A Note from the Compiler

This book would have never gotten off the ground without Jeffrey Tucker’s bibliographical work on Henry Hazlitt. That work can be found in both book form (Henry Hazlitt: A Giant of Liberty) and on the Mises.org website. The genesis for this book started with that bibliography. I was browsing Hazlitt’s prodigious output throughout the years and tried to click on a few of his Newsweek editorials. The titles were beguiling: “Global Spending Forever?”; “Our Irresponsible Budget”; “Will Dollars Save the World?” Most of the titles I found myself gravitating toward would make perfect headlines in any newspaper, magazine, or blog today. For some reason the hyper-links were broken, obviously an oversight. But I just had to read them. I immediately went to Newsweek’s website and searched for back issues. Incredible—nothing online. It occurred to me just how spoiled I had become by Mises.org, where so much information is freely available at the click of a mouse. So after speaking with Jeffrey and concluding that these editorials were truly not available anywhere in print or online, I decided to track them down and in my own small way try to give something back to Mises.org and Henry Hazlitt.

The rest was a simple study in the division of labor: A young student I hired photocopied and scanned old editions of Newsweek on the weekends. I spent months trying to digitize the texts using character recognition software. When that failed miserably, I employed a team of entrepreneurial women and men in New Delhi to transcribe the editorials by hand. India, of all places! I hope Henry Hazlitt would find that as encouraging a sign of freedom as I do.

I would like to acknowledge all of the people who, in addition to the prolific pen of Henry Hazlitt, helped make this book possible. First of all to Lew Rockwell, the Mises Institute, and all of the amazing writers and educators there who have truly changed my life with knowledge. I would like to also thank in particular the following people: Jeffrey Tucker, Paul Milazzo, Trevor Hytmiah, Judy Thommesen, N. Joe Potts, John Russell and the University of Nevada/Reno Students of Liberty, Chad Parish for the cover, and Bhawna Seth, and all the great workers at IdesIndia.com. Most of all, thanks to my wife Sarah, daughters Ruby and Violet and son Walter. They give my life and work meaning.

So please, enjoy the marvelous introduction to these editorials by Paul Milazzo. Paul undertook the herculean task of putting these editorials in thematic and historical perspective and the introduction he has written stands by itself as a major addition to Hazlitt scholarship. Above all, enjoy these beautifully crafted pieces of literature by one of the premier economists and journalists of the twentieth century. Read from the hand of someone with the courage to speak truth to power throughout his entire professional career.

Marc Doolittle, MD
Chapel Hill, NC
2011
Introduction
PAUL CHARLES MILAZZO

Loyal readers of Newsweek had reason for disquiet when the latest issue hit the stands on May 3, 1954. Those who managed to endure the details of the ongoing Army-McCarthy hearings or the deteriorating French position in Indochina sought solace, and more stimulating fare, by flipping through as usual to the business section. There, in a series of pieces over the past month, columnist Henry Hazlitt had offered his typically engaging analysis of contemporary economics, examining, in the context of the recent recession, how a more steeply progressive tax code might dampen both government revenues and business profits. Now, however, his “Business Tides” column—a staple of Newsweek’s back pages since 1946—was nowhere to be found. Weeks passed, spring gave way to summer, but the troubling void remained. Nervous letters began to flood editors’ in-boxes. “I would like to know what has become of Henry Hazlitt’s column in your magazine,” demanded the executive VP of one Midwestern industrial association, echoing scores of other concerned correspondents. “Frankly, it was the principal if not the only reason that I subscribed.” Such missive-writers shuddered to contemplate whether management had discontinued the column, silencing the most clarion voice for economic liberty in American popular media.1

Newsweek’s editors elicited a collective sigh of relief upon announcing the return of “Business Tides” on July 12, now that its sixty-year-old author had convalesced from an extended cardiac illness. They also took the opportunity to reintroduce Henry Hazlitt to his audience, describing him as a “genial, quick-moving, soft-spoken Philadelphian” whose forty-year career in journalism began at the Wall Street Journal and included distinguished editorial positions at the New York Evening Mail, New York Herald, New York Sun, Nation, American Mercury, and New York Times. An esteemed literary critic and financial reporter, Hazlitt had cemented his national reputation with a best-selling primer on free market economics, Economics in One Lesson, published the same year he started at Newsweek—where, eight years later, his columns remained “extremely popular with readers.” Hazlitt would remain a fixture at the magazine until 1966, his longevity as a regular columnist surpassed at his retirement only by Raymond Moley’s.2

This extensive volume makes it possible and convenient for another generation to encounter “Business Tides” anew. The pages that follow reproduce every column Henry Hazlitt wrote for Newsweek throughout his twenty-year career. They offer both a testament to his diligence and insight, as well as a vantage to rediscover how free-market economic thought in the post-World War II era was transmitted and popularized, and why it endured. Even as recent histories of the American Right have transformed our perceptions of the United States after 1945, the significance of economics has only begun to attract the attention it deserves. The latest accounts emphasize that conservatives occupied a modern vanguard, not an atavistic fringe, in post-World War II politics. During an era of putative liberal “consensus,” their ideas appealed to great numbers of Americans, particularly among the middle class in rapidly developing regions like the Sunbelt. Historians have also come to view World War II less as a bright dividing line, and American conservative thought more as an evolving continuum stretching back to the 1930s. In the process, the focus has shifted from social and cultural issues, particularly with respect to race, to the more overtly economic concerns that generated resistance to the New Deal Order. Recent work has recognized that opposition to liberal economic policies arose not simply out of corporate self-interest or business intransigence, but also from principled libertarian objections voiced by theorists with a coherent critique of state power and an articulate defense of the free market.3

---
1C.W. Anderson to John Denson, 10 May 1954, Folder “Correspondence re: 1954 Heart Attack,” Henry Hazlitt Papers, Foundation for Economic Education Archives.
Recovering Henry Hazlitt’s long career serves to advance this unfolding narrative. Hazlitt matters, because over the course of the twentieth century he became the most important economics and business journalist in the country, the most influential mainstream purveyor and popularizer of the Austrian School of free market economics, and, prior to the ascendance of monetarists and supply-siders, the most prominent, articulate, and persistent critic of prevailing Keynesian doctrine. From the Great Depression to the dawn of the Reagan era, Hazlitt applied the tenets of Austrian and classical economists to interpret contemporary economic issues for a mass audience, making a principled case for capitalism and a practical case against the unforeseen negative consequences of statist economic policies. To the extent that many readers sampled the work of Friedrich A. Hayek and Ludwig von Mises directly, they did so on Hazlitt’s recommendation: A student, confidante, and patron of these Austrian luminaries, a founding member of the Foundation for Economic Education and the Mont Pèlerin Society, an urbane yet lucid writer with an international reputation, Hazlitt stood at the epicenter of American economic conservatism.

Yet the notoriety Hazlitt deserves has thus far eluded him. Out-sized personalities on the Right tend to draw more popular and scholarly attention, not least because of the media amplifying their messages. The gadfly fusionist William F. Buckley helped consolidate the modern conservative movement by launching National Review in 1955, but he also reached the masses through his long-running television program, Firing Line, along with popular novels, books, and syndicated columns. Ayn Rand’s evocative, idiosyncratic, and philosophical fiction never loosed its grip on the best-seller list or the consciousness of millions of readers. Even Milton Friedman, scion of the Chicago School, managed to parcel his academic genius into a media empire of sorts.

Although a less flamboyant personality like Hazlitt could never hope to close this charisma gap, none should disparage the audience he reached as a journalist in the employ of a mass circulation weekly magazine. His career at Newsweek coincided with the rise of the “information press” pioneered by Henry Luce in the twenties and thirties. Luce’s entrepreneurial vision led him to perceive a market for a new kind of weekly periodical, one that amassed, condensed, and narrated general interest news features in a slicker, more easily digestible form than that offered by stalwart publications like Century, Outlook, or Literary Digest. Launched in 1923, Time became the gold standard for newsmagazines by the depression years, staffed by an army of researchers, writers, and editors whose anonymous work bore the trademark stylistic and ideological stamp of their founder.

Luce’s overt biases and lucrative readership inspired competitors. Chief among them was News-Week, founded in 1933 by Luce’s former foreign-news editor, Thomas J.C. Martyn, who described Time as “too inaccurate, too superficial, too flippant and imitative” and promised to deliver a magazine “written in simple, unaffected English [in] a more significant format [with] a fundamentally sober attitude on all matters involving taste and ethics.” The start-up hemorrhaged money until 1937 when it merged with Today, a publication associated with one-time Roosevelt brain-truster and New Deal apostate Raymond Moley. Malcolm Muir, former president of McGraw-Hill, took over as editor-in-chief, while the deep pockets of real estate magnate Vincent Astor kept the enterprise solvent. Newsweek soon lost the hyphen but never gained the edge over Time, settling in as the nation’s second-ranked newsweekly. Critics found its nondescript style of prose and reportage bland, its departmentalization of news derivative of Luce’s model. Unlike Time, however, it did feature signed columns, and the prospect of escaping relative anonymity helped draw Henry Hazlitt into the fold—that, and the responsibility of penning just one column per week instead of five or more for the New York Times, where his position as chief economic editorialist kept him tethered to his desk and left little time for book projects, travel, or family life.

Newsweek also delivered an expansive and expanding audience for Hazlitt’s writings. During the 1950s, the magazine’s circulation increased by 80 percent, reaching 1.5 million by 1961. Its “pass-along” readership, and narrated general interest news features in a slicker, more easily digestible form than that offered by stalwart publications like Century, Outlook, or Literary Digest. Launched in 1923, Time became the gold standard for newsmagazines by the depression years, staffed by an army of researchers, writers, and editors whose anonymous work bore the trademark stylistic and ideological stamp of their founder.

or those who viewed the periodical's contents without paying directly for it, approached ten times that figure. Millions more encountered Hazlitt's work when Reader's Digest reprinted his columns or newspaper editorials nationwide and quoted them. In short, a post-war generation of readers who enjoyed more affluence, education, and leisure time than ever before provided an eager market for the kind of periodicals in which Hazlitt appeared—and an often receptive ear for his free-market analysis. Businessmen and entrepreneurs most appreciated his defense of unencumbered capitalism. General Electric Vice President Lemuel Boulware, for example, made Hazlitt required reading for the company's corporate supervisors, managers, and executives.6

More broadly, however, Hazlitt appealed to the growing “suburban warrior” demographic that historian Lisa McGerr identified in her history of the New Right in Southern California. These middle-class Americans, drawn from the Midwest to the Sunbelt's high-tech, white-collar economy after World War II, took up residence in booming industrial metropolitan areas, embraced presidential candidate Barry Goldwater in 1964, drove the subsequent rightward shift of the Republican party, and prepared the way for Ronald Reagan. Neither status-anxious nor backward-looking (as liberal intellectuals at the time assumed), these thoroughly modern men and women imbued the self-identified, grass-roots Right with a political and cultural resilience grounded in “deep-seated conservative ideological traditions.” A flood of printed materials generated by conservative writers, publishers and periodicals, passed from household to household and discussed among neighbors, co-religionists, and business associates, helped uphold those traditions. As his fan mail attests, Hazlitt's journalistic contributions circulated prominently within these and other intellectual communities throughout the country.

James L. Wick certainly believed so, and he exhorted Hazlitt not to take lightly the extent of his reach. A Republican activist and later executive publisher of Human Events, Wick wrote to Hazlitt in the wake of his work-induced heart attack. Over the course of the last four years, Hazlitt had dutifully filed his column while traveling extensively on the lecture circuit, co-editing the fractious libertarian journal, The Freeman, publishing a novel, The Great Idea, and appearing as a rotating co-anchor for the Longines Chronoscope, a network news interview program on late-night television (in this sense, Hazlitt, like his more famous friends, was no stranger to multi-media exposure). Wick was “thrilled beyond description” to see “Business Tides” up and running again. “You are among the few people in America on our side who have an enormous following,” he insisted. “Your column is read throughout the world. It has an influence beyond any reaction that you get. Some young person of 22 who later may become very powerful may have his views changed or even reversed by continued reading of your column. . . . For every person who writes you there are, as every editor knows, a thousand or ten thousand who feel the same way but don’t think to drop you a line.”

Wick’s letter also serves as a reminder that, despite Hazlitt's loyal following and mass audience, “Business Tides” retained a distinctly counter-cultural flavor. For contemporary readers, these columns offer a glimpse at the wider economic history of the post-1945 era. During that time, Hazlitt assumed the bearing of a dissenter: from price controls and other microeconomic planning mechanisms; from the Marshall Plan and similar foreign aid programs thereafter; from the reigning Keynesian macroeconomic policies that supported full employment and downplayed the risk of inflation; from the expanding welfare state. These positions did not endear him to power brokers in academic circles or the halls of Washington. Moreover, during an era that assigned great cultural capital to credentialed experts in the realm of public policy, Hazlitt's detractors found ample reason to marginalize a libertarian without a college degree.

But through the force of his autodidactic erudition and penetrating prose, Hazlitt established his position in the upper echelon of opinion makers. On a weekly basis, he stood athwart conventional wisdom yelling “stop” while maintaining the first principles of Smith, Mill, Bastiat, Wicksteed, Hayek, and Mises (among others) in public discourse. He did so in the guise of a didactic polemicist, edifying and exhorting an audience of business people, decision makers, and informed laymen, stimulating discussion and debate along the way.

ECONOMICS IN A THOUSAND LESSONS

Intrepid readers of this volume face a potentially daunting task, since Hazlitt produced 971 columns in his two decades with Newsweek. By comparison, Milton Friedman, one of his successors at the magazine, penned around 300 between 1966 and 1984. How best,

then, to plumb the depths of such an opus? It helps to keep in mind that this survey begins near the end—Hazlitt’s libertarian outlook had essentially matured by 1945, forged during the preceding thirty years of boom, bust, and war. His jeremiad over the course of four post-war presidential administrations, then, retains a certain consistency familiar to those acquainted with his most popular publication.⁸

Hazlitt’s stock and trade consisted of exposing persistent economic fallacies cultivated through ignorance of basic economic interrelationships. The eponymous “lesson” offered in Economics in One Lesson was to recognize the long-term, secondary consequences of economic policies beyond the immediate benefits sought by pleading interests. For Hazlitt, who channeled the classical economists of the nineteenth century, good economics comprehended both sides of the equation: supply is demand; all credit is debt; exports pay for imports; saving is spending of another sort; one person’s income is another’s cost. Bad economics did not, and was thus invoked to justify various ill-founded schemes to fix prices, protect domestic markets from foreign competition, and divert tax dollars to subsidize favored industries, commodities, public works, exports, or welfare projects.

In applying the insights of Economics in One Lesson writ large to the pressing issues of the day, “Business Tides” also broadcast the basic Austrian tenets animating that book. Hazlitt condemned state intervention in the market, championed free trade, questioned under-consumption as a catalyst for recession, celebrated entrepreneurial creativity, and viewed inflation, rather than unemployment, as first among economic evils. He also emphasized how the spontaneous order of the price system conveyed vast quantities of information among countless market actors, allocating scarce capital, labor, and resources far more efficiently than top-down planning mechanisms ever could.

In this context, the first columns worth sampling are two that preview, by way of parody, nearly all the major themes Hazlitt would treat over the years. In the first, “A Modern Corporation Reports” (9/1/47), a befuddled company president, I.M.N. Addlepate, breezily informs stockholders of his efforts to align corporate practice with the “precepts of the most forward-looking economists and statesmen.” Accordingly, the firm boosted wages by 15 percent a month every month to increase national purchasing power—but violated federal labor laws by doing so without engaging in collective bargaining, making “high-salaried union leaders” appear superfluous. To insure “full employment,” the company found ways to reduce efficiency and remove labor-saving machinery, improving job figures by “37.2 per cent last year with no increase in output whatever.” To enhance export sales, it granted credits to foreign customers with few concerns about reimbursement; after all, defaulted loans would benefit the nation as a whole by preventing imports and protecting “our home industries.” Likewise, issuing bonds in great excess of the corporation’s assets was no cause for concern, “because as one big family we merely owe this debt to ourselves.” And in the fight against inflation, the company heeded the government’s request to reduce prices to a “fair” level far below production costs, triggering an anticipated increase in the volume of sales that reached its apex when the goods were given away for free. Addlepathe paints these policies as a triumph of the New Economics, noting just one hiccup: the company had gone bankrupt in the process of implementing them.

In “The Fairdeal Family at Home” (5/29/50), George Fairdeal sits with his wife Alice at breakfast, wondering aloud why buying a new house should prevent them from taking a summer European vacation as well. Why not do both, even if it means borrowing from his brother, Bob? After all, the family deserves the best. Alice demurs, suggesting that such spending would preclude saving for retirement or medical expenses and create an unsustainable debt, since Bob will have to be repaid someday. George scoffs, insisting that the “richest nation in the world” ought to provide old age pensions and medical insurance. Alice points out that government health care and pensions are subsidized by other average taxpayers like themselves, so they would be no better off socializing these costs or thinking “that everybody can be supported at the expense of everybody else.” When George protests in the name of equality and fairness, Alice reminds him that redistributive schemes dampen the incentive to earn for both subsidizers and subsidized, reducing the total amount of wealth available for redistribution in the first place. George, un mouved by the connection between production and wealth, sees no reason why the government can’t provide for all the needs and wants of citizens. “All you’re saying, dear,” his exasperated wife retorts, “is that every family should be forced through higher taxes to spend its money on the things you think it needs instead of on the things each family itself thinks it needs.” A hungry and distracted George proceeds to inquire about the coffee cake they

had yesterday, learning to his utter dismay that it has all been consumed.9

Apart from proceeding chronologically, approaching “Business Tides” on a thematic basis provides a logical blueprint to peruse Hazlitt’s prodigious output. What follows, then, are some brief synopses of the most common, interrelated themes Hazlitt developed in his columns, leavened with enough relevant historical context to suggest why he might have chosen to address a particular issue when or how he did. Although it is impossible to summarize here all of the positions Hazlitt took or all the subjects he explored, these sections feature some of his most representative and noteworthy columns. Readers are encouraged to consult the footnotes, where more comprehensive citations and suggestions appear.

INFLATION
The specter of inflation haunted “Business Tides.” More than a third of the columns Hazlitt wrote addressed the issue in some way. Hazlitt’s fixation on inflation stemmed from his immersion in the works of Mises and Hayek, but also reflected a change in public outlook dating from the Second World War. After 1939, the focus of economic concern shifted from depressed to runaway prices, and during the war federal agencies like the Office of Price Administration (OPA) fostered expectations that government controls could administer the problem. In a broader context, since 1933 the New Deal had mobilized consumer and labor groups in a way that promoted a more active conception of “economic citizenship,” conditioning them to approach wages and prices as negotiable targets, properly set through an institutionalized process of bargaining. As the economy grew still more political in the post-war years, the matter of managing inflation assumed center stage.10 To read about inflation in “Business Tides” is to encounter Henry Hazlitt at his most didactic. Faulty understanding and false diagnoses, he feared, inspired only bogus remedies. Given the inflationary challenges inherent in post-war reconversion and then remobilization for the Korean conflict, he covered the topic most intensely during the Truman years, although subsequent administrations all evoked his displeasure on the subject in varying degrees.

The best place to begin is with a five-part series published between 3 September and 1 October 1951, entitled “Inflation for Beginners,” which, when issued separately by Newsweek as a pamphlet, drew over 100,000 requests from readers. Hazlitt characterized inflation as “the increase in the volume of money and bank credit in relation to the volume of goods.” The colloquial interpretation of inflation as merely a rise in prices, he insisted, mistook an effect for a cause. More accurately, expanding the number of dollars in circulation allowed consumers to bid up the prices of things they wanted to buy, effectively reducing the purchasing power of individual dollars—as with anything else, increasing the supply of money decreases the value of the marginal unit. Drawing upon Mises’s Theory of Money and Credit, Hazlitt also underscored inflation’s psychological component, noting how the present value of the dollar anticipates the future, “just as the value of a bushel of wheat depends not only on the total present supply of wheat but on the expected future supply and on the quality of the wheat.” Producers and creditors who foresaw further depreciation likewise could be expected to adjust the prices of their goods and services upward to compensate.11

Since individual employers, wage-earners, or consumers had no power of their own to grow the money supply, Hazlitt observed, governments stood out as the primary culprits responsible for inflation. Alternative explanations for a general inflation that focused on the velocity of money, shortages of goods (demand pull) or wage-price spirals (cost push) let state actors off the hook for a problem they themselves brought into being. Only governments could create new money, and they could resort to more subtle methods than the printing press to do so. To help finance the war, for example, the Federal Reserve agreed to purchase unlimited government securities from the Treasury at a fixed (or “pegged”) rate of 2.5 percent, creating demand deposits from which the government could draw. Wartime expediency encroached into peacetime, however, and the Fed dutifully continued “monetizing” government debt, flooding the system with dollars, propping up an artificially low interest rate in the bond market, and displacing real savings. Many commentators criticized the practice of “pegging” (which was discontinued in 1951), but few other than Hazlitt lamented how the persistent budget deficits racked up by post-war administrations were regularly subsidized through similar bond sales or

9The family name is an obvious take off on “Fair Deal,” the label bestowed on Harry S. Truman’s domestic agenda.
11For more on inflation, see Business Tides (BT) 9/22/47, 12/8/47, 3/1/48/, 10/18/48, 8/1/49, 9/25/50, 5/28/56, and 5/2/60.
Inflation

Treasury collaboration to suppress interest rates acted Truman’s midyear economic report for 1947, Hazlitt
(GNP) sounded less impressive if the relative purchas-
ing power of the dollar amounted to “only 55 cents as compared with the dollar of 1935–39.” Bondholders
suffered from similar illusions if they believed the Fed/
Treasury collaboration to suppress interest rates acted
to preserve the value of their investments (the relation-
ship between bond price and yield is reciprocal). In fact,
the long-term inflationary effects of easy money eroded
their real value.13

For Hazlitt, then, inflation transcended mere eco-
nomics; he viewed it as a moral issue. Governments
reneged on sovereign debts when they knowingly deval-
ued the currency used to pay them off (or, in the case
of the United States in 1933, repudiated the obligation
to discharge them in gold). But that was just one sin
among many. Inflation, Hazlitt emphasized, “depreci-
ates the value of the monetary unit, raises everybody’s
cost of living, imposes what is in effect a tax on the
poorest at as high a rate as the tax on the richest, wipes
out the value of past savings, discourages future savings
. . . encourages and rewards speculation and gambling at
the expense of thrift and work, undermines confidence
in the justice of a free enterprise system, and corrupts
public and private morals.”14

But because inflation, “like Janus,” showed “two
opposite faces,” Americans remained confused, ambiva-
 lent, and incapable of presenting a “united front” against
it. When the wage earner, farmer, or businessman com-
plained about inflation, Hazlitt observed, they usually
referenced the prices they paid for the goods and ser-
vice of others, rather than those garnered for their own.
Forgetting that high money incomes and high money
prices represent two sides of the same coin, citizens suc-
cumbed to the rhetoric of politicians who promised to
promote heads while containing tails. Rather than halting
the expansion of money and bank credit, for exam-
ple, President Truman endorsed higher industrial wages
and agricultural commodity prices to keep up with the
cost of living, while calling on businesses to reduce
their prices voluntarily and lamenting the burden high
rents exerted on city dwellers. Yet, Hazlitt observed,
since 1939 industrial wages had risen far ahead of rents,
just as the price of agricultural commodities had out-
stripped that of other goods. “The real evil of inflation
is that it redistributes wealth and income in a wanton
fashion often unrelated to the contribution of different
groups and individuals to production,” he noted. “All
those who gain through inflation on net balance neces-
sarily do so at the expense of others who lose through
it on net balance. It is an illusion to suppose that the
losers can ever be brought abreast of the gainers except
by setting the gainers back. And it is often the biggest
gainers by inflation who cry the loudest that they are
its chief victims.” Policy makers’ hypocrisy when deal-
ing with the causes of inflation, Hazlitt warned, invariably
bred counterproductive statist solutions like price
controls. Political rhetoric that treated higher wages
and farm income as “virtuous and welcome, but higher
profits as a disaster and a sin” prepared the way, since
it obscured the function of profits both as an incentive
to production as well as a source of capital expansion
and employment.15

For Hazlitt, the cure for inflation was to stop
inflating. For two decades, his advice to policy makers
remained consistent: stop running deficits and monetiz-
ing government debt, cut the budget, maintain higher
legal reserve ratios for Federal Reserve banks, don’t hold
interest rates at artificially low levels, eliminate foreign

aid and similar loan programs, and commit to returning to the gold standard. As he informed his readers, however, government officials had few incentives to follow this advice, because they had a vested interest in promoting policies that sustained a perpetual inflation. He characterized this inflationary orientation, in turn, as a direct consequence of the regnant economic doctrine of the post-war period: Keynesianism.

KEYNESIAN ECONOMICS

Hazlitt wielded a broad brush when depicting the landscape of Keynesian economics. He never drew distinctions between, say, John Maynard Keynes himself or his American disciples; between Keynesian theory and Roosevelt’s often ambivalent New Deal feints in that direction; between Depression-era proponents like Alvin Hansen, who believed a “mature” American economy required the government to serve indefinitely as an employer of last resort, or post-1945 liberals like Leon Keyserling, whose renewed faith in that economy following World War II led them to favor growth, rather than redistribution, as the path to prosperity and income equality; between laborite proponents of public sector spending and high wage policies or more conservative “corporate” Keynesians who favored military contracts and tax cuts.16

Whatever the iteration, Hazlitt judged the commanding status of the New Economics as “one of the great intellectual scandals of our age,” a doctrine destined to enervate capitalism in the long run rather than rescue it from its putative excesses and enemies. His critiques of Keynesianism usually addressed one or more of the following basic tenets: (1) aggregate demand and consumer purchasing power provided the engine for economic stability and growth; (2) to sustain them, the government had the responsibility for maintaining “full employment,” given the inherently unstable nature of the market economy; (3) state actors possessed the knowledge and technical capacity to do so using macroeconomic instruments; (4) countercyclical measures to prevent economic downswings and maintain “full employment” abided annual budget deficits when necessary; and (5) a little inflation could be traded off for higher employment. Hazlitt often employed the term “compensated economy” as shorthand for these prescriptions, or the belief that “it is the government’s function to ‘stabilize’ the economy and to ‘compensate’ for the mistakes of private business.” He penned dozens of columns detailing why this was neither possible nor desirable; a number of them written in 1958–59 previewed the arguments he would present in The Failure of the New Economics (1959), an intensive critique of Keynes’s 1936 magnum opus, The General Theory of Employment, Interest, and Money.17

At root, Hazlitt defined Keynesianism as a prescription for inflation and false prosperity. Keynes desired to remedy a problem that “orthodox” proponents of Say’s Law supposedly never acknowledged: chronic unemployment at market equilibrium. Indeed, he considered full employment at equilibrium the exception rather than the rule, and sought a “General Theory” applicable beyond this special case. According to Hazlitt, Keynes never accepted downward wage flexibility as a solution to unemployment, because he believed it politically unworkable. Labor would, however, accept (or otherwise not notice) a decrease in real wages. Thus government efforts to achieve “full employment” by stimulating aggregate demand operated, in effect, to lower the value of money, raising the selling prices of commodities far enough ahead of wages to maintain temporary profit margins. The subsequent appeal of such policies reflected the haunting memory of the Great Depression and the “delusion that under inflation we can gain more in our role as sellers and producers than we must lose in our role as buyers and consumers.”18

Hazlitt rejected this strategy. He believed Keynes’s misreading of Say’s Law led him to promote a fallacious, demand-driven model of the economy that obscured the role of production (supply) in creating demand. “Mere inflation” and the higher prices and wages that resulted only appeared to do so, but “in terms of the actual production and exchange of real things” it did not. Rather, inflationary booms distorted “the structure

---

of production,” promoted misallocations of capital and resources, invited economic collapse, and reduced long-run productivity and profits, the only authentic sources of economic growth and real income. Likewise, a weakened dollar acted to diminish the purchasing power Keynesians so cherished.19

When the 1946 Employment Act declared it a government policy to maintain “maximum production, maximum employment, and maximum purchasing power,” one available method to go about it was deficit spending reminiscent of the World War II experience. While Hazlitt condemned the inflationary effects of “priming the pump” in this way, he also questioned the assumption that “what principally determines the level of economic activity is the volume of government spending.” He underscored the point using the specific case of defense expenditures, where supposedly “the more resources we are forced to devote to making guns and tanks and shells, instead of consumer goods, the richer we become.” But, he argued, assume for the moment that taxes ultimately paid for defense expenditures. If in 1953, as the Korean War wound down, “defense payments suddenly dropped from the present $50 billion a year to only $10 billion, taxes could also be cut by $40 billion. Then the taxpayers. . .would have $40 billion more to spend than they had before, to make up for the $40 billion drop in government spending.” While the pattern of production would change, “there is no reason to suppose that the over-all volume of output or activity would decline.” In actuality, however, tax receipts did not cover the full cost of defense expenditures. The prosperity affiliated with Keynesianism, military or otherwise, derived from the inflationary effects of deficit spending, which, Hazlitt emphasized, could not be planned or controlled in the long run.20

For Hazlitt, inflationary Keynesian policy was inherently a monetary policy, regardless of its fiscal dimensions. “Debauching the currency is the oldest and most discredited trick in the world,” he noted, “and this is all there is to the much-touted “Keynesian revolution” when you take its sophisticated clothes off.” The Keynesian embrace of “government planning in the field of money and credit,” however, was not limited to the Left. According to the historian Robert Collins, the brand of deliberate Keynesianism adopted by post-war administrations was that embraced by corporate elites. It nominally eschewed large-scale discretionary government expenditures for the stability and relative “automaticity” of tax cuts and monetary manipulation. A number of more conservative actors, from the businessmen on the influential Committee for Economic Development (CED) to President Eisenhower and the chairman of his Council of Economic Advisors, Arthur Burns, advocated countercyclical policies to address economic downturns and maintain employment levels. They favored monetary instruments (manipulating the discount rate, reserve requirements, and open market operations) as among the least intrusive alternatives.21

Indeed, the Eisenhower administration’s resort to such options during the recessions of 1953–54 and 1957–58 (in part to facilitate government deficit borrowing) prompted Hazlitt to declare, in a July 1954 column, “We are all Keynesians now.” Students of history will associate those words with Milton Friedman, who was said to have uttered them in reference to the economic zeitgeist circa 1965 and the enthusiastic Keynesianism of the Kennedy-Johnson White House. Yet more than a decade earlier, prior to the ascent of Samuelson, Heller, or Tobin, Hazlitt coined the phrase in response to an administration known more for its concern about balanced budgets. The sentence that followed helps to clarify: “We are all monetary inflationists.” While sympathetic to Eisenhower’s efforts, Hazlitt still criticized ballooning federal expenditures, continued deficits, and low discount rates relative to international norms. In particular, he believed Keynesian easy money advocates misunderstood how the structure of interest rates provided incentives for savers. Seeing only the borrower’s side of the equation led to artificial rate reductions that “discourage[e] normal thrift, savings, and investment” and “reduce[e] the accumulation of capital” that actually drove job growth. When the administration did manage a balanced budget (as it did in 1956, 1957, and 1960), he suggested that surpluses alone could not prevent inflation if the supply of money and credit remained bloated.22

19See Hazlitt, Economics in One Lesson, pp. 164–76.
20On “military Keynesianism,” see BT 4/20/53, 11/9/53, 10/3/55 (quote), and 1/12/53. On the 1946 Employment Act, see Jacobs, Pocketbook Politics, p. 233. Hazlitt denied that deficit spending had any “multiplier effect” on employment or economic growth, citing the deficits run during the 1930s and the rate of unemployment during that time. As a percentage of GNP, he argued, the deficits of the 1930s were larger than those of the post-war period, and the deficit-spending of World War II represented too extreme an example to serve as a model to follow. See Hazlitt, The Failure of the New Economics, pp. 135–55, 421–26.
22Quote: BT 7/5/54; see also “The Economy: We Are All Keynesians Now,” Time (31 December 1965). On the
Even in the midst of recession, then, inflation concerned Hazlitt more than unemployment. He trusted the workings of a free market would alleviate the latter, while the encroachments of the state created and exacerbated the former. Accordingly, Hazlitt placed little faith in countercyclical strategies to “smooth out” business cycles. “It is no accident that the most violent fluctuations in prices, production, and employment have corresponded with the period of most government interference in business,” he observed with a nod toward Austrian theories of the business cycle. “Most major modern business oscillations have been the result either of credit and currency expansion deliberately instigated by government, followed by inevitable collapse, or at least by failure of government to halt an unsound credit expansion until too late. The best government ‘contracyclical’ policy would be to keep an inflationary boom from starting, not to try to whip it up again after it has begun to flag.”23

As Keynesians became more overt in their stated desire to sustain particular levels of economic growth in the late fifties and sixties, Hazlitt focused his attack on the aggregate statistical concepts they employed. He did not harbor the same animus toward mathematical modeling in economics as Ludwig von Mises did, finding, for example, the empirical data compiled by Simon Kuznets useful enough to cite on more than one occasion. Compared to members of the Chicago School, however, whose highly technical work retained a macroeconomic focus, Hazlitt was wont to find such measures as gross national product and national income arbitrary and unreliable. Not only did he consider GNP calculations of economic growth exaggerated by inflation, he also thought it fanciful that executive branch experts could predict national income when they had a hard enough time predicting the size of the annual budget deficit. In the late fifties, Hazlitt refuted Walter Lippmann and other pundits who cited the Soviet Union’s explosive economic expansion as a spur to accelerate U.S. growth rates. Hazlitt’s Austrian-influenced analysis of socialist systems produced a healthy skepticism about the veracity of Soviet statistics or likelihood that a command economy without a price system could meaningfully increase outputs of agricultural or consumer commodities.24

Suffice it to say, Hazlitt did not share the Keynesians’ confidence in cyclical or “full-employment” budgets that tolerated deficits in years of economic decline and anticipated surpluses in growth years. Balancing income and expenditures over the course of an economic cycle, rather than a single fiscal year, presented two dilemmas. The first involved a straightforward knowledge gap. “No one knows when an ‘economic cycle’ has begun or ended,” he noted, “or just where we are in it, or when employment is ever high enough to take the terrible risk of balancing or overbalancing the budget.” The second, however, invoked the broader politics of the budgeting process and the very nature of the welfare state—reinforcing on another front Hazlitt’s misgivings about the viability of the entire Keynesian project.25

THE FEDERAL BUDGET AND THE WELFARE STATE
Roughly every January, “Business Tides” conducted the same grim ritual: reviewing the annual federal budget. Pick any of these columns at random, and a palpable sense of déjà vu overtakes the reader. Each year, Hazlitt administration’s Keynesian outlook, see BT 7/19/54 and 9/19/55. For a critique of Arthur Burns (whom Hazlitt generally admired), see BT 11/8/54. Generally speaking, Eisenhower prioritized deficit reduction and currency reduction (especially after 1959). See John Sloan, Eisenbower and the Management of Prosperity (Lawrence: University Press of Kansas, 1991), pp. 69–151. Hazlitt saw the problem of interest rates as an outgrowth of flawed Keynesian concepts like the “propensity to consume,” “liquidity preference,” and an inconsistent definition of the relationship between savings and investment, all of which led Keynes to a problematic understanding of interest rates and how they operated. The upshot was a Keynesian disparagement of savings. See Hazlitt, Economics in One Lesson, pp. 177–90 and The Failure of the New Economics, pp. 49–54, 78–131, 186–212. On interest rate-fixing as a kind of price-fixing, see BT 12/20/65. 23BT 6/29/53 (quote), 7/13/53.

lamented a budget larger than the last, “a constantly mounting percentage even of our inflated national income.” In 1949, Truman’s $42 billion offering equaled “the amount spent in the entire five peacetime years from 1935 to 1939 inclusive. And few people ventured to describe those Roosevelt spending years as models of economy at the time.” The $73.9 billion budget for fiscal 1959 included a then-record $28.1 billion for non-defense spending, not counting trust funds for social security and highways (another $16 billion). The stated estimate of $97.9 billion for fiscal 1965 actually came in at a half-billion less than that for 1964, although Hazlitt believed the Great Society’s aspirations would render such optimism laughable—he had seen it happen too many times before. So too, the attitude toward economizers he first noted during the Truman era proved applicable for every administration thereafter:

Apologists for this budget are already falling back on the familiar technique of trying to silence its critics by asking rhetorically: “Where would you cut?” ... The burden of proof, on the contrary, must be placed for each item squarely on the shoulders of those who demand the expenditures. And it is not enough for them to prove, even if they could do so, that everything that these expenditures will buy is “needed.” They must prove that the citizens of the country need each of these things even more than they need the things for which they would spend their own money if it were not taken away from them in taxes.26

Hazlitt’s annual budget litany served to undercut the view of full-employment budgets as automatic instruments fine-tuned by experts and immune somehow to the distributive impulses ingrained in democratic, interest-group politics. In 1966, he noted that only 6 out of the last 36 budgets had run surpluses; yet the United States had not exactly suffered thirty years of recession justifying those deficits. In reality, Hazlitt observed, few politicians had the wherewithal to sustain the deflationary or budget-cutting measures required in years of surplus, for few wanted to face the wrath of client interests who benefited from inflationary policies. Rather than encourage automatic budgetary adjustments, Keynesian policies seemed to validate the worst instincts of solicitous politician’s intent on extending economic booms indefinitely through unchecked social spending.27

Hazlitt anticipated the economists of the Public Choice School in the 1970s, then, in arguing that Keynesian policy facilitated and accelerated rent seeking. Although he never evoked that specific terminology, “Business Tides” offered a mountain of evidence to support the assertion. For two decades, Hazlitt chronicled ever-ballooning post-war federal expenditures in the form of agricultural subsidies, subsidized low-interest mortgages, educational and small business loans, welfare spending, foreign aid, water projects, and highways. Such deficit-inducing programs offered countless examples of the “one lesson” unlearned. Since funding for the welfare state did not come from “the fourth dimension,” it had to come from either inflationary borrowing or taxation. Taxes effectively transferred the income of the politically unconnected to the politically connected, offering no net social benefits but merely increasing the purchasing power of certain interests at the expense of others. Burgeoning government programs did not “meet more national needs,” as President Kennedy claimed in 1963. Rather, they caused “every tax-paying family to meet fewer of its own needs, [leaving] less for private persons and private business to invest in the future, in increased productivity or economic growth.” Like inflation, the welfare state offered merely the illusion of prosperity.28

Hazlitt underscored the role of interest groups and bureaucratic self-promotion in the perpetuation and expansion of the administrative state. Observing the British system led him to speculate, astutely, whether

---

26 BT 1/24/49 (quote), 1/27/58, and 2/10/64.

27 BT 8/4/47, 1/31/49, 12/19/49, 2/10/61, 4/17/61, 5/8/61, 2/5/62, and 1/17/66. By 1966, Hazlitt recognized the “embarrassing dilemma” President Johnson faced after forging ahead simultaneously with the Great Society and the escalating war in Vietnam: “With the economy already overheating, with labor shortages in many lines, with consumers’ prices every month going to a new high record, how big a deficit can be tolerated in the next fiscal year, without letting loose a serious inflation?”

