress of physical knowledge and the constant effort of every man to better himself will do to make a nation prosperous. It has often been found that profuse expenditure, heavy taxation, absurd commercial restrictions, corrupt tribunals, disastrous wars, seditions, persecutions, confiscations, inundations, have not been able to destroy capital as fast as the exertions of private citizens have been able to create it.”

So, in the mid-nineteenth century, wrote Thomas Babington Macaulay in the chapter of his famous History of England describing the state of the country in 1685.

It could easily be proved, he went on, that the national wealth of England had been almost uninterruptedy increasing for at least the six preceding centuries. For example, “in spite of maladministration, of extravagance, of public bankruptcy, of two costly and unsuccessful wars, of the pestilence and of the fire, it was greater on the day of the death of Charles the Second than on the day of his Restoration.” And this economic progress had been proceeding during the nineteenth century with “accelerated velocity.”

Claiming the Credit
Macaulay was calling attention to a fact of the first importance, but one that is constantly overlooked. It is systematically ignored today by nearly all governments, who are, at least by implication, constantly claiming for their own policies all the credit for all the economic improvement during their term of office.

This has been especially true since gross-national-product statistics have been compiled. Spokesmen for the Truman Administration boasted that the GNP increased from $211 billion in 1944 to $347 billion in 1952. Spokesmen for President Eisenhower pointed to the increase to $503 billion in 1960; spokesmen for President Kennedy to the increase to $584 billion in 1963; and spokesmen for President Johnson to the increase to $670 billion in 1965. But it remains to be determined to what extent these increases (even after allowance is made for a constant rise of dollar prices) were because or in spite of the government policies followed.

Most European governments boast an even faster “economic growth,” since the end of World War II, in their countries than in our own. But by far the greatest part of the credit for this growth must be given to the efforts of private citizens of these countries to improve their own condition. If the governments also deserve some credit, it is chiefly because they did not put too many restrictions and deterrents in the way.

Usual and Expected
The great fact that Macaulay emphasized, “the constant effort of every man to better himself,” is important not only as it affects the question of who or what should receive the main credit for economic progress. It is the tremendously reassuring fact that all of us would do well to keep in mind as we read our daily newspapers. Too many of us become disheartened anew every morning as we read the sorry record of accidents, divorces, quarrels, unemployment, diseases, deaths, burglaries, muggings, murders, riots, looting, racial violence, strikes, fires, revolts, revolutions and war, as well as droughts, floods and other natural disasters. We forget that the newspapers print the “news,” and that the news means the unusual and unexpected.

We do not pick up our newspaper and read such items as “Strange case of virtue in the Bronx” or “More than 70 million people all over the United States went to their jobs yesterday morning, working in factories, offices and on farms till late afternoon. The police did not interfere.” We do not read such items because they are the usual and the expected.

The normal thing, in short, is not merely that most people are leading peaceable lives, but that most people are daily working and producing. Many are producing just enough to meet their current living expenses, but others are able to save something—in brief, to accumulate the capital, the money to create the new tools and equipment, that will make not only themselves but later generations constantly more productive.

Inviting Strikes
October 11, 1965

The newspaper strike in New York City (after the 114-day strike of 1962–63 that helped to put one newspaper, the Daily Mirror, out of business) is one more example of the increasing tendency of unions to make excessive demands whose acceptance would be not only against the long-run interests of the economy, and therefore of the great body of workers, but against the long-run interests even of the majority of union members themselves.

One of the demands of the Newspaper Guild on The New York Times is the compulsory union shop—though 2,200 out of 2,400 eligible employees are already on the union rolls. This would mean that all stories about labor disputes would be written by union members. The
The compulsory union shop, moreover, is against the interests of every worker considered as an individual. He cannot get employment unless he is a member of the union; and he is not free to leave the union (except at the cost of his job) if he is dissatisfied with the way it is being run.

The main issue that gave rise to the strike is automation. The guild is asking that no man be fired because of automation and that the guild have a veto on the introduction of any labor-saving machine that could place work performed by a guild member under jurisdiction of another union.

VETO ON PROGRESS
Now a veto on automation is a veto on progress. It forces work that could be done more efficiently and with less labor to be done more expensively, less efficiently, and with more labor. In the long run such a veto does not make more jobs but fewer. By depressing the average productivity of labor it correspondingly holds down the average level of wages. What it protects (temporarily) is a continuance of a few specific jobs that already happen to exist. But it does so only by preventing the creation of more productive jobs. It continues Peter’s present job only by closing off Paul’s, or his own, future job.

In the New York newspaper strike, wages are not an issue. But they have been the principal issue in practically all other major union negotiations this year. Labor costs have already been raised on New York newspapers to such an extent that most of them are losing money and one or two more may be driven out of existence.

When a union succeeds in driving wage rates or costs above the marginal productivity rates that a free market would establish, it merely cuts the number of jobs that would otherwise be available. Unions cannot raise real wages above what they otherwise would have been without cutting employment below what it would otherwise have been. Unions cannot raise the general level of real wages; they can at best raise some wages at the expense of others. This result is usually disguised from the general public by the fact that constant increases in man-machine productivity lead to increases in most wages. But the unions—to the extent that they reduce production by work rules, featherbedding and delaying automation—reduce wages below what they would otherwise be.

DOUBTFUL LABOR LAWS
The recent costly strikes and “wage-inflation” resulting from strikes have led to proposals that industry-wide unions be prohibited, or even that strikes be prohibited, and that all disputes be submitted to compulsory arbitration. All such proposals are in the totalitarian direction, and they would in fact create more problems than they solved.

But before the situation becomes still worse, it might be a good idea to take a hard look at the wisdom of the labor legislation that we began passing in the 1930s, and at local law-enforcement attitudes. We might remove, for example, some of the present one-sided compulsions on employers to bargain exclusively with specified unions and some of the one-sided immunities to unions which enable them, through picketing and other forms of intimidation, to force a business to shut down until it has yielded to their demands. Under present laws and rulings, a company hardly dares to warn strikers that it will permanently replace them with other workers and carry on its business. The laws invite strikes both by taking the major risks out of them for strikers and multiplying the risks of employers who try to combat them.

A World Money Plan
October 25, 1965

At the end of September the International Monetary Fund held its annual meeting in Washington and celebrated its 21st birthday. Secretary Fowler happily announced that the fund had been broadened this year by the addition of Malawi and Zambia. The delegates of the 103 nation-members made speeches. Nearly all of them said that the IMF monetary system has been working very well but is in urgent need of reform.

The system has, of course, been working very badly. The last twenty years have been years of disgraceful world inflation. In the last ten years alone the German mark has lost 19 percent of its purchasing power, the British pound 26 percent, the Italian lira 27 percent, the French franc 36 percent and leading South American currencies from 92 to 95 percent. The keystone of the system has been the American dollar. It has lost 43 percent of its commodity-purchasing power since 1945.

Plainly reform is urgent. But nearly every proposal for reform has been in the wrong direction. Each wants to create more “international liquidity,” which in English means more paper money. President Johnson says that what is needed is “the creation of additional reserves.” Secretary Fowler adds: “We can hardly expect that . . . the world can be satisfied very long to limit future growth in reserves to the very modest level of new monetary gold supplies.”

If this means anything, it means that the new “reserves” are to consist of paper money.
This would restore international cooperation in currency stability instead of the present system of central banks cooperating in inflation.

Dilemma of Foreign Aid
November 8, 1965

In 1947, in a book on foreign aid, Will Dollars Save the World?, written when the program was first launched, I pointed out that intergovernmental loans and grants “are on the horns of this dilemma. If on the one hand they are made without conditions, the funds are squandered and dissipated and fail to accomplish their purpose. . . . But if the lending government attempts to impose conditions, its attempt causes immediate resentment. It is called ‘dollar diplomacy’; or ‘American imperialism’; or ‘interfering in the internal affairs’ of the [recipient] nation.”

In the eighteen expensive years since then, the champions of foreign aid have persistently ignored or denied the existence of such a dilemma. But in practice they have swung uncertainly from one horn to the other—imposing conditions, dropping them when criticized, silently watching the aid funds being misused, then trying to impose conditions again.

And today, two decades and $115 billion later, the danger is that the dispensers of our foreign aid will follow the worst policy of all—imposing conditions, but exactly the wrong conditions.

In signing the new $3.2 billion foreign-aid bill, President Johnson declared that our future foreign aid will go to those countries “willing not only to talk about basic social change but who will act immediately on these reforms.”

‘LAND REFORM’
The next day Senator Aiken of Vermont indicated the nature of the “reforms” that our aid dispensers want. “American aid,” he said, “was based on an assumption that there would be substantial amounts of self-help—that the rich of a poor nation would invest in their own economies, that they would pay their taxes, that they would support land reform and show some interest in the poor of their own societies. This has proved largely a false expectation.”

What Washington apparently now has in mind is to ask of the countries that receive our foreign aid, not that they give guarantees of the security of property, the integrity of their currencies, refrainment from crippling government controls and encouragement to free markets and free enterprise, but that they move in the
direction of the welfare state, the redistribution of land and other wealth and government planning.

When Senator Aiken and others demand “land reform,” precisely what are they asking for? Do they mean the breaking up of big estates, with inadequate or no compensation, and the redistribution of land to the peasants? Have they studied the recent history of most such “reforms” in Mexico, for example—and how and why they have been followed by less food production rather than more? When the senator complains that the rich in a poor nation do not “invest in their own economies” but place their funds abroad, has it occurred to him to ask why they do so?

WHY FUNDS GO ABROAD

If he asks them confidentially, they will tell him. Abroad, they are free to choose their investments. They are free to look for the best returns. They are not subject to excessive taxation. They are not holding a currency that is constantly falling in value. (In the last ten years the currency of the Argentine has lost 92 percent of its purchasing power; the currency of Chile has lost 94 percent; of Bolivia 95 percent; of Brazil 96 percent.) The rich in most such countries live in constant fear of expropriation. Will “land reform” reassure them?