“the welfare state, once embarked upon, set up such powerful vested interests for its own preservation that it . . . becomes irreversible.” Closer to home, the farm program stood out as a particularly egregious example of an “emergency” initiative (designed to raise severely depressed farm prices during the 1930s) that achieved profligate permanency thanks to the workings of bipartisan “iron triangle” politics. Dedicated farm groups, congressional subcommittees, and the Department of Agriculture succeeded in erecting a program of price supports that served to “raise the cost of food to our own poor, to pile up huge unsold farm surpluses in government warehouses, and to stimulate food giveaways or cut-rate sales to foreign (including Communist) countries.” It did so for the stated purpose of closing the income gap between farm and non-farm labor, even as the price of agricultural commodities rose higher than average during the post-war period. This gift from taxpayers to farmers, which subsidized a massive unsold surplus, prompted Hazlitt to wonder, in the spirit of reductio ad absurdum, why the parity principle wasn’t just applied universally: “why not . . . demand equality of everybody’s income with everybody else’s, regardless of his contribution to production” and sever any lingering connection between “income received and value produced?”

“Neoconservatives” of the 60s and 70s are usually credited with bringing social science research methodologies to bear on Great Society social programs and introducing the concept of “unintended consequences” to policy debates. Yet Hazlitt routinely applied economic analysis to a host of government programs to reveal their unforeseen shortcomings, inequities, and market inefficiencies. In 1962, he wrote with concern about the “unfunded liabilities” of the social security system and noted that the Medicare program introduced under Kennedy stood to “give heavy (unearned) benefits to the present aged and load the cost onto the present young.” During the fifties, he detailed how transforming unemployment insurance into a more generous relief program “dampen[ed] incentives to find work quickly,” penalized those who worked part time, “subsidiz[ed] the unemployment created by excessive wage rates, and reliev[ed] the pressure on powerful unions to bring wage rates down to the level at which full employment could be restored.” Likewise, raising minimum wage laws, a popular initiative with every administration, increased unemployment among low-paid workers, precisely those most targeted for assistance. “The first thing that happens when a law is passed that no one shall be paid less than $1.25 an hour is that no one whose work is not deemed worth $1.25 an hour will be employed at all,” he noted, depriving such laborers “of the right to earn the amount that [their abilities] permit [them] to earn.”

Hazlitt did not dedicate as much space to Lyndon Johnson’s “War on Poverty” in “Business Tides” as he would in later books like Man vs. the Welfare State and The Conquest of Poverty, but offered some perceptive critiques all the same. “The problem of curing poverty is difficult and two-sided,” he noted. “It is to mitigate the penalties of misfortune and failure without undermining the incentives to effort and success.” Johnson’s flood of social legislation, on the other hand, more resembled a set of government interventions intended to “try to cure evils brought about by previous government interventions.” Duplication was inevitable. The Job Corps and similar manpower training programs, for example, cost $340 million and overlapped with existing Kennedy-era initiatives. But these expensive efforts stood to assist only a relatively small number of enrollees, few if any of whom represented the poorest, least skilled workers (later critics would similarly underscore this tendency for poverty programs to benefit the better off disproportionately). Hazlitt was also prescient enough to see that Johnson’s aspirations for “total victory” over poverty far outstripped programmatic expenditures of under $1 billion per year. “This comparatively tiny price tag for such a vaultingly ambitious goal, one suspects, is merely a way of getting the camel’s head in the tent,” he observed. “If the history of social security is any guide, we can expect the price tag to increase geometrically as the years go on.”

31Henry Hazlitt, Man vs. the Welfare State (New Rochelle, N.Y.: Arlington House, 1969) and The Conquest of Poverty (New Rochelle, N.Y.: Arlington House, 1973); BT 1/27/64 (quote), 4/6/64 (quote), 8/24/64 (quote), 10/12/64, and 1/18/65. On the unintended consequences of Great Society Programs, see Allen J. Matusow, The Unraveling of America:
Hazlitt likewise took note when liberal defenders of the welfare state in the Kennedy-Johnson years began to advocate what he called “the socialization of consumption,” a position most commonly associated with Harvard economist John Kenneth Galbraith. Galbraith exerted little direct influence on White House economic policy, dissenting from Kennedy’s Council of Economic Advisors when it endorsed a Keynesian tax cut. But he remained a renowned public intellectual, best known for books like The Affluent Society. There and elsewhere, he argued that liberals needed to rethink their emphasis on corporate Keynesianism and target income inequality more directly, increasing government spending on public infrastructure rather than relying on economic growth alone to close the gap.33

Galbraith’s thesis prompted spirited dissent from Hayek and other economists associated with the Mont Pèlerin Society, but Hazlitt’s own series of columns on the subject summarized their objections in bracing terms. As Hazlitt saw it, Galbraith had abandoned the old socialist contention that capitalism could never obtain optimum production or improve the standard of living of the working class. The problem now was that capitalist production worked all too well, directing too much wealth into the hands of the middle class, who spent it excessively on the consumer goods the economy generated in overabundance.

In recommending a redirection of resources via taxation from the private to the public sector, Hazlitt observed, Galbraith scored a semantic victory by implying the selfishness and wastefulness of the former and the democratic, public spiritedness of the latter. But Hazlitt preferred to describe the private sector as the “voluntary sector” (where people spend their own money on goods and services as they see fit) and the public sector as the “coercive sector” (where, in the words of Bastiat, “everybody tries to live at the expense of everybody else”). For Hazlitt, Galbraith’s thesis supposed that “people are individually unfit to spend the money they themselves have earned, but somehow able to choose wisely the officeholders who will seize the money and spend it for them.” Moreover, it assumed that “people will continue to work to earn the same amounts or more, no matter how much their freedom to keep or spend their earnings is curtailed.” Galbraith ultimately erred in decoupling goods and income: without the former, which he found excessive, the latter, which bureaucrats coveted, would not exist. In the end, it was the public sector that proved wasteful, selfish, and parasitic on a private sector that created and sustained the affluence Galbraith derided. The workers of the world, Hazlitt concluded, “have enormously more to gain from continuous increase in per capita production than from any conceivable redistribution.”34

PLANNING AND ECONOMIC CONTROLS

The qualms that liberal intellectuals like Galbraith expressed about consumer decision-making in the private sector paralleled the suspicions bureaucrats held about the price system in general. As Hazlitt often reminded his readers, prices convey information that helps countless individuals solve complex problems of production, distribution, and consumption in a decentralized marketplace. But administrative experts preferred to solve these problems by employing technocratic methods within centralized institutions. Disturbed by a system they did not entirely understand, planners sought constantly to improve or correct it, “usually in the interests of some wailing pressure group.”35

In this context, Keynesian policy prescriptions proved so troubling because they did not merely involve “non-invasive” macroeconomic manipulations, as many proponents claimed. For Hazlitt, Keynesian policies led ineluctably to an escalating series of microeconomic controls, statist planning schemes, and restrictions on individual freedom, not to mention long-term economic decline: a road to serfdom and impoverishment. Accordingly, “Business Tides” chronicled how the Truman, Kennedy, Eisenhower, and Johnson administrations habitually turned to microeconomic planning to mitigate the inflationary effects of the macroeconomic policies they pursued.36

In a spate of articles condemning Truman’s various flirtations with price control programs, Hazlitt noted “the spectacle of a government’s assuming to protect us from the consequences of its own policies by asking for more powers against “speculators,” producers, and “profiteers.” Of course, “voluntary” business efforts could do nothing to hold down prices if the administration ran deficits and expanded currency and bank credit. But

---

34BT 7/18/60, 6/27/60 (quote), 11/14/60 (quote), 1/22/62, and 9/24/62.

imposing arbitrary ceilings prevented adjustments in relative prices necessary to “[synchronize] the production of thousands of different commodities in relation to each other,” resulting in the very shortages officials decried. When Democrats denounced “profiteers” (but not, he noted, union “wageteers”), they ignored how profits actually guided output to alleviate shortages while providing the capital to increase production and wages. Some businessmen held out the prospect of “fairly administered” price-fixing plans allowing them “cost of production plus a reasonable profit” to achieve these same ends. But, Hazlitt noted, such a scheme wouldn’t work, since “a uniform percentage profit for everyone . . . would give no more incentive for producing an article in critically short supply than one in relative excess.” Thus, production bottlenecks were endemic, as evident during the national meat shortage in 1946 that so angered Americans and eroded popular support for the OPA:

As a result of ceilings, cattle raisers found it more profitable to fatten their cattle on the lots than to send them to market. This led to a whole series of other shortages. A soap crisis is being created because soap is mainly made from tallow and tallow comes from steers. Synthetic rubber and hence tire production are threatened in turn by the shortage of soap. A meat shortage also means a hide, leather, and shoe shortage. A bread shortage may come from a scarcity of lard needed in baking, for lard comes from hogs.37

Not even the most brilliant bureaucrats could solve the calculation problems price controls imposed, Hazlitt concluded, channeling Mises. With something like 9 million different prices in the United States, and 40 trillion interrelationships between them, “general” price controls remained a totalitarian fantasy. But instituting more targeted controls, he observed, resembled squeezing a balloon: holding down the price of certain goods in an economy inflated with a greater volume of money will simply lead to distortions elsewhere, as consumers’ dollars flow to bid up the prices of uncontrolled commodities. An extension of controls on beef, pork, and lamb in September 1946 caused the prices of their substitutes, poultry and eggs, to rise, for example, until they were removed.38

Accordingly, Hazlitt bucked conventional wisdom in refusing to attribute a spike in prices to the lifting of wartime controls in November 1946. Cost-of-living indexes that suggested price stability between 1942 and mid-1946 peddled a fiction, he insisted, since the fog of wartime controls masked the true extent of credit inflation and ignored “the realities of black market prices, shortages, rationing, queues, favoritism, deterioration of quality, and non-existent goods.” Even though some prices rose sharply in the wake of decontrol, he cautioned, others would decline, “for the very reason that all commodities will be competing freely for the consumer’s dollar, so that if more of it has to go for one commodity, less of it will be left for others.” He also urged the phasing out of lingering controls, like those for rent, which only “intensified the housing shortage by encouraging existing tenants to use space wastefully, and by discouraging repairs, improvements, and new construction.” Not surprisingly, Hazlitt counseled against imposing similar types of controls during the mobilization effort for Korea in 1950–51.39

Even after the formal lifting of wartime price controls, Hazlitt could point in future years to other inefficient forms of control and planning: agricultural price supports, the continuation of rent control, JFK/LBJ “wage-price guideposts,” consumer credit controls, and, with the onset of the balance of payments problem after 1957, various exchange controls and restrictions on foreign investment. The “parity formula” in agriculture, for example, attempted to freeze in place World War I-era price relationships that happened to favor farmers even as it forced city workers to pay more for food. If it were really possible to preserve dynamic price relationships in amber this way, Hazlitt mused, why not do so universally for everything from freight rates to neckties? Why not adjust the parity rate downward if agricultural prices exceeded those of other goods (not surprisingly, no one in the farm bloc ever suggested such a thing). The political favoritism inherent in the administration of the parity principle even victimized other farmers, as it applied to certain select commodities but not others—boosting wheat growers, for example, while sticking

38 *BT* 10/21/46, 11/4/46, and 9/24/51.

hogs or poultry raisers with more expensive feed. And like most government controls, the farm program inevitably bred corruption and preferential treatment, since “arbitrary quotas must breed lobbies.” Hazlitt summarized the process in a July 1962 piece examining the sugar and cotton quota system:

The government, say, guarantees farmers higher prices for certain crops than they could get in a free competitive market. As a result it finds that it has encouraged huge surpluses. To prevent these it limits the number of acres on which each farmer is permitted to grow the subsidized crops. But these privileged acres then sell for enormously higher prices than those on which the subsidized crops are forbidden. So what happens when someone stands to win or lose millions of dollars, depending on the discretionary decision of some petty bureaucrat…? The result is the most inevitable consequence of substituting discretionary favoritism for the rule of law. One of the worst consequences of “government economic planning” all over the world has been the corruption of the civil service. 40

When viewed in the wake of the 2008 financial crisis, Hazlitt’s columns on credit control make for some particularly eye-opening reading. During the fifties, he attributed the rapid growth of consumer credit to the Federal Reserve’s failure to maintain interest rates at appropriate levels. Rather than clamp down on the total supply of credit, the government chose instead to substitute “bureaucratic judgment and favoritism for the judgment of the marketplace,” setting limits and conditions on specific types of installment credit used to purchase consumer durables or obtain margin loans for corporate securities. Yet, he observed in 1956, “the same government that fears the too-rapid growth of installment credit, even when financed by private lenders at their own risk, has promoted an enormous housing boom by itself guaranteeing mortgages on shoestring margins that make the installment credit terms of automobiles or television sets look like the acme of conservatism.” It came as no surprise, he mused, that government-backed lenders lacked the incentive to assess a borrower’s fitness or integrity, when the money they stood to lose belonged not to them, but to taxpayers. Hazlitt spoke here specifically regarding the veterans mortgage program, but his Eisenhower-era lament echoes still, with haunting prescience, amidst the modern ruins of Fannie and Freddie: “What sort of government policy is it that encourages families to assume debts beyond their resources?[…] The only real remedy is not for Congress to ‘set up more safeguards,’ but to get the government out of the lending business.” 41

LABOR POLICY AND UNIONS

Hazlitt ranked federal labor policy as the most puerile of the various forms of economic control, because he believed that state-sponsored efforts to fix the price of work cut to the heart of Keynesian purchasing power and full-employment fallacies. The collective bargaining regime created by the 1935 National Labor Relations Act established organized labor as a “countervailing force” in the industrial marketplace to balance the considerable influence traditionally wielded by corporate management. Given that over the past six decades, the federal government had aligned itself more or less consistently against the trade union movement, this leveling of the playing field under force of law represented one of the most consequential of Roosevelt’s reform efforts—not least because it cemented a permanent electoral alliance between unions and the Democratic Party.42

According to Hazlitt, the inevitable politicization of wage setting under the Wagner Act took on a Keynesian patina once Democrats accepted that “higher wage rates under no matter what circumstances increase the income of labor and increase prosperity by increasing labor’s purchasing power.” Under

normal conditions, if government-facilitated contracts imposed hourly wages exceeding marginal worker productivity, production costs would increase, the volume of sales and gross income would fall, and unemployment would rise, since most overpriced commodities, including labor, remain unsold—unless the money supply expanded as well. In that case, an unstable prosperity could be maintained as long as prices kept ahead of wages, that is, as long as union labor acceded to falling real income.\footnote{BT 8/22/49 (quote). On high labor costs and unemployment during recessions, see BT 8/1/49 and 4/24/50. In the latter column, Hazlitt noted the similarity between price fixing in the agricultural and labor markets, where taxpayers end up subsidizing unsold surplus in silos and via unemployment benefits.}

But unions had grown sophisticated and sensitive to any decline in real wages. Rather than fall for the “money illusion,” Hazlitt suggested, they would demand wage increases (automatic or otherwise) to compensate for inflation. Since inflationary policies work only through stealth (as soon as consumers or lenders become aware of inflation, they hedge against it) the result would be a wage-price spiral supported by ever-larger volumes of depreciating currency. Under such conditions, unemployment could co-exist with inflation (stagflation) if wages managed to exceed prices; eventually the entire edifice would collapse.\footnote{On inflation, see BT 5/21/56, 6/11/56, 3/21/57, 11/4/57, 7/15/57, 1/20/58, 3/6/61, and 12/17/62. Hazlitt’s analysis here overlaps with that of German economist (and Keynesian critic) L. Albert Hahn. See The Economics of Illusion (New York: Squier Publishing, 1949), pp. 49–62, 119–45, 166–84, and Common Sense Economics (London: Abelard-Schuman Limited, 1956). Hazlitt lauded both books, and wrote the introduction to the former; see BT 3/4/57. Hazlitt believed Keynes confused wage rates with wage income. Reducing wage rates could actually increase aggregate income if rate reductions led to an increase in the number of workers employed (See The Failure of the New Economics, pp. 267–69). For Hazlitt, downward wage revisions remained the primary means to correct economic downturns. He believed Keynes erred in thinking equilibrium was possible with unemployment. Rather than equilibrium, the situation Keynes was actually describing was “merely frozen, such as prolonged mass unemployment because of a prolonged maladjustment between prices of different commodities, or between individual wage rates, or most often between prices and wage rates” (Failure, p. 54). Keynes’s focus on aggregates such as “the wage level” or “price level” led him to overlook constant shifts in relative prices and wages: “Keynes remained blind to the most glaring fact in real economic life—that prices and wage never (except perhaps in a totalitarian state) change uniformly or as a unit, but always ‘relatively’” (Failure, pp. 20–31, quote, 27).}

Excessive wages acted to raise prices for consumers and thus reduce the real purchasing power of all other (non-union) workers, Hazlitt argued. Indeed, Hazlitt was at pains to demonstrate that the wages and benefits secured by the most influential unions in major industries like automobiles and steel routinely outpaced the cost of living by significant margins. But by increasing the costs of production, they also reduced corporate profits. Without profits for capital investment, companies could not purchase the machinery that increased worker productivity—the only non-inflationary method to raise wage rates. Indeed, the “fetish” of full employment obscured this connection between maximum production and efficiency. Even the most primitive or tyrannical societies employed everyone, he observed; only free-market systems fostered the innovation necessary to get the most production with the least labor, the hallmark of economic progress. The best way to bring about enduring “full employment,” Hazlitt concluded, was “to provide a stable currency, and to keep prices, wages, and interest rates free, competitive, and flexible, so that a workable dynamic relationship can be constantly maintained between one price and another, one wage and another, between prices and costs, prices and wages, payrolls and profits.”\footnote{BT 9/12/55 (quote); On full employment, see BT 1/6/47, 9/1/47, 11/27/50, and 5/7/51; Economics in One Lesson, pp. 71–73; The Failure of the New Economics, 399–408; on purchasing power, see BT 1/27/47, 9/1/47, 8/15/49, 9/1/47, and 12/28/48. On productivity, profits, and wages, see BT 2/11/52, 3/22/54, and 7/16/56.}

The transformation of the political economy of labor under the New Deal state militated against such free-market alternatives, Hazlitt believed, because it had institutionalized inflationary wage demands that employers had little recourse to refuse. In addition to the Wagner Act, he could point to the expansion of minimum wage provisions through successive amendments to the 1938 Fair Labor Standards Act or via the 1936 Walsh-Healy Act, which covered federal contractors. Related rules for overtime pay, he added, tended to penalize employers offering the highest wages and reward the best-paid workers disproportionately. Again, Hazlitt credited a combination of capital investment, improved production technology, and market competition for driving marginal labor productivity and the general wage level steadily upward over time. If the reformers were right and causation lay elsewhere, he noted, then even the poorest of nations could create...
prosperity at any time by legislative fiat or through “bargaining.”

Not even the 1947 Taft-Hartley Act gave Hazlitt reason for hope. Taft-Hartley emerged as the conservative counterweight to the Wagner regime, the product of a Republican-dominated 80th Congress elected in 1946 in response to post-war inflation, excessive government controls, and historic levels of labor strife. Passed by an alliance of anti-labor Republicans and Southern Democrats, Taft-Hartley did not roll back, so much as circumscribe, New Deal labor law. It retained the process of collective bargaining supervised by the National Labor Relations Board, but outlawed wildcat strikes, secondary boycotts, and the closed shop. It prohibited both management and labor from engaging in “practices which [sic] jeopardize the public health, safety, or interest” and required anti-communist affidavits from all unionists. Moreover, it authorized the president to intervene in strikes that threatened national security and enabled individual states to pass “right-to-work” laws outlawing exclusive union shops.

Despite his initial optimism, however, by 1949 Hazlitt began calling for Taft-Hartley’s repeal, judging it equally guilty of rigging the system against business owners. Both Wagner and Taft-Hartley forced employers to negotiate exclusively with industry-wide unions, granting the latter effective monopoly power denied to other associations or corporate entities. Neither spelled out what good faith collective bargaining actually meant. What it amounted to in practice, according to Hazlitt, was relentless pressure on employers to concede to union demands and on workers to join unions whether they wanted to or not. “The right to strike does not necessarily imply the right to win a strike, and the right to quit work does not imply the right to prevent others from working,” he emphasized.

Hazlitt judged that American labor law had removed all the risk associated with striking, and with it any incentive for labor representatives to bargain in good faith. Contrary to the expectations of lawmakers, the guarantee of federally supervised collective bargaining did not usher in a new era of industrial peace. The period between the late forties and the early seventies saw the most frequent and contentious series of work stoppages in the twentieth century, averaging 352 major events annually in the fifties and 285 per year over the next two decades. The steel industry alone was convulsed by national strikes in 1946, 1949, 1952, 1956, and 1959.

When the collective bargaining process broke down in an industrial dispute with national security implications, presidents frequently convened independent fact-finding commissions to arbitrate an equitable solution. As documented in “Business Tides,” however, such recourse to “neutral” experts invariably produced recommendations that ratified the most inflationary union demands for wages and benefits. The 1926 Railway Labor Act created the template in an effort to deter debilitating railroad strikes, but FDR and Truman employed similar boards to deal with coal and steel stoppages as well. “If government boards know how to set steel wages, then they know how to set all wages and prices,” Hazlitt opined during the 1949 steel strike. Of course, no board could know for certain how much a given wage increase stood to affect company profits, prices, or competitiveness, even if it acted with complete objectivity “and not, as in the past, merely to buy off a strike, or to hold the labor vote, or to pay a political debt.” Indeed, stated commitments to wage stability usually evaporated, as they did during the Korean War, when Truman’s Wage Stabilization Board recommended that striking steel workers receive an 11 percent increase despite the fact that their wages, among the highest in the country, outstripped the cost of living. Industry efforts to compensate with a 5 percent price increase, however, provoked denunciations from the administration. De-linking wages and prices in this way created an ingrained double standard that, Hazlitt contended, squeezed employers in a Keynesian vice. In
practice, “wage stabilization” served as little more than “a political effort at redistribution of income.”

As a last resort, presidents faced with a prolonged strike jeopardizing national security could opt to seize the industry in question and operate it under government auspices. Truman did so with the railroads (1946) and steel (1952), and his threat to take over the coal industry in 1950 forced mine operators to accept the recommendations of federal arbitrators. Hazlitt decried this nuclear option as an assault on property rights and an exercise in blaming the victim, one that stretched the bounds of constitutionality (the Supreme Court agreed in 1952) and effectiveness. “Mr. Truman seems to have forgotten entirely that even when he seized the railroads in May of 1946 he did not end the strike that had been declared against the generous wage decision of his own fact-finding board,” he noted during the dust-up over coal. “On that occasion Mr. Truman was finally reduced to proposing that he be given the totalitarian power to throw the strikers into the Army and force them to run the trains that way.” Yet none of this damped President Kennedy’s desire in 1961 for enhanced authority to conduct labor relations, including stronger seizure laws and more vigorous fact-finding boards whose new powers, Hazlitt feared, would amount to compulsory arbitration and wage fixing.

Ironically, by the early sixties such demands reflected concerns within the Kennedy White House that unions had grown powerful enough to “demand and get excessively high wage rates . . . that would force more inflation, price us out of foreign markets, imperil the dollar [and] bring unemployment.” This shift in perspective, even among establishment liberals, reflected broader changes in how Americans perceived the role of labor unions in national economic life after 1957–58. Ever a persistent critic, Hazlitt approached labor affairs with a renewed sense of urgency around this time.

Two notable trends upended labor’s fortunes after 1957. First, the serious recession that began that year underscored the onset of urban deindustrialization, particularly in the “Rustbelt” states bordering the Great Lakes and extending throughout the Northeastern, Mid-Atlantic and Midwestern regions. Whereas the industrial base in this area managed to absorb the higher production costs and discord that accompanied union activism in the forties and fifties, the high demand and lack of competition that characterized those years could not be sustained indefinitely. Hazlitt had long warned that exorbitant, inflation-indexed union wages and fringe benefits threatened to price American companies out of an increasingly competitive global market. His extensive coverage of the great 1959 steel strike represented the culmination of this argument. Though a conflict over shop floor rules precipitated the walk-out, Hazlitt chose to emphasize, as always, the ruinous implications of union wage demands on employment and competitiveness. As it turned out, the strike paralyzed the American Steel industry for 116 days and marked the beginning of its permanent decline, as cheaper imports from more efficient foreign forges filled the gap for domestic manufacturers.

The second blow to labor’s prestige came in the form of congressional committee hearings on union corruption and criminality, chaired by Arkansas Senator John McClellan in 1957. Though a majority of committee members hailed from right-to-work states the evidence linking prominent unions like the Teamsters to organized crime and racketeering proved hard for anyone to ignore. The hearings tarnished the moral standing of labor and induced Congress to pass the 1959 Landrum-Griffin Act, which instituted tighter restrictions on secondary boycotts and stricter regulations of union financial dealings.

Around this time, the emphasis in Hazlitt’s labor columns shifted from the structural flaws of the collective bargaining process under Wagner/Taft Hartley to the endemic problem of labor violence enabled by the 1932 Norris-LaGuardia Act. The Act barred federal courts from issuing injunctions to halt “nonviolent” labor disputes. But in so doing, Hazlitt maintained, it removed the primary instrument for preventing the intimidation and coercion routinely associated with mass picketing, made replacement of striking workers nearly impossible, and left the Federal government with no means of policing local strikes or preventing violence. The Taft-Hartley Act was “practically blind to the existence of such matters,” while ambiguous federal court decisions left the power of states and localities to respond in doubt. Hazlitt never denied the right of workers to strike peaceably, but the cultural animus

52BT 4/9/62 (quote).

54Lichtenstein, pp. 162–66.
against strike-breaking nourished by Norris-LaGuardia and other labor laws meant that “if no strike can ever be broken, the strikers must always win, no matter how extravagant their final demands, and more and more strikes, with consequent economic paralysis, must be encouraged and rewarded.”

In developing his extended critique of how state-sanctioned labor violence and intimidation eroded the rights of employers and workers alike, Hazlitt drew upon the research of Sylvester Petro, a libertarian legal scholar and longtime admirer of Mises. Petro’s publications included a summary of the McClellan hearings, Power Unlimited: The Corruption of Union Leadership, and tracts such as The Kohler Strike: Union Violence and Administrative Law and The Labor Policy of the Free Society, where he promoted “free employee choice” as the central principle in American labor law. Like Hazlitt, he recommended repealing Norris-LaGuardia, Wagner, and Taft-Hartley, abandoning labor boards, outlawing mass picketing and all forms of violence and coercion by either side, and insuring all individual workers and employers enjoyed the right to “free bargaining,” that is, the freedom to engage whatever collective bargaining unit they chose, rather than limiting the choice to a single, state-approved, industry-wide union.

“Not until private coercion is prevented can personal liberty be secure,” Hazlitt insisted. He reaffirmed this principle and deplored the fruits of violence in a series of columns between 1959 and 1966 covering a multitude of work stoppages beyond the steel industry. These included the New York newspaper deliver strike (1/29/59); the New York hospital strike (6/8/59); the meatpackers strike (12/28/59); the Kohler strike (9/12/60); the Pennsylvania Railroad strike (9/19/60); the New York Printers Union strike (12/24/62); the dockworkers strike (1/21/63, 2/25/63); the national railway strike (9/16/63); the New York newspapers strike (10/11/63); the New York transit strike (1/31/66); and the airline mechanics strike (8/15/66). In a number of these pieces, Hazlitt also critiqued union efforts to maintain featherbedding shop floor rules that shortened hours or maintained sinecures for obsolete workers in the face of capital expansion. The long-held economic fallacy that machines immiserated workers rather than emancipated them, he observed, lay at the root of these endeavors.

**TAX POLICY**

Liberal labor and welfare policies were designed to stimulate a “propensity to consume” that supposedly grew more tenuous as aggregate income increased. Hazlitt, however, faulted Keynesian theory for neglecting and undermining the more critical propensities to work, save, and invest. Specifically, he judged the punitive post-war tax rates assessed on corporations and the wealthy as further evidence that Keynesians wished to transfer the impetus and initiative for capital investment from the private sector to the public sector.

World War II compelled a transformation of the American tax code. Since its inception in 1913 until 1940, the federal income tax had applied, at most, to 6 percent of the population, exempting all but the wealthiest tiers. Such a peripheral, class-targeted approach, however, could not begin to shoulder the fiscal demands of global war. Accordingly, the Revenue Acts of 1942 and 1943 created a system of “mass” taxation that broadened eligibility across all incomes, imposed a more steeply progressive rate structure topping out at 90 percent of the top marginal rate.

---

56Hazlitt cites or mentions Petro in BT 6/2/58, 10/6/58, 2/23/59, 5/4/59, 10/12/59, 4/4/60, 7/10/61, 4/8/63, 9/21/64, and 6/7/65. See also The Labor Policy of the Free Society (New York: Ronald Press, 1957); Power Unlimited: The Corruption of Union Leadership (New York: Ronald Press, 1959); The Kohler Strike: Union Violence and Administrative Law (Belmont, Mass.: American Opinion, 1961), and BT 11/2/59 (free collective bargaining). Hazlitt worried that ham-handed government efforts to address the violence government policies fostered only curtailed freedom further. These included the Taft-Hartley Act’s overly broad emergency injunction provision, which ordered all strikers back to their jobs during an 80-day cooling off period. Traditional court injunctions exerted more limited authority, requiring strikers to desist from violence and other unlawful interference with the rights of others. Not only did the cooling off period victimize strikers, however, it did little to help employers. When Eisenhower invoked it during the 1959 steel strike, Hazlitt believed it ratcheted up the pressure on the steelmakers to settle. Of course, when the 80 days expired, strikers were free to resume mass picketing and other forms of intimidation. See BT 10/26/59. Hazlitt described his proposal for labor peace as “a simple provision, enforceable in the courts, that an employer substantially engaged in interstate commerce could not discriminate in hiring or firing either against union members or against non-union members.” He also defended industry wide unions and their right to freedom of association against suggestions on the part of some conservatives that they be outlawed. See BT 1/9/59.

58For a critique of the “propensity to consume,” see BT 5/21/56 and 6/11/56, and The Failure of the New Economics, pp. 98–134.
percent, and introduced withholding to collect income at the source. The number of taxpayers grew from just under 4 million in 1939 to nearly 43 million by 1945, while tax revenue ballooned from $2.2 billion to $35 billion ($19 billion personal, $16 billion corporate) during that same period. The onset of the Cold War kept rates high, although a bevy of deductions and loopholes mitigated the burden somewhat. In short, mass taxation became a permanent feature of American life. It enabled the growth of the post-war state, as the federal government came to dominate the nation’s revenue system, collecting over half of all taxes by 1950. And it provided Keynesians with a more precise instrument with which to implement countercyclical budgeting.59

The hundred or so “Business Tides” columns on specific tax issues rank among the most technical Hazlitt wrote. They are difficult to summarize easily or in brief. One in particular, however, published on March 30, 1953 and reprinted in Readers’ Digest, neatly captures his overarching approach to the matter. In it, Hazlitt recounts a conversation with a friend who tried to figure out how much he needed to earn under the current tax code to pay a recent $100 plumbing bill. Since the friend qualified for the top bracket, he calculated that $1,000 in dividends from his General Motors stock would leave him with $100 after the 90 percent tax bite. To generate those dividends, however, GM had to earn over $4,000 before taxes, meaning it needed to move more than $21,000 worth of its product to dealer showrooms. In sum, to pay the plumber his $100 required GM to sell 18 Chevrolets. In recounting this tale, Hazlitt did not seek to drum up sympathy for the wealthy so much as draw attention to the impact of the tax burden on the productive capacity of the economy. When the government took, on average, 57 percent of yearly corporate earnings and wrung “42 times as much out of the average corporation as the investor in the top income-tax bracket is allowed to get and keep,” it threatened to dry up the capital investment needed to maintain wages, employment, and production.60

Despite his steady drumbeat for cuts in federal expenditures, Hazlitt demonstrated a willingness to forego balanced budgets temporarily in exchange for significant tax reform. In many respects, his formula conformed to that later associated with supply-side economics, emphasizing significant, permanent reductions in the top personal and corporate tax rates as well as in the overall number of brackets, cuts in the capital gains tax, elimination of the effective double taxation of dividends, and more generous depreciation allowances. He sought above all to alter the incentive structure of the tax system to promote more savings and capital investment among society’s most productive actors, rather than to make that system more “fair.”61

Indeed, Hazlitt was wont to reject broader tax reductions in the lower brackets. He decried several Democratic efforts during the Truman and Eisenhower eras, for example, to increase personal exemptions across the board, which he feared would remove millions of Americans from the rolls and severely inflate the federal deficit. On the one hand, releasing so many Americans from a tax obligation effectively cut the connection between expenditures and taxes, breeding fiscal irresponsibility among those who assumed “the wealthy” would pick up the bill for a profligate welfare state. But the hard fact remained that the bulk of tax revenue came from the base of the pyramid (below the 20 percent rate), not the apex. “Cutting taxes on low incomes, at the cost of a huge budget deficit, will not increase the purchasing power of low-income groups,” he insisted, “for if the deficit is financed by borrowing from the banks and increasing the money supply . . . it will create inflation”—the most regressive of all taxes—driving up prices and eviscerating purchasing power.62

For these reasons, Hazlitt opposed the Kennedy-Johnson tax reform bill, which, he felt, cut taxes too much in the lower brackets and too little in the upper (while monetary policy was kept far too loose). The result was an $11 billion deficit—a tax cut financed through borrowing and inflation. Recent scholarship has made an intriguing case that the logic driving the landmark

60Hazlitt did not spell out how deductions, exemptions, and loopholes may have shielded wealthy and corporate taxpayers. See Zelizer, Taxing America, pp. 88–96.

1964 tax reduction—which reduced rates from 91 percent to 70 percent at the top of the pyramid and from 20 percent to 14 percent at the base—derived more from the supply-side theories of Robert Mundell than the Keynesian orthodoxy within the Council of Economic Advisors. Historians and economists will continue to debate the origins of the policy, but for his part, Hazlitt sensed Keynesianism afoot. As he wrote on March 9, 1964, “the Administration’s pressure for the $11.5 billion tax cut just enacted may be cynically ascribed to an effort to win the coming election. But it is also supported by an economic theory, a theory now widely and sincerely held. . . . It is a pure ‘demand theory.’ It assumes that, whenever there is recession or unemployment, the reason must be ‘insufficient demand.”

BRETTON WOODS AND FOREIGN AID

Henry Hazlitt never considered extensive domestic travel a prerequisite for composing “Business Tides.” With few exceptions, like a trip to the Texas cattle country in 1948, he filed his nationally oriented columns from New York, the nation’s (and the world’s) financial capital. He adopted a considerably more peripatetic approach, however, when addressing international economic affairs, something he did quite frequently during his tenure at Newsweek. Nearly every summer, bylines from London, Paris, Berlin, Madrid, Stockholm, Zurich, Brussels, or Amsterdam announced that Hazlitt was abroad. As he recalled years later, the challenges of roving journalism proved exhilarating, if exhausting:

I had to start interviewing people on my first day, usually a Monday. I would typically begin with the economics officer at the American Embassy and would get further “leads” from him among the informed economists and businessmen of the country. I would try to finish up my fact collecting by Friday morning, and start my column, filing it late Friday or early Saturday. Sunday would often be my day for a plane to the next country. I do not remember that I ever failed to fulfill this schedule.64

Whether written out of his office or his suitcase, Hazlitt’s analysis of world economic problems garnered an engaged and influential foreign readership consisting predominantly of Europeans and Americans abroad (although his following in Latin America was also significant). He estimated that the version of his column published in Newsweek’s international edition generated about 25 percent of his mail, even though it reached the equivalent of only 5 percent of the domestic circulation. Public figures like Chancellor Ludwig Erhard of West Germany and Reinhard Kamitz, President of the National Bank of Austria, counted among his readers. The BBC thought enough of his reputation to make his ruminations on the British budget the subject of a transatlantic broadcast. For this international audience, Hazlitt projected his domestic concerns about inflation, Keynesian theory, statist controls, and the welfare state on a global scale, dissenting once more from the conventional wisdom informing economic policy after 1945.65

As Allied victory in World War II appeared more certain, western officials resolved to apply the lessons of the previous war’s aftermath to the process of post-war reconstruction. They envisioned a cooperative system designed to buttress global economic interdependence. It would prevent a collapse of finance and trade by discouraging autarky: the competitive currency devaluations, high tariff walls, and like policies that had aborted post-war recovery in the twenties and brought about worldwide depression in the thirties. The most influential architects of the Bretton Woods agreement, however, including John Maynard Keynes and Harry Dexter White, determined not to sacrifice the well-being of domestic economies upon the altar of stable currencies. The institutions they helped create at the 1944 Bretton Woods Conference, including the International Monetary Fund (IMF) and World Bank, were designed to maintain liquidity and adjust imbalances in trade payments without dampening the flow of goods or capital, but also without disturbing domestic prices or inducing unemployment.

The Bretton Woods agreement as enacted required the United States to serve as a world economic hegemon. The U.S. offered its own currency as a global reserve that provided the peg for a system of fixed international exchange rates, tying all other currencies to the dollar and the dollar to gold at $35 per ounce, making it convertible upon demand of central banks. The United

For Hazlitt’s criticism, see BT 2/18/63, 4/15/63, 6/3/63, 9/2/63, 12/30/63, 1/20/64, 2/24/64, 3/9/64, 3/16/64, 4/25/66, and 6/20/66. For supply-side revisionism, see Domitrovic, Econoclasts, pp. 70–75. Despite their differences in interpretation, Domitrovic considers Hazlitt to be “the greatest economic commentator of the century” (p. 54).

States also provided a massive influx of capital to jump-start European recovery. The severity of the problem seemed clear in the summer of 1947, when Great Britain reneged on its loan agreement with the United States and suspended convertibility of the pound in order to stop the hemorrhage of dollar resources from British banks. Meanwhile, Germany’s own economic dislocation disrupted critical supplies of coal and other goods that Europe’s industrial base and civilian population required. The Marshall Plan formed the lynchpin of the subsequent American rescue effort, funneling billions of dollars overseas to rebuild the infrastructure of Western Europe. In the context of the emerging Cold War conflict with the Soviet Union, American officials interpreted such economic aid, in combination with billions more in direct military assistance, as the critical pillars supporting the global containment of communism, a commitment that would extend beyond the immediate post-war crisis and the borders of Europe.66

Hazlitt viewed these trends with alarm, but not because he considered himself an “isolationist.” Indeed, he bristled at the term, especially when used to delegitimize criticisms of prevailing policy. “Our own economic and political future will be deeply affected by the fate of Europe,” Hazlitt confirmed in 1947, and “we should do anything we can that promises to increase Europe’s welfare without imperiling our own.” He approved of military alliances such as the 1949 Atlantic Pact, an unprecedented guarantee on the part of the United States to come to the direct aid of victims of Soviet aggression, and advocated economic engagement by the private sector. But Hazlitt’s brand of conservative internationalism did not abide by the unsound and fallacious economics he saw informing much of U.S. foreign policy. He rejected the mantle of global hegemon if it meant the United States had to sacrifice its economic well-being by fronting for policies that bred statistism, autarky, and inflation at the expense of efficiency, production, and freedom.67

In brief, Hazlitt believed that American foreign aid, from the Marshall Plan on, perpetuated unsustainable financial practices on the part of foreign recipients, incentivized, in turn, by Bretton Woods’s flawed system of international monetary “reform.” He described the 1944 agreement as having abandoned a true gold standard for a Potemkin village. Behind the façade of the fixed dollar, individual governments were allowed to peg their currencies at “an artificial, arbitrary, and unreal valuation” supported not by a free, self-correcting price system but rather “police penalties” and state controls. They did so in concert with Keynesian prescriptions. Internal post-war politics within each nation dictated policies to maintain high wages, full employment, and consumer purchasing power, all of which required expanding supplies of money and credit. Under a true gold standard, such inflated currency would quickly lose value in international markets, but under IMF regulations governments had the obligation and the flexibility to preserve the “official” exchange value relative to the dollar. They accomplished this through exchange controls: forbidding citizens to buy and sell currency at the rate a free market would actually bear (black markets in currency usually reflected the difference). As a consequence, these artificial, official exchange rates tended to overvalue the pound, the franc, the lira, and the mark by a significant margin.68

Hazlitt blamed chronically overvalued currencies and other self-imposed state policies, rather than the devastation of war, for the post-war “dollar gap” that prompted the hue and cry for U.S. foreign assistance. Because overvalued currencies make foreign imported goods less expensive and domestic exports more so, they encourage trade deficits. British and French consumers shunned their own products for cheaper American ones, for example, and needed a constant supply of dollars to purchase them. But since exports pay for imports, a slowdown in the former led to a shortage of dollars to pay for the latter (of course, under free currency exchange, such a high demand for dollars would make them, and American goods, more expensive, altering consumer incentives accordingly). The problem, Hazlitt explained, was not a “dollar gap,” but rather the simple fact that “Britain and Europe and Latin America wish

68 BT 8/36/57 (quote), and 9/2/57.
to buy more from the United States than they sell to it. . . They wish to buy more than they can afford to pay for. They are consuming more than they are producing.” The only permanent remedy involved an increase in their production or a reduction of their consumption. “As long as they do neither,” he observed, “they can only keep up the one-sided trade with us with the proceeds of our loans or gifts.”

Ironically, Hazlitt observed, even as President Truman denounced critics of foreign aid as “isolationists,” the Marshall Plan’s Economic Cooperation Administration (ECA) subsidized autarkic policies that reduced American import levels and proved more deserving of the label. They left American consumers worse off, he lamented, while sticking American taxpayers with the tab for trade deficits and socialism abroad.

Hazlitt recommended the lifting of exchange and other controls as the most direct cure for the world’s economic ills. Nations that did so, like Canada or West Germany under Ludwig Erhard and his advisor Wilhelm Röpke (acting against the wishes of American occupation officials), soon reaped the benefits. Those that did not resorted instead to a series of patchworks. “The most brilliant schemes of the planners today consist in tapering off their previous plans,” Hazlitt noted in 1950. These included reducing (but not eliminating) import quotas or, more commonly, adjusting currency exchange rates. While the Bretton Woods system meant to discourage competitive devaluations, it essentially encouraged corrective ones. France independently devalued the franc in February 1948; Britain slashed the official value of the pound from $4.03 to $2.80 in September 1949, and dozens of other nations soon followed suit. Within a year, Britain’s gold and dollar reserves more than doubled, and America’s own imports increased. Yet rather than throw off the yoke of controls entirely, most states chose to retain them in modified form. France, Hazlitt noted, continued to “fix the franc at an arbitrary official level,” tried to balance trade by “offering a 20 per cent subsidy on most exports and imposing a 20 per cent tax on imports,” and kept its economy “honeycombed with protections, subsidies, vast welfare programs, and rent, price, and wage controls.” He considered “managed” devaluations, rather than those dictated by the market, as “a confession of bankruptcy” and a “high-sounding euphemism for continuous currency debasement,” where bureaucrats unilaterally violated sovereign promises and habitually cheated creditors. As such, Hazlitt considered

---

“automatic currencies based on gold” superior to “managed currencies based on guile.”

While Hazlitt approved of U.S. security guarantees to western nations, he looked more skeptically upon efforts to bundle “military assistance” as an essential component of foreign aid. The House Committee on Foreign Affairs included one of the columns he wrote on the subject, “Why Foreign Arms Aid?,” in its minority report on the 1954 Mutual Security Act. His argument echoed the concerns of prominent congressional conservatives, including Robert Taft (R-OH), a persistent critic of the national security state and Truman’s activist foreign policy. Any nation that had the will to defend itself likely had the means to do so as well, he assumed. Although exceptions occasionally arose, like Turkey, Greece, Iran, Korea, or Formosa, U.S. contributions earmarked for arms aid usually “released that much of the [recipient] governments’ own funds for other purposes,” including social security schemes, food subsidies, or paying the deficit on nationalized industries. At the very least, he suggested, Congress ought to deduct sums authorized for arms aid from foreign aid appropriations or the U.S. military budget. In the midst the Korean conflict and at the height of Cold War tensions, Hazlitt noted that Western European nations allocated roughly 5 percent of their national incomes and 18 percent of their government expenditures to defense. By comparison, even before the war over a third of the U.S. budget went for that purpose, even though the direct threat of Soviet aggression loomed larger for Europe. Like other forms of foreign aid, Hazlitt concluded, military assistance spared European nations from making zero-sum budgetary choices and ultimately subsidized profligate social welfare states.

Part of Hazlitt’s unease with the Truman administration’s foreign and military aid proposals stemmed from their inherent potential for mission creep. Not only did future administrations expand the European component of these programs, they also followed Truman’s lead in targeting the Third World. Indeed, by 1961, the United States had spent $90 billion dollars in foreign aid, including $60 billion in direct economic assistance to over 70 countries. Hazlitt hardly stood out as a lone voice of dissent. Foreign aid consistently ranked among the most controversial items on the political agenda, drawing fire from both the right and the left at different times for different reasons—indeed, on this subject Hazlitt managed to find common ground with both conservative representative Otto Passman (D-LA) and liberal Senator Wayne Morse (D-OR). Nevertheless, his dogged persistence stands out, as does the clarity of the economic case he presented.

Hazlitt’s critique of Truman’s “Point Four” Program (later expanded into a 1950 pamphlet entitled, Illusions of Point Four) presents some of the arguments he would mount against aid to “developing” countries in the fifties and sixties, and mirrors other points of analysis directed at the original European aid program. Hazlitt was fond of noting that no country got rich by giving its exports away. “We are told that ‘three out of every four dollars’ in our foreign giveaway program ‘will be immediately spent within the United States,’” he recalled. “This is like trying to appeal to the self-interest of an automobile dealer by telling him that if he makes you a gift of $4,000, you will use $3,000 of it to buy one of his cars.” Likewise, resources “invested” by the government overseas merely diverted them from private domestic development. Foreign capital normally flowed to opportunities offering the highest returns or the lowest risk, but foreign aid bureaucrats had few incentives to make such distinctions, much like their colleagues overseeing subsidized domestic mortgages or educational loans. Of course, if the United States did decide to use its aid as a wedge to force internal economic reforms and render recipient nations more credit-worthy, it would likely generate ill will and anti-American sentiments that communists could exploit.

---

74 BT 4/17/50, 12/4/50, and 5/9/55 (quote). Even if the Point Four program were necessary, Hazlitt noted, its functions seemed to overlap with the International Bank for Reconstruction and Development and the Export-Import Bank. See also Henry Hazlitt, Illusions of Point Four (Irvington-on-Hudson, N.Y.: Foundation for Economic Education, 1950).
Yet, Hazlitt insisted, developing nations like India needed precisely such reforms to draw efficient capital and increase world production in ways that would benefit their populations. Charitable gifts intended to prevent starvation in such countries inevitably overlooked the fact that government policies, rather than acts of God, usually caused or exacerbated the crisis in the first place. “The argument that India cannot pay $190,000,000 for grain because it has only “limited foreign exchange reserves” and an “unfavorable balance of payments” is economic nonsense,” Hazlitt noted in 1951. “These conditions are the result of the Nehru government’s own exchange control measures. It has made dollars scarce in the same way as it has made foodstuffs scarce—by putting artificial price ceilings on them.” What these nations needed was not handouts but “internal political stability, order, and good faith, and the adoption of policies calculated to attract the confidence rather than distrust of domestic as well as foreign private capital.” These included recognition and protection of property rights, freedom to withdraw earnings or principal, which would require dismantling exchange control, and the elimination of other “vexatious controls” such as “price-fixing, wage-fixing, and arbitrary profit limitation.” Hazlitt anticipated the arguments of contemporary economists like Hernando de Soto when he described capitalism as the “marriage of liberty and security,” where the rule of law worked to incentivize production and create wealth.75

Hazlitt did not hesitate to question other fundamental assumptions underlying the foreign aid program. Why, for example, was it suddenly considered “the duty of the American taxpayer ‘to promote welfare and growth for the peoples of Africa’”? Could U.S. aid actually achieve this goal? Did any demonstrable correlation exist between the level of aid provided to developing nations and their rates of economic growth? Moreover, if politicians belittled the cost of such programs to the taxpayer, did that mean that foreign aid dollars accounted only for “a similarly minute percentage of the total GNP of the hundred or so nations” receiving such aid? “How, then,” he asked, “could it substantially increase their living levels?” And was there any guarantee that aid recipients like Egypt, India, or Yugoslavia would actually support U.S. national interests during an international crisis?76

In this vein, Hazlitt dared to revisit an even more fundamental supposition: “has our economic aid, scattered over nearly a hundred countries, done anything appreciably to arrest the spread of Communism?” Indeed, he doubted the essential premise that “poverty and despair” created a fertile breeding ground for indigenous communist movements, or that American aid served a vital function by lifting the standard of living high enough to ward off the threat. Again, U.S. officials had confused cause and effect. “It is not true that the nations of Europe are in danger of Communism today primarily because they have run into a series of economic crises,” he asserted. “They have run into these crises, rather, mainly because they have adopted monetary inflation, dictated economies, and socialistic controls which have destroyed the price mechanism and its incentives.” Anticipating modern debates concerning the motivations driving Islamic terrorism, Hazlitt believed the appeal of communism or other statist ideologies had an ideological rather than a material basis. “Germany went Nazi with less poverty, illiteracy, hunger, or disease than any country outside the United States,” he noted, while richer industrial districts tended to nurture more communist sympathies than poorer agricultural regions. Indeed, Communism and world income had advanced together. Military assistance may have slowed communist aggression in areas like Formosa or Vietnam. But in the end, Hazlitt wondered whether American foreign aid programs from the Marshall Plan on were “framed and administered as to save socialistic [nations] from Communism or . . . to save [them] from capitalism.”77

Hazlitt’s critical analysis remained consistent even as the global economic dilemma shifted from a dollar gap to a dollar glut, and U.S. policy makers grew increasingly concerned after 1957 about the drain of gold prompted by a worsening balance of payments deficit. It came as no surprise to Hazlitt that the burden of hegemony was beginning to weigh the U.S. economy down. The Bretton Woods system tied an anchor around the dollar, expecting it to hold its gold price firm

while supporting all the other currencies that governments felt free to devalue at will (43 leading currencies depreciated between 1952 and 1962). At the same time, U.S. foreign aid programs flooded international markets with billions of dollars, inviting a trade imbalance. Likewise, the expense of those aid programs, coupled with unchecked domestic spending, exacerbated budget deficits and domestic inflation, fanned as well by loose Federal Reserve interest rate policies. These inflationary pressures acted to weaken a dollar that served as the lynchpin of the entire global monetary network.78

“What the United States faces today is only derivatively a ‘balance of payments’ crisis,” Hazlitt observed, “it is primarily a crisis of inflation.” Setting aside “the goods and dollars that we deliberately give away in foreign aid, payments always balance,” because foreign currency received in a sales transaction is eventually used to buy back goods from its country of origin. But, he noted, “if in return for the goods they sell to us, foreigners buy gold instead of other goods, it is because they think gold is the better bargain. They will think this as long as our commodity prices, as a result of domestic inflation, are too high as compared with the price at which we sell gold.” In other words, inflated money supplies, prices, and wage levels had turned the tables on the United States, making foreign imports cheap, domestic exports expensive, and gold—steady at $35 an ounce since 1944—the best deal in town.79

Hazlitt emphasized that policies designed to discourage imports offered no solution to the balance of payments problem. The Kennedy and Johnson administrations attempted in various ways to reduce foreign investment, duty-free purchases, and similar commercial exchanges for foreign goods or services. But, he observed, “by the exact amount that we cut down our purchases from abroad, we ultimately cut down our sales abroad, by depriving foreigners of the dollar purchasing power to buy them.” Indeed, Washington’s crackdown on foreign investment made little sense given its magnanimous commitment to foreign aid. As Hazlitt surmised, “when we give away the dollars to buy part of our exports, we give away those exports. We cannot use the proceeds from those exports to buy our needed imports.” As such, they did little to bring about a trade balance, while retarding capital development and economic growth. Exports facilitated by foreign investment, however, were “real” because foreigners paid for them, and they helped to build “American economic strength.” Anyone worried about the negative effects of foreign investment on the balance of payments, he concluded, “should doubly oppose foreign aid.”80

The American economy in the 1960s, with its booming growth and steady price levels, posed something of a dilemma for Hazlitt, who warned constantly of the dangers of inflated money and credit supplies. Where did this inflation manifest itself, then, if not in prices? The balance of payments problem pointed to the answer. “What has happened is that most of our inflation has been exported,” he maintained. “Broadly speaking, we have paid the cost of it, and Western Europe and the rest of the world have had the advantage of it.” Inflation led to the cumulative balance of payments deficit, precipitating “a massive movement of reserves to other countries from our own,” where they increased foreign money supplies, stimulated foreign economies, and employed foreign labor. Likewise, the International Monetary Fund always stood ready to lend to countries that ran up deficits, held down interest rates, and overvalued their currencies. The result, Hazlitt surmised, was an era of world inflation, a bubble waiting to burst.81

**GOLD**

Hazlitt knew the Bretton Woods system was unsustainable in the long run—it collapsed in 1971 when President Nixon closed the gold window. But what did he offer as an alternative? Again, he bucked convention by following his mentor Mises and advocating a return to a true gold standard, where all currencies, not simply the dollar, were backed by gold reserves at a fixed ratio, freely convertible on demand by anyone into any other currency. Hazlitt wrote dozens of articles related to gold, particularly in the context of the balance of payments problem, but a series of four columns written in January 1954 best captures the essence of his argument. Requests poured in from across the country when *Newsweek’s* editors released them in booklet form, as they had with the series on inflation. And the Senate Banking and Currency Committee invited Hazlitt to testify

The Federal Reserve also helped determine the flow of investment funds. “When the government holds down long-term rates, it drives more American investment abroad and discourages foreign investment here. If the Federal Reserve stopped inflating, and allowed domestic interest rates to be determined by market forces, there would automatically be less American investment abroad and more foreign investment here.” See *BT* 9/23/63.

on various gold bills then pending before Congress.\textsuperscript{82}

Hazlitt considered an international gold standard a bulwark against currency manipulation on the part of politicians and bureaucrats and a prophylactic against inflation. As such, he interpreted the Bretton Woods system as an outgrowth of the Keynesian animus against gold and its quasi-automatic stabilizing properties. Under a metallic standard, inflation compelled higher prices, shifted the balance of trade against the inflating nation, and precipitated an outward flow of gold. Shrinking gold stocks acted to contract supplies of money and credit, raise interest rates, arrest inflation, and bring the flow of trade back into equilibrium. According to Hazlitt, foreign bankers and currency dealers actually anticipated this sequence at the first hint of inflation, initiating an adjustment in the exchange rate and signaling central bank managers to raise discount rates to stem the drain on gold. “Unsound monetary and economic policies, or even serious proposals of unsound policies,” Hazlitt suggested, “were immediately reflected in exchange rates and in gold movement.” The inherent stability of fixed exchange ratios and free convertibility ultimately bolstered confidence and facilitated international trade and lending. The gold standard never “broke down” in times of crisis or war, Hazlitt insisted. Rather, it was willfully abandoned or undermined by the policies undertaken by public officials. The choice, then, between gold’s equilibrating mechanism and a currency “managed” by bureaucrats was a choice between free enterprise and collectivist planning. Hazlitt harbored no illusions about the complications involved in restoring an international gold standard. In the end, however, he believed gold could prompt governments to act in ways that promoted liberty and prosperity: “to respect . . . private property, economize in spending, balance their budgets, keep their promises, and above all refuse to connive in . . . the overexpansion of money and credit.”\textsuperscript{83}

MOVING ON

In 1961, publisher Philip Graham, president of the \textit{Washington Post} Company, purchased \textit{Newsweek} from the trustees of the Astor Foundation following Jacob Astor’s death. His inspiration for the move came in the form of persistent pleading from a group of \textit{Newsweek} insiders, including managing editor Osborn “Oz” Elliot, Washington Bureau Chief Ken Crawford, and his assistant, Ben Bradlee. The change in ownership breathed new life into the magazine and signaled an ideological shift. Graham was friendly with Vice President Lyndon Johnson and enjoyed access to the Kennedy White House. Oz Elliot, elevated to the editor-in-chief position, likewise counted himself a Kennedy partisan who sought to challenge \textit{Time}’s market dominance by expanding the range of issues the magazine addressed and appealing to a younger audience. Even after Graham’s suicide in 1963, Elliot continued to secure significant budget increases from his wife and successor, Katherine, to fund an overhaul in style and content. In addition to splashier graphics, he also inaugurated in-depth coverage of the major social and political trends of the sixties, including award-winning features on the civil rights movement that attracted prominent national attention and hundreds of thousands of new readers.\textsuperscript{84}

Years later, Hazlitt attributed his departure from \textit{Newsweek} in 1966 to the animus of Katherine Graham, but here his memory betrayed him. Graham generally deferred to Elliot on most editorial matters. Though the magazine’s new management treated Hazlitt well, renewing his contract several times from 1961 on and providing him with a generous pension, plans were already underway to phase him out. Elliot concerned himself with balancing the personalities and politics of his regular columnists, bringing on Walter Lippmann and Emmet Hughes, for example, to balance Raymond Moley’s “predictably conservative” views. In that vein, he “thought it equally desirable to counter the antediluvian economics of Henry Hazlitt with something closer to current day reality.” In 1965, “Business Tides” began running on a biweekly schedule, alternating with a new column by Henry Wallich, Yale professor and former economist at the Federal Reserve Bank of New York. Wallich described himself as a “conservative,” but noted in the same breath that “the new conservative in economics today must accept most of the

\textsuperscript{83}On Keynes and gold, see \textit{BT} 11/11/63.

changes of the past 25 years and go on from there to improve them.”

Elliot’s quest for diversity and new blood also led him to sign up two of the nation’s leading economists, Harvard Keynesian Paul Samuelson and Chicago monetarist Milton Friedman, completing the triumvirate that would replace Hazlitt. “We need three people to fill the spot formerly occupied by one,” Oz graciously informed him, although he was quite satisfied to usher the “dull right-winger” from Newsweek’s new, glossier pages. For his part, Friedman realized that his outlook and Hazlitt’s were “essentially the same,” so much so that he thought it proper to seek out his blessing before accepting the assignment—Hazlitt, of course, enthusiastically urged him to take it. Perhaps Elliot had imbibed enough of the Kennedy mystique to consider youth and Ivy League credentials sufficiently exciting. At any rate, Hazlitt was 72 years old in 1966, and ready to move on. Soon after his last column appeared on September 12, he received a fan letter testifying to his longevity and influence:

Some 35 years ago as a freshman or sophomore in an economics course at the University of Chicago I was assigned an article by you. I can’t remember its title, but I do remember its general subject matter: that the deductive method was indispensable in the field of science, including the social sciences. I was much struck by the example you gave of the discovery of the new planet (Neptune?) by Leverrier and Adams purely by deductions from Newton’s equations and the aberrations in the observed orbit of known planets. A writer never knows what his impacts have been. I can say that one of the reasons I decided to go into economics was reading your article.

The letter writer’s name? Paul Samuelson.

BACK TO THE FUTURE

The preceding pages have couched Henry Hazlitt’s significance predominantly in historical terms, but it is fitting to conclude by noting his continuing contemporary relevance. During his tenure at Newsweek, an era of growth and prosperity when federal budget deficits typically amounted to around 1 percent of GNP and citizens registered more confidence in the power of government to improve their lives, liberals could more easily dismiss Hazlitt as a crank. After surveying the economic landscape from the 1970s to the present day, however, he appears a lot less cranky, and a good deal more prophetic.

Even readers who do not necessarily share the depth of his profound libertarian suspicion of the state can appreciate the broader cautionary message Hazlitt delivered through the medium of economic analysis. The post-World War II mandate for government-managed prosperity, he warned, created an institutional bias toward inflationary policies that public officials, regardless of political orientation, would find difficult to resist or ultimately contain. In the long run, the hubris of technocrats offered no substitute for the decentralized genius of the market. Moreover, he observed, Liberalism could articulate no implicit limit on the scope of its socio-economic agenda, and so possessed no inherent brake on its recourse to state power. The private resources required to nourish the resulting public sector promised to be, in William Voegeli’s phrase, “never enough,” such that the welfare state threatened to sap the very social and economic capital that sustained it.

William Voegeli, Never Enough: America’s Limitless Welfare State (New York: Encounter Books, 2010). Many conservative economists, such as Chicago School monetarists, do not share the Misesian aversion to inflation that Hazlitt articulated. Accordingly, questions concerning the proper tolerance level for credit expansion in normal times or periods of economic distress continue to prompt lively discussions on the Right.
Hazlitt found no contradiction in a vision of progress achieved through free markets, individual initiative, and a smaller role for government. As he clarified in his final *Newsweek* column, his criticism of liberal economic and social policy did not arise out of callousness or disinterest in reducing poverty or increasing wages. “I do not differ from my ‘liberal’ correspondents in their goals, but simply in their proposed methods of achieving them,” he explained. “In trying to bring about some wished-for result directly and immediately, they too often fail to see that the ultimate results of the policies they propose will be exactly the opposite of what they desire.” Modern readers acquainted with economic stimulus plans, “quantitative easing,” automotive and bank bailouts, health care reform, “cash for clunkers,” housing and higher education bubbles, “green” jobs subsidies, underfunded state pension programs, public sector union contracts, climate change legislation, the crisis of the Euro, escalating debt ceilings, denunciations of “tax cuts for the rich,” and “living constitutions” can certainly relate to such sentiments. The academic Walter Russell Mead suggested recently that if America is to prosper in the twenty-first century, “power is going to have to shift from bureaucrats to entrepreneurs, from the state to society, and from qualified experts and licensed professionals to the population at large.” The toolkit of twentieth century progressivism has little to offer in bringing about such a transition, but the “Business Tides” columns of Henry Hazlitt surely do.88

How ‘Stabilization’ Unstabilizes
September 30, 1946

After much wavering, the Truman Administration was finally brought, months ago, to acknowledge that price control could not work without wage control. But while its price ceilings have been fixed and rigid, its wage ceilings have from the first been vague, movable, and, in fact, fictitious. It has never applied the same principles to wage control as to price control and, to do it justice, it has never applied the same vocabulary. Prices have frankly been fixed; but wages have merely been “stabilized.” Whatever nebulous meaning may once have attached to this word was completely lost in the settlements of the New York trucking and maritime strikes. It was at last made crystal clear that there is no national “wage policy” or “wage line” that cannot be destroyed the moment any powerful union chooses to challenge it through a strike.

The history of these “wage policies” has now become drearily repetitive. The various wage boards set up by the Administration, ostensibly for the purpose of “stabilizing” or holding down wages, have been in reality wage-boosting agencies. The famous 18½-cent wage-increase formula was an open invitation to every labor union leader to demand at least that. He could hardly afford to ask less for his members than the amount the President himself had declared to be only their just due. This “stabilization” policy could be put into effect as long as the government was forcing the oil, motor, steel, and other industries to pay greater increases than the unions could obtain through their own unaided bargaining power. The new 18½-cent higher ceiling was smashed the moment John L. Lewis decided to smash it. The government cooperated with him in smashing it, in fact, by seizing the mines and negotiating and signing the new ceiling-smashing contract with him itself. One consequence of this was the New York trucking strike and its settlement by wage boosts of 31 cents an hour.

The truth is that the government by its own policies has finally placed itself in a position where it must surrender to every strike. It not only fails to penalize; it rewards every strike by giving the strikers more than they would have got without striking. A never-ceasing round of strikes under these circumstances can hardly be regarded as a mystery. Every time the government buys off one present strike by forcing the employers to grant the substance of the demands made it buys itself twenty future strikes.

And it begins by creating a situation in which it is all but impossible for a union to lose a strike. By the Wagner Act the government turned itself, in effect, into a union-organizing agency. One provision of that act makes it in practice impossible for an employer to dismiss men on strike and to hire permanent workers to take their place. Local governments, in addition, fail to provide adequate police protection not only for substitute workers but even for workers who wish to continue peaceably at their old jobs. Under these conditions all the natural risks are taken out of strikes, the previous function of the strikers cannot be taken over by anyone else, vital production must come to a halt, and the deadlock can only be broken by giving in to the strikers’ demands.

The least that we may hope for is that the Administration will candidly recognize the situation it has brought about, and will now give up the pretense that it has any “wage stabilization policy” or that it can enforce any. But the logical and indeed the only workable corollary of abandonment of a wage control that has always been fictitious is an abandonment of price control; otherwise artificial scarcities must continue to be brought about and production must continue to be discouraged, unbalanced and disrupted. Yet the administrators hang on grimly to every inch of price control that the present extension law permits, and even interpret the law to retain far more control than Congress intended.

Though the national production of meat this year was substantially higher than in the prewar years, both the Price Decontrol Board and the Secretary of Agriculture calmly ruled it to be “in short supply.” Restoration of price control then brought about the worst meat shortage in our history.

The government’s “stabilization” policy, in short, continues to create worse difficulties than any it was designed to solve.

New Ironies of Price Control
October 7, 1946

It is hard to decide which has been more harmful—the new Price Control Extension Act or its administration. The law itself provided that controls could not be reimposed on meat unless meat was “in short supply.” As the production of meat when the present law went into effect was substantially above the prewar average, meat could have been decontrolled immediately. But the Price Decontrol Board, instead of adopting the simple standard of supply mentioned in the law, put meat back under control on the ground that it was in short supply “in relation to demand at reasonable prices.”
Under this elastic standard, price control can be retained indefinitely. A comparison of present with past supplies is definite and measurable, but a comparison of supply with “demand at reasonable prices” depends on the concept of reasonableness in the minds of administrators.

The new price-extension law was so badly conceived that only expert administration could have made it work. The administrators proceeded to follow the precise combination of policies likely to do the most harm. First, meat was needlessly put back under control. Then, as if to make certain that there would be a meat famine, grains and animal feeds were left free of controls, while the OPA delayed a couple of weeks in restoring ceilings.

Livestock raisers, fearing a profit squeeze, rushed their unfattened cattle to free markets while they lasted. This added temporarily to the supply of meat at the cost of a long-term shortage. When controls were restored, livestock raisers decided to fatten the cattle that remained on the range rather than sell it; at the latest, they figured, price control would end next June.

The result has been the worst meat famine in the nation’s history. Residents of New York City found themselves for the first time reduced to trying horse flesh. Poultry and egg prices soared. Die-hard price controllers blamed this rise on the free market, though it should have been obvious that when a scarcity of meat was brought about by price control, the whole demand would concentrate on the substitutes remaining, and force their prices far above any levels that would have existed without price controls over other items.

The crisis reached a point where even the Democratic Majority Leader of the House, who had fought tenaciously to have price control restored, called for a 60-day suspension of controls over meat and other scarce foods. Republicans were prompt to denounce this as a political trick, and to point out that it would suspend price control over meat until safely after the elections and then probably reimpose it. But wholly apart from the political aspects, a mere 60-day “suspension” of meat controls would be another economic error. That was precisely what we had in July and August. A second price-control suspension would produce the same kind of results. When producers are left with a sword of Damocles hanging over them, they do not act as they would in a free market. The government cannot monkey with the price mechanism in this way without courting disaster. Only one thing will do now—the definite termination of meat control and, in fact, the definite termination of all price control.

What is particularly ironical is that the restoration of price control itself brought about the very shortage in meat that the Decontrol Board and the Secretary of Agriculture declared to exist when there was no shortage. It would be embarrassing for Secretary Anderson to declare meat now not to be in short supply, in order to get rid of price controls, when he declared it to be short at a time when it was obviously more plentiful than today.