In the last twenty years foreign aid may have made American taxpayers $115 billion poorer, but it has not made the recipients that much richer. The funds have not gone into the most productive ventures, but largely into grandiose but wasteful socialistic projects.

If our economic aid were tapered off, the poor countries would have to try to attract private investment, both domestic and foreign. They would have to give guarantees that capital and profits could be repatriated, and guarantees against currency exchange restrictions, against discriminatory taxation, price and profit controls, government-owned competition and above all against expropriation.

And the government that reluctantly gave such guarantees would be amazed to find how suddenly its country would begin to prosper.

Great Society’s Cost

November 22, 1965

The last session of Congress passed bill after bill to enact the Great Society, the complete welfare state. It gave something to everybody. Major programs included medicare, the war on poverty, aid to Appalachia, foreign aid, aid to local elementary and high schools, aid to colleges, aid to farmers, aid to cities. Congress voted money for public health, for economic development, for public housing, for work-training programs, for adult education, for control of water pollution and air pollution, for making salt water into fresh water, for a National Foundation on the Arts and Humanities, and so on and on. It authorized rent subsidies for low-income families, but postponed an appropriation.

The first year’s money-cost of each of these programs was often specified, and sometimes even the rising cost in later years. But neither Congress nor the Administration has so far bothered to put the total cost together, even for the first year, let alone the next five.

SIZE OF THE BILL

That total cost will be high. Senator Dirksen made public a compilation by the staff of the Republican policy committee of just 50 examples of authorizations and appropriations passed in the last session. The total cost of these, over the next five years or so, came to more than $112 billion. The New York Times reports that total Federal government spending will rise a minimum of $10 billion and a maximum of $13 billion in the calendar year 1966 over 1965. Still another unofficial estimate is that total cash Federal spending will rise to $130.2 billion in the current fiscal year ending next June 30 (as compared with $122.4 billion in the 1964–65 fiscal year), and to $143 billion next fiscal year.

Where is the money going to come from? Who is going to pay for the Great Society—and when? There is no evidence that either the Administration or Congress has so far paid any attention to these questions.

Let us suppose that we miraculously resolved to return to balanced budgets, and to pay as we go for the Great Society. How much would taxes have to be increased?

Last January the President estimated total cash receipts for the current fiscal year at $123.5 billion. Just to pay for this fiscal year’s $130.2 billion would mean raising $6.7 billion more. To pay for next year’s expenditures we would have to raise $19.5 billion more. Over the last five years tax revenues have risen an average of $2.8 billion a year in the administrative budget, and an average of $4.7 billion a year in the total cash budget. But even if we assume that they will rise $5 billion next year, we would still have to raise about $14.5 billion more by more taxation.

WHO WILL PAY?

How and where would we get it? Let’s look at our four main revenue sources, which together raise 87 percent of all our tax receipts. Personal income taxes are officially estimated to bring in $48 billion this fiscal year. The tax rates in excess of 50 percent, however, have been bringing in less than $250 million a year—not enough to run
the government for a full day. If raised they would probably yield even less. More money would have to come from increases in rates on middle and lower incomes.

The corporation tax yields less than $28 billion. It already takes nearly half of corporate income. If raised it would further penalize and discourage production. Excise taxes yield less than $14 billion. Even if restored to previous levels they would only yield about $1.7 billion more—and of course discourage sales and output. Employment taxes yield less than $19 billion. They will certainly be raised; but they fall proportionately on the lowest incomes, and force the poor to pay for their own welfare benefits.

If our Federal government were bound by the restrictions of many foreign governments, and of some of our states, and were forced to accompany every new spending bill with a new tax bill to raise the money for it, so that everybody knew who was paying as well as who was getting, there would be considerably less enthusiasm for the Great Society.

The current delusion is that the cost will come out of some fourth dimension. But there is strong reason to suspect that in the long run the anti-poverty program will create more poverty than it relieves.

Garrotting by Guideline

December 6, 1965

It is hard to say whether it is the legal and political or the economic implications of the government’s recent adventures in price-fixing that are most disturbing.

The Administration has no legal authority from Congress to fix prices. Yet by public threats to use its huge stockpiles to flood and depress the market (and also, according to some published accounts, by off-the-record threats of antitrust action, income-tax review and shifting of defense contracts) it has succeeded in forcing the aluminum and copper industries to roll back announced price increases.

Nor did the government state clearly in advance, nor has it stated yet, precisely what its price-fixing standards are, so that an industry or a particular firm may know when it is “violating” them, and by how much.

The best things we have to go by are the government “guidelines” for wages and prices. These turn out to be either very vague or very rigid, depending upon who happens to be involved. If one could state the guidelines as general rules, they would run like this: “Wages in any industry should rise no faster than the national average gain in output per man-hour, or ‘productivity’ (which the government says is 3.2 percent a year); and prices should not go up at all.”

ECONOMIC Nonsense

If we begin to count up even the government’s own “exceptions” to this, the guidelines dissolve into mist. And if we take a realistic look at the general rule itself, it turns out to be economic nonsense.

Even if we accept the government’s questionable average productivity-gain figure, it is obviously absurd to make the wage increase of an individual worker, or even of all the workers in a single industry, equal to the national average gain in “productivity.” For the “productivity” increase of some workers may be far higher than the national average, and the “productivity” increase of other workers far less. Why should all get the same increase? This would not only be unjust but would retard the flow of workers to the industries where they are most needed.

Again, the “man-hour productivity” that the Council of Economic Advisers “measures” is really man-machine hour productivity. It is not “labor productivity” but the combined productivity of labor and capital; and it has been rising each year not because workers annually work harder but because more and better equipment is put into their hands. If the whole increase went to the workers, and none to the capital investment that made the increased productivity possible, the capital investment (and the increased productivity) would cease.

Prices are Guides

Still more absurd is the attempt to hold every price just where it is. The government is trying to apply the Procrustean rule to steel, aluminum and copper, though conditions are radically different in the three industries. Aluminum, for example, even if its price increase had been allowed to stick, would still be selling below its price five years ago. The industry’s return on net worth in 1964 has been calculated at 7.4 percent as compared with a 12.7 percent average for all U.S. industry.

The government’s rigid rule overlooks the whole function of prices in a free economy. Prices are an indispensable guide to producers. The relative profits and losses they lead to determine the ever-changing balance of production among thousands of different commodities and services. It is always harmful to freeze prices. Prices have work to do. Each individual price must be free to tell the truth about conditions in its industry. Government bureaucrats do not know what the price of anything, let alone the price of everything, ought to be. Only the free market, only the unceasing play of supply and demand and competition, can decide. Price-fixing can only choke and disorganize production.
The real author of inflation is the government. It has been averaging an annual cash deficit of $4 billion for the last six years. It has been pushing down interest rates. It has been increasing the money supply recently at an annual rate of 8 percent. It has cheapened the dollar. And now it tries to divert attention from its own inflation (which it calls “expansionary” policies) by making industry the scapegoat.

Fixing Interest Rates
December 20, 1965

The action of the Federal Reserve Board in raising the discount rate from 4 to 4½ percent was necessary to head off a further inflation. So far from being premature, as suggested by President Johnson, the step was overdue. Interest rates have already been held down by government policy too much and too long.

In a free economy every price has a vital function to perform. That function is to register the state of supply and demand, to guide the economic actions and decisions of all of us, to maintain a constantly balanced and synchronized output of thousands of different commodities and services. Government price-fixing can only misguide and dislocate production.

If there is one price in the economy that is more important than any other it is the interest rate. This is popularly thought of merely as the cost of borrowing “money.” Some economists have called it, more broadly, the price paid for the services of capital. It would be much better to call it the price of time. It is the discount on future goods as against present goods. It affects the price of all securities and all price relationships. The interest rate determines the relative production of capital goods as compared with consumption goods. It affects how much people spend of their income, how much they save and invest and where they invest it.

A COMPETITIVE PRICE
The market rate of interest—or, more realistically, the constellation of market rates of interest—is extremely competitive and fluid. There are more than 14,000 banks in the country, all in daily competition with each other for customers. It is preposterous to assume that they could all conspire to fix any interest rate or set of interest rates. Anybody with cash is free to decide at any moment to become a lender. Interest rates fluctuate daily and hourly in the markets of the world.

And yet the President’s economic advisers presume to know better than the market exactly how high interest rates ought to be. Mr. Johnson recently indicated that he would be gravely displeased if banks raised their “prime rate” to their best customers above 4½ percent. Secretary Fowler solemnly declared that any increase in interest rates would be “premature and unwise.”

How do government officials get that way? They get that way because they and their advisers have come to believe devoutly in the theories of the late Lord Keynes. According to Keynesian theory it is properly a function of government, and not of the market, to fix interest rates. And it is likewise always the government’s duty to fix interest rates very low. The theory is that low interest rates encourage borrowing, investment and full employment.

CAN’T GO ON FOREVER
One thing the theory overlooks is that arbitrarily low interest rates discourage saving. This does not bother the Keynesians because they forget that what is being borrowed and lent is ultimately real capital. They assume that the only thing involved is “money”—and more paper money can be printed at will. Therefore, if you want to push down interest rates all you have to do is increase the supply of money and credit. So Federal Reserve policy had been increasing the money supply in recent months at an annual rate of 8 percent.

It is true that, under certain conditions (such as we have had for the last five years), cheap money and currency expansion can bring about a temporary boom. But the process in the end defeats itself. The increased money supply raises prices and costs. Expectations of further increases in the money supply then cause an increase in interest rates to compensate lenders for an expected fall in the purchasing power of money. (As the cost of living has increased 1.8 percent in the last twelve months, a government bond with a money yield of 4.2 percent has had a real yield of only 2.4 percent.)