The dilemmas of the administrators are no worse than the paradoxes in the law itself. In the agricultural realm it provides for price controls only over commodities in short supply. But the effect of holding down the price of goods in short supply is to increase their consumption, discourage their production, and intensify the shortage. The only defensible course with regard to goods in short supply would be to ration them without controlling their price. This would restrict demand without reducing incentives.

Between price controls and priorities, production has been thrown into more chaos than we have ever seen in peace times. ❇

Inflation, Deflation, Confusion
October 14, 1946

In the last two years left-wingers have been fond of referring to private enterprise as a “boom-bust” economy; OPA officials have contended that only price fixing can prevent a repetition of the 1920–21 boom and collapse, and British statesmen have insisted that their new “democratic socialism” will work beautifully if only mercurial America doesn’t crack again and drag the rest of the world down with it. Small wonder that so many people now ask each other whether the recent slump in the stock market does not at last foreshadow this long-predicted business setback.

The question is not easy to answer, because the American economy has now become the football of political policies and counterpolicies that are not inherent in it but essentially external. These conflicting political policies are on the one hand those tending to create inflation, and on the other those tending to bring about disruption.

The inflationary forces are obvious, and until now have been controlling. Their primary causes are government deficit financing and other political policies that increase the volume of money and credit. Past inflationary forces are roughly measured by the increase in the national debt to $265,000,000,000 and of money and credit to more than three times the prewar volume. Potential future inflation is indicated by a still unbalanced budget in prospect (in spite of a balance...
in the first quarter of the current fiscal year), and by a policy of artificially low interest rates that promotes further increases in credit and further monetization of the public debt. As long as inflation raises prices faster than costs it stimulates business expansion, new ventures, and employment.

Against this, however, are equally powerful forces of disruption. The chief of them is price control, administered in a spirit hostile to profits and business. This has distorted relationships among profit margins and disrupted and unbalanced production. Builders find themselves with bricks and no doors, glass, or bathtubs. Automobiles wait on assembly lines for bumpers or batteries.

The profit squeeze from the top meets another from the bottom. Endless strikes, interrupting output, are followed by endless wage increases. To encourage or compel such wage increases the Administration ignores elementary property rights, seizes coal mines, and signs wage-boosting contracts itself. These wage increases must ultimately either raise costs to the point where many firms can no longer operate, or force up prices to levels that will cut off buying. In either case they will slow down production and force unemployment. Add to all this a basic hostility to business on the part of Washington agencies which is reflected in countless harassments.

Which of these two sets of forces will dominate the next six to twelve months—the inflationary or the depressive? That is impossible to say until we know the complexion of the next Congress and the main decisions that key political figures—President Truman, Secretaries Snyder, Byrnes, and Anderson, Paul Porter, Wilson Wyatt, Marriner Eccles, and members of the PDB, ICC, OWMR, NLRB and CPA—are going to make. The decisions of such men are incomparably more important today in determining the future course of business than the merely derivative decisions made by private businessmen.

One thing we could not have simultaneously is both “inflation” and “deflation,” for we could not have simultaneously both an expansion and contraction of the money supply. But we could have a frustrated inflation. We could have simultaneously, as experience in Europe has already proved, both inflation and industrial disruption, inflation and unemployment, inflation and stagnation.

The real danger we face in the next six to twelve months is that if the present combination of political policies brings about this result, Administration officials, instead of removing the throttling controls that cause it, may decide that the real trouble has been insufficient inflation, and may embark upon the disastrous policy of further increasing and debasing the money and credit supply. Our greatest enemy today, in short, is the economic illiteracy and confusion on the part of those who insist on “planning,” “stabilizing,” and straitjacketing the economy and who have the political power to do it.

Price-Fixing Brings Bottlenecks

October 21, 1946

The meat shortage may serve as an illustration of the way in which price fixing brings about scarcity in general. As a result of ceilings, cattle raisers found it more profitable to fatten their cattle on the lots than to send them to market. This led to a whole series of other shortages. A soap crisis is being created because soap is mainly made from tallow and tallow comes from steers. Synthetic rubber and hence tire production are threatened in turn by the shortage of soap. A meat shortage also means a hide, leather, and shoe shortage. A bread shortage may come from a scarcity of lard needed in baking, for lard comes from hogs.

Production is held back everywhere by missing vital parts: automobile makers wait for sheet steel and radio makers for cabinets. The National Association of Home Builders, reviewing the veterans’ housing program, has pointed out that “the success of the veterans’ program will be measured not by the supply of the most available building material but by the supply of the least available building material.” It points, as one illustration, to the critical shortage of nails, “fast approaching a national scandal.” But as the remedy it proposes, not the termination of price fixing, but “incentive pricing” for nails.

Such a proposal indicates that even the chief victims of price fixing still fail to recognize that the problems which confront price fixers are inherently insoluble. If there is to be incentive pricing for nail manufacturers, why not incentive pricing for everyone? How can the government allow a higher rate of profit for nail makers as compared with brick makers, for example, without laying itself open to charges of favoritism?

How can it decide, in fact, just what rate of profit on nails as compared with bricks is necessary to bring forth just the right amount of nails as compared with the right amount of bricks? Or just the right amount of nails and bricks compared with the right amount of each of tens of thousands of other commodities? The output of every part must be synchronized with that of scores or hundreds of others if there are not to be bottlenecks which slow down whole industries.
The persistent belief among many businessmen that price fixing would be all right if it were “fairly administered”—if it allowed “cost of production plus a reasonable profit”—completely overlooks this problem. A uniform percentage profit for everyone (assuming that price fixing could achieve it) would give no more incentive for producing an article in critically short supply than one in relative excess.

The most brilliant of bureaucrats could not solve through price fixing the problem of balancing and synchronizing the production of thousands of different commodities in relation to each other. Yet this problem is solved quasi-automatically through the mechanism of free markets. When a given article is scarce in relation to demand its price immediately rises; the profit margin in making that article becomes greater than for making articles in ample supply; manufacturers expand its output and new firms take up its production until the shortage is relieved and the price and profit margin once more fall to an equilibrium level with that in other lines. There is no delay and red tape in getting “price adjustment”; price changes occur daily and hourly the moment unfulfilled demands or increases in supply anywhere make themselves felt.

It is true that, in spite of all the complaints about specific shortages under price fixing, the figures of overall production, as compiled by the Federal Reserve Board, have been high. For July the Federal index of industrial production was 78 percent above the 1935–39 average. But before we attempt to explain this apparent paradox, serious questions must be raised concerning the accuracy of the Reserve index. Andrew Court of General Motors has pointed out that while the Reserve index showed automobile production 78 percent above the 1935–39 average in July, actual production that month was about 300,000 cars and trucks compared with an average of 335,000 for the 1935–39 period—i.e., down 10 percent instead of up 78 percent.

The Reserve index error is apparently the result of measuring production of cars and parts by the treacherous figure of man-hours worked instead of by the actual number of cars and trucks produced. ✠

**Meat and the Speed of Decontrol**

October 28, 1946

President Truman took exactly the right action on meat after giving all the wrong reasons for it. His arguments on the radio were necessarily inconsistent because he was attempting to do an inconsistent thing—to make the voters angry at the Republicans for trying to do in July what he himself was at last being forced to do in October.

It was the President’s veto that brought about the summer price-control holiday he was deploring. This holiday was in fact salutary. For the first time in years it gave the American public a glimpse of the free market. In spite of the manipulation of index numbers by government agencies, the public knew that it was buying meat below the black-market prices that most buyers had previously been forced to pay. And the public was really getting meat.

Mr. Truman and his advisers now say, in fact, that it was then getting too much meat and that this is the real reason for the subsequent shortage. The figures do not support this contention. For a short six weeks meat production was up an average of only 30 percent above the corresponding period of the preceding year. But the stockmen who did rush unfattened and unfinished cattle to slaughter did so, not primarily because there was then a free market, but because they correctly feared an early reimposition of controls. The President himself conceded the truth of this when he wisely refused to declare another price-control holiday and announced instead that meat controls would be permanently lifted.

But Mr. Truman’s final wise act threw a sad light backwards on the price-control record of his Administration. He and his assistants had roundly denounced the Senate when it twice voted for termination of controls on meat. The Price Decontrol Board, had it acted with common sense and adhered strictly to the requirements of the law, would not have put meat back under control on Aug. 20. The Secretary of Agriculture had a chance to decontrol meat on Sept. 1 merely by failing to list it as “in short supply.” Production of meat was in fact then running above the prewar rate. He had a second opportunity on Oct. 1, but consistency with his September ruling forced him to pass it by.

When the Democratic Majority Leader of the House then called in alarm for a 60-day suspension of price controls on meat, the President flatly rejected the idea. Instead, Price Administrator Porter rushed to inform the country that “stabilization” was more important than steaks—in other words, that it was more important that the OPA should continue to fix ceiling prices on meat than that there should be any meat to buy. And then Mr. Truman acknowledged that, after all, it was price control that had been bringing about the shortage; and he lifted it.

A few weeks must elapse before meat on the hoof can become meat on the dinner table. Empty trade
The recent crisis in meat brought out an important consequence of price control that until now has been overlooked. It was illustrated most vividly by what happened to poultry and egg prices. When beef, lamb, and pork were put back under price controls in September, an immediate result was an increased price of poultry and eggs. The price controllers, naturally, blamed the free market. But the public had the good sense to realize that when price ceilings made meat impossible to get, and the whole demand for meat was concentrated on the only available substitutes, the prices of poultry and eggs were being forced substantially above what they would have been in a free market for everything. When ceilings were taken off meat, poultry and egg prices immediately dropped. And when ceilings were removed from margarine and other fats, the price of butter immediately dropped.

These effects on particular commodities merely illustrated a broad principle. The day after the President lifted meat ceilings, a regional price administrator declared that the OPA had never governed the entire economy. American consumers, he estimated, spent a total of $250,000,000,000 a year; the OPA at its maximum had never controlled more than $100,000,000,000 of this, and after the release of meat it controlled only about $65,000,000,000 of goods.

These estimates are of doubtful accuracy, but they will do well enough to illustrate the principle. If the public buys altogether some $250,000,000,000 of goods and services of all kinds (I suppose the OPA administrator included in this total real estate, securities, professional services, and other items never brought under ceilings) while the government controls the prices of only $65,000,000,000 or even $100,000,000,000 worth, what happens to the prices of the other $150,000,000,000 worth?

To the extent that prices of controlled commodities are kept down by price-fixing, consumers will be able to get them for less. They will have just that many more dollars left over, therefore, to bid up the prices of the uncontrolled commodities. In other words, to squeeze down the prices of the controlled commodities is to force up the prices of the uncontrolled commodities.

What we have fundamentally is a certain total volume of money or money incomes bidding for a certain total volume of goods. If we increase that volume of money or money incomes without a corresponding increase in the volume of goods, the inevitable effect is to push up the prices of those goods. If we hold down the prices of all those goods, we must either pile up a certain amount of unspent savings in the hands of the public, or we must divert part or all of that unspent amount to the uncontrolled goods. If you squeeze a toy balloon at one point, it will swell all the more at some other, because the gas pumped into it has to go somewhere. In the same way, if you prevent money from having its effect on goods at one place, it must affect goods all the more at some other. The money has to go somewhere.

This brings us to a major conclusion precisely the opposite of that usually drawn. The ultimate effect of fixing the prices of only part of the goods in an economy is not necessarily to reduce the general price level at all.

Perhaps the best solution of our immediate economic problem that is politically feasible is to decontrol everything but rents on old houses. But if we do this we must not retain rent control itself too long. For one consequence of holding down rents is merely to divert
that much more purchasing power to the bidding up of other commodities or services.

Because the problem that price fixing seeks to solve cannot be solved by partial price fixing, it does not follow that it can be solved by fixing the price of everything. Such a plan could be made to work in the long run only by universal allocation and universal rationing, not merely of raw materials but of labor. That could only lead to totalitarianism. The problem can be solved only by dealing, not with the mere symptoms and consequences, but with the basic cause of inflation. That basic cause is the increased issue of money and bank credit, and the policies that encourage it.

Leonard Ayres on Business Cycles
November 11, 1946

The death of Leonard P. Ayres last week at the age of 67 left a vacant chair in American economic life that will not be easily filled. His business forecasts were better known and more heeded than those of any other individual. With a firm theoretical grasp he combined an unexcelled knowledge of living facts. He ranks high among statisticians. His writing was distinguished for its clarity and compactness, and his charts for their telling simplicity. He arrived at his results by an elegant economy of means.

The last Cleveland Trust Bulletin to come from his pen, dated Oct. 15, was typical of his best writing. Two paragraphs from it not only illustrate his forthright analysis, but throw a sharp light on the current business situation:

“It is nearly incredible that this great essential [automobile] business, with its huge backlogs of unsatisfied demands, should be losing money in this postwar period. If the automobile industry and the construction industry were prosperous, this country would be experiencing a business boom that could be of exceptional duration. As things are, both of them are far from being prosperous. Their output is low and erratic; their prices are high; and their customers are dissatisfied. They are making progress toward greater efficiency of production, but it is disappointingly slow progress. Conditions in these two industries typify those in many other industries. The companies are suffering from shortages of materials, extreme wage increases, and low per capita production by employees.

“We have great productive capacity. We have more workers employed than ever before. There is ample credit available on easy terms for almost any constructive enterprise that needs credit. We have great accumulated shortages of many kinds of goods, and large numbers of eager buyers competing for opportunities to buy the things they want. It is preposterous that under this combination of conditions the prospects for profits are so dubious that we have had a collapse of security prices. Wage costs per unit of production have advanced too rapidly, and price relationships are disorganized.”

In 1939 Ayres published a volume on “Turning Points in Business Cycles.” He found that over the previous 75 years a certain economic sequence had occurred “with almost complete regularity:” A rise in short-term interest rates had brought about a downturn in bond prices. This had been shortly followed by a downturn in stock prices. Declines in security prices had created unfavorable markets for new securities; the volume of new issues had consequently shrunk. With this decrease in the inflow of new funds into productive enterprise, a business decline had been started.

If we apply this description of the business cycle to current conditions, we find that part of this sequence has already occurred. Short-term interest rates began to stiffen perceptibly in March. In the first week of April high-grade bonds reached their peak level and then began to decline. The high point for stocks was not reached until May 29, and a violent fall has since taken place.

All this, however, does not in itself mean that a business decline is now necessarily in the offing; it may be doubted whether General Ayres himself, on this ground alone, would have predicted such a decline. For short-term interest rates today are highly artificial; their rise has been slight; they are still fantastically low; they still promote inflation. They can be held down to the present levels, in fact, only by a continued inflationary policy of keeping the money market flooded with funds. A moderate rise in short-term interest rates today need mean nothing more than the termination of dangerous artificial situations that should never have been permitted to occur.

A far more serious menace to continued prosperity has been a recent rise in wage rates without any corresponding rise in productivity. Leonard Ayres in his last Bulletin calculated that manufacturing costs per unit of production had risen by March of this year 64 percent above their 1939 level; 42 percent of this increase occurred in the preceding eleven months. Unless we can now achieve an increase in the volume of production without corresponding increases in hourly pay, this startling rise in costs may lead to a crisis.
The Consequences of Decontrol

November 18, 1946

In his sweeping decontrol order four nights after the election President Truman proved that he could recognize a mandate when he saw one. His decontrol order was not only, with the exception of one or two paragraphs, an eminent example of good sense; it was also, with this exception, an eminent example of good sportsmanship. Mr. Truman would have been more than human if he had not accompanied his decontrol order with at least a little attempt at face saving; but that little was unfortunate.

He declared that “the real basis of our difficulty is the unworkable price-control law which the Congress gave us to administer.” It is true that the price-control law was unworkable; but this was precisely because of the provisions that Mr. Truman and his administrators had themselves insisted on, and not because of the amendments that Congress had inserted over their opposition. Some of its “fair-price” amendments never got a chance to go into effect; the so-called Decontrol Board did nothing but recontrol; and it is improbable that the President could have decontrolled first meat and then practically everything else without the discretionary decontrol powers which Congress insisted on giving his administrators without his or their request. Price control had lost popular support not, as the President asserted, because the law was “inadequate,” but because it was altogether too adequate.

Nor is it true, as the President declared, that “in the fifteen months since V-J Day the stabilization program has preserved a large measure of general economic stability during a period in which explosive forces would otherwise have produced economic disaster.” It is not true, either, that the situation today is “far more favorable for the return to a free economy” than it was only four months ago, when the President insisted on retention of overall price control for an additional full year.

On the contrary, it is altogether probable that prices will be higher this winter than they would have been if price controls had been lifted on V-J Day. For the effect of peacetime price control has been to retard, unbalance, and discourage production and to produce shortages. The net effect, also, of government intervention in labor relations and wages has been to raise wage rates faster than they would otherwise have been raised and to jack up production costs.

The first result of the President’s decontrol order will be price advances in most of the products that have been controlled and sharp advances in the products that have been controlled most tightly. The most spectacular advances will make the headlines, thus giving a distorted view of the overall picture. The advances will be blamed on decontrol. But the real reason, as in meat, will be the shortages brought about largely by control itself, supplemented by the wild swings inevitable when both buyers and sellers are first groping for the real equilibrium price.

While advances are still going on in some commodities, declines will be taking place in others, for the very reason that all commodities will be competing freely for the consumer’s dollar, so that if more of it has to go for one commodity, less of it will be left for others. It may be doubted whether the general price level in the next few months will rise more than another 5 or 10 percent. And any general rise in the price level will be basically due, not to the absence of price controls, but to the increase in money and bank credit in recent years brought about by the war and by governmental policy. With the false remedy of price control out of the way, public attention will at last be able to concentrate on the real remedy for inflation, which is to halt the increase in the money supply.

In retaining ceilings on rents, the President doubtless followed the only course that seemed to him at the moment politically possible. But it is unfortunate that he did not at least remove rent ceilings at once on all new and remodeled housing; for such rent ceilings merely prevent a great deal of such housing from being built, and so themselves prolong the housing crisis. The next step should be to remove rent ceilings from all houses or apartments voluntarily vacated by the former tenants. The third step should be to allow at least some moderate maximum increase on new leases for old tenants.

Repeal Anti-Employer Legislation

November 26, 1946

If we are not to have a further great wave of strikes, if labor costs of production are not to be forced up to levels where it at last becomes impossible for industry to operate, there must be basic changes both in the text and administration of our labor laws. If the election of a Republican Congress was a mandate for anything, it was a mandate for this.

Central to any improvement in labor relations is revision of the Wagner Act. Any discussion which ignores the need for this must be set aside as unrealistic. The Wagner Act overshadows all labor relations and all wage negotiations, even where there is no direct appeal to it. It would not be difficult to suggest a dozen major
amendments to the act, all of which would improve it. But would they improve it enough to make it do what it ironically professes to do—“diminish the causes of labor disputes”? The real question is not so much what amendments should be added to the Wagner Act as what part of it, if any, it would be wise to retain.

Let us take in illustration Senator Ball’s proposal to strip from the Wagner Act its legalization of the closed shop, and to write into the law, instead, a provision that membership in a labor union must not be a condition of employment. Such a change would remove an obvious self-contradiction in the act. Its supposed central principle makes it an unfair labor practice for an employer “by discrimination in regard to hire or tenure…or condition of employment to encourage or discourage membership in any labor organization.”

If this principle is to be retained in law, then it should be retained in just this two-sided form. But this would make it logically compulsory to outlaw the closed shop, maintenance-of-membership clauses, the check-off, or any other device which makes employment contingent on union membership or compels the individual worker to join or stay in a union.

Could a two-sided law of this sort be enforced? If not, should the present purely one-sided act be retained? That act forces the employer (though not the union) to “bargain collectively.” No one has yet succeeded in saying precisely what this means. It has been interpreted as meaning that the employer cannot break off negotiations even when he is slandered and abused by union representatives. It has even been interpreted as compelling the employer to make some kind of counteroffer, “to meet a union half-way,” no matter how unreasonable its demands or what he can afford.

The employer is not allowed to “dominate or interfere with” any union or to “restrain or coerce” any employee in the exercise of union rights. These fair-seeming provisions have in practice been used to deprive employers of ordinary freedom of speech. J. Warren Madden, then chairman of the National Labor Relations Board, told a Senate committee in April 1939 that an employer who called a union leader a Communist might be held guilty of coercion under the Wagner Act even if his statement were completely true.

By the mere way in which it defines an “employee,” the Wagner Act makes it illegal for an employer to discharge a striker and hire another permanent worker to take his place. Add to all this the failure of local governments to protect against violence and intimidation the workers who wish during a strike to continue peacefully at their jobs. Add the practice in some states of paying unemployment insurance to strikers. By government policy, all the natural risks have been taken out of striking. It has been made all but impossible for a union to lose a strike. Should we be surprised that unions now keep raising their demands and threatening new strikes?

A commonly proposed remedy is to leave all present restraints on employers but to “balance” them by corresponding restraints on labor. It may be doubted whether such restraints would be enforceable. What we need at bottom is not “anti-labor legislation” but the repeal of anti-employer legislation. People are not born employers; they become employers by choice, and they can quit by choice if too much discouraged. Unless we restore to the employer the freedom to select his own employees, the freedom to hire and discharge solely on the basis of what is good for the business, we cannot maintain discipline, efficiency, or production—which means that we cannot maintain living standards.

How to Taper Off Rent Control
December 2, 1946

Now that ceilings have been removed on everything else, it is clear that rent controls ought to be whittled down. With the ceilings removed on wages and materials, on everything that goes into a house, it becomes administratively and economically absurd to maintain price ceilings on new houses. That is the best of all ways for assuring that they will not be built. For the same reason, it is obvious that rent ceilings of any kind should be removed on new housing. The only way to solve the housing problem, the only way to bring down rents in the long run, is to increase the supply of housing. The quickest way to increase the supply of housing is to provide the maximum incentives for its production. It is preposterous that the only major thing on which we should continue to squeeze down the profit margin is precisely the thing of which we are most eager to increase the supply.

It will be argued by many, however, that price and rent incentives are needed only to maximize the production of new housing, and that to take the ceilings off rents of existing houses would merely increase the living costs of tenants, and put windfall profits into the hands of landlords, without doing anything to increase the housing supply. But this argument has several flaws. It is not so easy to differentiate between “old” and “new” housing. Housing is not merely to be measured by square footage of floor space; it must also be measured qualitatively. Housing is continuously being repaired, improved, modernized; remodeled, extended,
transformed from single homes to small apartments, from residential to business use, and vice versa. Whether or not any of these changes are made in rented property depends upon the absolute or relative profit incentives involved. When rent control removes these incentives, property is simply allowed to deteriorate.

The country’s available housing must at any time be rationed among its families. Under normal conditions it is rationed, like every other commodity, through the price or rent system through the competitive bids and offers of buyers and sellers, of tenants and landlords. Under rent control it is rationed by chance, luck, and favoritism. Those who happened to be in the housing they wanted to be in at the end of the war found themselves comfortably frozen in by OPA regulations. Veterans, war workers, and others who had given up their housing during the war found themselves frozen out by the OPA regulations and unable to compete on an equal bidding basis against existing floor-space holders.

In August, according to the Department of Commerce, the nation’s income payments were 152.3 percent greater than in 1935 to 1939. In the same month, however, according to the Bureau of Labor Statistics, average rents had gone up only 8.7 percent. This means that the overwhelming majority of people have been called upon to pay a much smaller percentage of their income for rent than before the war. The result has been that residential floor space has been used more wastefully. An average of 3.1 persons, according to a census report, occupied the same number of rooms in 1945 as 3.3 had occupied in 1940. This is the real secret of the housing “shortage.” It is caused primarily by rent control itself. Yet this shortage has become in turn the basis for insisting that rent control must be continued.

One final argument is that the removal of rent control would cause inflation, and raise the cost of living. Inflation, however, is caused by the overissuance of money and bank credit. It is true that the removal of rent ceilings would be followed by an increase in rents, but this would not necessarily lead, in the long run, to an increase in living costs. For with more of consumers’ incomes being paid for rent, just that much less would be left to bid up the prices of everything else. It is precisely because rents have been kept down so drastically that, with existing money incomes, other prices have been bid up as high as they have.

Popular adherence to artificially low rents is still so powerful that it would be doubtless politically unrealistic to recommend immediately the entire elimination of rent controls. A possible compromise might involve (1) an immediate removal of all price and rent controls on new houses; (2) a maximum permissible increase in rents for existing tenants of 15 percent in the next calendar year, with complete decontrol thereafter.

What’s Wrong with Our Labor Policy
December 9, 1946

The coal strike has vividly revealed what is wrong with our present labor laws and previous labor policies. This, unfortunately, is no assurance that right policies will now be applied. A crisis may force men to revise their ideas; but no crisis, however great, can force them to think clearly. So the coal strike has revived all the old schemes for compulsory arbitration and for making strikes on public utilities illegal.

But if the coal strike has proved anything at all it is that these schemes simply do not work. The Smith-Connally Act, under which the government has been trying to combat John L. Lewis, is precisely such a scheme. It makes “wartime” strikes against the government illegal. But the first serious attempt to enforce this provision of it has proved futile. The government is afraid of making a martyr of Lewis. And it has no assurance that jailing him will stop the strike.

Compulsory arbitration of labor disputes, in fact if not in name, was tried during the war. It worked only when it gave the unions substantially what they wanted. When it did not, Lewis and other union leaders simply ignored or defied the War Labor Board, and the government was too frightened to do anything about it. The Railway Labor Act, in fact if not in name, imposes compulsory arbitration, certainly so far as the employer is concerned; but whenever one of the railway emergency boards has handed down a decision that the unions did not like they have defied it, and the government has been obliged to change its decision.

The assumption behind all the proposals for government “fact-finding” or compulsory arbitration of labor disputes is that the government board or “court” will know what is the “fair” or “right” wage and will settle the strike on that basis. This overlooks all the realities. The truth is that when a governmental board decides such questions it almost invariably, and sometimes grossly, favors the union—not merely because this seems the best political course, but because this is the way to make the decision stick. For the board is usually trying to avert a threatened strike or settle an existing one. It is therefore much more concerned to satisfy the union than the employer. And the very fact that government intervention of this sort exists or can be appealed to destroys any real collective bargaining.
Neither side will make a settlement if it thinks that a government board will award it something better.

Finally, even if the government board or “court” were courageously impartial, and much better informed on economic affairs than politically appointed boards are in the habit of being, it would be no more capable of fixing a “right” wage for each class of worker and occupation than of fixing a right price for each article. Compulsory arbitration of labor disputes means, in effect, government wage fixing. Government wage fixing would soon politically necessitate a return to government price fixing. Such a scheme, in short, would drive us back toward a controlled if not a totalitarian economy.

Only when such remedies are recognized as false are we likely to adopt the real remedy. This is simply to repeal the discriminatory curbs on employers and the discriminatory immunities to unions that we have enacted in the last fifteen years, and to subject both employers and unions impartially to the common-law provisions against force, fraud, intimidation, and violence. We may add whatever machinery of mediation or voluntary arbitration we think likely to be helpful; but the solution lies in restoring common rights and duties.

It is true that this will not prevent all strikes; nor will any remedy under a free system. But it would mean a tremendous improvement over the present legal situation, which, by making it all but impossible for a union to lose a strike, has put enormous irresponsible power into the hands of labor leaders. The Lewis coal strikes of 1927 and 1932, before we had a Wagner Act, collapsed completely. His union was shattered and prostrate until it was put on its feet first by the NRA, and then by the Wagner Act. What the Federal government needs to do today is not to prosecute Lewis in the courts, but simply to stop building him up. He seems very tall because he is standing on the Wagner stilts. Kick these out from under him, and he will shrink to normal size.

Inviolate Rights—for One Side
December 16, 1946

Federal Judge Walter J. La Buy has decided that the Lea Act, or “anti-Petrillo law,” is unconstitutional. The Lea Act makes it unlawful to use “force, violence, intimidation, or duress” to “coerce, compel, or constrain” a broadcasting company to employ any “person or persons in excess of the number of employees needed...to perform actual services.” Judge La Buy proceeds to argue that “the number of employees needed” cannot be objectively established, and that the law would therefore make the
guilt or innocence of the union wholly dependent upon the judgment or “whim” of the employer.

Such a conclusion ignores the fact that it is not the number of employees that matters, or even the objective necessity for their services. It is the use of “force, violence, and intimidation” to impose upon employers more workers than they want. Has it become “unconstitutional” to forbid unions to use force, violence, and intimidation” for this purpose—or any other?

Candor must concede that the Lea Act is inherently foolish. Judge La Buy correctly argues that under the Lea Act “broadcasting station employees are singled out and held to a more rigid rule than any other employees.” The Lea Act implies that it is all right for telephone unions, or railway unions, or barber shop unions, to force employers to hire more men than they need. It implies, in fact, that it is all right for a union to force any employer whatever to do anything else it can think of.

At least one ground on which Judge La Buy holds the Lea Act to be unconstitutional that it makes acts unlawful “when applied to these [broadcasting] employees and no others”—could have been avoided if the Lea Act had simply made it unlawful for unions to try to secure any end at all by “force, violence, intimidation, or duress.” But such a law, stating a rule that the common law has always been supposed to apply to everyone anyway, ought not to be needed at all.

Judge La Buy’s decision is a fresh reminder of how one-sided the application of so-called constitutional guarantees has become. One ground on which he sets aside the Lea Act is this: “A statute which either forbids or requires the doing of an act in terms so vague that men of common intelligence must necessarily guess at its meaning and differ as to its application violates the first essential of due process of law.” Yet under the Wagner Act it is an unfair labor practice for an employer “to refuse to bargain collectively.” And nobody has yet succeeded in defining precisely what this means.

In 1940, a House committee sought to reduce the vagueness of this requirement by proposing that it should not be construed as “compelling or coercing either party to reach an agreement or to submit counterproposals.” The American Federation of Labor succeeded in having this proposed definition withdrawn.

Judge La Buy, again, argues that “peaceful picketing” is “a form of speech and discussion that cannot under the First or Fourteenth Amendments be curtailed by any legislative enactment.” Let an employer denounce a union, however, in the unbridled terms in which the union denounces him, or let him advise his employees not to join that union, and he will soon find that his own freedom of speech is not beyond dispute.
“Under the Thirteenth Amendment,” continues Judge La Buy, defending strikes, “the right of any worker to leave his employment at will, or for no reason at all, is protected and that right is inviolate.” But let an employer try to discontinue employing somebody at will, or for no reason at all, and he will soon find that his right to do this is anything but inviolate.

It is not because the coal unions enjoy the unrestricted right to strike that John L. Lewis did and can at any time bring the nation’s coal industry to a halt. It is because the coal operators, under the Wagner Act, have lost the right to negotiate with anyone else but Mr. Lewis. It is because they have lost the right to drop strikers and hire other permanent workers to take their place. The Lewis union, because of ill-advised strikes beginning in 1927, had fallen almost completely apart in 1932. It was Section 7a of the NRA in 1933, supplanted by the Wagner Act in 1935, that put the union together again, and at last put it in undisputed control of the entire coal industry.

**Twenty Labor-Act Revisions**

December 20, 1946

John L. Lewis’s cancellation of the coal strike was not a surrender but a strategic postponement. In ordering the miners back to work “until 12 o’clock midnight, March 31, 1947,” he was in effect issuing a new strike call for that time.

There is no longer any excuse for regarding Mr. Lewis as an isolated accident. His solid support by both AFL and CIO leaders makes him a fitting symbol of the real labor problem today. That problem is not “Labor versus Capital” but the irresponsible and unbridled power of labor-union bosses.

The only proper way in which Lewis and other union bosses can be curbed is by a thorough revision of existing labor law, particularly the Wagner Act. Short of repeal, here are the amendments necessary:

1—Remove the joker which deprives management of the power to dismiss strikers and offer permanent employment to other workers. This more than any single provision has encouraged strikes by making it impossible for employers to take the normal means to counteract them.

2—Halt the NLRB’s drive to unionize foremen and other representatives of management.

3—Forbid unionists as well as employers to “interfere with, restrain, or coerce” workers in the exercise of their right to join or not to join unions.

4—Restore employers’ freedom of speech about unions wherever it does not involve actual threats.

5—As long as the law forbids employer “discrimination...to encourage or discourage membership in any labor organization,” it must in consistency also forbid the closed shop, “maintenance of membership,” and the checkoff.

6—Define “collective bargaining” so that it cannot be construed to require either party to meet a demand of the other in whole or in part.

7—Require unions as well as employers to bargain under this clarified definition.

8—Permit a majority union to bargain for its own members, but not “exclusively” for all workers unless the employer consents.

9—Remove the NLRB power to name any bargaining unit larger than the workers for a single firm. This would not illegalize nationwide unions, but simply withdraw Wagner Act support from them.

10—Restrict the NLRB’s power to throw off the ballot whatever it chooses to call a “company union.” Allow employees “representatives of their own choosing.”

11—Permit employers as well as unions to ask for bargaining elections.

12—Provide that any union claiming NLRB protection must come with clean hands; must use legal methods; must not be run by racketeers; must elect officers at reasonable intervals, publish accounts, have reasonable initiation fees and dues, and must not exclude new members unless they cannot meet fair skill standards.

13—Confine Federal intervention to workers clearly in interstate commerce.

14—Delete the clause that in NLRB proceedings “the rules of evidence prevailing in courts of law shall not be controlling.”

15—Put the burden of proof on the complainant.

16—Allow appeals from NLRB decisions to the courts.

17—Make factual findings of the NLRB no longer “conclusive” unless they are clearly sustained by the evidence.

18—Punish unfair labor practices by reasonable indemnification of the aggrieved employee but not by his compulsory reinstatement.

19—Repeal or revise the Norris-LaGuardia Act to make unions once more responsible for acts of their agents and to permit courts to halt union intimidation or violence.

20—Allow antitrust acts to apply against clearly antisocial practices of union monopolies.

Will all this mean excessive union regulation, a violation of labor’s basic rights? If so, union leaders are
free to choose between two-sided law of this kind and terminating the present one-sided coercions against employers. It should be pointed out, however, that a revised labor law of this kind would do nothing to legalize strikes. It would even continue to leave some unions free to act antsocially. But it would at least no longer fasten such unions on employers by law.

The New CIO Wage Drive
December 30, 1946

Preparing to soften up industry for its new wage drive, the CIO leadership has laid down a greater barrage than ever of statistics, theories, and fulminations. What stands out in the “study” made by Robert R. Nathan for the CIO is the double standard used in making wage and price comparisons.

Average hourly earnings of manufacturing labor in October of this year reached $1.13. This is the highest hourly wage for any month in American or world history. Average weekly earnings in October, at $45.83, though higher than those for any month since V-J Day, were, however, $1.50 less than those of January 1945. The Nathan report makes all its weekly wage comparisons with this January 1945 figure. It does not trouble to remind the reader that this was the absolute wartime weekly wage peak. Nor does it remind him that manufacturing labor worked an average of five hours more a week in January of 1945 than it did this October. Is it consistent to ask for higher pay for a longer week while rejecting lower pay for a shorter week? Mr. Nathan himself admits that hourly labor costs, even with considerably less overtime, were 8.6 cents higher in October this year than in January 1945.

When Mr. Nathan is discussing corporation profits, however, 1945 is promptly abandoned as the basis for comparison. That basis then becomes 1936 to 1939. In taking these four years as a norm, Mr. Nathan neglects to point out that nearly half of all corporations had no profits whatever to report then, and that there was an average of 8,000,000 unemployed throughout the period. Is that the sort of era the CIO now wishes to restore?

Incidentally, if that period were also taken for measuring wages, Mr. Nathan would have to point out that weekly money wages have since doubled. After full allowance for the increased cost of living, “real” weekly wages are still 33 percent higher than 1936 to 1939 levels.