Our artificially low interest rates, our budget deficits, our rapid expansion of the money supply have been the basic causes of the rise in prices and costs, the deficits in our balance of payments and waning faith in the dollar. The increase in the discount rate was a step in the right direction. Let us hope that the inflationists in Congress or the Administration do not nullify it.
1966
Manipulating Money
January 3, 1966

The action of the Federal Reserve Board in raising the discount rate from 4 to 4½ percent on Dec. 5 touched off a string of controversies. Let us look at three of the main questions it raised.

1—Was the Fed justified in raising the money rate? Yes. Failure to act, or even further delay, would have touched off a dangerous inflation. The question may be raised, in fact, whether the action went far enough. It was accompanied by official assurances of “continued provision of additional reserves to the banking system, in amounts sufficient to meet seasonal pressures as well as the credit needs of an expanding economy.” How will this be translated into action? If the Fed continues to expand the money supply as rapidly as in the recent past, it can nullify its discount-rate increase.

2—Should the Federal Reserve Board be independent, or should it be forced to “coordinate” its money and credit policies with those desired by the Administration in power? Clearly the Reserve Board should be independent. The government in office should not have the power to dictate or overrule its decisions. This was the express intention of Congress in setting up the Reserve System. This is precisely why the seven governors of that system are appointed for overlapping terms of fourteen years each. Without this independence the interest rate, and money and credit, would become the direct playthings of politics. For the politicians in power not only want perpetual prosperity, full employment and “economic growth,” but they are convinced that these can only be brought about by continuous cheap money and currency expansion—in other words, by chronic inflation.

During and after World War II, when the Treasury was allowed to dictate, it forced the Fed to create billions of new dollars to buy its bonds. Other illustrations were seen in recent weeks when the inflationists in Congress “investigated” the Reserve Board for raising the discount rate, when the President “regretted” its decision, and when the Secretary of the Treasury voiced the extraordinary opinion that higher interest rates here would probably do nothing to stem the flow of dollars abroad (a chief reason why it was done), but would simply lead Europe and Japan to push their own interest rates even higher. “Long before we could level rates here and abroad through this process,” the Secretary asserted, “we would drive this country into a recession.” His own theory seems to be that interest rates are not determined by market conditions but solely by government money managers; and that foreign governments have a suicidal desire to push up interest rates at home to recession-creating levels.

3—Should governments be in the business of fixing interest rates and manipulating the money supply? This is the first question that ought to be raised rather than the last. If the Fed is forced to “coordinate” its policies with those of the Administration in power the outcome is almost certain to be chronic inflation. But the dilemma is that if the Fed tries to act independently the result may be dangerous discoordination. The Fed cannot put its foot on the brake while the Treasury puts its on the gas. If the Treasury runs a chronic deficit it leaves the Fed no choice but to buy and monetize government securities.

When government officials are in the business of manipulating interest rates and the supply of money, everyone has a different opinion of what they ought to do. The Fed governors cannot agree even among themselves; their vote on the discount-rate increase was 4 to 3. A thousand “monetary economists” voice a thousand different opinions as to the exact “timing” and “policy mix” that are called for—what interest rate, what size budget deficit, what open-market operations—and when. To apply the proper mix and timing all we have to be sure of is the future.

But none of these insoluble problems arises if we stop assuming that it is the function of government to fix interest rates and to manipulate the money supply. Its function and duty are to maintain the integrity of the currency unit at all times (by, say, keeping it always convertible into a fixed amount of gold). It should leave interest rates to the market. *

LBJ’S Budget Dilemma
January 17, 1966

For the last five fiscal years, the government has been run at a continuous deficit. Spending has been increased year by year. In the current fiscal year it is expected to exceed $105 billion, some $24 billion more than in fiscal 1961. In addition, substantial tax cuts have been enacted. The result has been an annual deficit averaging more than $6 billion.

This fiscal record has been accompanied by five years of uninterrupted boom. And the boom, following the tenets of the “new economics,” has been attributed to the fiscal policy.

But now Mr. Johnson finds himself confronted with an embarrassing dilemma. The cost of the war in Vietnam is mounting ominously. This comes on top of the scores of Great Society programs rushed through
Congress last year. These alone, if uncurbed, could call for $10 billion more spending in the next fiscal year than in the current one. Even in the current fiscal year the deficit is expected to reach $8 billion. With the economy already overheating, with labor shortages in many lines, with consumers’ prices every month going to a new high record, how big a deficit can be tolerated in the next fiscal year, without letting loose a serious inflation?

For in a situation like the present one even orthodox Keynesianism prescribes that “expansionary” policies should be terminated, if not thrown into reverse. This means not only that the recent $6 billion average annual deficit must not be allowed to grow, but should be completely wiped out.

**UNPALATABLE COURSE**

But **politically** such a course would be not only unpalatable but almost unthinkable. If the Great Society expenditures are not forthcoming or are drastically curtailed, there will be a deafening outcry from the favored groups to which they have been promised. The political loss to the Johnson Administration will be far greater than if the subsidies had never been proposed. Should taxes be raised, then—say by canceling the tax cuts made in the last two years? This would be politically even more repugnant. As the tax cuts were proportionately greatest on the lower incomes, the argument would be made that the little fellows were the biggest victims of the tax restoration. Besides, the public was told that a tax cut is the way to increase revenues. Can it now be persuaded that a substantial tax-rate boost will really bring in the needed added revenue?

**NEVER TIME TO BALANCE**

The present dilemma is the inevitable product of past fiscal philosophy and practice. In the 1930s it began to be said that those who asked for an annually balanced budget were ridiculous “puritans” preaching an outmoded orthodoxy. The new slogan was a “compensated economy.” The budget was to be balanced only over the “business cycle.” There were to be deficits in all the bad years and balanced budgets or surpluses only in the good years. But it soon turned out that hardly any year was considered good enough in which to risk even a balanced budget, let alone to achieve a compensating surplus. To plan for a substantial surplus was considered fiscal folly. Even to balance the budget was to invite a dreaded “fiscal drag.” So the only answer left was continual deficits.

If this doctrine was not invented by the politicians, it exactly suited their needs. They adopted it with alacrity. That is mainly why we have had 30 deficits in the last 36 years. Nothing is more popular than voting big handouts from the public till to innumerable pressure groups. Nothing is more unpopular than raising taxes to pay for them. If Congress (like some of our state legislatures) were obliged to accompany every proposed new appropriation with higher taxes to pay for it, our Federal nondefense expenditures today might not be half as large as they are.

Nothing breeds fiscal irresponsibility faster than cutting the connection between expenditures and taxes. There is no real watchfulness over increased expenditures when nobody is being asked to pay for them, when they are going to be paid for by “the other fellow” in the sweet by-and-by.

The policies promoted by the “new economics” are not only unsound in all their economic assumptions; they are politically demoralizing. We shall soon learn whether they are also politically irreversible.

---

**The Right to Replace**

January 31, 1966

The New York transit strike was handled with incredible ineptitude; but the Transit Authority and the new mayor were not solely to blame. They operated in an ideological climate and in a legal framework that made sensible action difficult.

If the strike had occurred in a different atmosphere (like that, say, in 1919 when Calvin Coolidge broke the Boston police strike) we can imagine a vastly different official attitude. The city authorities would have announced at the very beginning their determination to keep the buses and trains running. They would have immediately hired drivers for the buses and motormen for the trains, offered them permanent employment and given them police (or even National Guard) protection. Strikers would have been considered as having quit their jobs, and would have had to apply individually for reinstatement.

If such an announcement had been made before the strike deadline, it is unlikely that the strike would have been called. Even if it had been, it is probable that the city would have had buses running the first day and some trains within two or three days. Either the strike would have collapsed or the union would have quickly accepted a much more reasonable settlement than it did.

**FEAR OF VIOLENCE**

Instead, a disastrous strike was allowed to paralyze transportation for twelve days, and to inflict hardship and suffering, and losses estimated at $1 billion, most of them irrecoverable, on the people of New York. In the end, the strikers were handsomely rewarded for their callousness and defiance of law by the most extravagant
and costly wage increase in the city’s transit history—an increase that went far beyond what they would have got if they had not struck. And what is most amazing is that the obvious course of keeping at least the buses running never publicly occurred to the mayor or the Transit Authority.

The chief reason why this straightforward course was not taken was never mentioned. The city authorities feared vandalism and violence on the part of the strikers. For the strikers set up picket lines, the very purpose of which was to prevent anybody else from taking the jobs that they themselves had vacated. Their right to do this was not questioned.

It was not always so. In earlier days a realistic judge would decide that picketing in numbers, so far from being peaceful exercise of free speech, “tends, and is designed by physical intimidation, to deter other men from seeking employment in the places vacated by the strikers. It tends and is designed to drive business away from the boycotted place, not by the legitimate methods of persuasion, but the illegitimate means of physical intimidation and fear.” (Judge Henshaw in 1909.)

**Freed to Intimidate**

And only last June, Enoch Powell, one of the leaders of the British Conservative Party, declared: “[British] law permits things to be done in furtherance of a trade dispute which would be criminal or would give rise to a right to damages if they were done in any other circumstances. . . . Private coercion of the trade union rests [on] the freedom to intimidate—technically this is called peaceful picketing, but it is what you and I call intimidation—the freedom to damnify another person with impunity; and the immunity of trade unions from action of tort—all provided the acts in question are in ‘contemplation or furtherance of a trade dispute’.”

The American legal situation is in some respects even worse. Yet one-sided laws, and the fear of violence, are not the only reasons why steel mills no longer attempt to keep operating during a strike, why newspapers don’t dare to publish and why New York City did not even try to keep its buses and subways running. A confused public opinion must also take part of the blame. Union propaganda has succeeded in making “strikebreaking” the most wicked crime on the calendar. But if no strike can ever be broken, the strikers must always win, no matter how extravagant their final demands, and more and more strikes, with consequent economic paralysis, must be encouraged and rewarded.

If the New York transit strike at last causes a realistic reappraisal of law and opinion on picketing, it may have been worth its cost.