If Mr. Nathan had written down corporation earnings, as he does wages, to their comparative purchasing power, he would have had to make drastic reductions in his calculated percentages of increase. But he does not even compare money corporation earnings in 1936 to 1939 with actual corporation earnings today. He compares them with his own very high forecast of what these earnings are going to be. His guess may possibly be right; but he has hitherto not done well as a prophet. It was he who was responsible for the official OWMM forecast in October of 1945 that unemployment would rise to 8,000,000 in the spring of this year.

Suppose, however, that the profit forecasts of Mr. Nathan and the CIO leaders prove to be correct. How do they decide what profits are “enough” and what are “too much”? The unprecedented wages of American workers have been made possible by our national accumulation of capital and our willingness to risk it in enterprises that give jobs. Capital always runs the risk not only of losing its return, but of being lost itself.

Does the CIO know exactly how great a return is necessary not only to permit capital savings, but to induce investors to risk them in creating jobs? Profits as a percentage of the national income are today—even if we accept Mr. Nathan’s high guesses—actually below the level normally attained in prewar years of reasonably good employment. Corporate profits are normally about 9 or 10 percent of the national income. Would that be too high a price to pay for full employment and the highest general living standard in the world?

Mr. Nathan and the CIO leadership look at wage rates only from one side—as the basis of labor’s purchasing power. They refuse to look at them from the other side—as management’s costs of production. They know that goods priced too high must mean a reduction in sales. They try to ignore or deny what is equally true—that labor priced too high must mean a reduction in employment. When wage rates force up production costs to a point where business cannot operate, or force up prices to a point where consumers can not or will not buy goods, neither purchasing power nor production is increased. Both, on the contrary, are destroyed.

That a new wave of wage increases will force this result is the real danger the country faces today. It is precisely the opposite of the danger that Mr. Nathan and the CIO leadership now profess to fear.
The ‘Purchasing Power’ Theory
January 6, 1947

The CIO argument for another general wage increase of 25 percent has caused such deep concern not merely because the statistics on which it is based are so misleading but because the policy the labor organization advocates is a threat to the survival of the free-enterprise system itself.

In the period 1929 to 1945, wages and salaries averaged 69.6 percent of the national income. Corporate profits averaged 4.9 percent. After allowing for wages from non-corporation sources, a 25 percent increase in wages, without any increase in prices, would wipe out corporate profits several times over.

The CIO will no doubt answer that this does not apply today because corporate profits are now so “fantastically high.” As George Terborgh has shown, however, corporate profits, even on the high guess of Robert Nathan, are today actually lower in relation to the national income than in any other full-employment, peacetime year on record.

Here is a fact that will repay contemplation. The last sixteen-year period, two-thirds of which was a period of mass unemployment, and the rest of abnormal profit taxation, has led us to forget what level of corporate profits, in relation to the national income, has been normal with full employment. The thesis of the CIO seems to be that high profits mean depression and low profits prosperity. The statistics show the precise opposite. Full employment goes with high profits, and mass unemployment with low profits or deficits.

From 1929 to 1945 the years of highest profits were the years of highest employment, the years of lowest profits the years of lowest employment. When corporations as a whole took a loss, in 1931, 1932, and 1933, we suffered the greatest mass unemployment in our history. The year in which labor got the greatest percentage of the national income it has ever had was 1932. From 1909 to 1929, the lowest profits came in 1921, the year of greatest depression and unemployment. A dozen of the 21 years from 1909 to 1929 were years of substantially full employment. In those dozen years the average ratio of corporate profits to national income was not 5 percent, but 9.75 percent.

The statistical case for the CIO purchasing-power theory, in brief, is simply nonexistent. The chief of the many fallacies on which the CIO purchasing-power theory rests is that of mistaking consequences for causes. It is true that when production is highest, real income is highest and real purchasing power is highest (though these must not be confused with income or purchasing power stated as monetary totals without allowing for price levels). But that is because production, real income, and real purchasing power are, in effect, three names for the same thing.

It does not follow that we can invoke or perpetuate prosperity merely by raising wage rates above their existing level, whatever it may happen to be. Even if this step had the first results that the purchasing-power theorists suppose, it would obviously deduct as much from the purchasing power of investors, employers, and all other groups in the nation who normally contribute about 30 percent of its purchasing power, as it would add to the purchasing power of labor.

But such a step does not have even the first results that the purchasing power theorists imagine. If the wage increase is confined to the strong unions, it forces an increase in the prices of what these unions make. That means a rise in the living costs, and a corresponding decline in the real purchasing power, of all other workers. If the wage increase is general, it must force a general increase in prices that cuts back the real purchasing power of everyone, including the workers who have received the increase. This rise in prices discourages buying, and therefore produces a contraction in production and employment. If, finally, an attempt were made to take the wage increase entirely out of profits, as the present CIO program contemplates, marginal producers would be thrown immediately out of business. Mass unemployment would once more be upon us.

That is why the present CIO plan is the most dangerous anti-labor program that has ever been proposed. What we need are the particular wage rates and prices that will encourage the highest possible employment, payrolls, production, and sales. These equilibrium wage rates and prices can be found only by free markets.

The High Cost of Judicial Legislation
January 13, 1947

The decision of the Supreme Court in the Mount Clemens Pottery case on June 10 has brought on union claims for alleged unpaid wages that could completely ruin great American industries. We can find the simplest way to extricate ourselves from this “portal-to-portal” mess by retracing the legislative and judicial blunders that got us into it.

The Fair Labor Standards Act of 1938 prescribes a minimum hourly wage of 40 cents. But it goes on to provide that an employer must pay “not less than one and one-half times the regular rate” for all hours above 40 a week. It is the latter provision that extends
the control of the Federal government over the wages, high or low, of practically everybody. It benefits most the highest paid and penalizes most the employer who pays most. If he pays his workers only 40 cents an hour, he is penalized only 20 cents more for overtime, but if he pays them $1.50 an hour, he is penalized 75 cents more for overtime.

But Congress at least stopped with this blunder. It did not go on to redefine what constitutes an hour’s work. This meant that it accepted the established customs of industry in this respect. This was the sensible view taken by the special master appointed in the Mount Clemens Pottery case, by the Circuit Court of Appeals in overruling the district court, and by the Supreme Court minority.

But it was not the view of the Supreme Court majority. Mr. Justice Murphy argued that walking time to the place of work within the employer’s premises must be considered part of the working hours, because “without such walking on the part of the employees, the productive aims of the employer could not have been achieved.” On this logic, there is no reason why he could not have gone on to include in working hours the time spent by the worker in traveling to work from his home, or even the time spent in getting up, dressing, or reasonable sleep—f or without such activities on the part of the employees, the productive aims of the employer could not have been achieved either.

Justice Murphy even boldly declared that “the statutory work-week includes all time during which an employee is necessarily required to be on the employer’s premises.” Yet there is no such definition whatever of the workweek in the statute. It is arbitrarily imposed by the Supreme Court.

This is a glaring case of judicial legislation. If the Supreme Court is to be free to rewrite legislation in this way, under the guise of telling Congress what it really meant to do, then it becomes a third house of Congress whose members cannot be reached by the voters and whose laws cannot be vetoed. This is intolerable. There is a simple way in which Congress can rebuke such judicial usurpation as it must be rebuked, and at the same time prevent the immeasurable harm that the Mount Clemens Pottery decision could work. It should pass a joint resolution reading somewhat as follows:

“In using the word ‘work-week’ in the Fair Labor Standards Act Congress did not mean to redefine this common term or to set aside long-established contracts or customs which had absorbed in the rate of pay of the respective jobs recognition of whatever preliminary activities might be required of the workers for that particular job. ‘Work-week’ is a simple term used by Congress in accordance with the common understanding of it. For the courts to include in it items that have been customarily and generally absorbed in the rate of pay but excluded from measured working time is not justified in the absence of affirmative legislative action.”

These are not my words. They are taken straight out of the dissenting opinion of the Supreme Court minority in the Mount Clemens Pottery case. This joint resolution could be supplemented, under ample precedents, by an amendment to the Fair Labor Standards Act closing the Federal Courts to all suits of the type now being filed by unions. Congress need not stand by helpless when a court pretends to tell it that its own law means what it does not mean.

If it wants to go farther, and undo some of the harm it has itself done, Congress should reduce the legal minimum overtime wage rate to 50 percent above the legal minimum regular rate. This would confine its intervention to the wages of marginal workers. It should stop trying to regulate everybody’s.

The most important thing about the budget for 1948 is its overall dimensions. It calls for expenditures, in the second full year of peace, of $37,500,000,000. This is more than was spent in four whole years just before the war or in twelve whole years around the ’20s. It permits no reduction whatever in the present wartime level of tax rates. And it provides a balanced budget only on the most optimistic assumptions.

A regular technique has now been established for disposing of those who express concern about a peacetime budget of these dimensions. It is to ask tauntingly: “Where would you cut?”—as if no answer could be given except something like “I’d refuse to pay the interest on the national debt,” or “I’d cut out national defense.” Sensible budget economies, of course, can never be made by offhand amateur efforts to throw out arbitrarily whole categories of expenditures. But it is absurd to conclude that substantial budget economies therefore cannot be made at all.

What is mainly wrong with the rhetorical “Where would you cut?” is its implicit assumption that the burden of proof is on those who wish to cut. The burden of proof, on the contrary, must be on those who wish to make the expenditures. Any dollar of expenditure that they cannot affirmatively justify ought not to be made. It is the duty of Congress, acting on behalf of the American people who are asked to pay the bill, to
scrutinize every dollar of these proposed expenditures with the utmost care.

The duty of scrutinizing requests for funds falls upon the Congressional appropriations committees. They need to do a far less perfunctory job than they have done in the last sixteen years. They need expert investigators. They need examiners who know what questions to ask and what evidence to require. Such a procedure would squeeze down present estimates, with few exceptions, all along the line.

The biggest items, of course, would profitably repay the closest scrutiny. Perhaps we do need to spend more than $11,000,000,000 for national defense in 1948. But the question is not closed by mere rhetorical insistence that “We cannot imperil our national defense.” This sum for one peacetime year is more than we spent on defense in the whole fourteen years from 1926 through 1939, in the latter half of which the Nazi and Japanese aggressions were yearly mounting.

It may be replied that we were starving our armed forces at that time. Yet it is still appropriate for Congress to ask first, whether we now need to spend more than $11,000,000,000 a year on defense, and second whether, if so, the armed forces are proposing to spend all the money in so effective a way that we shall actually be getting $11,000,000,000 worth of defense.

The same type of scrutiny might be made regarding expenditures for veterans’ benefits. For 1948 these are set down at $7,343,000,000. This is the estimate of the President a year ago for veterans’ benefits even in the current fiscal year. It exceeds our entire Federal expenditures for all purposes whatsoever in the fiscal year 1938. It will bear examination. If the President’s estimates for national defense and veterans’ benefits, as well as other major items in our national expenditure, are to be considered sacred and untouchable, we shall never get economy.

A final fact must be borne in mind when the budget is discussed. There are few Federal expenditures for which some plausible defense cannot be found. People tell us that we “must” keep this or that item in the budget because it does this or that good. What is forgotten is that every dollar of budget expenditure means the removal of a dollar from somewhere else by taxes. It is money that the taxpayers could and would otherwise use to buy things that they need themselves. Where the taxpayers are corporations, it is money that would probably be used for expanding plant, increasing production, providing employment and higher wages out of increased productivity.

The unparalleled burden of taxation on this country today discourages and retards increased production and industry growth at a thousand points. It is hurting our strength for either war or peace. This above all is what should be constantly kept in mind.

‘Stabilizing’ the Economy
January 27, 1947

President Truman’s recent economic report to Congress was a self-contradictory document, in which conflicting economic philosophies nestled cozily side by side. The report was full of expressions of faith in a free economy. Yet one recommendation after another was based on the assumption that the economy would not in fact be stable without government intervention and control at a score of crucial points. The phrase “consumer purchasing power” kept beating through the message like a tom-tom. The net result was a victory for the old New Dealers over the new Council of Economic Advisers.

For if there is any consistent basic assumption in the report, it is that the maintenance of “consumer purchasing power” is the one thing that matters. If this term means merely monetary purchasing power, it is naked inflationary doctrine. If it refers to real purchasing power (after price rises are allowed for) it confuses consequence with cause. It looks at everything purely from the consumer’s side. The problems of production below receipts from sales are ignored.

The president recommended that Congress should extend rent control beyond next June. The only reason he gave is that “a large increase in rents would substantially reduce consumer purchasing power.” But an increase in rents would not reduce national purchasing power at all. Landlords would have just as many additional dollars as tenants had fewer. The real difference would be that a larger percentage of the nation’s monetary purchasing power would go for rents, leaving a smaller percentage over for everything else.

The prices of other things (if there were no further monetary inflation) would fall to compensate for the rise in rents. The cost of living therefore would not on net balance increase.

Such a readjustment, it is true, would create strains in the economy. In many lines costs have already gone up to a point where producers could not absorb a price decline. This does not mean that it would be a mistake to remove rent control in June. It means, on the contrary, that it would be mistake not to make at least a beginning now in allowing rents to rise. For these economic strains will have been caused by the very fact that rent control in the first place was so much more stringent than any other form of price control.
To prevent a serious problem of readjustment to resume when rents are allowed once more to resume their normal relationships to the general price level, we should allow any future monetary inflation (if, as is probable, we fail to prevent such inflation) to be absorbed through a rise in rents instead of a still further rise in other prices. If we wish to continue rent control after June we must at least remove rent control from all houses not yet built, and allow at least a 10 or 15 percent increase in rents of existing apartments for the coming year.

The President wants social security benefits revised upward. These payments, he thinks, will “provide a desirable support to mass purchasing power.” If these additional social-security payments are financed by a budget deficit, they will simply produce the inflationary consequences that the President elsewhere in his report deplores. If the payments are financed out of taxes, as much purchasing power will be taken away by greater taxes as is added by the payments. There will be no net increase in “mass purchasing power.” On the contrary, bigger and longer unemployment insurance payments, as experience has shown, only buy more unemployment. This reduces production and real purchasing power.

The most topsy-turvy conclusion in the report is that: “In the present economic situation, it is clear that it would be unsound fiscal policy to reduce taxes.” The real conclusion, of course, is that it is entirely unsound fiscal policy to maintain such a fantastically high level of government expenditures. If expenditures were slashed sufficiently, then a substantial cut in taxes would still leave the desired surplus. The present level of taxation is a constant threat to production. It is a threat to the very maintenance of a healthy free enterprise system. Not unless the executive departments justify every dollar of the proposed huge $37,500,000,000 expenditure for 1948 can the President’s conclusion about existing taxes be accepted.

The Fruits of Foreign Lending

February 3, 1947

Now that the International Monetary Fund is no longer a dream but a reality, all the problems that were so lightly set aside by the rhetoric and propaganda used to get the plan adopted by Congress are beginning to emerge in their full dimensions. The whole approach at the Bretton Woods monetary conference was unsound. The International Bank, and particularly the fund, were set up to deal merely with the symptoms and consequences of international monetary chaos and not with its causes. The irony of the fund is that it could work only under practically ideal conditions, in which it would not be needed.

The first thing to remember is that monetary chaos is not primarily “international” at all. It exists basically within each nation. If each nation’s currency unit were freely convertible into a definite weight of gold, if there were no overissue of its currency, so that this convertibility could be at all times maintained, then the relationship of one currency to another would necessarily be fixed and stable. If the dollar were always convertible into, say, one-thirty-sixth of an ounce of gold, and the pound into one-ninth of an ounce of gold, then pounds would always be freely convertible into dollars at a ratio of one to four. But where there is no common unit of measurement there cannot be anything more than, at best, a temporary and unreliable exchange stability.

The Bretton Woods arrangements ignored all these basic considerations. They tried to cure international monetary instability by hiding its symptoms or preventing its consequences. They provided in the fund that when any nation’s currency started to slide downward, the nations with relatively strong currencies must use them to buy the weak currencies at par. Of course a currency can be kept at par by doing this—as long as the strong nations are willing to throw their money away and as long as that money holds out.

United States Steel or any other stock could be kept at par as long as someone with sufficient funds kept in a standing bid to take all the stock offered at par. But the SEC and the stock exchange would soon bring charges against such a bidder of flagrant manipulation. If a private agent, moreover, used his client’s money to buy stocks or anything else above the open-market price, he would be sued for breach of trust or dissipation of funds. But when governments do such things, they are given pleasanter names and are justified by the complex reasoning of “economic experts.”

The managers of the fund are not even permitted to make their buying of currencies contingent upon internal reforms in the nations whose currencies they are supporting. Insistence on such reforms is regarded as “interference” in the internal affairs of such nations or outside “dictation” of their policies. The nations with sound currencies are merely permitted—in fact, obliged—to finance the inflationary policies and all the other economic errors of the nations with sinking currencies.

The only real remedy for this fantastic situation would be for the United States to withdraw entirely
from the fund. The articles of agreement themselves permit it to do this “at any time.” At the very least, if the fund is not to end in a disastrous failure, the United States ought to insist on an amendment unequivocally authorizing the managers of the fund to withhold the use of its resources from any nation which in their opinion is following either internal or external policies not conducive to exchange stability.

Among such policies the amendment should list specifically excessive deficit financing, excessive expansion of currency or bank credit, trade discrimination against other member nations, unreasonable exchange controls, a policy of autarchy, of military or diplomatic aggression, and so on.

When governments could no longer have their economic errors subsidized from the outside, at least major follies might be brought to a halt in time. Meanwhile, our government continues to pour out billions of dollars of foreign loans. A great deal of these will certainly never be repaid in full. Not only is our government failing to get really compensating monetary and trade reforms in exchange for these funds, but it is aggravating a domestic boom and inflation, and preparing a corresponding reaction for the future.

They Are the Workers’ Corporations
February 10, 1947

Persistent union propaganda has made most people overlook the most important single fact about the corporations. This is that the chief beneficiaries of the corporations are the workers employed by them. Labor must be paid before it can be determined what funds are left over for either the stockholders or the bondholders. The employees are not only first in priority but overwhelmingly first in the amount they receive.

Let us take as an example the year 1944. It was, with the exception of 1943, the year of highest corporation profits on record. Yet in that year, for every $1 left over after taxes for the stockholders, General Motors paid out $8 to its employees. United States Steel $15, du Pont $5, Bethlehem Steel $23, General Electric $8, Curtiss-Wright nearly $40, and Westinghouse Electric $15.

The Department of Commerce found that the employees received 61 percent of all corporate distributions in 1944, and that after deduction of other costs and taxes there were left for net profits 9 percent. The employees, in other words, got from the corporations in that year between six and seven times as much as was available for the stockholders.

The best data we have shows that the executives of manufacturing concerns get on the average about 6 percent of the total of wages and salaries paid out.

These facts, unfortunately, do not at all correspond with the general public’s idea or the average worker’s idea of the facts. In a recent survey, two-thirds of the workers interviewed actually believed that industrial companies pay out more to the stockholders and to top management than they do to the workers. The typical factory worker, it was found, believes that wages take only about one-fourth of the money paid to workers, executives, and stockholders. The truth is that workers get five-sixths to even higher proportions of this total, depending on the conditions of particular years.

When we consider the stake that business has in this matter—when we consider that the ideas upon which the average worker and the general public act have the power either to preserve or destroy not only individual corporations but the whole private-enterprise system—it is incredible how little business has done to make these basic facts known. Practically all corporations today print reports to their stockholders; only a meager handful print reports to their jobholders. Half of the 50 largest manufacturing corporations do not bother to make public their annual payroll figure, though it is certainly far in excess of their dividend figure. Here is an incredible failure in “public relations.”

For illustrative purposes, I should like to call attention to one of the outstanding exceptions—the Johns-Manville Corp. Last June it published a two-column advertisement in more than 100 mediums throughout the country under the head “A Report to the Public by Johns-Manville.” “Here are the highlights,” this advertisement declared, of Johns-Manville’s annual statement in the critical year of 1945:

- Total income: $886,000,000
- For all costs (except those shown below): $41,000,000
- To employees for salaries and wages: $36,500,000
- To government for taxes: $3,500,000
- To stockholders in dividends: $3,000,000
- Leaving in the business: $2,000,000

They Are the Workers’ Corporations
February 10, 1947

Persistent union propaganda has made most people overlook the most important single fact about the corporations. This is that the chief beneficiaries of the corporations are the workers employed by them. Labor must be paid before it can be determined what funds are left over for either the stockholders or the bondholders. The employees are not only first in priority but overwhelmingly first in the amount they receive.

Let us take as an example the year 1944. It was, with the exception of 1943, the year of highest corporation profits on record. Yet in that year, for every $1 left over after taxes for the stockholders, General Motors paid out $8 to its employees. United States Steel $15, du Pont $5, Bethlehem Steel $23, General Electric $8, Curtiss-Wright nearly $40, and Westinghouse Electric $15.

The Department of Commerce found that the employees received 61 percent of all corporate distributions in 1944, and that after deduction of other costs and taxes there were left for net profits 9 percent. The employees, in other words, got from the corporations in
Boom in Mexico
February 17, 1947

MEXICO CITY—Mexico is in the midst of a Florida boom. Real-estate values are fabulous. Prices are high even for Americans. There is a tremendous volume of building. Whether in the middle of the city or in the outlying country, one sees feverish new construction everywhere—new homes, new office buildings, new luxury hotels, new factories. And the new buildings are aggressively and often handsomely “modern.” The Mexican architects are bolder than all but a small handful of our own in handling modernism.

The statistics amply confirm first impressions. Wholesale prices had risen by 1946 about 130 percent above the level of 1939. In the same period the cost of living has risen on various indexes from 170 to 200 percent. Foodstuffs alone have gone up 210 percent. Weekly wages and salaries have not begun to keep pace with this. As compared with 1939 they had risen on the average only 107 percent by 1946.

Among the workers those in the petroleum industry (operated by a government corporation) have done best. In 1946 their average weekly wage was 107 pesos, compared with 81 pesos for the railway workers, 70 for the miners, 58 in the textile industry, and an average of 55 pesos in some 34 other industries. (The peso equals about 20 cents U.S.)

Explanations of the rise in prices and the cost of living are as diverse in Mexico as they are for the smaller rise in prices in our own country. Some Mexicans blame it on the expenditures of American tourists. But though tourist expenditures are estimated in Mexico to have risen on net balance from $4,000,000 a year in 1938 to $88,000,000 in 1946, they would not begin to be sufficient to account for what has taken place.

The best-informed thought in Mexico ascribes the inflation to the increase in the volume of money and bank credit. Money in circulation rose from 517,000,000 pesos at the end of 1938 to 1,720,000,000 at the end of 1946. Checking accounts in the same period rose from 224,000,000 pesos to 1,787,000,000. This is a rise of 373 percent in the volume of money and credit from the end of 1938 alone.

There has been no corresponding increase in physical production. Industrial output has been spotty, with spectacular rises in some lines and sharp declines in others. But the general index of industrial production was up in 1946 only 32 percent above the 1939 level. This great increase in the volume of money and small increase in overall production are enough to account for the rise of prices and living costs without looking further.

But the building boom is very real. In the Federal District more than three times as many buildings were completed in 1945 as in 1939. In terms of peso costs the comparison is even more striking. Total construction in monetary values was four to five times as great in 1946 as in 1939, construction of office buildings alone ten times as great, of factories more than eight times as great.

Part of the explanation of this is that building wages and material costs have not gone up as fast as the volume of money in circulation. The index of building-material costs was up in 1946 only 128 percent above the level of 1939. (Mexico, however, had price fixing until the Aleman regime came in December. Official indexes, I am told, do not fully reflect the higher black-market prices really paid.)

In spite of the fact that Mexican price levels have risen much faster than our own, the exchange rate has been kept stabilized at 4.85 pesos to the dollar since 1941. This is even an improvement over the rate of 5.18 in 1939. This stability has been maintained by a stabilization fund and by agreement with the United States Treasury. But the stability of the peso is obviously threatened by basic factors. Mexico’s high prices are out of line with American prices. This threatens the continuance of the growing American tourist trade. It threatens Mexican exports. It unduly encourages imports.

In 1946 Mexico imported 2,637,000,000 pesos worth of goods—five times as much as in 1938.
Yet Mexican exports in 1946 were valued at only 1,384,000,000 pesos (plus about 450,000,000 pesos in gold and silver). It is estimated by some authorities here that a “purchasing-power parity” would today be six or seven pesos to the dollar rather than the present 4.85.

Mexico's Oil and Export Problem
February 24, 1947

MEXICO CITY—If Mexico is to maintain the present exchange value of the peso and put its economy on a permanently sound basis, it must solve the basic problem of providing enough exports to pay for its necessary imports. In 1946 it imported 2,637,000,000 pesos worth of goods and exported only half as much—1,384,000,000 pesos worth (not including about 450,000,000 pesos in gold and silver). Part of the gap can no doubt be covered by long-term borrowing from abroad, but even this will not be encouraged unless the gap is narrowed.

A large part of Mexico's recent exports reflect a wartime demand that cannot continue. An outstanding example is textiles. Exports of cotton cloth rose from zero in 1940 to 177,000,000 pesos’ worth in 1945, and may fall back to zero again.

Mexico's principal hope for future exports, according to the best opinion here, lies chiefly in two sources—petroleum and mining products. Yet the outlook for either is far from promising at the moment. The history of oil in Mexico is a perfect illustration of the shortsightedness of seizure and nationalization.

The American and British oil properties were expropriated by the Mexican Government on March 18, 1938. They were turned over for operation to a semi-autonomous government corporation, Petróleos Mexicanos, or Pemex. Incredible as it may seem, this corporation does not publish even perfunctory annual reports. Its operations are shrouded in mystery. The new manager, however, Antonio J. Bermudez, who is highly regarded, has made a few statements within recent months from which a picture of Pemex operations can be pieced together. In 1937, the year prior to the seizure, the payroll of the oil companies amounted to 56,000,000 pesos. In 1941 it had been raised to 91,000,000, and in 1946 to 216,000,000. The number of workers was increased from 13,120 in 1937 to 24,726 in 1946. But this huge increase in personnel and payroll expense has not been matched by any corresponding increase in production. On the contrary, annual production has never since (with the possible exception of 1946) equaled the 47,000,000 barrels of crude petroleum produced in 1937. Average production in the eight years from 1938 through 1945 was only 40,000,000 barrels.

Even this production has been achieved only by the dangerous practice of over-pumping existing wells, which may mean a loss of part of the reserves. Almost no exploration work has been done to bring in new wells. Yet up to 1936 statistics showed that the average life of a Mexican well was less than eight years. An official report in 1937, advocating the expropriation, itself declared that all the existing petroleum fields of Mexico were about to be exhausted with the exception of those at Poza Rica and El Plan. There is no evidence that Pemex makes adequate depreciation or depletion allowances in its accounts. It is widely taken for granted that its deficits are chronic. In fact, some think appropriations, ostensibly for capital works, were really to cover operating deficits.

Petroleum exports, once the chief means of balancing Mexico's foreign accounts, have declined heavily. This is partly because of the increase in domestic consumption of petroleum, which has increased ten-fold since 1925. Sr. Bermudez recently announced that Pemex was exporting a million barrels of petroleum a month. Yet astonishing as it seems, Mexico has recently been on net balance an importer of petroleum products from the United States.

Mexico's mining problem is similar. Its high-grade metallurgical deposits have been nearly worked out. Virtually no new fields have been brought in since Spanish colonial days. Mining is inordinately taxed. The result has been to drive small producers out of business, to discourage exploration, and to prevent the working of low-grade ores. In 1946, metallurgical production, including gold and silver, was only 60 percent of that of 1929.

Mexico's budget problem, which lies at the basis of the inflation, is far from solved. Federal expenditures for 1947 are estimated at 1,667,000,000 pesos, 72 percent above the average of the war years, and the greatest in the history of the country.

Yet most of Mexico's difficulties are man-made. They can be surmounted by the adoption of more far-sighted policies.

Chinese Handwriting on the Wall
March 3, 1947

On March 1 the International Monetary Fund, with some 40 members, begins exchange operations. It could hardly start in less promising circumstances. Most of
the 40 nations have sent in the “par value” of their currencies. In very few cases do these official values at all correspond with the values as measured by black markets or free markets. The French franc is officially valued at 119 to the dollar; it has been selling on the outside market at 290 to the dollar. The Belgian franc, with an official value of 43 to the dollar, has been selling on the outside market at 60. The Dutch guilder, with an official value of 2.65 to the dollar, has been selling at 6.75. These are among the “stronger” currencies. The situation in Poland, the Balkans, Greece, and China is incomparably worse.

Yet the fund will buy the currencies of all member nations at par. This means that the relatively strong currencies—above all, the American dollar—will be forced to support the weak ones. It means that the United States will throw away further billions of dollars in buying foreign currencies far above their real values. This type of support by subsidizing the unsound policies of the governments that issue these currencies, postpones the day of reform. For the fund managers are given next to no power to insist on internal fiscal or economic reforms before they grant their credits.

Unfortunately the fund managers, instead of pointing to the dangers of this situation, have sought to rationalize it. “For practically all countries,” they said in a statement on Dec. 18, “exports are being limited mainly by difficulties of production or transport, and the wide gaps which exist in some countries between the cost of needed imports and the proceeds of exports would not be appreciably narrowed by changes in their currency parities.” This is not true. There would be a dramatic change in their trade balance if the currencies of these countries were allowed to sell at their real values. It is precisely because their currencies are ridiculously overvalued that the imports of these countries are overencouraged and their export industries cannot get started.

The current situation in China demonstrates how impotent the fund would be to correct any major decline in a currency. In recent weeks Chinese dollars have collapsed from an official quotation of 3,350 to the American dollar to 18,000 and more on the black market. Of the “stabilization” measures announced by the Chinese Government on Feb. 16 only those designed to reduce governmental expenditures and to increase revenues are likely to be effective. One of these is of outstanding importance. It provides for the public sale to private individuals or corporations, either directly or by the issuance of shares, of all government-operated enterprises except “those necessarily requiring government operation.” This proves that the road to Socialism is not, as usually supposed, necessarily a one-way street: A return to private enterprise is not merely possible, but simple.

But practically all the other measures announced by the Chinese Government—those seizing foreign assets of Chinese citizens, prohibiting private transactions in American dollars or dealings in gold, forbidding speculation and hoarding, and imposing price and wage ceilings all over again—must only make matters worse. Insofar as they are not evaded they must increase private fears and discourage trade and production. Yet, though exaggerated in extent, these Chinese measures are typical in principle of those now being taken by most countries to “stabilize” their currencies.

The steps by which China or any other country could permanently stabilize its currency would be far different. They would run somewhat as follows: (1) Reduce expenditures and increase revenues; balance the budget. (Engaged as it is in a civil war, this problem for China, however, is today obviously formidable.) (2) Announce that the volume of currency in circulation will not be increased beyond its existing amount. Keep the promise. (3) Remove internal price controls and all restrictions on trading in the currency. (4) Fix a provisional par value for the currency unit—but do not prohibit transactions above or below that value. (The fund agreement actually compels such a prohibition.) And finally, (5) provide for the ultimate conversion of that currency into a definite quantity of gold. ♦

How England Got That Way
March 10, 1947

England’s coal crisis is far from a mere cold-weather crisis. The record freeze hastened and intensified a collapse that was certain to come. It is, after all, a generally known fact that it is colder in winter than in summer. This news, however, seems to have come to England’s “long-range economic planners” as a stunning surprise. They are reduced to the humiliation of admitting that everything depends on the weather, and that it is “not feasible so far to give any forecast of conditions beyond noon tomorrow.”

But the British coal shortage was already obvious long before winter set in. The October figures of distributed stocks are crucial. In 1944, these amounted to 18,500,000 tons; in 1945 to 13,800,000 tons; in 1946 to only 10,900,000 tons—the lowest for winter stocks on record.

Behind such figures lies the long-range decline of the British coal industry. In 1913 Britain produced
287,000,000 tons of coal; exports (including bunkers) amounted to 94,000,000 tons—55 percent of all world coal exports. In 1929 coal production was 258,000,000 tons; exports 77,000,000. In 1938 production was 227,000,000 tons; exports 46,000,000. In 1945 production was down to 182,000,000 tons and exports to 8,000,000. In other words, exports had fallen to almost one-twelfth of the former level.

Passing over the results of the coal nationalization program, which has been in legal effect since last July and in formal effect since Jan. 1 of this year, the British crisis is sufficiently explained by the tight network of controls and the chaos of government “planning.” It is impossible to know to what extent that present shortage of miners results from the success of the British labor unions in preventing a free wage market. It is not the absolute level of wages in the coal industry that determines the number of workers attracted to it; it is the level compared with that offered in other lines. But if sufficient British labor cannot be attracted to the mines even by a substantial wage premium, then the obvious remedy is to admit Polish or other immigrant miners who would be delighted to take the work. British controls have prevented either solution.

Great Britain still retains general price-fixing. If it had depended upon free prices as its guide, it is wholly improbable that the present crisis would have arisen. The shortage of coal would have reflected itself long ago in a rise of price. This would have raised a brilliant red light for all to see. Consumers would have been forced, without appeals or allocations, to reduce their demands. Higher wages could have been offered to attract more miners. Imports of coal would have started to Britain long before winter set in. (Our own government still severely limits the quantity and grade of coal that can be exported; so it is only fair to point out that our own “planning” might have prevented this remedy even if Britain’s had been ready to accept it.)

No less serious a cause of the present crisis has been the price-fixing of other British goods. This prevents the British from knowing where their real relative shortages and surpluses are, and from automatically correcting them through the price-and-profit system. One reason why the British people have lost the incentive to work is that they cannot buy what they wish even with the money that their government leaves them after taxes. The economic planners do not trust the people. They tell them in the White Paper that if they are permitted to spend their money as they wish, they will buy “too many luxuries” and “not enough food and clothes and coal; too many toys and not enough children’s boots; too many greyhound tracks and not enough houses”; and so on. So the British people are treated as wards of the state. They are permitted to have not what they want but what the economic planners think is good for them.

Unfortunately the British people accept this totalitarian view. They are told, and the great majority of them still believe, that the “austerity” program of the Labor government is essential to the country’s economic salvation. It is true that individual austerity is something that most of them probably cannot escape. But the kind of planned and measured austerity imposed upon them by the government is not only unnecessary, but the most serious obstruction to their national recovery. Why this is so, I hope to explain more fully in a succeeding issue.

‘Planning’ vs. the Price System
March 17, 1947

The British White Paper, “Economic Survey for 1947,” will repay the closest study by everyone interested in the survival of economic freedom. It typifies the attitude of the most sincere, well-meaning, and intelligent government planners everywhere. It makes no direct attack on the private-enterprise system. It contains, indeed, many statements with which every defender of that system will heartily agree, e.g.: “In the longer view, increased output per man-year is the only way to expand production and the standard of living.”

The White Paper decries “theoretical blueprints.” It tells us that the “essential difference between totalitarian and democratic planning” is that “the former subordinates all individual desires and preferences to the demands of the state,” but that a democratic government must “conduct its economic planning in a manner which preserves the maximum possible freedom of choice to the individual citizen.”

The authors of the White Paper seem to be quite unaware, however, of the extent to which their actual plans contradict these announced ideals. We soon find them declaring that “the government must lay down the economic tasks for the nation; it must say which things are the most important.” This means that neither producers nor consumers are permitted to do this for themselves. After repudiating “economic blueprints,” moreover, the authors of the White Paper set their own “targets.” They tell us by exactly what percentage exports must increase in 1947. “Export targets are being worked out for the individual industries to correspond with the global target.” They insist that the government must control imports “tightly,” and they present a “program for 1947” showing just how much food, raw
materials, machinery, oil, tobacco, and consumer goods can be permitted to enter. They have detailed quantitative programs for the production of coal, electric power, steel, railways, shipping, agriculture, building and capital equipment.