---

**Irresponsible Budget**

February 14, 1966

If we accept the budget on its face, it is better than the country was led to fear. Administrative spending is put at $112.8 billion, instead of $115 billion, and the budget deficit is put at $1.8 billion, which would be the smallest in seven years. Yet even $112.8 billion spending would be the highest for any year in our history—$6.4 billion more than in the current fiscal year, and $46.6 billion more than ten years ago. The deficit would be the 31st in the last 37 years.

In the cash budget, which includes social security, and more fully reflects the economic realities, total spending for fiscal 1967 is put at $145 billion. This is $10 billion more than in the current year and $72.5 billion more than ten years ago.

Many dubious accounting gimmicks have been used to keep down the expenditure figures, to put up the revenue figures and to get a low deficit estimate. For example, the government proposes to sell private investors $4.7 billion of Federal financial assets. But the expected proceeds from these sales, instead of counting as revenues, are counted as a reduction of expenditures. Scores of items scattered through every crevice of the new budget launch or continue programs that are sure to grow substantially later.

**How Reliable?**

The government counts on a huge $11 billion increase in revenues. But only $1.2 billion of this is to come from “temporarily rescinding” previous excise-tax cuts. About $3.7 billion is to come from advancing corporate and individual income-tax payments. These are nonrecurring items. Again, the Treasury counts on $1.6 billion “receipts” by a shift to silverless coins. The rest of the expected $11 billion increase in revenues represents optimism about “economic growth.”

Suppose now, instead of accepting the spending and revenue figures on their face, we ask how reliable the estimates are. If we judge by the past, the answer is not reassuring. Last year Mr. Johnson estimated fiscal 1966 spending at $99.7 billion; it is now placed at $106.4—$6.7 billion higher. A similar error for 1967 would mean administrative spending of $119.5 billion and a deficit of $8.5 billion, even if present accounting gimmicks were retained.

Suppose we go back to Mr. Johnson’s predecessors. In January 1962 President Kennedy said: “I am submitting for fiscal 1963 a balanced Federal budget.” But there turned out to be a deficit of $6.3 billion. In January 1961 President Kennedy submitted expenditures which he promised “will not of and by themselves unbalance
the earlier budget.” But the deficit for 1962 was $6.4 billion. In fact, with few exceptions the budget estimates of the last 37 years have either grossly underestimated deficits or promised surpluses that never materialized.

NON-DEFENSE BILLIONS
The truth is that we have never had a responsible budget—in the sense, say, that Great Britain has a responsible budget: one that, once adopted, both the legislature and the executive must scrupulously adhere to. What we have is a set of Presidential guesses not binding on anybody. But the budget just submitted by Mr. Johnson is irresponsible even in its proposals. At a time when he himself declares inflation to be our most serious economic danger, and when he is forced, according to his own estimate, to increase national defense expenditures in 1967 by $10.3 billion because of Vietnam, it is irresponsible to propose also an increase in welfare programs by $3.3 billion. If he had refrained from this increase he would have been able to report at least an intended surplus of $1.5 billion instead of an intended deficit of $1.8 billion.

The President talks as if only unavoidable defense costs create his budget problem. But if we compare even the 1967 budget with that of ten years ago (1956), we find defense costs up only $20.5 billion while all other costs are up $52 billion.

The new budget is undoubtedly inflationary. But it would be inexcusable to increase the already excessive and growth-stunting burden of taxation on the American people on the plea that this is necessary to combat the inflation. The way to prevent further inflation is to start slashing billions of fat out of 1967’s projected non-defense spending of $83.6 billion.

Big-Brother State
February 28, 1966

The annual Economic Report of the President, a child of the Employment Act of 1946, has come to be considered a sort of official economic textbook. Yet it is primarily a political rather than an economic document. I described it here in 1952 as “political propaganda paid for by the taxpayers.”

That description would apply to most of the annual economic reports, and certainly to the latest, which reads like a campaign speech. Most of it hammers in the message that you never had it so good and implies that you owe it all to the Great Society programs. The rest of it proposes still more controls and spending programs. All of these, of course, are to be piled on top of all the welfare and subsidy programs that have grown up during the preceding 36 years. The idea that private competition, free enterprise and individual initiative ever accomplished anything is scarcely acknowledged.

These welfare programs are expensive, though in the President’s Economic Report, otherwise crammed with euphoric figures, this expense is not mentioned. The government’s total cash expenditures in fiscal 1967 will be $145 billion, of which $83.6 billion will be nondefense spending. Both figures will be the highest on record. Compared with only five years ago (fiscal 1961) non-defense spending will be up $31.8 billion. Compared with ten years ago (fiscal 1956) it will be up $52 billion.

ALL TO SPONGE ON ALL
All this must be collected from the taxpayers. The government has nothing to give to anyone that it does not first take from the community. Yet Mr. Johnson constantly talks as if his Great Society programs will fill far more needs than the people could fill for themselves. Everybody is to live at the expense of everybody else.

This bewildering multiplicity of new programs adds up to the Big Brother state. Are there any unfulfilled desires anywhere? Then the government will fill them. If there are or ought to be any limits to the sphere and powers of the state, the Economic Report gives no hint of what they are.

The report makes scores of recommendations, but with one or two exceptions (e.g., more pollution control) nearly all of them are questionable. Instead of proposing that the government refrain from further inflation, the report seeks to end the balance-of-payments deficit by continuance of controls. It proposes that international monetary inflation be facilitated by “creation of new [non-gold] reserve assets.” It proposes that the aims of foreign aid be expanded. It proposes that the Federal government “rebuild” the cities—i.e., that the taxpayers of every city pay for the rebuilding of all the other cities—as if this somehow relieved them of the cost. It proposes to end compulsory unionism even further by repealing Section 14(B) of the Taft-Hartley Act. It proposes to increase compulsory unionism even further by proposing to raise the minimum wage and so make it still harder for teen-agers and unskilled workers to get jobs.

WHO MAKES INFLATION?
But what is of most immediate importance in the Economic Report is its discussion of inflation and the need of “maintaining cost-price stability.” At one point, it is gratifying to see, the report comes close to acknowledging that the primary responsibility for inflation lies with the government’s own policies: “The basic precondition for price stability is a fiscal-monetary policy that deters total demand for goods and services from...
He does “not believe the Congress will wish to make the House the least representative of our three elective elements by perpetually condemning half its membership to a shrunken electorate.”

This is surely a strange argument. Today the whole membership of the House, and a third of the Senate, is “condemned” in off-year elections to a “shrunken electorate.” But no one has previously suggested that this weakens their political position. On the contrary, the congressmen elected in Presidential midterm are more likely to be elected on their own merits, and not merely on the President’s coattails or the party label.

The principle of staggered elections and overlapping terms, which already governs the Senate, should be carried still further. There would be clear advantages in electing one-fourth of the members of the House every year for four-year terms—and even in electing one-sixth of the members of the Senate every year, instead of the present one-third every two years, for six-year terms.

The primary advantage would be those “frequent elections” which the authors of the *Federalist Papers* thought the best assurance for securing that the House of Representatives should have “an immediate dependence on, and an intimate sympathy with the people.”

IN CONSTANT TOUCH

Annual elections would keep both Congress and the President in constant touch with and response to public opinion. It would keep constantly alive the people’s interest in the policies of their government. It would give them a sense of constant control of these policies. In Britain intense interest is taken in a by-election, to fill a vacancy in Parliament, for whatever indication this may give of a new temper or verdict of the voters. Annually staggered elections to Congress would do this in a balanced and systematic way.

In the past, the months just prior to a national election have usually been marked by hesitation and uncertainty in business and the markets. The election of one-fourth of the members of the House each year would obviate the fear of a violent reversal of established policies, a complete overturn of the House, the election of a preponderance of new and inexperienced members. Above all, it would obviate the consequences of a momentary landslide, and a lopsided rubber-stamp Congress that had ridden in on the coattails of a charismatic Presidential candidate. Policies would not be fixed for four long years by the mood or fears dominant in a single election. Congress would be more likely to remain what the Founding Fathers intended a check and balance on Presidential power, and not merely one more instrument of that power.
Slash the Spending
March 28, 1966

For the last five years the “new economists” have denied that their policies led to more inflation. Now that they are at last forced to recognize this, they are proposing one of two cures, or both. The first is price and wage controls; the second is another tax increase. The first is not a cure at all but merely an additional disease. The second is harmful and unnecessary.

The simple cure for inflation is to stop inflating. The direct cause of inflation is the increase in the quantity of money and bank credit; the direct cure is to stop this increase. In order to make this possible we must stop the budget deficits. There are two ways to do this. One is to increase taxes; the other to cut expenditures.

But a further tax increase, on top of the $5 billion annual increase in social-security taxes that went into effect Jan. 1, and on top of the $6 billion increase just enacted, i.e., on top of the unparalleled tax burden of $145 billion that the American people already carry for 1967, would discourage production and constrict the economy. No one has been more insistent on this result in the last few years than the new economists themselves. They supported a tax reduction when we could not afford it. As we already had an inflationary deficit, the tax cut simply made it greater. It was therefore a sham tax cut. It merely substituted inflation, which President Johnson has called “the most unjust and capricious form of taxation,” for other taxes.

HUGE NON-DEFENSE COST
And it was the wrong kind of tax cut, both politically and economically. If everyone’s taxes had simply been cut by an equal percentage, it would now be politically easy to restore them by a corresponding percentage. But proportionately the tax cuts were greatest on the low-bracket incomes, making income-tax rates even more steeply progressive than they already were. The Administration and Congress would therefore not dare now to restore personal income tax rates to their previous levels because they would be accused of making the increase greatest on the lower incomes.

Yet with the clear threat of further inflation, it is imperative that we reduce or eliminate the “inflationary gap,” i.e., the excess of expenditures over revenues. The best way to do that is to reduce expenditures.

We are being told that this cannot be done, because the present huge spending is necessary to pay for the war in Vietnam. But this is not so. In the cash budget for the fiscal year 1967 total national defense expenditures are estimated at $60.5 billion. Non-defense spending comes to $83.6 billion. If we compare the 1967 budget with 1956, we find that defense costs in this eleven-year period have risen only $20.5 billion while non-defense spending has increased by $52 billion. The way to prevent further inflation is to start slashing this enormous non-defense total.

SAVING $10 BILLION
How many billions need to be slashed off? Technically, the 1967 cash budget is already estimated to be in balance. But if (allowing for the dubious accounting gimmicks and the probable underestimate of expenditures) we assume that the real deficit will be at least $5 billion to $10 billion, then this is the amount that expenditures should be cut.

Anyone who thinks there is anything unreasonable or impossible about a cut of these dimensions need merely look at the increase in non-defense spending in the last few years. For 1967 it is $12 billion more than in 1965, $23 billion more than in 1963 and $32 billion more than in 1961. All we have to do to cut out even $10 billion is to cut out the new spending programs added since 1965 alone. If we don’t want to do it that way, we might do it by slashing one or two of the more dubious categories of spending such as the $4 billion for foreign aid, the $3 billion for farm subsidies, the $4 billion for the most expensive road-building program in history, the $4 billion for putting a man on the moon or part of the $46 billion of welfare spending.

But don’t let anyone tell you that we need to levy $5 billion or so of increased taxes (on top of $145 billion already there) to “prevent inflation” or to pay for the Vietnam War. The money is “needed” only to pay for the extravagant Great Society programs of the last few years.

Minimum Wage vs. Jobs
April 11, 1966

If there is anything that economists of nearly all schools are agreed upon, it is the folly of minimum-wage laws. They hurt most the very people they are designed to “protect.” When a law exists that no one is to be paid less than $50 for a 40-hour week, then no one whose services are not worth $50 a week to an employer will be employed at all. We cannot make a man worth a given amount by making it illegal for anyone to offer him less. We merely deprive him of the right to earn the amount that his abilities and opportunities would permit him to earn, while we deprive the community even of the moderate services he is capable of rendering. In brief, for a low wage we substitute unemployment.
Among eminent economists who have recently expressed their opposition to minimum-wage laws are Prof. James Tobin, formerly President Kennedy's economic adviser; Prof. Arthur Burns, former head of the President's Council of Economic Advisers, and Prof. Gottfried Haberler of Harvard. As Professor Tobin has put it:

“People who lack the capacity to earn a decent living need to be helped, but they will not be helped by minimum-wage laws, trade-union wage pressures or other devices which seek to compel employers to pay them more than their work is worth. The more likely outcome of such regulations is that the intended beneficiaries are not employed at all.”

CONTINUOUS BOOSTS
The Fair Labor Standards Act of 1938 fixed a minimum wage of 25 cents an hour. This was raised to 30 cents in 1939, to 40 cents in 1945, to 75 cents in January 1950, to $1 in March 1956, to $1.15 in September 1961 and to $1.25 in September 1963.

In an illuminating study published in The Management of Prosperity (Columbia University Press, $3.50), Professor Burns has found that each time the minimum was raised, it was set at approximately half of the average manufacturing wage. However, the statutory minimum was only 29 percent of average hourly earnings in manufacturing just before the increase in 1950, while the corresponding figure reached 40 percent just before the increase of the minimum in 1956, 43 percent before the increase in 1961 and 47 percent before the increase in 1963.

Thus, over the years there has been a strong rise in the ratio of the legal minimum to the average wage. The minimum wage rose 67 percent between early 1956 and 1964, while average hourly earnings in manufacturing rose 34 percent. Meanwhile, the Federal minimum has become effective over a greater range of industry, and many states have likewise raised or expanded the coverage of their minimum wages.

UNSKILLED MOST HURT
The result of all this has been to force up the wages of unskilled labor much more than those of skilled labor. A result of this, in turn, has been that though an increasing shortage has developed in skilled labor, the proportion of unemployed among the unskilled, among teen-agers, females and non-whites has been growing. The ratio of the unemployment rate of teen-agers to that of male adults, Professor Burns finds, was invariably higher during the six months following an increase of the minimum wage than it was in the preceding year.

“The broad result of the substantial increase of the minimum wage in recent years,” Professor Burns concludes, “has therefore been a curtailment of job opportunities for the less skilled workers.” And his calculations indicate that “another increase of 25 cents in the minimum wage would be likely to raise the unemployment rate of non-white teen-agers by as much as 8 percentage points.” Teen-age employment has improved recently at least in part because the minimum wage has not been raised since September 1963.

Professor Haberler concludes that “Raising the minimum wage would thus be an irresponsible anti-social measure, reducing job opportunities of the poor, promoting inflation and retarding growth.”

Yet under pressure from the union leaders, Congress is all set to give another boost to the compulsory minimum wage from its present level of $1.25 an hour to $1.40 next February and $1.60 in February 1968 and to extend the coverage to more than 6 million more workers.

Why Inflation Grows
April 25, 1966

While expressing constant concern about inflation, the Johnson Administration is still inflating. It is scolding the symptoms while doing nothing to stop the causes.

The cause of inflation is the increase in the quantity of money and credit. The money supply (including time deposits) now stands at a new high record of $317 billion, 9 percent higher than a year ago, and 48 percent higher than at the end of 1960.

One main reason for the increase in the money supply is the action of the Federal Reserve System in buying and “monetizing” U.S. Government securities. It holds today $41.1 billion of them, which is $3.3 billion more than a year ago. Interest rates are still kept low enough to encourage continued expansion of bank credit.

The rapid increase in the money supply has been in turn brought about by the Federal deficits. We are heading into the 31st deficit in the last 37 years. The real cash deficit for 1967 is concealed by various bookkeeping gimmicks and an underestimate of probable expenditures. Objective analysts expect the real deficit to be $5 billion to $10 billion.

TAX CUT OR SPENDING?
The deficit can be reduced or wiped out either by reducing expenditures or by raising taxes. By all odds the sounder course is to start restraining nondefense expenditures, and certainly not to impose any further tax increase. Cutting planned expenditures by $5 billion or $10 billion might be awkward for vote-conscious
continued to increase spending with the casualness and recklessness of the last few years. We would face the grim prospect of a thumping tax increase plus still more inflation.

There is no substitute for a curb on spending.

Retarding Growth
May 9, 1966

The Johnson Administration now daily proclaims its concern about inflation, while it completely ignores its own chief role in creating it and puts the blame on everybody else, particularly businessmen. It neglects the right remedies and presses for the wrong ones. But of all the strange things it is doing, perhaps the strangest is to urge businessmen to reduce their investment in new plant and equipment.

The fear that productive capacity is expanding too fast, or that costs of production are being reduced too much, reveals a complete confusion of cause and effect. The present high rate of plant expansion and capital-goods expenditures is not a cause of inflation; it is simply one of the results of inflation. The direct cause of inflation is the increase in the quantity of money and credit. The newly created money must go somewhere. If the Administration can succeed in keeping it from going into productive investment, it will merely go into unproductive consumption.

WHY PLANT EXPANSION

The reason a good deal of the new money is going into plant expansion is clear. The new money increases monetary demand in varying degrees for nearly all products. It tends to raise their prices. Corporations, making bigger sales and bigger profits, are encouraged to invest in additional and newer plant and equipment to expand their output and increase their margins of profit. If they expect inflation to continue, their stimulus to plant expansion is even greater. The sooner they expand, the cheaper they can get their new plant and equipment; the longer they delay, the more it will cost them—not to speak of the profit they will lose if expansion of output is delayed.

Of course this has its dangers. Inflation and the expectation of more inflation create distortions, illusions and false expectations. Much of the new investment will go into the wrong places. It will not pay off. But the cure is for the government to halt its inflation before it is too late; it is not to call up businessmen and to ask them to exercise “voluntary restraint” in new politicians but could be done with economic advantage all around. Planned nondefense expenditures for 1967 are $12 billion more than in 1965, $23 billion more than in 1963 and $32 billion more than in 1961.

Those who argue that the only way to eliminate the deficit is to raise taxes are by implication making the preposterous claim that every dollar of the $83.6 billion of nondefense expenditures planned for the next fiscal year is essential and untouchable. Yet this nondefense total alone is $52 billion higher than ten years ago.

The Republicans in Congress are on the right track in pushing for a cut in spending. Their voting record in this respect is far from perfect, but it is immensely better than that of the Democratic majority. In seeking to cut a uniform 5 percent out of each domestic appropriation bill the Republicans, it is true, are not adopting the most defensible course. A family forced to cut expenses would hardly think it sensible to cut both its food budget and its annual vacation in Europe by the same percentage.

The Republicans in Congress would be in a stronger position if they (and, we may hope, Democrats too) were to memorialize the President to submit an amended budget cutting at least $5 billion out of his present proposed total cash spending of $145 billion for 1967. This ought not to be too difficult. The nondefense part of this spending alone is $6 billion more than in the current fiscal year and $12 billion more than in 1965. If the President refused to make his own cuts, he would be in a poor position to criticize the cuts made by Congress.

There are decisive reasons why a further tax increase at this time would not be justified:

1—Such an increase is not necessary if present unparalleled nondefense spending is cut.

2—All tax increases retard and restrict economic growth.

3—They would not bring in revenues that would be proportionate to increased rates.

4—The tax reductions made in the last two years, in the face of existing deficits, were political. The Treasury’s own estimates showed that 78 percent of the reduction in personal income taxes enacted in 1964 was made in the taxable income brackets of $4,000 and under. Congress would not dare to restore the 1963 rates for fear of being accused of throwing the burden on the low incomes. But the necessary revenue simply could not be raised by restoring the rates only in the brackets above $10,000.