The one thing they seem to forget is that under a free price system these problems solve themselves. Production tends to increase most precisely where the greatest relative shortages exist, because under a free price system it is here that the greatest profit incentives are offered.

It is said that less than 10 percent of the British economy is or will be nationalized under present plans, and that “private enterprise” is responsible for the other 90 percent. But at every turn in Britain private enterprise is prevented from functioning. The White Paper itself points to “a large number of direct controls…rationing, raw-material controls, building licensing, production controls, import licensing, capital issues control, etc. Other controls again, such as price control, influence the course of production by limiting profiting margins.” The authors, however, give no sign of recognizing the extent to which these controls have reduced and unbalanced production. They talk, on the contrary, as if production could only be kept in balance by their own constant intervention at every point.

Yet such controls are as unnecessary and harmful in the field of foreign as of domestic trade. If American foodstuffs are more essential to British consumers than American movies, they can be trusted to make that discovery for themselves. If you forbid a British consumer to buy an American automobile, he will use the money to buy a British automobile or some other domestic product instead. That will mean one less British car or other home product available for export. Though the British consumer is deprived of what he wants, the trade balance is not improved. In peacetime “planned” imports are needless and foolish, and “planned” exports are still more so. The British must export what foreigners want, not what the government thinks foreigners ought to get.

Under free exchanges all such problems used to solve themselves. If a country bought more from abroad than it sold, it ran short of foreign balances. Equilibrium was usually soon restored by gold shipments or a corrective movement of prices and exchange rates. But price controls, exchange controls, and blocked currencies now prevent all such automatic signals and adjustments. Here is simply one more illustration of how one control brings on an ever-expanding network of controls.

### Foremen under Judicial Legislation

March 24, 1947

Once more, as in the Mount Clemens “portal-to-portal” case, the Supreme Court has handed down a decision that, unless it is quickly nullified by Congress, must do immense practical harm. Once more the Supreme Court affects to be “interpreting” a law when it is in fact amending it. Once more we have a flagrant case of judicial legislation superseding the actual legislation passed by Congress.

In holding that employers are forbidden under the Wagner Act to object to the unionization of their own foremen, Mr. Justice Jackson, speaking for the five-to-four court majority, sets aside the plain wording of the Wagner Act itself: “The term ‘employer’ includes any person acting in the interest of an employer, directly or indirectly.” If foremen aren’t put in charge for the very purpose of acting in the interest of the employer, who is?

Yet even if the Wagner Act had gone on to list foremen specifically by name among “employers,” it is clear that Justice Jackson’s reasoning would have set aside even this. After citing from the law the very definition just quoted, he blandly goes on to say: “Even those who act for the employer in some matters…still have interests of their own as employees.” No doubt. But as Mr. Justice Douglas pointed out for the court minority, if on such reasoning, foremen are “employees,” then “so are vice presidents, managers, assistant managers…and indeed all who are on the payroll of the company including the president.”

Though his decision flies in the face of the plain definition in the Wagner Act, Justice Jackson affects to be able to find no other possible interpretation of the law. “It is for Congress, not for us,” he solemnly declares, to create exceptions to the present “plain terms” of the Wagner Act. Yet if there were any doubt in the act itself about the intent of Congress, it was completely removed last spring when both Houses of Congress passed the Case bill. This explicitly excluded foremen as employees under the Wagner Act. But this measure was vetoed by the President.

Justice Jackson dismisses the argument of the Packard Co. by declaring: “In other words, it wants to be free to fight the foremen’s union in the way that companies fought other unions before the Labor Act.” Are these the words of a judge trying only to interpret the Wagner Act as written? Or are they the bitter words of a man legislating his personal feelings?

The unionization of foremen under this decision will do immense harm to production. The foreman
cannot faithfully serve two masters. He cannot act at the same time as the agent of the employer in dealing with labor and as himself a unionized employee hostile to the employer. His divided loyalty to his employer and to his union must go far to nullify the ability of management to manage. It must lead to growing indiscipline and further tension and chaos in labor relations.

The National Labor Relations Board itself, in the Maryland Drydock case, recognized “the dangers inherent in the commingling of management and employee functions.” It acknowledged that unionizing foremen under the Wagner Act would “disrupt established managerial and production techniques.” As Gerard D. Reilly, a former member of the NLRB, pointed out in dissenting in the Packard case, in which the board reversed itself, foremen’s unions cannot really secure their bargaining aims “unless they ally themselves in their policies and tactics with representatives of the employees whom they are hired to supervise.”

But beyond its immediate practical dangers, the foremen’s decision of the Supreme Court majority once more raises a serious constitutional issue. Congress will no doubt now try to undo the harm of the Supreme Court’s foremen decision as it is trying to undo the harm of the same court’s “portal-to-portal” pay decision. But even a new bill faces not only the hurdle of another Presidential veto, but the possibility of still another “interpretation” by the Supreme Court saying that the new law means the opposite of what it says.

If the Supreme Court has unlimited power to say what a law means, even though its “interpretation” flatly contradicts the plain words of that law, then the real power of legislation has passed from the hands of the Congress elected directly by the people to an unelected and irremovable set of nine unpredictable men.

Six Principles of Foreign Aid
March 31, 1947

During and since the war our government seems to have assumed that it could solve almost any international problem, economic or diplomatic, by the simple process of lending or giving away American money. However necessary financial aid to Greece or Turkey may now be to prevent the further spread of Communist aggression, it could prove worse than futile unless it is recognized to be only a part of a much broader policy or, it might be better to say, reversal of policy. Regarding foreign aid of every kind, it is time we recognized some elementary facts and principles hitherto flouted or ignored.

1—America cannot feed the whole world. Before the war the United States produced less than 9 percent of the world’s food supply as measured in calories. Today, as a result of increase in our own production and the falling off of Europe’s, we produce nearly 12 percent of the total. Even this is hopelessly inadequate to fill the gap left by the decline in European production. America has 140,000,000 mouths to feed; but Europe has 350,000,000. It should be obvious that the real solution is not to distribute scarcity but to restore production. This is prevented in Europe everywhere today—by Russian looting, by socialism and Communism, by “agrarian reforms” which seize land, break up farms and displace populations, by export and import barriers, by exchange controls, and by price-fixing which makes it unprofitable or impossible to grow, transport, or sell food.

2—Food relief and financial help should be extended only on condition that the country aided discontinues policies that discourage or prevent production. Otherwise the help is worse than futile, and merely prolongs the distress it was designed to relieve. A few weeks ago Yugoslavia “suddenly awakened” to the threat of starvation among 5,000,000 people within its borders. Its new appeal for American aid was properly refused. It is only in planned or Communized economies that such awakenings come so late. In a free economy a prospective shortage would have been made known to everyone long in advance by the movement of prices. The rise in price would have drawn food to the area of shortage, and would have given a greater incentive to every producer to increase his output of food. To send food to Yugoslavia without insisting on reforms would have been not only to subsidize Communism but to perpetuate the very policies that create or intensify the food shortage.

3—Additional help to any country goes eventually to relieve the LEAST urgent need which that country is able to meet. This follows from the ability to divert resources. Those that think that if we do not send food to Yugoslavia we starve its people forget that Yugoslavia conscripts an enormous standing army from men who would otherwise work on farms to produce food. To solve Yugoslavia’s food problem by outside gifts is to release the manpower and financial resources to maintain this military establishment. Such aid without stringent conditions would merely support the military threat against our own interests forcing us, for example, to extend more counteraid to Greece.

4—The function of foreign lending, apart from purely political loans or outright charity, should be restored to private hands. Though our aid is worse than useless unless extended with conditions, it is difficult and dangerous
for one government to impose conditions on another. Private lenders, however, can do this without arousing international resentment by simply declining, as in the past, to make a loan unless reforms are made in the borrowing country calculated to make repayment probable.

5—The proposed $400,000,000 aid to Greece and Turkey need not be a net addition to other foreign aid already contemplated. In a score of ways we are subsidizing or planning to subsidize socialism, Communism, and strangling government controls throughout the world. These not only reduce production but constitute a further threat to our own free-enterprise system. We can still save most of the nearly $3,000,000,000 we are planning to throw away in a futile effort to stabilize the overvalued currencies of governments following policies that prevent recovery.

6—Don’t count on gratitude in return for foreign aid. We didn’t get it from Communist Russia even from $11,000,000,000 of Lend-Lease. Gratitude between nations is too apt to mean “the lively expectation of future favors.”

High Taxes vs. Incentive and Revenue
April 7, 1947

In a recent Gallup poll the question was asked: “About how much do you think a married man with two children who earns $50,000 a year now pays in Federal income taxes?” The typical answer was $9,000. The actual tax on such a net income, however, is around $24,000. It would be instructive to learn how many people know that a $300,000 net income shrinks to $66,000 after taxes and a $1,000,000 income to $161,000.

In its March letter the National City Bank publishes some illuminating income-tax tables. One of these shows how much is actually left at various income levels for the taxpayer himself out of every extra dollar he earns. The figures are for a married man with two children and legal deductions of 10 percent of his gross income.

When the Gallup poll asked people how much they thought a man who earns $50,000 a year ought to pay in income taxes the median average answer was $7,500. This is only about a third of what such a man actually does pay. The taxpayer is allowed to keep less than half of everything he earns above $22,000. The question of “fairness,” however, is one on which it seems impossible to get agreement. No matter how much is taken from the big incomes, some people cannot see why those who earn more than they do should be allowed to retain any amount higher than they themselves can earn.

<table>
<thead>
<tr>
<th>Gross Income</th>
<th>Taxpayer keeps out of each additional dollar</th>
</tr>
</thead>
<tbody>
<tr>
<td>$2,000</td>
<td>$1.00</td>
</tr>
<tr>

<td>.15½</td>
</tr>
<tr>
<td>350,000</td>
<td>.13½</td>
</tr>
</tbody>
</table>

It seems more profitable from a pragmatic standpoint, therefore, to consider not so much the “fairness” of the tax structure as its practical effects on the economy. One obvious effect (considering the present corporate as well as personal income-tax structure) is to soak up the principal sources of capital funds. The funds that the present tax structure takes are precisely those that would have gone principally into investment—that is, into improved machines and new factories to provide the increased labor productivity which is the only permanent and continuous means of increasing wages.

An even more important effect of taking so much of the taxpayer’s earnings is to diminish or remove the incentives to bringing such earnings into existence in the first place. This means not merely a loss to the taxpayer who does not trouble to earn the money. It means a loss to the wealth of the whole nation. It means a loss even to the Treasury itself. Another table compiled by the National City Bank, based on reports of the Bureau of Internal Revenue, strikingly illustrates this result. (The dollar figures stand for millions of dollars.)

<table>
<thead>
<tr>
<th></th>
<th>1926–28 average</th>
<th>1942 average</th>

<td>Top tax rate applicable (%)</td>
<td>25</td>
<td>88</td>
</tr>
<tr>
<td>Number of returns</td>
<td>2,276</td>
<td>654</td>
</tr>
</tbody>
</table>
Let’s see what this means. During the same period that the total national income increased 58 percent, total incomes over $300,000 fell 77 percent. If each individual’s income had risen by the same percentage, total incomes over $300,000 would have risen by a much greater percentage, for all incomes previously above $190,000 would now be counted among the incomes over $300,000. Yet even if the aggregate of such incomes had risen no more than proportionately to the whole national income, the total would have reached $2,637,000,000—seven times greater than it actually was. And if this income had been taxed at the same schedule as in 1926–28, with a top tax rate of only 25 percent, the yield to the Treasury would have been about $444,000,000.

It would have been, in other words, about 50 percent greater than the actual yield from the greatly reduced incomes taxed at a top rate of 88 percent. For there can be little doubt that overwhelmingly the most important reason for the contraction of incomes over $300,000 in 1942 compared with 1926–28 was precisely the increase in the top personal income-tax rate from 25 percent to 88 percent. In other words, there can be little doubt that a sharp reduction in the top tax rates prevailing today would eventually greatly increase rather than reduce revenues.

Our Fiscal Irresponsibility
April 14, 1947

In the present temper of the country, and under our political setup, the champions of government economy labor under a heavy handicap. They work first of all against the implicit assumption that the burden of proof is on those who wish to economize to point out exactly where and how they would do so. The burden of proof, on the contrary, must always be on those who are asking for the appropriations. They should be made to justify affirmatively every dollar of expenditure they propose.

It is right here that we encounter the first great dilemma of budget-making. Only those asking for the money are in position to know intimately how much is really needed. Yet these are precisely the persons whose personal interests are most directly involved. Their usual interest is to obtain as large an appropriation as possible. And the farther away any official is from the point of origin of the request the less he can know at first-hand about its justification. Requests for Army funds may be filtered up from captains to colonels, colonels to generals, generals to procurement officers or an Assistant Secretary of War, from him to the Secretary, and thence to the Budget Bureau or the President. Each in turn must rely in large part upon the word and judgment of his subordinates.

It follows from this that even a very conscientious and economy-minded Bureau of the Budget can do only a partial job of screening out wasteful and unnecessary expenditure. It can only cut down or eliminate the items that look excessive or wasteful on paper or in replies to questions. And what a conscientious Budget Bureau can only do inadequately by working full time, Congressional appropriation committees, without such a conscientious Budget Bureau, must do far less adequately. Their so-called investigation is too often perfunctory. They cannot hope to do this task well unless they are assisted, not only by a staff of full-time experts who know what questions to ask the department heads requesting money, but by field examiners who can see for themselves how money has been, is being, or could be spent.

If the appropriation committees, acting half-blindly, go into a huddle and emerge with a proposed slash of $6,000,000,000, or 16 percent off the amount that the President has requested, without publishing in detail the wheres and whys of their cuts, they find their well-intended efforts denounced from all sides.

The department heads who have asked for the appropriations accuse them of “undermining the national defense,” or torpedoing foreign aid, housing, social security, or what-not. Newspaper editorial writers who are not in a position to know the real facts join in the clamor. Their usual line is that the President must be supported. They forget that even the President has been obliged to rely for his estimates on many anonymous and not disinterested subordinates. The beginning of any Congressional budget control would consist in the establishment of an adequate staff of experts to act as the eyes, ears, and legs of the Congressional appropriation committees.

But we shall never have any real fiscal responsibility at Washington without far more basic reforms even than this. The first of these would be to adopt the wholesome rule that has prevailed in Great Britain since the time of Queen Anne—to wit, that the legislative body cannot make any appropriation whatever not recommended by “the government.” Only such a rule can prevent raids on the Treasury by Congressional logrolling. Only by making the executive solely responsible for the budget can there be a responsible budget.
The proper function of members of Congress is to act on behalf of the people as watchmen of the Treasury. They cannot be suitable guardians of the public till as long as they are themselves permitted to stick their hands into the till. The proper use of the legislative power of the purse is to deny the purse to the executive for wasteful or unjustified expenditures. Congress will do this best only if it is itself removed from the temptation of trying to buy votes with the people’s money. It will be a vigilant watchdog only if it is itself denied access to the Treasury. As Henry Jones Ford has put it: “There is no propensity of human nature more marked than jealousy of opportunities that one does not share.”

The German Paralysis
April 21, 1947

GENEVA—This former seat of the League of Nations is still the best listening post in Europe. Bordered by Germany, Austria, Italy, and France and speaking the languages of all, Switzerland is the meeting place of nationals who have penetrated the curtains of its frontiers to say the things it is useless or dangerous to say at home. The most ominous situation that emerges from these reports is that of Germany.

The comfortable assumption of most of us has been that the sickness of Germany and Europe is a temporary consequence of war destruction and will be cured almost automatically by the passage of time. But closer examination makes it clear that prostration has been brought about mainly by postwar governmental policies and that it grows worse, not better, every day. The economic chaos in Germany is the product of many causes—war and postwar destruction, Russian and other Allied seizure, displacement of populations, dismemberment of the country, watertight political and economic zones, the level-of-industry plan, and currency inflation, which is wholly out of control.

In addition, there is one cause as important as any of these, though it has so far received amazingly little outside attention. When the occupying powers took over Germany, they accepted virtually the whole existing Nazi system of economic controls. This included the Nazi device, imitated by the whole world, of great monetary inflation on one hand with its normal consequences prevented on the other by a system of price, wage, exchange, and production control.

Such a repressed inflation not only destroys all economic liberty but is far more harmful in its ultimate economic consequences than an open inflation. It removes all incentives; it deprives the price system of its whole function in directing, allocating, and synchronizing production as among thousands of different goods and services.

The result has been an appalling waste of manpower in Germany. There is full employment, with millions of people wastefully and wrongly employed under German planned economy. Wages, prices, and rents are purely nominal, and almost no activity is permitted except by special official license. The available food rations are so small nobody can live on them. Workers are paid in useless marks. Under these conditions a primitive barter economy has grown up outside the planned economy. True German currency consists of brandy for large transactions and cigarettes for small ones. City workers must devote an increasing part of their time, at the expense of their regular jobs, to home gardens. They are officially encouraged to do what is officially prohibited in the French zone.

Textile firms and makers of kitchen utensils are legally required to pay workers 10 percent of their wages in goods, but after a few weeks these are useless except to barter for food stuffs which are supposed to pass through official markets at official prices. So workmen spend their weekends in cycling or trudging many miles into the country to bring back a few wretched potatoes. Potatoes are actually exchanged singly. Apart from any other aspect this is an appalling waste of labor. German industry entered the postwar period with high stocks of raw materials put aside for this purpose. German production in the last two years has been living on these stocks. They are now nearly exhausted. Where German producers are paid in marks at official prices, the worthlessness of these marks and official restrictions prevent them from replacing the raw materials they have used up. This threatens a further drying up of production. Until it is cured through currency reform, a return to free markets, and foreign exchanges and credits on a commercial basis, the German paralysis at the heart of Europe must drag down the rest of the world.

As the recent Hoover report has pointed out, American and British taxpayers are contributing nearly $600,000,000 a year to prevent the Germans from starving simply because the Germans are prevented from producing for themselves. This has contributed to the serious European shortage of fertilizers and coal. “The whole economy of Europe,” as Mr. Hoover
declares, “is interlinked with German economy. . . . The productivity of Europe cannot be restored without the restoration of Germany as a contributor to that productivity.”

Switzerland as a World Mirror
April 28, 1947

GENEVA—The traveler in Switzerland, if he depended on first impressions, could easily imagine himself in a paradise of peace and plenty. Physically untouched by the war, incredibly neat, with every utilizable square inch of soil seemingly under cultivation, the whole Swiss countryside looks like one enormous golf course that has just been rolled and mowed, and the tourist, though he may sometimes have trouble getting sugar or butter, is extremely well fed. True, he must present ration coupons in restaurants, but he seems to get all that he can use in the cities. Stores display a surprising variety of quality goods. Industry also seems prosperous.

Switzerland exports 90 to 95 percent of its entire production of watches, about half of which go to the United States. Switzerland is actually compelled to ration its own exports in money values (though not quantity). Its exports of watches are at record levels. They rose from 195,000,000 francs’ worth in 1939 to 492,000,000 francs’ worth in 1945.

But beneath this smiling surface, Switzerland has her serious problems. Rations for Swiss families are more severe than those for the tourist. There are separate rations for sugar, jams, pastry, flour, cheese, butter, lard, meat, bread, and milk. Wholesale prices have more than doubled since 1938. The cost of living has risen in the same period more than 50 percent in spite of price controls which hold down rents to the 1939 level. The inflation is reflected in the rise in bank-note circulation from 1,700,000,000 francs at the end of 1938 to 4,100,000,000 at the end of 1946. The budget is still out of balance.

A great problem in a small industrialized country like Switzerland is that, in a world of super trade barriers, it is absolutely dependent on foreign trade. It must export or die and import or die. The basic function of its exports is to buy imports. Yet, though the present demand for its exports is unlimited, Switzerland is cut down to about half its prewar supplies of coal. It is short of raw materials. It is forced to make bilateral agreements with other nations.

To supply its essential import needs, it insists that nations receiving credits from it use part of the money to buy some of its luxury products as well as the machinery they need. Where these special bilateral agreements do not exist, it obliges each private trader to develop his own bilateralism. The exporter must arrange an approved import equal to his export and the importer an approved export.

Switzerland is almost the only country in the world today where it is both legal and respectable to deal in foreign currencies at the reevaluations put on them by buyers and sellers. These Quotations are published daily in the newspapers. As the convex mirror of an automobile focuses a large world in small space, the Swiss market in foreign banknotes gives a miniature survey of the currency chaos.

This market certainly reflects the local supply and demand situation in these banknotes. There is more dispute concerning the extent to which it reflects their real values. Is there, for example, a real discount on the American dollar or only a temporary one due to special conditions in Switzerland? The question is difficult to answer with confidence, yet discounts on other currencies seem to reflect rather accurately the known general conditions. Here are quotations in Swiss francs on April 14 of some outstanding banknotes compared with their official rates:

<table>
<thead>
<tr>
<th>Currency</th>
<th>Market</th>
<th>Official</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dollar</td>
<td>3.65</td>
<td>4.30</td>
</tr>
<tr>

<td>119.50</td>
</tr>
</tbody>
</table>

It will be noticed that the free dollar, or what the Swiss call the financial dollar, is selling in Switzerland at a discount of about 15 percent. The reasons for this are too complex to go into here, but the situation has some strange results. The Swiss National Bank will exchange up to $125 a week for American tourists, converting travelers checks into Swiss francs at the official rate of 4.30. It is then perfectly legal for the tourist to go
France on a Quiet Volcano
May 5, 1947

PARIS—Some experts here tell you that the key to France’s economic problem is coal; others insist that the real key is currency. Certainly, both problems strike the visitor on his first day. Shortage of coal means shortage of electric power. At night the streets of Paris are dark. The currency chaos is equally evident in the bundles of ill-assorted bills one is forced to carry in denominations ranging from five to one thousand francs each. An unpretentious restaurant meal costs around 500 francs; a really good meal, 1,000 francs and up. At the official exchange rate, this means from about $4 to well above $8. Even translated at the present black-market rate of slightly less than 200 francs to a dollar, meals and most items of clothing soar far above New York levels.

The franc has an internal purchasing power on official indexes of less than one-eighth its value in 1938. Allowing for black-market prices, foodstuffs are more than thirteen times as high as in 1938. Today, the franc is worth only one-fortieth of what it was in 1914 in terms of dollars, and perhaps only one-hundredth in terms of goods. This long-term decline has meant the steady erosion of the French middle class, with its conservative capitalist psychology and traditional habits of thrift.

The budget continues unbalanced. The volume of money in circulation continues to mount. Prices, especially of foodstuffs, mount with it. The Blum orders for a 10 percent reduction in prices caused a momentary arrest in this upward movement. But for the most part French price controls are ignored or evaded. Where some of them are seriously enforced they disrupt deliveries and distort production. Farmers are called upon, for example, to deliver all their wheat above certain deductions for seed and farm consumption to authorized agencies at official prices. But the price of wheat is fixed too low in relation to actual prices received for meal or other cereals. The result is that farmers have been wastefully feeding wheat to livestock. This reduces the amount available for direct human consumption and adds to the difficulties arising from the destruction of one-third of France’s sown wheat by last winter’s frosts.

The great official overvaluation of the franc has made many imports cheap in terms of francs, but French exports, including tourism, are very high priced in terms of foreign currencies. This reduces and discourages French exports. It makes France more dependent on outside loans, principally from the United States, to continue its imports.

Despite such policies, some lines of production have recovered astonishingly. Iron and steel output in February are 85 percent of the 1938 average, but 180 percent of the output in February 1946. Automobile output in February was 80 percent of the 1938 average and almost double that of the corresponding month in 1946. Production of coal in February was actually 108 percent of the monthly average in 1938 and is now around 115 percent. But France normally imports about one-third of its coal, and coal imports in February were only 34 percent of the 1938 figure. Coal is still the chief bottleneck in French production.

High hopes are placed by the French in a plan drafted by Jean Monnet, which was approved by the Blum Cabinet in January. It calls, among other things, for a balanced budget, a 48-hour week, and modernization of “key resources”—coal, electricity, steel, cement, agricultural machinery, and transport. But the political obstacles to its serious application are great, particularly as concerns the budget. It depends also on substantial credits from the United States.

The fate of French economy rests today mainly on political factors. The chief of these is the strength of the Left, above all of the Communists. Communists occupy key posts in the government. They dominate the most powerful labor union, Confédération Générale du Travail. For reasons of international policy, Communists now play “conservative,” work for increased labor output, restrain wage demands, discourage strikes, sometimes even break strikes; but these tactics may be reversed at any moment. The French are no longer defeatist in spirit. But they live like inhabitants of a town built on the sides of a volcano, speculating uneasily in sidewalk cafes on the meaning of the rumbles beneath their feet.

Belgium: Experiment in Freedom
May 12, 1947

BRUSSELS—It is only an hour’s airplane trip from Paris to Brussels, but in that hour one passes from shortage to comparative plenty. The most dramatic evidence comes at night, when the streets are ablaze with electric signs, contrasting with the blackness of Paris or
London. Belgium's output of electric power in March was 80 percent higher than the rate in 1936–38. This in turn was made possible by a coal output ranging from 85 to 90 percent of prewar levels.

In Belgium, as in France, the complaint is that coal is the great limiting factor on production. Yet an index just prepared by the newspaper Agence Économique et Financière gives Belgium's overall industrial production as 108 percent of the prewar level in March, with an estimate of 112 for April. This compares with an index for France of about 88 percent of the prewar level and for Holland of about 80.

Comparative plenty is also found in the stores. There is a wide variety of imported clothing. Nylon stockings have actually become a glut on the market. Cigarettes seem plentiful. In restaurants one has little trouble getting coffee, tea, sugar, butter, California oranges, and other fresh fruits. For Belgium has deliberately followed a different policy from that of its French and British neighbors. It has not discouraged or prevented imports.

The Belgian authorities figured correctly it was worth risking a shortage of foreign exchange in order to stock up adequately with materials for industry, to "fill the workman's belly," and to give production incentives to their people. The policy has paid handsome dividends. Belgium has not lost exchange, though the statement of the National Bank of Belgium for April 17 shows a decline of 5,716,000,000 francs in gold compared with the corresponding date a year ago. It shows a compensating increase of 5,135,000,000 francs in foreign exchange holdings.

Belgium has sought to deal with inflation through its causes rather than by trying to suppress its symptoms and results. Immediately after the German occupation, the government mopped up a huge excess of outstanding currency to prevent any further inflationary effect. The authorities boast that since the end of 1945 they have been able to prevent the total supply of money from increasing. There is still a heavy budgetary deficit, however, and this problem is far from solved. Yet the country has been remarkably successful in holding up the value of its currency, which has actually gone to a premium over the British pound on the outside market.

This spectacle—together with governmental pledges against nationalization or new taxes on capital—has increased Belgian confidence and led to the voluntary repatriation of Belgian funds from abroad.

The Belgian Government has been working hard for the reduction of foreign trade barriers. It has removed almost all restrictions on imports. This policy is no doubt inspired by self-interest. Belgium is a “transformation” country heavily dependent on foreign trade. But the policy is also farsighted. Just as foreign exchange controls force domestic controls and vice versa, so external and internal free trade go together. Since early 1945 Belgium has been steadily relaxing price controls and rationing. In any case, it seems unable to enforce controls. It is estimated that about 80 percent of all Belgian agricultural products go through the black market.

The desire of Belgians for freedom of trade has led to perhaps the most heartening single development in the whole of Europe. This is the pending customs union between Belgium, the Netherlands, and Luxembourg. The agreements, already signed by representatives of the three governments, now await ratification by their legislatures. They contemplate adoption by Belgium and Holland of identical tariff schedules, designed more for revenue than for protection, and the gradual elimination of trade barriers between the two countries. When this union has been completed, "Benelux" will be the greatest foreign trading market in the world next to Britain and the United States.

But the real importance of the union is symbolic. When other countries are rushing toward more economic nationalism, tighter trade controls, and dreams of autarchy, when they pay freedom of trade chiefly lip service, Belgium and Holland are getting a model for action.

Austerity in Holland
May 19, 1947

AMSTERDAM—Holland suffered far more from the war than Belgium did. The Germans had to evacuate Belgium in a few days without time to destroy. Holland was occupied for months longer. Rotterdam and other cities had been ruthlessly bombed; the retreating Nazis systematically demolished houses, factories, power plants, railroads, and bridges. They systematically looted cattle, farm equipment, locomotives, cars, barges, cranes, thousands of industrial machines, and scores of factories, including a complete steel mill and Holland's sole aluminum plant. They broke the dikes and flooded the land. Holland, which had had one of the highest living standards in the world, lost more than 40 percent of its productive capacity. Industry was paralyzed. It had to start again from the bottom.

Holland has lost also, as a present source of income, the Dutch East Indies, with more than seven times the population and more than 50 times the area of the mother country. It has lost Germany as its largest single
People lose the incentive to work when they cannot buy what they want with the money they earn. Holland tries to solve its formidable exchange problem by separate bilateral agreements with more than a dozen countries, but all such agreements undermine a free multilateral market and the freedom of consumers. Though Holland, like most of its neighbors, regards these bilateral agreements as a temporary expedient, they are tying themselves into an entangling web from which extrication will not be easy. The expedients they adopt perpetuate the very conditions they are intended to cure.

The Middle Way Swings Left
May 26, 1947

STOCKHOLM—Neutrality has obvious advantages. You are struck by the freshness and brightness of Stockholm, its nocturnal wealth of neon lights, its rich display of goods, its fine food, and not least of all by the clothes of its men and women, so much newer and smarter than one finds elsewhere in Europe. The net effect is one of prosperity and opulence. Industrial production is in fact 30 percent above that in 1935 and at the highest level ever reached in spite of the shortage of coal and constant complaints of the shortage of manpower. The money value of foreign trade last year broke all previous records. Many firms have enough orders on their books to keep them in full production for years to come.

Yet there are signs of serious trouble ahead. On March 15 the government suddenly imposed a licensing system to curb nonessential imports, among them motorcars, fruits, and coffee. The public was jolted by the re-imposition of coffee rationing. These measures were taken because of the alarming reversal in Sweden's trade balance. An export surplus of 674,000,000 kronor in 1945 had turned into an import surplus of 842,000,000 kronor in 1946. Though exports had actually mounted from 1,757,000,000 kronor in 1945 to 2,529,000,000 in 1946, imports more than tripled, jumping to 3,370,000,000 kronor. A great part of these imports represented not the coal, oil, and raw materials that Swedish industry is so eager to get but consumer luxuries. This meant an alarming drain on the central bank's gold and foreign exchange reserves, which dropped from 2,973,000,000 kronor last June to 1,364,000,000 by March 15.

This result is generally blamed here on the freedom of private individuals to import. It is, however, a
perfect illustration of how one control makes another necessary until nothing can be left alive. Last July, following Canada, Sweden revalued its currency upward by about 16 percent because it feared an American price rise. By making its imports cheaper, however, it simply encouraged an increase in the volume bought. The government, moreover, held down the export prices of timber, pulp, and paper below the world market and so reduced the amount of foreign exchange that Swedish exports could bring in. Its rigorous internal price fixing more importantly left “an inflationary gap” between the supply of money and the supply of goods at official prices. The excess money naturally flowed into abnormal purchase of imports. Under free exchanges the situation might have corrected itself automatically by a fall in the krona, making imports more expensive and exports more profitable. But in Sweden, as elsewhere, it is illegal to buy or sell currencies in accordance with the values established by supply and demand and no self-adjustment takes place.

Sweden has bilateral trade treaties with nearly every country in Europe. These also create inflexibility. Sweden is bound to take luxury import quotas from treaty countries. A sudden import ban must therefore hit principally American exporters because the United States has not taken part in the bilateral-treaty game.

The recent outflow of gold and exchange reserves was most disturbing, however, in connection with the huge volume of foreign loans and credits extended by Sweden. Part of these went to Norway, Denmark, Finland, and Holland, as Sweden’s contribution toward rebuilding Europe. Part were extended to facilitate Swedish exports. Hardest to explain from Sweden’s standpoint is its loan to Russia. This reaches 1,000,000,000 kronor, bringing the total of Sweden’s foreign credits to 4,500,000,000. Comparing population and national incomes, this total would be equivalent to at least $45,000,000,000 from the United States.

The Russian credit is variously explained as good-neighbor policy, a substitute for vanished German trade, and an anticyclical measure. But it means, in the next few years, a tremendous drain of unrequited exports.

A final factor in the Swedish trade picture is the actual and potential flight of capital. Social Democrats of the Swedish labor party are in power. Wartime government controls have not been appreciably relaxed. There are rumors of devaluation of the krona. There is fear of further socialization. The combined income and capital taxes are almost confiscatory. And the threatened flight of capital brings hints of even more stringent controls.

**England vs. the Price System**

June 2, 1947

LONDON—England’s major economic troubles today seem not so much the result of its war losses, appalling as these were, as of its postwar policies. Temporary impoverishment was inevitable, but the postwar series of special crises in coal, food, and dollars was not. The underlying assumption beneath the present strangling network of economic controls is that a free market and price system is at best a fair-weather system, a luxury a country can afford only when it is already well off. It is the precise function of free prices, however, to allocate production among thousands of different commodities and services and to relieve the most serious shortages most quickly by providing the greatest profit and wage incentives precisely where those shortages exist. A free price system last fall would certainly have signaled the impending shortage of coal long before the Labor government was awake to its existence. It would have encouraged imports of coal from America, instead of waiting until now. It would have enabled higher wages or bonuses to be paid for increased production. It would have attracted more men to mining. If the miners had been free to spend their money for things they really wanted, higher money wages would have meant higher real production incentives.

On May 7 Emanuel Shinwell, the Minister of Fuel and Power, indiscursively declared before a meeting of union delegates that “the organized workers of the country are our friends; as for the rest they don’t matter a tinker’s cuss.” This statement, which has since become a source of great embarrassment to the Labor party, does supply a key to the real nature and animus of recent British planning. The essentially collectivist and egalitarian philosophy behind it begins to emerge more clearly. A ceiling has been put on imports and particularly on the purchase of so-called luxuries because “dollars are short” and “we cannot afford it.” But who are “we”? Certainly not the individual who wishes to buy.

The real principle applied here is “If I can’t afford to buy it, you shan’t be allowed to buy it. If organized labor cannot have it nobody shall have it.” This is most clearly illustrated in food. The overall food supply is not nearly as bad as is commonly supposed. Though it lacks interest and variety, the Minister of Food estimates in terms of calories it is only 6 percent below the prewar level. But analysis of its distribution is instructive. In
April wage rates in Britain were 68 percent above their 1939 level. Weekly wages were about 80 percent higher. The cost of living index, however, has gone up only 31 percent. Food considered separately had risen only 22 percent. This means that the average British worker is considerably better off in terms of goods than he was before the war.

One can say that this is a very good thing, but one cannot argue at the same time that production is low because nutrition is low (the coal miner in particular gets a much higher than average allotment) and one cannot call it austerity. Austerity is not being imposed on the British nation as a whole; it is being imposed through heavy taxes on the British middle and upper classes to subsidize the British working class.

Food prices are being subsidized to the extent of $1,572,000,000 a year in spite of the fact that the British worker is spending a much smaller percentage of his income for the same amount of food than he did before the war. It is the middle and upper classes who have now been reduced to something approaching the workingman’s diet.

Insofar as austerity has been imposed on the whole British people, it consists in refusing to permit either consumers or producers freedom of choice. The consumer is not free to spend his money on things he himself wants but only on things government officials think are good for him. The producer is not free to make what he wishes but only what government officials think is good for the country.

The whole system of priorities, allocations, quotas, and licenses causes endless delays, keeps efficient concerns from expanding, and keeps inefficient concerns in business. Production is lost all around not merely because an army of men is created to issue orders rather than produce, but because producers themselves must spend so much of their time trying to get licenses and allocations instead of finding out how to reduce costs and prices and make the goods consumers really want.