5—Finally, an increase in taxes of $5 billion would be completely futile if the President and Congress
investment. This vague admonition may merely reduce or prevent precisely the new investment that most needs to be made, without preventing gross malinvestment by those less vulnerable to political pressure.

The quantity of money and credit (including time deposits) has been increased by 9 percent in the last year and 48 percent since the end of 1960. The way to reduce or halt this rate of increase is for the Federal Reserve System to stop buying and monetizing government securities (it has made encouraging moves in this direction in recent weeks), and for the government to stop all attempts to hold down interest rates.

**INTEREST RATES HIGH?**

Historically the present 5½ percent prime lending rate of the banks seems high. But if we assume the continuance of the 2.8 percent annual rate of increase in consumers’ prices, this 5½ percent reduces to a real interest rate, allowing for dollar depreciation, of only about 2.7 percent. This is why business borrowing demand continues to be heavy.

There is an obvious inconsistency between the Administration’s call for investment cutbacks and its decision to retain the 7 percent investment tax credit. But let us hope this inconsistency is resolved in favor of keeping the investment credit. It would be a serious mistake to suspend it. It was enacted by Congress, on President Kennedy’s recommendation, to stimulate capital investment, promote economic growth and make American industry more efficient and more competitive abroad. It is a necessary offset to an excessive corporate income tax. It tends to increase productivity, to provide better-paying jobs, to reduce costs and hence to reduce prices to consumers.

It was designed to be permanent. To try to turn it into an off-again, on-again countercyclical device would lead to belated and unpredictable responses and create business uncertainty. It would substitute the unreliable judgment and timing of government bureaucrats for that of businessmen close to their own special markets.

Let the government stop its inflation, and leave the investment decisions to private enterprise. ✯

**The Attack on Profits**

May 23, 1966

It was bound to happen. Any observer of any previous inflation anywhere could have safely predicted it. The government, having deliberately adopted inflation as a policy, is now blaming businessmen for the unpopular part of its consequences. The attack is led by the very man who has been the chief advocate of the government’s present inflationary policies—Gardner Ackley, chairman of the President’s Council of Economic Advisers. He has been the official spokesman for the “new economics,” for big spending, chronic deficits, cheap money and every other policy that leads to an expansion of the money and credit supply and a lower value of the currency unit. It is he who now exclaims that profits are much too high. “And so I ask you,” he warns businessmen, “to stop, look and listen. Is that price increase you are considering really necessary?” His speech before the United States Chamber of Commerce was ominously reminiscent. The particular rationale for inflationary policies that Ackley has adopted was first advocated by John Maynard Keynes in 1935. Because the chief problem of that time was depression and unemployment, Keynes entirely forgot his own eloquent warning in his “Economic Consequences of the Peace” in 1919:

**KEYNES’S WARNING**

“Lenin is said to have declared that the best way to destroy the Capitalist System was to debauch the currency. . . . Lenin was certainly right. . . . The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose. . . .” The governments of Europe, being many of them at this moment reckless in their methods as well as weak, seek to direct onto a class known as ‘profiteers’ the popular indignation against the more obvious consequences of their vicious methods. These ‘profiteers’ are, broadly speaking, the entrepreneur class of capitalists, that is to say, the active and constructive element in the whole capitalist society, who in a period of rapidly rising prices cannot help but get rich quick whether they wish it or desire it or not. If prices are continually rising, every trader who has purchased for stock or owns property and plant inevitably makes profits. By directing hatred against this class, therefore, the European Governments are carrying a step further the fatal process which the subtle mind of Lenin has consciously conceived. The profiteers are a consequence and not a cause of rising prices. . . .”

**ROLE IN PRODUCTION**

Even Keynes failed to recognize all the distortions brought about by inflation. For a great part of the profits reported by corporations in an inflation are illusory. The deductions for depreciation and replacement, for example, are increasingly inadequate. Moreover, profits
The Cost of Guideposts

June 6, 1966

It would be immensely reassuring if the Administration not only abandoned all efforts at “voluntary” price control and all threats of compulsory price control, but quietly dropped all the nonsense about “guideposts” that the Council of Economic Advisers has been preaching for four years. No one has yet spelled out all the harm that these guideposts have done and are still doing. They are imposed without legal authority and by veiled threats of public censure, antitrust prosecution, income-tax investigation, cancellation of defense contracts or other penalties. The guideposts are discriminatory as between unions and businessmen. Union workers are supposedly “entitled” to a 3.2 percent annual advance in wage rates, based on some calculation of “average growth of labor productivity,” but business is not entitled to any price advance at all. The guideposts are discriminatory as between industries, because public obloquy can be more effective in a line of production, such as steel, aluminum or automobiles, dominated by a few big nationally known corporations, which make easy targets, than in a line of production in which there are thousands of small firms, no one of which can be easily turned into a political scapegoat.

The guideposts are discriminatory as between unions, because when a powerful union contemptuously ignores them, the Administration is either silent or makes a barely audible murmur after the damage has been done. We have yet to see a President demand a rollback of wages.

FUNCTION OF PRICES

Nearly all criticism of the guideposts has concentrated on such discrimination. Unfortunately, much of it has implied that there can really be such a thing as “fair” wage and price controls. The truth is that though the standards adopted by the CEA for fixing guideposts are completely untenable, there are no tenable standards. These guideposts are all based on crude notions of “fair” wages, “fair” prices and “fair” profits; but what is essential is functional wages, prices and profits.

All price-fixing does harm. Even if the government were not continually cheapening the dollar by continually increasing the money supply, it would do immense harm to try to “hold the line” by freezing every price just where it is. Prices have work to do. They guide and allocate production. A price rise for product X usually reflects an increased demand for X or an increased cost of producing X; a price fall for product Y usually indicates a reduced demand for Y or a reduced cost of producing Y. It is precisely the daily relative changes in prices and profit margins that direct more production into the products that are more wanted and release labor and capital resources from products that are less wanted. To freeze relative prices is to reduce, distort and unbalance production.

REMEDY POSTPONED

All this would be true even if the government were not constantly increasing the quantity of money. But when it cheapens the dollar and then tries to “hold the line” on prices, the harm is immensely multiplied.

An incisive analysis of the cause of inflation and the harmfulness of the guideposts was made in a recent speech by Milton Friedman, economist at the University of Chicago:

“Inflation is always and everywhere a monetary phenomenon, resulting from . . . a rise in the quantity of money relative to output. . . . The guideposts confuse the issue and make correct policy less likely. If there is inflation or inflationary pressure, the governmental monetary authorities are responsible. It is they who
must take corrective measures if the inflation is to be stopped. Naturally, the authorities want to shift the blame, so they castigate the rapacious businessman and the selfish labor leader. By approving guidelines, the businessman and the labor leader implicitly whitewash government for its role and plead guilty to the charge. They thereby encourage government to postpone taking the corrective measures that alone can succeed. . . .

“Whatever measure of actual compliance there is introduces just that much distortion into the allocation of resources and the distribution of output. . . . The more faithfully [the guideposts] are complied with, the more harm they do.”

### Income-Tax Illusions

June 20, 1966

An increasing number of economists (though still a minority) are beginning to have second thoughts about the wisdom of the progressive income tax. Their misgivings arise from three main suspicions: (1) that it is unjust; (2) that it undermines incentives and sets back economic growth; and (3) that the high rates at the upper end of the scale do not even produce increased government revenues, but tend to reduce them.

The argument that a discriminatory “progressive” tax rate is unjust was stated as long ago as 1833 by the Scottish economist J.R. McCulloch:

“The moment you abandon the cardinal principle of exacting from all individuals the same proportion of their income or of their property, you are at sea without rudder or compass, and there is no amount of injustice and folly you may not commit.”

The principle that the same rate of tax should apply to everybody was almost universally established before the “graduated” income tax came along. This principle is still adhered to in every other type of tax—real-estate taxes, sales and other excise taxes, import duties and even social-security taxes. It is accepted that a man whose house and land are worth ten times as much as another’s should pay ten times the tax but not (as can happen under progressive rates) 30 times the tax.

### NO ASSIGNABLE LIMIT

Some economists are beginning to recognize that all arguments in support of progression can be used to justify any degree of progression. No one dreamed, when the income tax was adopted in Great Britain in 1910 and in the United States in 1913, that within a generation Britain would be taxing the higher incomes up to 97½ percent, and the U.S. up to 91 percent. When a majority imposes on a minority a punitive rate of taxation that it refuses to accept for itself, democracy becomes irresponsible.

The higher rates in the progressive income tax undermine incentives and reduce production and capital accumulation. The early sponsors of the progressive income tax recognized this, but they had other aims in mind. In the *Communist Manifesto* of 1848, Marx and Engels frankly proposed “a heavy progressive or graduated income tax” as an instrument by which “the proletariat will use its political supremacy to wrest, by degrees, all capital from the bourgeois, to centralize all instruments of production in the hands of the state” and to make “despotic inroads on the right of property, and on the condition of bourgeois production.”

### RATES VS. REVENUE

Progressive rates of income taxation are not necessary to raise great revenues. A simple calculation, based on the Treasury’s own figures, shows that, with the same existing exemptions and deductions, a flat rate of 18.6 percent would raise all the revenue now raised from the scale of rates ranging from 14 to 70 percent. If all rates now above 50 percent were reduced to that level, then (on the basis of 1963 incomes) a maximum of $233 million revenue would be lost. This is not enough to run the government, at present spending rates, for a full day. For 1963, more than two-thirds of the total income tax was paid by people with adjusted gross incomes under $15,000.