---

**Why Europe Is in a Mess**

June 9, 1947

NAZISM was defeated in war. Hjalmar Schacht, the Nazi economic wizard, is in jail. But when Schacht and his surviving comrades survey the world today, they must feel consoled. Intellectually Schachtism has conquered Europe. The system of price control, wage control, profit control, interest control, exchange control, foreign-trade control, bilateral treaties, rations, priorities, allocations, quotas, with a special license required for almost every move, and with a mounting currency inflation hidden and repressed by these devices—this is Schachtism. And this is the system which nearly every country in Europe has now embraced. If it does not repudiate outright the free-market and free-price system, it regards that system as a luxury that it may be able to afford after its recovery has already been achieved.

The central economic problem of the world today is Europe, and the central economic problem of Europe is Germany. Yet in Germany the looting, the “level of industry” plan, the combination of a chaotic currency with legal prices and wages far below what a free market would bring, destroy production and all incentives. In misdirected efforts to prevent Germany from again becoming a menace to the world we have made it a burden to the world.

It should be possible to prevent it from becoming either—by permanent supervision, by forbidding war production, by permitting full peace production, by setting up a stable currency, by abolishing the whole system of price and wage control, allocations and licenses, by imposing reparations up to the point where they do not endanger output or disrupt world economy, and finally, by forcing on Germany entire freedom of trade with other nations.

This last policy, the opposite of Hitlerian autarchy, would make Germany heavily dependent on imports at the same time as it would increase world efficiency. To protectionists and government planners and socialists, it should be pointed out that from their point of view it ought to be the worst of punishments to deprive Germany of protection and planning and socialism.

It is precisely because Germany exhibits a bankrupt Schachtism in extreme form that it is so instructive an example. But elsewhere the same disease is illustrated in milder forms. Let us take a sort of composite photograph, and call it Ruritania. The situation in Ruritania will be found to apply with only minor modifications to most of the countries of Europe.

Ruritania’s budget is unbalanced. Heavy sums are being spent on armaments, on food subsidies, and on increasing pensions, family allowances, and other forms of social security—but obviously, the government points out, none of these expenditures can be reduced. Tax rates have been kept up or increased on the higher incomes. A capital levy has been added. Further nationalization is discussed. Sales taxes on luxuries, with one or two exceptions, have been reduced.

It is surely not the finance minister’s fault if these arrangements are not bringing in more revenue. Meanwhile the volume of money in circulation has
risen enormously and is still rising. The government, however, is holding down interest rates so that it can borrow cheaper and encourage business borrowing. The policy also increases the inflationary pressure, the volume of money and bank credit, and ultimately the government’s general expenditures; but about this nothing is said by government spokesmen.

But if the government is creating inflation, it is determined to prevent the unpopular consequences of this inflation. It blames all price rises, not on its own inflationary policies, but on the greed and rapacity of producers and sellers. It fixes ceiling prices on everything. Holding down prices to arbitrary levels of course dislocates all profit margins. But as goods are produced in accordance with relative profit margins there is a huge misdirection and waste of capital and labor. Necessities are underproduced; luxuries are overproduced; there are universal complaints of “labor shortage.”

Where inadequate profit margins discourage or prevent production, and where prices fixed below the market over encourage consumption, an attempt is made to correct the situation by rationing, arbitrary priorities, and allocations. The shortages brought about by bad price control are treated as inescapable and inherent. As all output is interdependent, production all around is slowed down to that of the item in shortest supply, whether coal or timber or “labor.”

Price control economically necessitates wage control; but wage control in turn politically necessitates price control; and no one knows how or where to break out of the circle.

On its foreign trade Ruritania imposes controls made necessary by, and in turn necessitating, its internal controls. The country has an inflation and wishes to conceal it. It does this internally by price fixing. But one consequence of this is that the volume of money is kept in excess of the total volume of goods at official prices. This produces the “inflationary gap”—i.e., the amount of money or money incomes with no outlet.

If imports are allowed to come in freely, all this excess money, as Sweden discovered, will be used to buy them. Yet Ruritania wants imports of raw materials and machinery, and wants to get them as cheap as possible. It can do this by keeping its official exchange rate arbitrarily high and making it a crime to buy or sell its currency below this rate. This makes foreign goods cheap in terms of its own currency; but it also makes its own export goods extremely, if not prohibitively, expensive in terms of foreign currencies. The high rate for its currency, in short, encourages imports and discourages exports. It is also likely to make the American traveler feel that he is being swindled by the obligation to convert his dollars at the official exchange rate, and so provokes resentment and discourages tourism.

Ruritania tries to cure all this, not by allowing its currency to seek its natural supply-and-demand level, but by refusing to permit any import to come in except by special license. It orders manufacturers to set aside specified goods for export and forbids its own citizens to buy at any price the goods set aside for export.

The result of refusing to permit its own citizens to buy “luxury” imports with their own money, however, is to hurt the luxury export trade of all other countries. Yet each European country has its own luxury exports which it is eager to push to get dollars or other exchange to buy necessary imports. France has its wines and brandies, perfumes and laces. Holland has its tulip bulbs and fancy cheeses. Switzerland has its embroideries and resort hotels. Each argues that it is unsound and unrealistic to expect people in these trades to turn to other work. Their capital and long-acquired skills are irrevocably invested in what they are doing. It is often a way of life inherited from their fathers and grandfathers. To force them into other lines would involve huge losses and radically dislocate the whole national structure of production. So each country tries to force other countries to take its luxury exports while refusing to take theirs.

The stalemate is broken by bilateral trade treaties in which each country forces its neighbor to take some of its luxuries along with its necessity products. These treaties, however, do not merely leave matters where they would have been under freedom of trade. Both necessities and luxuries are exchanged against each other at artificial prices which do not have to meet world competition. Each country is forced to take, not the goods that its consumers want, and in the proportions that they want them, but the luxuries that its neighbor is most eager to get rid of.

Bilateralism is politically popular because its basic principle, “Buy where you sell,” is easier to understand than free multilateralism. It is obviously imitated from Schacht and Hitler, who in turn revived a mercantilist fallacy centuries old: “The sneaking arts of underling tradesmen,” wrote Adam Smith in condemning it, “are thus erected into political maxims for the conduct of a great empire; for it is the most underling tradesmen only who make it a rule to employ chiefly their own customers.”

Bilateralism is a necessary part of a “planned,” that is to say, a dictated, economy. An internally dictated economy would break down immediately if it permitted free international trade. Internal and external controls necessitate each other. Bilateralism is ideal for
government “planners,” because it permits them to say just how much of this or that shall be sold or bought, and to or from just what country. This enables them to keep their hands on all the strings of business, to retain life and death control over particular industries, and to throw trade this way or that in accordance with the foreign political policy of the moment. But none of this makes for peaceful, free, or stable world trade.

Once we in America have recognized the real nature of the European disease, it should be clear that we have been applying the wrong remedies. Between July 1, 1945, and July 1, 1947, it is estimated, the United States will have contributed abroad nearly $817,000,000,000 in cash and goods. In general, we have been pouring these gifts and loans into Europe without conditions, or with wholly inadequate conditions. It is not surprising that we have achieved such small results from such huge sums, and that the crisis grows worse instead of better.

The operations of the Export-Import Bank have drifted insensibly from commercial loans to political loans, and then to thinly disguised relief. The managers of the International Fund have next to no power to insist on internal fiscal or economic reforms before they grant their credits. The $25,000,000 credit recently granted to France, for example, will be used to keep the franc far above its real purchasing power, and at a level which encourages imports and discourages exports. This will merely prolong the unbalance of French trade and create a need for still more loans.

Such a use of the resources of the Fund not only fails to do good but actually does harm. The International Bank has at least the power to refuse loans unless the borrower is “in position to meet its obligations.” But it also lacks clear power to insist on reforms.

It is now contended in Administration and other circles not only that we must make further huge loans to Europe, with equally inadequate conditions, but that there is no use dealing with this matter on a “patchwork, one-at-a-time” basis. We must treat Europe, we are told, on a “Continental plan,” and lend it as a unit one huge sum.

This is much as if a banker were to call all his applicants for loans into a single mass meeting and say: “Listen, it’s just too much trouble to deal with each of you separately, to find out just how much each of you really needs, and whether your individual plans, past record, and present business methods are such as to give reasonable assurance that the money will be properly used and has a good prospect of being repaid. I’ve only got a limited amount of money anyhow, so I’m turning it over to you fellows in a lump and you can divide it among yourselves.”

The real need is the exact opposite of this. Instead of this whole-lump approach, what is needed is a far more careful and critical examination than we have yet been willing to make, of the particular problem of each country and the precise merits of each application for aid. No loan should be granted except in exchange for far-reaching reforms that would really make it possible for the loan to achieve its purpose. Among reforms on which lenders should insist are balanced budgets, a termination of inflationary policies and of exchange controls, and reasonable restoration of external and internal freedom of trade.

After the first world war two types of loans, as W. Randolph Burgess recently pointed out in London, were especially effective—the Central Bank stabilization loans and the League loans. They were effective because each was preceded by a thorough review of the position and program of the borrowing country. The loans were accompanied by expert aid and supervision. The granting of the credit thus became itself an assurance to the world that an effective program had been adopted. Big results were obtained with moderate means.

All this underlines the need of returning the business of international lending as soon as possible to private hands. There could still be an important role for the International Bank while such a shift to private hands was going on. It could stand ready to take the unsold balance of any loan it approved, provided private investors had already subscribed to a certain percentage of it. In this way the Bank would make only loans that had met some test of the market. It would not place itself in the position of imposing conditions, but would merely be a bond buyer.

Certainly it would add to clarity of purpose and better international relations all around if from now on relief were clearly relief, politics were clearly politics, and loans were really loans.

Why Living Costs Have Risen
June 16, 1947

In recent months there has been increasing concern, as there ought to have been, about rising prices and living costs. And in political discussion the chief blame, as so often in the past, has been placed on the American businessman. Producers and sellers have been asked by the President to hold prices down, as if everything depended solely on their decisions, and as if all they had to decide was whether to hold out for “reasonable” or “unreasonable” profits. But the plain truth is that the rise in living costs has been brought about overwhelmingly
by governmental practices. It is the very people who now point accusatory fingers at the businessman whose policies have done and are doing most to bring about the rise in prices.

The primary cause of the rise in prices has been the mounting volume of money and credit. This has more than tripled since the outbreak of the war. The increase has been mainly the result of the cumulative deficit in the Federal budget financed chiefly by borrowing from the banks. You cannot give people three dollars for every dollar they had before and not expect them to bid up prices. For the rise in the price level must be mainly explained from the side of increased money rather than from the side of shortages of goods. Industrial production in March, in fact, was estimated by the Federal Reserve Board to be running 89 percent higher than in 1935–39. But this was more than offset by income payments 163 percent higher than in 1935–39.

The Administration has certainly made no vigorous attack on this basic cause of higher prices. It continues to spend five times as much money a year as in the immediate prewar period. Through Federal Reserve manipulations it continues to keep interest rates dangerously low. This policy maintains the vast excess of bank deposits and money circulation and encourages further monetization of the public debt.

The government, again, has adopted a consistent policy of promoting wage rate increases. It has done this through Federal laws which take the risks out of striking and make it all but impossible to resist wage-increase demands. It has done it through direct imposition of higher wage rates by so-called “fact-finding boards,” by Presidential intervention, or by property seizure and direct government negotiation of higher wage contracts with unions. As a result of these policies, average weekly manufacturing wages in March, before the latest 15-cent-an-hour increase got started, were 99 percent above the 1939 level and the highest on record. Hourly wages in March, also at the highest point ever reached, were 86 percent above the 1939 level. Wages are normally about eight times as great as profits. To force up wages is to force up prices.

Another major cause of the rise in prices in recent months, which is only now beginning to receive the attention that its real importance warrants, is our national policy of creating a huge export surplus by government gifts and loans to foreign countries. Our exports of goods and services to the rest of the world during 1947 are officially estimated to total $16,000,000,000, an all-time peacetime high, compared with annual exports of goods and services of only about $4,000,000,000, before the war. Against this we are expected to import only about $8,000,000,000 of goods and services. The export surplus of $8,000,000,000 a year is inflationary. It means that we are paying out $8,000,000,000 in wages, salaries, and profits for goods and services that we do not get. It adds $8,000,000,000 to the excess purchasing power competing for the goods that are left.

Mr. Truman keeps making his drive for “voluntary price reductions” against industrialists. But the great rise in prices has in fact taken place in foodstuffs and farm products. It is on these that the abnormal foreign demand made possible by our gifts and loans has chiefly concentrated. On May 31, on Mr. Truman’s own figures, wholesale prices of farm products were 78.4 percent above the 1926 level. All commodities other than farm products and foods were up only 32.3 percent. All this does not mean we should halt forthwith the gifts and loans to Europe that create our export surplus. We have world responsibilities that we cannot evade. But we must frankly recognize the major inflationary effects of this policy and try to offset it by other means. The government can at least stop artificially supporting prices of farm products.

Subsidizing Planned Chaos
June 23, 1947

It is unfortunate that Secretary Marshall, in his speech at Harvard, could come so close to diagnosing the real economic disease of Europe and then miss it. He pointed out that “in many countries, confidence in the local currency has been severely shaken.” But he did not tell us why. It is because the governments of these countries have insisted on living beyond their fiscal means; because they have financed the difference by printing more money; and because the ideology and vested political interests within these countries give little assurance that this process can be brought to a halt.

But there is an obstacle to European recovery even more serious. The money, though fallen in value, would still facilitate production and exchange if commodity prices and foreign rates were free to move in response to actual supply and demand. But precisely this is prevented by government controls which make it a crime for anyone to buy or sell goods in accordance with the shrunken value of the currency. The European farmer refuses to plant wheat, or feeds it wastefully to livestock, not, as Secretary Marshall says, because “he cannot find the goods for sale which he desires to purchase,” but because the distortions of price fixing either make it more profitable for him to sell wheat in the form of
poultry, hogs, or beef, or make it unprofitable for him to raise wheat at all. And the principal reason why he cannot get goods in the cities is because price fixing in turn discourages and prevents production and sale in the cities.

Secretary Marshall’s speech at Harvard represents an advance in American policy in at least one important respect. It indicates that further financial aid will not be forthcoming from this country except under conditions. But it is extremely vague regarding what these conditions ought to be. There must, said Mr. Marshall, be “some” agreement among the countries of Europe as to the requirements of the situation. Everything depends, however, on precisely what this agreement is. It is not important whether or not some European nations agree to a “joint” program. What is important is whether the programs they adopt, jointly or individually, are really such as to promote economic recovery.

Secretary Marshall’s reluctance to suggest a definite program is understandable. He does not wish to put the American Government in the position of “dictating” to Europe or “interfering in its internal affairs.” But this is the inescapable dilemma of government lending. For unless the American Government does impose conditions, its future loans, like its past loans, will merely subsidize and prolong the socialistic and restrictive policies that are strangling production and making recovery in Europe impossible.

We now seem ready to make loans to practically any government that says it is anti-Communist, even though the policies it follows mean that the loan will soon be used up, that it will be back for more, that private enterprise in that country is tied hand and foot, and that the borrowing government, in short, though it is “fighting the Communists,” is meanwhile pursuing the very economic course that leads toward Communism.

All this suggests that, instead of framing still more grandiose foreign lending schemes, our government ought to get out of the foreign lending business as soon as possible. The best immediate policy is to leave all further foreign loans either to private hands or to the International Bank, which is compelled to take credit-worthiness into account because of the fact that it must sell its debentures to private investors. If the International Bank sends an expert economic mission to each country that applies for a loan, if it frankly tells each borrowing country that investors will not be interested unless that country makes certain specified economic reforms, then a loan may really achieve its purpose. Under such conditions, in fact (as experience with the League of Nations loans proved after the first world war), it is not the loan itself that is important in assuring recovery, but the reforms made in order to get the loan.

**The New Labor Law**

June 30, 1947

It is not surprising that union officialdom should have fought with every weapon in its armory against what it unscrupulously tagged the Taft-Hartley Slave Labor Bill. The new law is not perfect. It retains some mischievous provisions from the old Wagner Act. It includes several provisions which may prove difficult to enforce. But it represents nonetheless an immense step forward. As compared with the last dozen years, the whole climate in which labor negotiations are conducted will now be profoundly improved.

Where the Wagner Act started off with the falsehood that only the transgressions of employers burden or obstruct commerce, the new act from the beginning is two-sided. It declares that neither labor nor management has a right to engage in “practices which jeopardize the public health, safety, or interest.” The new law defines foremen, and exempts employers from the legal obligation to bargain collectively with them, so clearly that not even the National Labor Relations Board or the Supreme Court majority can “interpret” the provisions away. It makes the general counsel of the new five-man NLRB a direct appointee of the President instead of a creature of the board. This should make the counsel independent and help to separate the board’s prosecuting from its judicial functions.

The new law removes the Wagner Act’s specific endorsement of the closed shop. It sanctions only the union shop, provided the union itself is “open.” It authorizes the checkoff only on the written agreement of each employee affected. For the first time the new law makes it an unfair labor practice not only for an employer, but for a union, to “restrain or coerce” employees in the exercise of their bargaining rights. The new law illegalizes the secondary boycott. It illegalizes “excessive or discriminatory” initiation fees. It restores freedom of speech to the employer when his expression of opinion contains “no threat of reprisal or promise of benefit.” The new law makes collective bargaining for the first time a “mutual obligation” of employers and unions. The new law makes it clear for the first time that the obligation to bargain “does not compel either party to agree to a proposal or require the making of a concession.” The new law holds both parties to a collective bargaining contract. It requires a 60-day notice.
on either side before the termination of an existing contract. It deprives any employee who strikes within this 60-day period of his status as an employee under the act unless his employer willingly takes him back. The new act allows an employer as well as a union to petition for a bargaining election. It withholds recognition from unions that refuse to file statements revealing officers’ salaries, methods of election, initiation fees and dues, qualifications for membership and grounds for expulsion, and audited financial statements. No union is given protection under the act whose officers refuse to file affidavits that they are not Communists.

Where the old Wagner Act declared that in proceedings before the NLRB “the rules of evidence prevailing in courts of law or equity shall not be controlling,” the new act just as specifically requires that such proceedings “shall, so far as practicable, be conducted in accordance with the rules of evidence applicable in the district courts of the United States.” Where the Wagner Act held that in court appeals the findings of the NLRB as to the facts should be conclusive “if supported by evidence,” the new act insists that they must be “supported by substantial evidence on the record considered as a whole.” These two procedural changes alone will make an immense improvement in the fairness with which labor relation cases are tried.

The new law repeats from the Wagner Act the provision that nothing in it shall be construed “so as either to interfere with or impede or diminish in any way the right to strike”; but this time it adds the significant provision “or to affect the limitations or qualifications on that right.”

This is by no means a complete list of the important changes. The new law does not guarantee labor peace. No law could. But it provides two-sided bargaining and should improve the whole atmosphere of labor relations. *

**Mr. Truman Invited Strikes**

*July 7, 1947*

The series of crippling “protest” strikes which have taken place since the enactment of the new labor law ought to have surprised no one. The union leaders by their hysterical attack on the Taft-Hartley measure as a “slave labor” bill, and the President by the reckless language of his veto, openly invited precisely this result. Mr. Truman repeatedly called the measure “unworkable,” He declared that it would “cause more strikes, not fewer.” He repeatedly said that it left unions no means of protecting their rights “except by striking” and “no option but the use of economic force.” In the light of this provocative language, Mr. Truman cannot disown responsibility for the strikes that have followed the veto which he must have known would be overridden.

Under the Constitution it is the President’s sworn duty to enforce this act in good faith. Yet he can do this now only by doing everything in his power to disprove and discredit his own predictions. It is not realistic to expect this. By his reckless course he has thrown justified suspicion in advance upon every appointment he makes under the new act and every ruling or decision made by his appointees. For the President’s veto and warnings will be borne out only if the new law is so administered that it does cause more strikes instead of fewer, if it is so interpreted that it does open up endless lawsuits, and if it really does cause employers to regret the day it was conceived.

It has been suggested that Mr. Truman should recognize his self-created dilemma by asking the whole National Labor Relations Board to resign, and appointing only administrators recommended by the Congressional sponsors of the new labor law. Such a drastic course might solve this particular problem. But the major constitutional dilemma would remain. Mr. Truman’s fight a year ago for all-out prolongation of price control, and his veto then of the Case Labor Disputes Bill, were repudiated by the voters in November. It must be said in Mr. Truman’s favor that he then interpreted the sweeping verdict of the polls correctly, and appeared to accept it gracefully. He said: “The people have elected a Republican majority to the Senate and House of Representatives. Under our Constitution the Congress is the lawmaking body. The people have chosen to entrust the controlling voice in this branch of the government to the Republican party. I accept this verdict in the spirit in which all good citizens accept the results of any fair election.” And Mr. Truman promised to “cooperate in every proper manner” with the new Congress.

Mr. Truman’s course in recent months has shown that these fair words meant precisely nothing. For feeble and unconvincing reasons he vetoed a tax-reduction bill that had been passed by heavy majorities in both Houses. This was only the second time in our history that a President had ventured to veto a general tax measure. He then vetoed—but this time unsuccessfully—a major labor bill that had cost Congress five months of work—a bill that he himself described as “perhaps
the most serious economic and social legislation of the past decade."

Immediately after the political upheaval last November it was suggested, by members of the President’s own party and adherents of his policies, that he could create “a notable precedent in American history” by resigning, after allowing Congress to propose a man whom he would name as Secretary of State and who would then constitutionally succeed him. Those who dismissed this suggestion as “silly” could not have stopped to weigh the full consequence of the traditional course. It meant two years of recrimination and deadlock.

The present division and paralysis at the heart of our government makes it next to impossible today for either Congress or the President to frame sound economic policies and put them into effect. This situation darkens the whole economic outlook, domestic and foreign.

**Consequences of Rent Control**

*July 14, 1947*

The President’s scolding message on the new rent-control extension law not only implied that Congress should have kept indefinitely almost every wartime control over rents and building, but that no real housing can be built now except by still further government intervention. Yet Congress needlessly left itself open to attack by drafting this rent-control extension with astonishing clumsiness, even from a purely political point of view.

Though Mr. Truman greatly overstated the case against the “voluntary” rent increase of 15 percent, it is subject to legitimate criticism. Nobody wants a rent increase. The individual tenant, therefore, before “agreeing” to such an increase, is really forced to decide what future Federal or state rent-control laws are going to be, how long they will last, and whether his acceptance of a 15 percent increase now will in fact buy sufficient good will from his landlord to assure him a lower rent in the long run. This “voluntary” provision, in other words, forces the individual tenant to gamble on political and psychological factors he cannot measure.

In exempting hotels, again, while keeping rent controls on other residential space, Congress managed to create an exaggerated impression of how much rents in general would rise if all controls were removed. As long as rents in general are legally held below the market level, existing tenants take advantage of this to keep spread out and to use space less economically than otherwise. By increasing the number of people who are compelled to bid for the uncontrolled space left over, this forces up the market price of such space compared with what it would be if all rents were free.

The biggest political mistake of all, however, was Congress’s refusal to provide that any state that wished to do so could at any time take over rent control within its own boundaries. This would not only have saved Congress from a political headache. It was the only Constitutional thing to do. There is not in the Federal constitution a single clause that could plausibly be interpreted to give the Federal government the right to regulate rents in peacetime. If rents are not essentially local, nothing on earth is local. Houses and apartments do not move across state lines. The Federal rent legislation is a symptom of how little anyone any longer cares about states’ rights or the limits that our Constitution put on Federal powers.

Mr. Truman in his rent-control message denounced the “brazen operations” of the “real-estate lobby.” The truth is that nowhere in the world does the landlord lobby begin to compare in power with the tenant lobby. Since the outbreak of the war rents have been held down far more than any other major item in the cost of living. In this country, compared with the prewar level, foodstuffs have risen 88 percent, clothing 84 percent, house furnishings 82 percent, all items together 56 percent. Rents have done most to pull this average down. They have risen only 9 percent. We can get some measure of the existing discrimination against the landlord if we ask ourselves what the reception would be to a proposal to treat the landlord as well, or even half as well, as other sellers—to permit him, say, to increase rents by as much, or even half as much, as the average percentage increase that has taken place in all other items in the cost of living.

What is not yet understood is that freeing rents from controls would not in the long run even increase the cost of living. It would merely restore the natural market relationships of prices, rents, and incomes to each other. If people once more had to spend the former proportion of their incomes for rent, they would have just that much less monetary purchasing power left over to bid up the prices of all other things. With rents alone arbitrarily held down, workers whose monthly incomes have more than doubled need spend only half the former percentage of their income for housing. This means that old tenants use space more wastefully, so intensifying the problem of those who happen to have been caught outside. The “housing shortage” is itself in large part a product of the very rent control that “protects” us from it.
The World's Santa Claus
July 21, 1947

More and more the strange idea is being put forward that America must make loans or gifts to foreign countries, not primarily to save them but to save itself. We are told that we must make these gifts or loans not as a humane or charitable duty but out of shrewd self-interest. Newspaper commentators in the recipient countries have more and more been interpreting our generosity to them on this theory. On June 25 Pravda declared that the Marshall Plan was influenced by a desire to prolong a postwar “boom in the United States” and to “lessen the ripening economic crisis” here.

That Communist Russia should hold such a view is not surprising. It fits in perfectly with all the other claptrap that Communists have long preached about capitalism. But the theory is just as eagerly embraced elsewhere.

A year ago, in its issue of July 12, 1946, the Eastern Economist of New Delhi put it forward in its most candid form. “The United States Lend-Lease plan of helping the Allies in the recent war has been acclaimed as an act of unparalleled generosity,” it said. “But it was also a brilliant and ingenious way of solving what would otherwise have been an intractable problem. . . . The productive power of America has multiplied itself so fast that it is now admitted that she cannot continue to give 60,000,000 jobs unless she is able to have a large export trade. . . . In such circumstances it would not be such a foolish thing (as some might imagine) to give away goods to other countries, for on balance it would be better to part with surplus goods than to create unemployment. . . . Machinery should be set up by America whose purpose would be to provide gifts of loans to countries. . . . The United States . . . will buy the goods, give them as gifts, and reimburse itself by additional internal taxation. . . . If this is to play the world’s Santa Claus, the United States is both rich enough and should have sense enough to fill the role.” This idea, in both crude and sophisticated guise, now runs like a refrain through the French and British press.

More surprising, it is endorsed by some American businessmen and even by some American economists. Yet it is unadulterated nonsense.

If we could create prosperity merely by making goods to give away, then we would not have to give them to foreign countries. We could make the goods to give away to our own poor. We could furnish them with free overcoats, free lunches, and free automobiles; build any amount of good new housing, which we badly need, and turn it over to them. Simplest of all, we could turn over to them direct additional money taken from the taxpayers and let them buy with it whatever they themselves wanted. Why confuse the issue by bringing in foreign nations and foreign trade?

It ought to be clear to the meanest intelligence that nobody can get rich by giving his goods away. What seems to confuse otherwise intelligent people when this proposition is applied to a nation instead of an individual, however, is the fact that particular firms and persons within the nation can profit by such a transaction while the rest of us are forced to absorb the losses. The exporter may profit because he makes additional sales. But if the foreign loan is not repaid, then the loss must be made good out of increased taxes on every American. American consumers will then have just that much less money to buy American goods. Domestic business will lose as much as export business has gained. And the country will be poorer by the amount of goods it has given away.

This would be the consequence of unsound foreign loans at any time. But the country is now in the midst of an unprecedented inflationary boom. Precisely when this inflation should be prevented from going further, a government foreign-loan policy can only intensify it. The theory that we need to create an export surplus by unsound governmental loans would be foolish enough even if we had unemployment and wished prices to go up; it becomes downright idiotic in a period of full employment and when everyone is already complaining of high living costs.

Telling Prices What to Do
July 28, 1947

In 1939, according to the Bureau of Labor Statistics, average weekly wages paid in all manufacturing industries were $23.86. In bituminous coal mining they were almost exactly the same—$23.88. In January of this year, weekly wages in all manufacturing industries had advanced 98 percent to $47.02. In the same period, weekly bituminous coal wages had been boosted 191 percent to $69.54. These were the highest weekly wages paid in any industry. The cost of living had gone up only 53 percent. The wholesale price of bituminous coal went up in the same period 43 percent.

Such was the situation before John L. Lewis’s final triumph a few weeks ago. Then he boosted the hourly wage rates of soft-coal miners from $1.18½ to $1.63½. He won $13.05 for an eight-hour day against $11.85 for a previous nine-hour day. This means that for the most productive periods the miners’ weekly wages were
provide new jobs and bring about a permanent increase in real wages?

Mr. Truman’s coal-price statement is even more disturbing to the business outlook than the latest forced boost in coal wages and the distortions in the economy which it will set up, serious as these are. For Mr. Truman’s statement is a resumption of the effort to talk down prices by exhortation and veiled warnings. It looks suspiciously like the groundwork of a campaign to restore price control. To encourage a further increase in labor costs while holding down prices would be, of course, the quickest and most certain way to bring prosperity and production to a halt.

The Midyear Economic Report
August 4, 1947

The President’s 82-page Midyear Economic Report, though it contains much instructive material, is clearly intended on the whole as an apologia for the Administration’s policies. The “Foreword and Summary” is purely political. The report refers frequently to our “free” economy; yet it tacitly assumes that the government must control everything in this economy and must constantly tell prices and wages what to do. That the government should simply assure an open competitive field, and then let price and wage relationships adjust themselves in a free market, is an idea that never seems to occur to the authors of the report.

There is a great deal of boasting in the report about our “$225,000,000,000 economy.” But there is no reference to the fact that the purchasing power of the dollar in which this “gross national product” is measured is only 55 cents as compared with the dollar of 1935–39. If the gross national product were stated in terms of the prewar price level, it would seem considerably less impressive. The report does not point to the huge increase in money and credit that has been the real cause of the rise in prices. It treats the rise in prices, in fact, as if it were mainly the result of arbitrary decisions by greedy businessmen.

Throughout the report there is an attempt to minimize the rise in wages at the same time that a great deal of alarm is expressed about the past or possible rise in prices. That the government should simply assure an open competitive field, and then let price and wage relationships adjust themselves in a free market, is an idea that never seems to occur to the authors of the report.

Mr. Truman did not stop to tell us what the result would be if this increase were not reflected in prices. In 1946 the average net operating profit margin to American mines on a ton of soft coal was 13 cents. The United Mine Workers Journal—which can be counted upon for a low estimate—contends that the cost of soft coal will not be raised more than 65 to 67 cents a ton by the new labor settlement. If the price of soft coal did not go up now, therefore, this would mean an average net operating loss to the mines of something in the neighborhood of 52 cents a ton. Would it help the miners, or the steel industry, or production and employment, if the soft-coal mines had to close down because they were losing money?

Do Mr. Truman’s advisers know by just how much the coal mines and steel companies should or should not increase the price of coal or steel in order to make just the “right” profit? In view of the heavy losses in the coal or steel industry in bad years, do Mr. Truman’s advisers know just how high profits should be in good years to attract both the absolute and relative amounts of new venture capital to assure the right production of steel or coal in relation to other production? Do they know what the profits of industry in general should be to accumulate or attract sufficient new capital to

raised from a former $69 to $75 to $78, depending upon when overtime begins.

All during the period that Mr. Lewis’s strike threats were forcing the soft-coal industry to add another rise of about 30 percent in total labor costs, President Truman did nothing. Or rather, he seemed to do everything to strengthen Mr. Lewis’s hands. Though the Taft-Hartley bill was finally enacted over his veto, his known opposition made it weaker than it would otherwise have been (particularly in dealing with an industry wide union like the United Mine Workers). By calling it “unworkable” he encouraged unions to flout it or treat it with contempt.

Immediately after the damage was irreparably done, however, the President expressed “deep concern,” not about the wage increase itself, but about the possibility of “a substantial increase in the price of coal.” This, he feared, would “renew the inflationary spiral.” “The people of the country,” he went on, “have the right to demand that their prosperity shall not be imperiled by immediate increases in the price of coal and in the price of steel.” In other words, he finds nothing to fear when Mr. Lewis or any other labor leader forces any increase whatever in wages. Our economy, it appears, is only “imperiled” when such wage increases are reflected in prices.

Mr. Truman did not stop to tell us what the result would be if this increase were not reflected in prices. In 1946 the average net operating profit margin to American mines on a ton of soft coal was 13 cents. The United Mine Workers Journal—which can be counted upon for a low estimate—contends that the cost of soft coal will not be raised more than 65 to 67 cents a ton by the new labor settlement. If the price of soft coal did not go up now, therefore, this would mean an average net operating loss to the mines of something in the neighborhood of 52 cents a ton. Would it help the miners, or the steel industry, or production and employment, if the soft-coal mines had to close down because they were losing money?

Do Mr. Truman’s advisers know by just how much the coal mines and steel companies should or should not increase the price of coal or steel in order to make just the “right” profit? In view of the heavy losses in the coal or steel industry in bad years, do Mr. Truman’s advisers know just how high profits should be in good years to attract both the absolute and relative amounts of new venture capital to assure the right production of steel or coal in relation to other production? Do they know what the profits of industry in general should be to accumulate or attract sufficient new capital to

provide new jobs and bring about a permanent increase in real wages?
manufacturing wages have increased on the average 112 percent. Nor would the ordinary reader suspect, from the studious efforts to minimize the rise in weekly soft-coal wages, that they have gone up twice as much as other industrial wages, and are more than 200 percent above the prewar figure.

While further price rises are deplored throughout the report, we are told that “in some cases wage increases are still needed.” The President recommends an increase of “at least” 62½ percent in the present legal minimum-wage level. He does not say what the effect of this might be in causing unemployment among the very people it is intended to benefit, or in forcing up wages above the minimum to maintain existing differentials. He also wants wages increased that have risen “substantially less than the increase in the cost of living.” But he fails to draw the simple corollary that, unless wages which have increased more than the cost of living are correspondingly reduced, this will simply increase the cost of living still further.

The President’s report opposes “tax reduction now” on the ground that it “would add to inflationary pressures and would also prevent debt reduction.” But it says not a word about accomplishing this by cutting the government’s unparalleled peacetime expenditures. On the contrary, it proposes increased social-security benefit payments, housing subsidies, and government aid to Europe. Whatever the merits of these measures, they must add to inflationary expenditures.

In recent years it has become fashionable to believe that it is the government’s function to “stabilize” the economy and to “compensate” for the mistakes of private business. This belief rests on the assumption, not merely that government officials will always know better than businessmen what to do, but that they will put aside all political considerations and do it.

The President’s report illustrates what happens in real life. A dangerous inflationary boom is being treated as if it were a solid prosperity. Measures like increased social-security payments, housing subsidies, and foreign loans that stimulate exports, which under the “compensated economy” theory would be adopted only in depression, are advocated in a period of unprecedented employment and soaring prices. Further wage advances are encouraged. The net effect of government economic intervention is to push an inflationary boom still farther; for there is always an election ahead, and you must be at the peak of the boom when you get there.
The new labor law makes it an unfair labor practice for a union as well as an employer to “restrain or coerce” individual workers in the exercise of their bargaining rights. It illegalizes excessive or discriminatory initiation fees. It refuses to certify a union or allow it to bring complaints to the labor board unless it has published a report of its receipts and disbursements, as well as a statement giving its name, the names, titles and salaries of its principal officers, the manner of the election, the initiation fees and dues of the union, a detailed statement of its constitution and bylaws showing the procedure followed regarding qualifications for or restrictions on membership, election of officers, calling of regular or special meetings, levying of assessments, imposition of fines, authorization for strikes, authorization for disbursement of union funds, audit of union financial transactions, expulsion of members and the grounds for it.