Yet perhaps the most serious evil of the progressive income tax is that it produces the illusion in the overwhelming majority of taxpayers that the “rich,” the other fellows in the brackets above them, are really paying for most of the benefits that the majority get from the government. This illusion is shared even by taxpayers (all those with taxable incomes above $6,000) who are in fact paying more than the 18.6 percent average rate that would yield the necessary revenue. This illusion makes them accept a burden of government expenditure and taxation that they would not otherwise tolerate. Though this aspect of progressive income taxation is very little discussed today, its menace was recognized as early as 1899 by W.E.H. Lecky:

“Highly graduated taxation realizes most completely the supreme danger of democracy, creating a state of things in which one class imposes on another burdens which it is not asked to share, and impels the State into vast schemes of extravagance, under the belief that the whole costs will be thrown upon others.”
Shortsighted Remedy
July 4, 1966

The latest and in some ways the most thorough study that has ever been made of “The United States Balance of Payments” has just been published in a large book of 200 pages by the International Economic Policy Association. This is a private research group whose membership includes twenty major U.S. corporations. It makes, altogether, 33 recommendations for solving the payments deficit. Most of these are in the right direction, and some of them are excellent.

The most important recommendation is negative: the Administration should abandon as soon as possible its restraints on foreign investment.

By trying to restrain and penalize foreign investment, the government is in effect treating such investment (which even in total accounts for less than 10 percent of our outgoing payments) as if it were actually the cause of the payments deficit. Making foreign investment the scapegoat is completely arbitrary. It happens also to be foolishly shortsighted.

WHOSE DEFICIT?
The IEPA study, in fact, points out that for several years the private sector as a whole, as a result of export surpluses and income on private investments abroad, has generated a payments surplus, while Federal spending (foreign aid, military outlays, etc.) has been “consistently in deficit by over $3 billion a year, notwithstanding tied aid and military-hardware sales.” The study calculates that exports to affiliates of U.S. manufacturing corporations account for 35 percent of total U.S. exports of manufactured goods. In addition, direct investments abroad by U.S. companies return earned income which exceeds the outflow of capital in nearly every industry and in practically every area of the world.

The government insists that its foreign aid, even though it is given away, does not seriously add to the payments deficit. This is because, it argues, 80 percent of AID’s economic assistance has been in the form of goods and services procured in the United States. The IEPA study admits that this device of “tying” aid to purchases in the U.S. may curtail the direct adverse impact on the payments balance. But it points out that the government’s calculation fails to allow for the “substitution” effect. The aid-receiving country, in other words, may use its aid dollars merely to buy goods it would otherwise have bought here commercially with dollars it already owned. It is then able to transfer its earned dollars for purchases in other countries.

SUBSTITUTION EFFECT
Strong evidence that this is happening on a large scale is provided by a comparison of our aid to and trade with Latin America. U.S. net disbursements to Latin America almost doubled from the level of the 1956–1960 period, when they averaged roughly $360 million, to an average of about $652 million over the 1961–1964 period. Total Latin American imports went up from an average of $7,650,000,000 a year between 1956 and 1960 to an annual average of $8,060,000,000 during 1961–1964, an average increase of $413 million. Yet total Latin American imports from the U.S. declined by an average of $100 million, despite the doubling of total aid and the “tying” of such aid.

There is reason to think that the “substitution” principle has an even wider application than the IEPA study estimates, but there is not space to consider its ramifications here. If the study has a serious weakness, it is in not giving sufficient emphasis to the effect of inflation and our chronic budget deficits in making the deficit in the balance of payments inevitable.

But the great merit of the study is its proof of the harmfulness of governmental restraints on foreign investment. A substantial part of our exports depends upon such investment. The study urges the government to give assurances that, in addition to maintaining the gold value of the dollar, it will not try to restrict or control the movement of capital. “The only really long-run factor working in the direction of eliminating deficits,” the study insists, “is the growth in exports, income, royalties and fees which are related to direct private investments abroad. Any prolonged limitations in this area can serve only to weaken whatever long-range strength there is in the U.S. position.”

Socialism, U.S. Style
July 18, 1966

New York City’s first subway opened in 1904. The fare was 5 cents. The subways remained under private ownership until 1940. The fare was still 5 cents. But meanwhile wholesale prices had gone up 32 percent; wage rates had tripled; the lines were granted tax exemption by the city. They petitioned for higher fares. But the 5-cent fare was sacred. The city fathers decided that the only way to keep it was to eliminate private profit and run the trains themselves.

So the subways were bought by the city in June 1940. On July 1, 1948, the fare was doubled to 10 cents. On July 25, 1953, it was tripled to 15 cents. Between 1940 and 1953 other consumer prices went up 91 percent, but
New York subway fares went up 200 percent. The lines were still run at heavy loss. Even by its own method of accounting, the Transit Authority has lost money in seven out of the last ten fiscal years. If even one of its several subsidies from the city is deducted, it has lost money heavily in every one of those years.

The Transit Authority, which runs the subways for the city, is required by law to operate within revenues received from operations. This is a rather technical requirement. In the first place, capital funds (such as for subway construction, subway cars and buses) are provided by the City of New York. There is a subsidy for carrying schoolchildren, and a subsidy for Transit Police.

$62 Million Loss
In the fiscal year ended on June 30 last, the Transit Authority reported an operating deficit of $62 million. This deficit was achieved in spite of a tax subsidy of $166 million to Transit for the fiscal year. The subsidy was made up of New York City’s outlays for all debt service, construction and new equipment of $116 million; the subsidy for student fares of $20 million, and the subsidy for Transit Police of $30 million.

And now the fare has been raised to 20 cents—a 300 percent increase since 1940. The extra 5 cents is expected to bring in something in excess of $60 million, but probably will not be enough to cover the operating deficit even when all the subsidies are included. A 25-cent fare may be less than a year away.

As the charge for the service has been going up, the quality has been going down. The trains run less frequently; they don’t meet schedules; they get older and dirtier, and so do the stations.

The Wall Street Journal recently complained in an editorial: “The change-makers in the municipally operated subway system refuse, usually with great rudeness, to accept a $5 bill or anything higher. . . . A person finding himself with nothing under $5 has no choice but to trudge back up the stairs and find a store willing to make change. Nine times out of ten the shopkeeper will do so in perfectly friendly fashion. The contrast is illuminating. The salesman in the store knows his livelihood depends on courtesy and service. To many a minion of bureaucracy, however, people are nuisances at best and to be treated as such.”

This is “public” ownership. This is how socialism, U.S. style, works.

Subsidizing Fares
A theory has developed that municipal transportation ought not even be expected to pay its way. This theory is merely the outgrowth of government ownership. When cities own and operate the subways, the fare must be subsidized. When governments own the railways, the railway fare must be subsidized. When governments own the telephone and telegraph lines, the lines are subsidized. When governments own the power and the light companies, power and light are subsidized. When governments own the airlines, the airlines are subsidized. Governments run the mail service, and the mail is carried at a loss. Nothing is expected to pay its own way.

A subsidy on bread would be more defensible than any of these, but the government doesn’t yet own and run the bakeries.

The socialist argument begins by saying that fares are too high because private industry is under the necessity to make a profit. What is overlooked is that it is precisely the need to make a profit, or to avoid a loss, that leads to economy, efficiency and good service. Government ownership removes the incentive to all three.

Prices Have Work to Do
August 1, 1966

The Administration forced the leading producer of molybdenum, a metal used in steel alloys, to cancel a 5 percent price increase announced a few days before. Why? To show the labor unions that the Administration isn’t afraid of them.

Believe it or not, this is the reason government officials gave when they disclosed to reporters their “basic motive for applying pressure on the company for the rollback.” As one prominent news account put it: “They wanted to demonstrate to unions, as much as to management, that the Administration’s anti-inflationary wage-price guidelines are not a dead letter.”

One would think the obvious way to demonstrate this would be to forbid wage increases beyond the guidelines or to force some union “voluntarily” to roll back a wage increase. Of course the Administration (fortunately) has not the slightest intention of doing this.

Let us look at the harm, however, that it is actually doing. The forced cancellation of the molybdenum price increase was arbitrary, discriminatory and without any sanction of law. In recent months the Administration has allowed price increases to occur in scores of items—services, apparel, shoes, tires, coal—without comment. It continues to force its rollbacks in industries—steel, aluminum, molybdenum—in which the bulk of the product is produced by a few big companies politically vulnerable to intimidation.
BLAMING MOLYBDENUM
When it forced the rollback in steel, the Administration’s excuse was that steel entered into so many products that a rise in steel prices would touch off another round of inflation. This excuse was lame enough as applied to steel (the total market value of which is only 2.6 percent of the gross national product), but it is completely absurd for officials to be speaking of the “direct inflationary impact” of a rise in molybdenum, the market value of which is less than one-fiftieth of 1 percent of the gross national product. To pounce on molybdenum as a scapegoat, out of thousands of products, is legally indefensible and economically ridiculous.

It is also economically harmful.

Prices have work to do. They guide consumers and producers. Molybdenum is in short supply. The rise in price would have led to more economy in consumption. And the rise was needed, according to the industry, to finance new facilities to produce the metal. It is not “in the national interest” to reduce incentives and funds for increased production.

NEEDED SIGNALS
It was absurd for Gardner Ackley to demand a cancellation of the price increase on the ground that the leading producer, American Metal Climax, was making profits above the average. This represents a complete failure to understand the working of a free-enterprise system. It is precisely constant relative price changes, and the consequent differences in profit margins in different commodities, that draw labor and capital resources away from the production of goods in relative oversupply and into increased production of goods in short supply. To freeze the price mechanism is to destroy the price signals and to prevent these necessary readjustments in production. It is the constant changes in price relations and in relative profit margins that determine the ever-changing balance in the relative production of thousands of different commodities and services.

It is the Administration, not private business, that is inflating. The cause of inflation is the increase in the quantity of money and credit. The Administration keeps increasing the quantity of money and credit. The nation’s money supply (demand deposits plus currency) averaged $171.6 billion in June, up 5.8 percent over the twelve-month period. By comparison, money rose at a 2.2 percent average annual rate from 1951 to 1965. If we include time deposits in the money supply, the rate of increase over the past year has been 9.3 percent. Higher interest rates discourage credit expansion and inflation; lower interest rates encourage credit expansion and inflation. The Administration is doing all it can to keep interest rates below the level at which a free market would set them. It inflates, and points an accusing finger at molybdenum.

How We Create Strikes
August 15, 1966

The crisis on the airlines is merely the latest example of the bankruptcy of most of the labor legislation of the last 40 years.

The naïve theory of the Wagner Act of 1935, ironically called “an act to diminish the causes of labor disputes,” was that it was above all “the denial by employers of the right of employees to organize and the refusal by employers to accept the procedures of collective bargaining [that] lead to strikes.” The simple cure was to abolish this gross “inequality of bargaining power” by turning the government into a union-organizing agency and compelling employers to bargain exclusively with certified unions. One-sided compulsions were laid on employers. One-sided immunities were granted to unions. And of course: “Nothing in this act shall be construed so as to interfere with or impede or diminish in any way the right to strike.”

So it has been. The number of annual strikes tripled after the Wagner Act went into effect. In 1947 the consequences became so bad that Congress passed the Taft-Hartley amendments. These made the Wagner Act slightly less disruptive but retained its essential one-sidedness.

THE PUBLIC HELPLESS
The result today is that a single labor union, until its demands are met, can halt the country’s railroads, tie up its shipping, shut down its steel mills, silence the newspapers of a great city, walk out on patients suffering or dying in hospitals, ground 60 percent of the nation’s airlines, and prevent others from taking the jobs that its own members have refused to perform. The public must stand by helpless.

The machinists’ strike on the airlines illustrates this enormous irresponsible power. To avert a strike, President Johnson appointed an emergency board under the Railway Labor Act. That board recommended a 3.5 percent annual increase over 42 months in the average $4.15 an hour in wages and benefits already received. This award was in excess of the government’s own 3.2 percent “non-inflationary guidelines.” The companies accepted the award; the unions rejected it.

The President originally used his full prestige to urge acceptance of the award, based on “testimony
that runs into the hundreds of pages.” When the union said no and continued the strike, Mr. Johnson made it clear to the airlines (which all need Federal approval for routes, rates and airmail subsidies) that he wanted them to give more. They then offered increases of 4.3 to 4.5 percent a year, which the union negotiators accepted. The President was still somehow able to assure the country that the agreement was “essentially within the general framework” of the emergency board recommendations (it was 25 percent higher), and even that it “will not be inflationary.”

Then the union rank and file turned thumbs down even on this.

**TIME TO REEXAMINE**

Whatever happens now, irreparable harm has already been done. The airline machinists were offered rewards, not penalties, for spurning the recommendations of a government board, and frustrating or stranding travelers. Other unions will note these rewards, demand at least as much, be at least as intransigent.

Compulsory back-to-work laws and longer “cooling-off” periods only postpone the reckoning as long as unions are given a legal stranglehold over industries. In the last generation we have removed the chief risks from striking and made it next to impossible for an employer to combat a strike.

When an employer is confronted with a strike today he hardly dares to try to carry on his business. First, union monopolies are so tight that it is difficult to find other sources of labor. Secondly, if he tries to hire replacements, he meets violence and vandalism on the picket line, and the Norris-LaGuardia Act in effect denies him injunctive relief. Thirdly, if these obstacles are overcome, the National Labor Relations Board, even years later, may order him to rehire all the original strikers with back pay.

Until Congress is willing to reexamine and drastically revise its labor legislation of the past, we will continue to have strike chaos or be forced into the evils of compulsory arbitration.

---

**Forced Arbitration?**

August 29, 1966

When the striking machinists’ union, before exacting its guideline-smashing 6 percent settlement, turned down not only the 3.5 percent wage-increase award offered by the President’s emergency board but even the 4.3 to 4.5 percent increase then offered by the airlines under White House pressure, even newspapers that prided themselves on their “liberal” opinions began to demand compulsory arbitration.

When a major strike is causing great public hardship, such a demand seems plausible. The strike is obviously harming not only the workers and industries involved but other workers and industries. The damage done may be nationwide and grave. Should not the government have a right to prevent it? Every strike will eventually be settled on some terms. Why not have an impartial tribunal fix such terms, and save the costs, waste and disruption of a prolonged and bitter strike?

What is usually overlooked by the advocates of compulsory arbitration is that we already have something very close to it, and it has obviously failed. The airlines strike was handled under the Railway Labor Act, which we have had since 1926. Under that act, when a strike has been called, the President has the power to require the workers to stay on the job for 30 days while he names an emergency board to study the dispute and report its recommendations within that time. President Johnson had already done this. When the machinists rejected the Presidential board’s recommendations and walked out, it was not the first time transportation workers had done so. They have done it repeatedly. In practice the board’s final recommendations have been binding in effect on the employers while unions have rejected them.

**IT KILLS BARGAINING**

Once it is known, or even suspected, that a governmental board will eventually recommend settlement terms, serious collective bargaining usually stops. Each side makes only enough concessions to give the appearance of bargaining. Both sides reserve their real arguments for the arbitrators.

Compulsory arbitration could only increase the number of threatened strikes. The tendency of all arbitrators is not to find what settlement terms would be “just,” but to find some acceptable middle ground between the employer’s last offer and the union’s demand.

After the first major compulsory award had been made, the government arbitration boards would face the demands of all other unions who felt they had had a less favorable deal. The arbitrators will be under tremendous pressure to make all their awards “consistent.” But what will “consistency” consist in? In granting all other unions the same percentage wage increase? Or the same dollar and cents wage increase? And from what common past base would the increase be measured? Or would the boards fix the same “just” wage rate for everybody, regardless of skill or past differentials? In
any case, the tendency would be toward universal govern- ment wage-fixing—toward a rigid and regimented economy.

PUBLIC MADE HELPLESS
How would the compulsory awards be enforced? It was already illegal for the New York City transit workers to strike, but when they contemptuously defied the law and the public, nobody dared to penalize them.

But if we should not try to impose compulsory arbitration, if we cannot forbid strikes, and if the imposition of longer back-to-work “cooling off” periods merely postpones the eventual capitulation to excessive union demands, is the public helpless?

We are so only to the extent that we have made ourselves so. In the last 40 years, through the Railway Labor Act; the Norris-LaGuardia Act; the Wagner Act; the Taft-Hartley Act and an incredible set of National Labor Relations Board decisions, we have taken nearly all the major risks out of strikes. We have made employers almost powerless to combat them. We have given unions special privileges and immunities. In brief, we have built up enormous irresponsible union power.

Yet Congress not only refuses to repeal, revise, or even to re-examine any of these laws; it acts and talks as if they had nothing to do with the recent epidemic of irresponsible strikes. #

Parting Words
September 12, 1966

In September 1946 I wrote my first regular column for Newsweek. Now, just twenty years later, I am writing my last.

This twenty-year record, I confess, is overshadowed by the phenomenal performance of my colleague Raymond Moley, who in 1963 rounded out 30 years on Newsweek without missing a single issue, and is still at it. But this leaves me the runner-up for continuity among Newsweek columnists, and I’ll have to settle for that.

My twenty years on Newsweek have been very pleasant ones. I have enjoyed complete freedom, within self-imposed bounds of good taste, to say what I want. Except for a special post-election issue once in four years, and one or two issues devoted to a single subject, no editor has even suggested what topic I should write on. No one, without my consent, has even changed my particular wording. When one considers how probable it is that the editorial management of Newsweek has not always agreed with me, my case is an impressive illustration of the full freedom of expression enjoyed by the Newsweek columnists.

FREEDOM OF WRITING
This respect for the integrity of the individual writer, I am happy to say, is not confined to this magazine. For twelve years prior to my service here, I wrote editorials for The New York Times. These voiced the opinions of the newspaper, and were of course unsigned. Yet at no time there was I ever asked to write a sentence that I personally did not believe to be true. And this was the situation also on the New York newspapers I worked on in my vicissitudinous youth—The Wall Street Journal, the old Evening Post, the Tribune, the Evening Mail, the Herald, the Sun—all but the first, alas, now deceased.

I do not think my experience has been exceptional. No doubt there are newspapers and magazines that try to tell their editors what to write, and that run items or opinions primarily to please the advertisers; but they represent a sort of journalistic underworld, and are certainly not typical.

I am grateful to the many readers who have taken the trouble to write to me about my columns or the subjects with which they deal. I tried to answer all letters that were reasonably polite. Naturally I have liked the praise and the expressions of agreement; but I have found even most of the hostile letters helpful. At the very least they have usually called my attention to some point that I failed to make sufficiently clear.

One point that I have apparently often failed to make sufficiently clear, judging by some of these letters, is that, when I criticize some alleged “liberal” or “anti-poverty” measure, I do not do so out of callousness, or because I have any less desire than my correspondents to reduce poverty or increase aggregate real wages.

SHORTSIGHTED CURES
I have opposed minimum-wage laws, for example, because the main effect of such laws is to create unemployment. They increase the incidence of unemployment most of all among teen-agers, the unskilled and Negroes. I have often defended employers, because they are the ones who provide employment. To get full employment it is necessary not to destroy incentives for employers—a necessity that self-styled “friends of labor” too often forget. I have opposed excessive corporate and personal income-tax rates because they seriously reduce both the funds and the incentive for new investment. Yet it is above all the rate of new investment that directly determines the rate of increase in labor productivity and in real wages.

In brief, I do not differ from my “liberal” correspondents in their goals, but simply in their proposed methods of achieving them. In trying to bring about some wished-for result directly and immediately, they
too often fail to see that the ultimate results of the poli-
cies they propose will be exactly the opposite of what
they desire. The difficult problem we face is how to
mitigate the penalties of misfortune and failure with-
out undermining the incentives to effort and success.

I shall shortly begin a twice-a-week nationally syn-
dicated column. Yet it is sad to leave old associates and
friends. I thank the readers who liked my articles for
their thoughtfulness in writing to say so, and those who
didn't for their forbearance. ✽