Every member of a union will want to know every one of these facts. It is only union bosses who find their arbitrary powers threatened, who want to continue to be highhanded, secretive, and irresponsible to the rank and file of their unions, who have anything to fear from such publicity. It is not surprising when such union bosses announce that they will “bypass” the new law.

Equally important protections for the rank and file are the provision requiring written consent of individual workers for the checkoff of union dues, the provision making it unlawful for an employer to buy off a corrupt or blackmailing union leader, and the provision to assure that so-called “welfare funds” really are used for the union members’ welfare and not merely to make labor leaders financially independent of the rank and file of their unions.

If we are thinking not of retaining unrestricted power for a small union oligarchy, but of the rights of the union rank and file and the rights of the individual workers, then the much abused Taft-Hartley Act far more deserves the title of a pro-labor law than the misconceived Wagner Act ever did.

The Myth of a Dollar Famine
August 18, 1947

Mr. Dalton’s defenders claim that he was unaware of the fact that not only Britain but Canada, Argentina, Spain, and other countries also were suffering from serious dollar shortages… The [British] Government defense is that the whole world is in the grip of a dollar famine that is rapidly becoming so severe that it will produce deflation and unemployment everywhere unless the United States acts quickly to relieve it.

These sentences from a London dispatch to The New York Times give an accurate reflection, not merely of the views of the British, but of outside nations in general. Their plight, as they see it, is not their fault, but ours. It is not Britain or Europe, but the United States, that must “act quickly.” It is we who must contribute still more loans or gifts to make up whatever deficit in its trade balance the outside world succeeds in bringing about.

It is of the first importance, if the world is to apply correct remedies for the present crisis, that it separate the sense from the nonsense in these allegation of a world dollar famine. In one sense, of course, Britain (or France, or Mexico, or the Argentine) is correct in attributing its troubles to a “dollar shortage.” In the same sense, an American would be correct in saying that the reason he could not pay his grocery bill or buy himself a new car is that he was suffering from a dollar shortage. But such a description does not explain anything. The real question we must answer, either for the foreign nation or the individual citizen, is what causes the dollar shortage.

Now for Britain or Europe or Latin America to describe its plight as a “dollar shortage” is really a way of implying that the situation is somehow our fault. We are being blamed for not supplying enough dollars. The real trouble, however, is that Britain and Europe and Latin America wish to buy more from the United States than they sell to it. They wish to get from us more than they give. They wish to buy more than they can afford to pay for. They are consuming more than they are producing. The only permanent remedy is for them to increase their production or reduce their consumption. As long as they do neither they can only keep up the one-sided trade with us with the proceeds of our loans or gifts. We are in fact supplying the outside world with $1,000,000,000 worth of goods and services every month in excess of what we get in return.

In brief, the trouble at bottom is not a shortage of dollars but a shortage of goods and services to exchange for dollars. To talk of a shortage of dollars in any absolute sense is absurd. In the last two years the United States has contributed to the outside world cash and goods estimated at nearly $17,000,000,000. The gold and dollars now held by the outside world are estimated to reach the unprecedented total of more than $20,000,000,000. Why, in the face of this, does Europe complain more loudly than ever of a “dollar famine”? Why has the world’s trade become so unbalanced? The whole answer would be complex; but the
chief responsibility must be placed upon government controls. Most of the governments of the world today, by forcing commodity prices below the levels that supply and demand would bring about, are creating artificial bottlenecks and shortages. When they draw on us for the deficiency, they cause shortages and higher prices even here.

But the gravest case of arbitrary price fixing is the overvaluation that nearly all countries place on their own currencies. They will not accept the verdict of the open market as to what those currencies are really worth. They will not even allow that open market to operate. By keeping their currencies artificially high, they make imports from America relatively cheap in terms of their own currencies at the same time that they make the prices of their exports prohibitively high in terms of dollars. It is this that is chiefly causing the chronic unbalance of trade.

What the world is suffering from today is not a dollar crisis. It is a sterling crisis, a franc crisis, a guilder crisis, a peso crisis. It staggers from crisis to crisis because it will not allow free markets to function.

The Bankruptcy of ‘Planning’
August 25, 1947

The British press regarded the recent economic proposals of Prime Minister Attlee as “inadequate” and “vague.” The Opposition called them “totalitarian.” But very few pointed out that, wholly apart from their effect on human liberties, the economic remedies put forward by the Prime Minister were precisely the opposite of those that the situation called for.

The fundamental trouble with the British economy today is governmental “planning” itself. The British Government has refused to let the free market work. And when the policy of government restriction breaks down, Mr. Attlee, far from recognizing that the past restrictions have brought about the present collapse, opines that “as things have turned out, we have perhaps moved too far and too fast” in the direction of restoring “freedom of individuals to undertake the kind of work that they prefer.”

Mr. Attlee thinks the trouble with England is “a world shortage of dollars.” The mistaken nature of this complaint was pointed out in this column last week. He is equally mistaken in complaining of the provisions in the American loan agreement for sterling convertibility and for non-discrimination against American goods. Both these provisions were sound in themselves. It is chiefly because of its own economic controls, particularly over sterling, that it has been difficult for the British Government to fulfill these provisions.

“Definite targets,” declares the Prime Minister reassuringly, “are being set for basic industries.” But definite targets were set long ago, and were simply not achieved. Mr. Attlee seems to think that if the targets previously set proved too high for achievement, the remedy is to set still higher targets. “For the year 1948, we must raise our sights.” But this is merely planning by exhortation and rhetoric; it is wish-planning. A nation cannot simply talk itself into higher production. Nor is it the function of government statisticians to decide precisely how great coal production, steel production, or particular exports ought to be. Neither government statisticians nor anyone else can know in advance precisely what steel production ought to be in relation to coal production, or the export of one commodity in relation to another. On the contrary, it is the function of individual consumers and producers, buyers and sellers, to establish the absolute and relative production of thousands of different commodities and services by expressing their decisions through a free market.

“We need,” declares Mr. Attlee, “faith in freedom.” Noble words. But in Mr. Attlee’s economic policy there is no faith in economic freedom, in freedom of the market, freedom of the consumer, or even in freedom for labor. Sir Stafford Cripps declared in the House of Commons on Feb. 26, 1946: “No country in the world, so far as I know, has yet succeeded in carrying through a planned economy without compulsion of labor. Our objective is to carry through a planned economy without compulsion of labor.”

But only eighteen months later Mr. Attlee is already admitting that his new program “will involve some sacrifice of individual liberty—by both employers and workers. . . . We shall have to take some measure of control over the employment of labor.”

In announcing his new plans Mr. Attlee repeatedly called for more “sacrifices” from the British public. But as Prof. John Jewkes of the University of Manchester pointed out last January: “Any plan which calls for ‘sacrifices’ should be subject to suspicion, since the purpose of a plan (except perhaps in case of war or threatened war) should be to lessen sacrifices and not increase them.”

Fanatics have been defined by Santayana as people who redouble their efforts after they have forgotten their aim. So the heads of the Labor government are forgetting their ideals of liberty, forgetting even the material purpose of their plan, and drive grimly ahead with a plan that has become an end in itself. Meanwhile their planned economy is running out of coal, running
out of food, running out of dollars. And perhaps most serious of all, it is running out of alibis.

A Modern Corporation Reports
September 1, 1947

To our Stockholders:

Your corporation has always sought to be up-to-date, and to act in accordance with the precepts of the most forward-looking economists and statesmen. Your corporation seeks only service, and not profits. We are happy to report that in the last calendar year we have been of infinite service and have made no profits whatever.

Your corporation has of course kept in mind the importance of constantly boosting wages. Our workers must be paid enough to buy back the product we make, which consists mainly of nuts and bolts. We also wish to boost wages to increase the national purchasing power. In accordance with our understanding of the objectives of the CIO, we last year granted our workers an increase of 15 percent every month over the preceding month.

In January we made the mistake of announcing our first 15 percent increase without consulting the union leaders. We were promptly notified by the National Labor Relations Board that we had been guilty of an unfair labor practice in not having engaged in collective bargaining. We rectified this mistake in February. In our March negotiations, however, the union leaders called our attention to the fact that these voluntary raises on our part were undermining their position with the rank and file, who were beginning to ask whether they needed any high-salaried union leaders at all. The union leaders therefore suggested that the 15 percent increase ought to be granted every month only after they had demanded 30 percent, so that the wage increases each month could appear to be wrung from us. We agreed to this arrangement as the only one under which collective bargaining and a strong union organization could be preserved.

In accordance with the demands for “full employment” we have naturally sought every means by which to make more work. For this purpose we have hired inefficiency experts and specialists in unscientific management who are able through motion analysis to find slower and more complicated ways of doing things and who call attention to points at which labor-saving machinery can be got rid of. Through their expert services we are proud to announce that we succeeded in raising employment 37.2 percent last year with no increase in output whatever.

We have paid special attention to expanding our export sales by granting credits to foreign customers. Our company economist has pointed out to us that it is of no importance whether or not these loans are ever repaid, because they enormously increase our export sales. Moreover, he points out that it will be of particular advantage to the country if the loans are never repaid at all, because in return for our exports there will then be no imports to threaten our home industries.

Your corporation has issued a volume of bonds during the year which greatly exceeds the value of the corporation’s assets. We consider our bondholders, however, part of our corporate family. There is nothing to worry about, because as one big family we merely owe this debt to ourselves.

Your corporation has also contributed outstandingly to the fight against inflation. In accordance with the President’s request, we have constantly reduced our prices. As they are now far below production costs we feel confident that they must be fair. It is in the realm of prices, in fact, that your corporation has made a great contribution not only to prosperity but to economic science. Our company economist has long pointed out to us that if we constantly reduce prices we will constantly increase our volume of sales. We have found this to be so. We have finally found, in fact, that we dispose of the greatest volume of goods when we charge no price for them at all.

In this shining record of achievement, your corporation must report only one fly in the ointment. This, we regret to announce, is our last report. We are bankrupt and going out of business today.

Signed,
I. M. N. Addlepate,
President

The Fund vs. World Recovery
September 8, 1947

The greatest single barrier to world recovery (if we exclude for the moment Russia and Communism) is hardly being discussed at all. This is the use of government police power to keep the price of currencies far above their real market value. It is failure to recognize the consequence of this policy that has made the whole
demand warranted, all currencies would be freely convertible at a price. Britain, for example, could convert its “soft” into “hard” currencies at will at prevailing market rates. It is only because people are not allowed to pay or ask the real market rates that the conversion does not take place.

Why is this simple solution to the dollar and foreign-trade problem not adopted? Because under the Bretton Woods agreements (Article IV, Sections 3 and 4) each member of the International Monetary Fund is not merely permitted but compelled to forbid currency transactions within its own borders at other than the official rates. There can be no solution of the world unbalance of trade and of the so-called “world dollar famine” until this provision is revised to permit the restoration of free world markets in foreign exchange. Not until such free world markets exist can we tell what the real “needs” of Europe are. We might find, indeed, that the restoration of free markets in exchange, especially if combined with the restoration of free markets in commodities, would make the whole “Marshall Plan” unnecessary.

Why Not Also Capital Day?
September 15, 1947

Union politicians chose the Labor Day week end this year to let loose a Niagara of nonsense. William Green, president of the AFL, denounced the Taft-Hartley Act as “the most oppressive. . . the most offensive and most reprehensible law ever enacted against the nation’s workers.” He neglected to submit a bill of particulars. Is the worker oppressed by the provision making it an unfair labor practice for a union as well as an employer to “restrain or coerce” him in the exercise of his bargaining rights? Is he oppressed by the provision requiring his written consent for a check-off of union dues? Or by the ban on excessive initiation fees? Or by the requirement that the union officials disclose how their union is run? Or is it perhaps merely the union bosses who resent these curbs?

“We believe industrial peace can be promoted,” continued Mr. Green, “through . . . collective bargaining contracts . . . which we hold sacred and inviolate.” Then why object to the Taft-Hartley provisions holding unions as well as employers legally responsible for living up to these contracts?

Philip Murray, president of the CIO, competed with Mr. Green in lashing out against the “infamous” Taft-Hartley Act. Mr. Murray is worried about the way
workers are being “squeezed economically” by higher living costs and “smaller and smaller purchasing power,” He wants to restore price control. That price control always reduces and distorts production, and that in the long run it cannot be made to work at all without wage control, are among the little details about which Mr. Murray never bothers his pretty head. But it is about time someone told him the elementary facts about “shrinking purchasing power” and the “economic squeeze.” The figures of the Department of Commerce show that purchasing power in this country is higher than any levels ever reached before in our history. And the figures of the Department of Labor reveal that while living costs had risen by June of this year 57 percent since 1935–39, average weekly wages in manufacturing industries had risen in the same period by 120 percent. Whoever is being “squeezed” compared with his pre-war status, it is not the average American factory worker.

President Truman also made his Labor Day statement. “Good labor relations,” he decided, “cannot be brought about by legislation.” He called for a “minimum amount of regulatory law.” This was strikingly similar to Mr. Murray’s statement that management and labor can settle their problems “without need of coercion, force, and legislation.” But this seems a rather belated discovery. Neither Mr. Murray nor Mr. Truman objected to “legislation” when it was directed solely against the employer. Only when the Taft-Hartley Act made some attempt to place upon unions duties and responsibilities commensurate with their expanded legal rights and privileges did this outcry against “legislation” come from the self-styled “pro-labor” ranks.

And one wonders about the consistency and sincerity of this outcry against “legislation” when it is accomplished by a plea by the labor leaders and the President for a further increase in minimum wage rates—in other words, for still more legislation, for a further substitution of government coercion for competition or collective bargaining. The simple truth is that nothing would jolt union leadership in this country more than a simple repeal of the [Wagner Act]. What union officialdom really wants is to restore the one-sided Wagner Act and turn the government once again into a union-organizing agency.

These criticisms should end on a constructive note. Why not set aside the Monday following Labor Day as Capital Day? Why not devote at least one day to pointing out the importance of profits as a means of guiding output and encouraging capital accumulation and investment, and to emphasizing the importance of investment for providing new jobs, increasing production and raising wages? Labor Day reminds us that capital depends on labor. Capital Day could remind us that labor depends no less on capital.

## Lenin Was Right

September 22, 1947

Lenin is said to have declared that the best way to destroy the capitalist system was to debauch the currency. Lenin was certainly right. The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose.

In the latter stages of the war all the belligerent governments practiced, from necessity or incompetence, what a Bolshevist might have done from design. Even now, when the war is over, most of them continue out of weakness the same malpractices. But further, the governments of Europe, being many of them at this moment reckless in their methods as well as weak, seek to direct on to a class known as “profiteers” the popular indignation against the more obvious consequences of their vicious methods.

These “profiteers” are, broadly speaking, the entrepreneur class of capitalists, that is to say, the active and constructive element in the whole capitalist society, who in a period of rapidly rising prices cannot help but get rich quick whether they wish it or desire it or not. If prices are continually rising, every trader who has purchased for stock or owns property and plant inevitably makes profits. By directing hatred against this class, therefore, the European governments are carrying a step further the fatal process which the subtle mind of Lenin had consciously conceived. The profiteers are a consequence and not a cause of rising prices.

This column up to this point should have been in quotation marks, with a few dots to indicate omissions. The foregoing are not my words, but the words of John Maynard Keynes. They appeared 27 years ago in "The Economic Consequences of the Peace." If they do not apply with uncanny accuracy to conditions now, it is only because conditions now are worse. European governments today, far from resting content with denunciations of “profiteering,” decree that regardless of how much they have debased their currencies, prices in terms of those currencies must not rise. The result of this direct meddling with the market mechanism has been to distort and prevent production. And to bring on a world crisis.

This is intensified by price control of the paper currencies themselves. It has been made a crime for
The basic causes for high prices in this country have been frequently rehearsed in this column. The volume of money and bank deposits competing for goods is now more than three times as great as in 1939. This has been reflected in money incomes. Total pay to employees increased from $47,800,000,000 in 1939 to an annual rate of $125,300,000,000 in the first half of this year. Expenditures on personal consumption of all classes increased from $67,500,000,000,000 in 1939 to a rate of $158,000,000,000 this year. Inevitably this has been reflected in an increased demand for food. In spite of the price rise, the per capita consumption of meat in this country, which was 132 pounds in 1939, is now running at an annual rate of about 155 pounds.

On top of this basic increase in domestic monetary purchasing power have been the shortages in Europe. European demand has been greatly increased by American Government aid which has supplied Europe with additional dollar purchasing power to compete for our goods. This has drained away part of those goods, particularly foodstuffs, and so raised prices further.

These, and prospective new loans under the Marshall Plan, have been the real major causes of the price rise. But politicians and professional business-baiters are ignoring them in a shrill hunt for personal scapegoats. First come “the speculators.” The drive against speculation is reflected in the demand of the Federal government that the nation’s principal grain exchanges double their margin requirements. This strikes merely at a symptom. Speculation is an inherent part of the process of production. Whether a prospector is sinking an oil well, or a department-store buyer is guessing what women’s skirt lengths will be a few months from now, or a miller has contracted for wheat, there is a speculative risk involved. Someone has to assume it. In the grain, cotton, and other markets there has grown up a class of professional speculators willing and eager to assume these risks, so that processors are relieved of them.

The speculator can make money only if he guesses right on future prices. If he guesses wrong he loses. He is popularly supposed to be wicked when he buys grain and holds it off the market in the hope of higher prices. But if his judgment is right, he performs a public service: he conserves supplies to sell at a time of greater scarcity than when he bought. To the extent that the speculator is right he stabilizes prices. Another set of scapegoats now being hunted out by the politicians are the “profiteers.” This is reflected in the drive of the Department of Justice against those perennial scapegoats, the meat packers. Now it happens, if facts matter, that the profit margin on sales of seventeen principal companies in the meat-packing industry in 1946 was only 1.7 percent, compared with an average of 6 percent for industrial companies in general. The “profiteering” drive has turned as well against retail butchers and grocers. Yet even if we assume for the sake of argument that nearly everybody in the business of supplying the world with food is greedy for profits, the assumption does not tell us why such greedy people were not charging just as high prices nine months ago or nine years ago.

The Profiteer Hunt Is On
September 29, 1947

Lenin was certainly right.
The rise in prices has been followed by the inevitable demands from the uninformed for a return to price-fixing. The reimposition of price-fixing in the United States would be particularly ironic. European price-fixing has been one of the major causes of the shortages in Europe.

The rest of the world has turned to the one great remaining free-enterprise country to make up the scarcities that its socialism and “planning” have brought about. This has naturally sent prices here soaring. If now we too reduce prices by decree, we in turn will reduce or remove the incentives to produce.

The one thing that government interventionists cannot learn is that wherever exceptional shortages exist we need exceptional profits to give exceptional incentives to production. The chief effect of the mania for government meddling all over the world has been to prevent free markets from balancing and increasing production.

How Much Does Europe Need?
October 6, 1947

The sixteen European nations reporting on the Marshall Plan calculate their needs for outside help over the next four years at more than $25,000,000,000. Of this some $19,000,000,000 is presumably expected to come direct from the United States Government, some $3,000,000,000 from the International Bank, for financing equipment, and some $3,000,000,000 for currency stabilization loans (presumably—though this is not made clear in the report—from the International Fund). The chief contributor both to the Bank and the Fund is, of course, also the United States Government.

Here is a staggering bill. And when we put it on top of some $15,000,000,000 that the United States will have spent by the end of the present year in rebuilding Europe since V-J Day, it brings the total to around $40,000,000,000.

How much validity do the “deficit” figures presented by Europe really have? The original total that the sixteen nations arrived at, we must remember, amounted to more than $29,000,000,000—apparently not including the $3,000,000,000 estimate for currency stabilization. Not until after our State Department privately protested that this sum was too large was it reduced to $22,440,000,000 (with $3,130,000,000 of it assigned to the International Bank). The estimate now published presumably meets our State Department’s demands, in that it is lower than the original estimate, and tapers down each year. But suppose our government does all that is now demanded of it, and the scheme still breaks down? Will we not be told that it was our fault—that our aid was “too little and too late”—that these were not Europe’s real estimates of its needs, but merely slashed figures put forward to conciliate the State Department and an “economy-minded” Congress?

Even apart from this, what reason is there to take seriously these estimates of annual deficits? The report itself declares: “Unfortunately, the size of the problem has proved greater than was expected. The disruption caused by the war was more far-reaching and the obstacles to recovery more formidable than was realized even six months ago.” But if the sixteen nations admit that they then failed to guess right even six months ahead, what reason is there to suppose that they are now guessing right four years ahead? And if (as we must suspect) the deterioration in the last six months has not been the result of a war that ended more than two years ago but of new factors, and primarily of the unsound economic policies followed by European governments themselves in these last six months, then the prospective European “deficit” could be either much greater or much less than the figures presented, depending upon the future policies followed.

It is impossible, in fact, for any nation to predict its future trade deficit by adding together its future “requirements” of specific goods. For such “requirements” are arbitrary except in relation to some standard, and the standard adopted must itself be arbitrary. There is, moreover, no such thing as a predestined trade deficit independent of loans from outside, of internal inflation, of price fixing, of tariff policies, of trade controls, of domestic production, and of foreign-exchange rates.

One of the most serious factors in bringing about Europe’s recent chronic trade deficit has been overvalued currencies and pegged exchange rates which encourage imports and discourage exports. The unpegging of exchange rates might reverse the trade balance of many European countries almost overnight. Yet there is no indication that a free market will be restored in foreign exchange or, for that matter, in anything else. On the contrary, the report assumes that government economic controls will be tighter than ever. Ambitious production and export “targets” are fixed by the sixteen governments. Is there any reason to suppose that these are more likely to be attained than previous targets which are now consigned to oblivion? The report indicates that Europe will continue in the main to rely on the very controls that have prevented postwar recovery so far.
Europe's Four-Year Plan
October 13, 1947

The report of sixteen European nations in response to the Marshall Plan is a skillful presentation of the case for heavy and immediate financial aid from America. But the more the report is examined the less assurance does it give that these nations are even yet prepared to abandon the economic restrictions that have been chiefly responsible for bringing on the present crisis.

Throughout the report there is constant emphasis on production “targets.” We are told precisely how much bread grains, potatoes, sugar, meat and milk these countries intend to produce in each of the next four years; precisely how many tons of coal and steel, and how many kilowatt hours of electricity; precisely how much they intend to expand oil-refining capacity, inland transport and merchant fleets. We are proudly told that “these production programs, taken as a whole, represent an expansion of output similar in general scale to that achieved by the United States in the mobilization years 1940–44.” There seems to be an implication here that to set a target is almost as good as to reach it. Surely the fate of the British targets adopted so confidently nine months ago ought to have sufficiently underlined the difference between ardent hopes and cold realities.

The whole concept of government “production targets” is in origin totalitarian. It is part of the modern mania for imitating Russian Five-Year plans—an imitation that is the sincerest flattery to Communism. Why should the Russian Communists doubt the superiority of their system when they see nearly all of Europe aping one of its basic features? For only under a collectivist concept is it considered the function of government officials to say just how much shall be produced of each major commodity. It is of minor importance that the guesses of the bureaucrats are almost bound to go wrong. Far more serious is the fact that the mere setting of government production targets is in effect a way of setting aside the free market, setting aside a free economy. It is a way of telling the consumers that the things that are produced, and the relative proportions they are produced in, are not to be determined by their own demands but by what government bureaucrats decide in advance is good for them.

The supreme irony is that the only country in the world today that is really producing anything—and for whose goods the rest of the world is therefore clamoring—is almost the only country that does not have government production “targets,” but merely turns out goods in the volumes and proportions determined by supply and demand, free prices and free profits. But just as the rooster Chanticleer was convinced that the sun could not rise until he crowed, so European bureaucrats are still convinced that there can be no production unless they first of all set production targets.

Implicit in production “targets” is the whole system of price control, rationing, allocations, government licenses, prohibitions, and decrees. There is no indication in the sixteen-nation report that this dictated economic system is to be abandoned, certainly not in the near future. Only once in the report is it admitted that the system of price control “is likely to jeopardize production.” But this delicate hint is not elaborated, nor is any conclusion deduced from it. Under present circumstances, the report assumes, “stability cannot exist unless it is constantly reinforced by controls and rationing.”

In short, European bureaucracy still believes what our OPA believed, that price control cannot be abandoned “until supply catches up with demand.” What this overlooks is that artificially low price ceilings increase demand and reduce production and supply, so perpetuating the shortage they were designed to counter. In the European system almost the whole mechanism of economic self-adjustment has been destroyed. Neither prices nor wages nor exchange rates are free to move to the points where they can tell the truth about ever-changing relations of supply and demand and restore equilibrium between them. The result is a chronic shortage of goods and a trade deficit.

The Drive against ‘Gambling’
October 20, 1947

President Truman had no legal power to order the nation’s grain exchanges to increase their margin requirements to 33½ percent. But he forced them to do so by threatening to exercise the legal powers he and the Commodity Exchange Authority did have to do something else. This is a technique of executive usurpation which deserves the careful attention of Congress. The purpose of the present column is merely to examine the economics of the Administration’s action. Its chief effect, like that of the 75 percent margin insisted on by the Federal Reserve Board for stocks, will not be to lower prices, but merely to make the market narrower and day-to-day fluctuations more erratic than otherwise.

When crop shortages or the government’s own monetary or other policies have brought about high prices for food, it has been the technique of governments from time immemorial to blame the result on
“speculators” and “gamblers.” What we are dealing with here, therefore, is not something that has merely happened within the last few weeks, but something that happens repeatedly. Let us, therefore, call in some expert witnesses from the past.

“Hasty attempts to control speculation by simple enactments have invariably proved either futile or mischievous.”—Alfred Marshall, in 1890.

“The result of regular speculation is to steady prices . . . A good example of this is afforded by the Gold Law during the Civil War. The discount on greenbacks was mistakenly ascribed to the speculation on the gold exchange, and a law was enacted to prohibit all such transactions. As a result, the premium on gold jumped at once from 195 to 285, with wild fluctuations day by day, to be followed, after the hasty repeal of the law fifteen days later, by just as sudden a recession of the price.”—E. R. A. Seligman, in 1905.

“Speculation . . . tends to make daily market prices conform to the seasonal market price . . . . The general effect of speculation is to lessen fluctuations . . . For the ultimate consumers, say of wheat, the early and exact adjustment of price brings more even utilization of the available supply. If the crop is short, some lessening of consumption is inevitable; and it is better that the deficit be spread through the season. The sooner and the more exactly the higher price is reached, the more likely is this result.”—F. W. Taussig, in 1911.

“[Blaming speculators] is the recourse of governments in search of a scapegoat . . . Price fluctuations are reduced by speculation, not aggravated, as the popular legend has it.”—Ludwig von Mises, in 1924.

While Washington is now pointing toward “gambling in grain” in Chicago, Kansas City and Minneapolis as a cause of high food prices, its own direct responsibility might be profitably considered. Passing over its inflationary policy in general, the government is committed to lend the farmer 90 percent of parity on his wheat. At the present time this comes to $2.08 a bushel at Chicago. The result of this, as already pointed out by Edward H. Collins in The New York Times (Oct. 6), is that the trader “has a speculation in which his loss is limited, on the downside, by the policy of the government itself, to about 67 cents a bushel. On the upside, by contrast, the ceiling is ‘infinity.’ Can there be any reasonable doubt that this constitutes an open and shut invitation to violent speculation on the long side?”

One more contemporary witness. “Under the law the government supported prices of potatoes—the best possible replacement for cereal foods—last year and this. Most of the potatoes it acquired last year were diverted to non-food uses, wasted, or destroyed. . . . The Department of Agriculture this year reduced potato acreage goals and stipulated that support would be given only to producers who complied with lower goals. As a result harvested acreage this year will be about 15 percent smaller and the potato crop in prospect is below normal consumption requirements. The potato policy therefore has turned out to be a mistake of the first magnitude.”—National City Bank of New York October Letter.

Are Profits Too High?

October 27, 1947

Corporate profits in terms of dollars are now running at the highest levels on record. In 1946 they amounted after taxes to $12,539,000,000. In the first six months of this year, according to estimates of the United States Department of Commerce, corporate profits after taxes were running at an annual rate of $17,000,000,000, an increase over the 1946 rate of about 35 percent.

Such figures are often cited today as a sort of economic scandal. They are taken as prima facie evidence that current profits are outrageous, that they bear an unhealthy relation to wages, and that prices could be substantially reduced without harm. The dimensions of these profits begin to evaporate, however, when we examine them more closely and in their broader context.

1—While corporate profits in recent years have been running at record levels, so have wages and the national income. Dollars themselves, in fact, are so plentiful that they have become cheap. As compared with its 1935–39 wholesale purchasing power, the dollar today is worth only 54 cents.

2—Corporate profits are greatly overstated today even in terms of depreciated dollars because proper deductions are not being made. The market price of a firm’s inventories may have doubled. The dollar increase in inventory value is set down as a profit. But when the firm comes to replace its inventories, as it must, it needs twice as much money to replace the same physical supply as it had before. If it restored only its original dollar investment in inventories, it could do only half its former volume of business. The Department of Commerce in its revised national income statistics published in July takes account of this factor, and
ments in 1946. y
average of only 2.75 percent on their property in-
vestments emphasize this fact. The country's railways, for
each company with a deficit. Even major group divi-

tions have estimated that a true corporate depreciation
allowance in 1946 may have run from $1,500,000,000
to $5,000,000,000 higher than the allowance actu-
ally made.

3—Practically all deductions for depreciation are
inadequate today. A worn-out or obsolete machine
that cost $10,000 ten years ago may cost to replace
not $10,000 but $15,000 or $20,000. The tax laws,
however, permit only depreciation charges based on
original cost, not on higher replacement cost. As a con-
sequence, the Machinery and Allied Products Institute
concludes that industry is understating the costs arising
from the consumption of its fixed assets, overstating
its profits, and in some cases perhaps underpricing its
products. In short, there is going on an erosion of real
capital not offset by depreciation charges. Economists
have estimated that a true corporate depreciation
allowance in 1946 may have run from $1,500,000,000
to $5,000,000,000 higher than the allowance actu-
ally made.

4—Present corporate profits are the result of
unprecedented volume of business rather than of wide
profit margins. The combined net income of 24 leading
companies in wholesale and retail trade, for example,
averaged 2.6 cents per dollar of sales in the first half of
1947, against 3.3 cents in the second half of 1946 and
3.9 cents in the first half. So-called corporate “break-
even points” are today much higher than before the
war, and wage costs are far more resistant to downward
adjustment. A comparatively small reduction in output
or volume of sales, therefore, could mean for many
companies today a very sharp reduction or even a dis-
appearance of profits.

5—Corporate profits can be added together for
special statistical purposes, but it is misleading ever
to discuss them as if they formed a common pool. A
high total of corporate profits is no help to an indi-
vidual company with a deficit. Even major group divi-
sions emphasize this fact. The country’s railways, for
example, on present methods of accounting, earned an
average of only 2.75 percent on their property invest-
ment in 1946.

The Dilemma of the Marshall Plan
November 3, 1947

The proponents of the Marshall Plan are right in believ-
ing that Europe is in the grip of an economic crisis. They
are right in believing that our own economic and
political future will be deeply affected by the fate of
Europe. They are right in urging that we should do any-
thing we can that promises to increase Europe's welfare
without imperiling our own.

But the proponents of the Marshall Plan mis-
takenly assume that the crisis in which Europe finds
itself today is primarily the result of the destruction
and dislocations of the war. They have yet to recognize
that, on the contrary, this crisis is for the most part
self-imposed. It is primarily the result of the economic
policies that have been followed since V-E Day by the
governments of Europe.

Europe is caught today in a strangling network
of governmental controls. These controls include the
pegging of foreign-exchange rates far above their real val-
ues. This encourages imports and discourages exports,
causes a chronic deficit in Europe's trade balance, and
brings about a so-called “dollar shortage” which is a
misnomer for Europe's effort to buy more than it sells
and to consume more than it produces. These govern-
mental controls also include price ceilings which dis-
courage, distort, and reduce production; priorities,
allocation, and prohibitions which paralyze initiative;
nationalization which brings inefficiency and increases
budget deficits; and confiscatory taxes and further
threats of socialization which remove whatever vestiges
of incentive may be left.

Europe, in brief, has destroyed the price mecha-
nism. It does not permit free enterprise to function.
Such a condition, as long as it continues, must null-
ify any further help that we can pour in. As Wilhelm
Röpke has pointed out in the English magazine Time
and Tide: “Without a drastic internal reform of the
national economy, to put an end to inflation and social-
ist controls, foreign credits can have no lasting effects,
just as a man cannot be kept alive indefinitely by per-
petual blood transfusions if the cause of his hemorrhage
is not removed.” This is precisely what happened to our
loan to England. Though we weakened ourselves by
“giving blood,” England is in a graver crisis than before
the transfusion was made.

Some supporters of the Marshall Plan assume that
this problem can be met simply by imposing “tough
conditions” with our loans. But the remedy would
perhaps prove worse than the disease. Any European
governments that felt forced to accept such conditions
to get the loans would resent their imposition. They would regard the conditions as an obstacle to recovery, as unworkable, as imposed primarily for the benefit of "American capitalists" rather than for the benefit of Europe. They would consider any conditions whatever as humiliating, an infringement of their sovereignty and independence. The Communists in every country have already seized upon this issue and are eagerly exploiting it. This is plain in the recent Communist manifesto and in the speeches of Zhdanoff and Vyshinsky.

And not the Communists alone. Even the usually staid London Economist, denouncing the conditions of the American loan as "crippling" and "intolerable," recently wrote: "Not many people in this country believe the Communist thesis that it is the deliberate and conscious aim of American policy to ruin Britain and everything that Britain stands for in the world. But the evidence can certainly be read that way."

Our foreign-aid policy, then, is on the horns of this dilemma. If we make loans to European governments without imposing conditions, our funds will be dissipated without bringing the recovery we seek. If we impose the conditions necessary for that recovery, we give color to the Communist contention that this is "a plan for enslaving Europe." Can we afford to hand the Communists so powerful an issue?

This dilemma is not accidental but inherent. It lies in the attempt of one government to bribe another into following economic policies which that other government does not believe in enough to follow without the bribe. 

Who Told Us What?

November 10, 1947

Those who now demand a restoration of price control have one favorite propaganda device. This is to declare that those who urged the termination of price control a year and a half ago told us that prices in a free market would be lower.

Some of those who urged the end of price control did make this mistake. Why did they make it? They made it because they assumed that prices are determined primarily, if not wholly, from the side of supply. But this is precisely the error that they shared with the leading spokesmen of the Administration, including the price controllers themselves. On Feb. 14, 1946, President Truman declared: "Production is our salvation . . . Production will do away with the necessity for government control." And even Chester Bowles before a Congressional committee on Feb. 18, 1946, declared: "Production is the only answer to inflation."

Answering these contentions in The New York Times of Feb. 25, 1946, I called attention to the simple fact that "prices are determined not only from the side of supply, but from the side of demand"; that demand was "far greater than it was before the war because money incomes are far greater; and money incomes are greater principally because the supply of money and bank credit has been almost tripled since the outbreak of the war." I concluded that "the solution to the problem of high prices . . . is not production alone; but that as long as money and bank credit continued to mount "they will continue to push up demand and to push upward against prices."

In his radio address of two weeks ago Mr. Truman admitted that "we are producing more goods for civilian use than ever before in history." So we now have the production that Mr. Bowles once thought was "the only answer to inflation," and that Mr. Truman himself announced would "do away with the necessity for government controls." Yet the inflationary menace seems greater than ever, and the President is demanding "emergency" controls. Why? Because, for one thing, the government has continued to follow artificial low-interest-rate and other policies that continue to increase the total volume of money and bank credit. Adjusted demand deposits of reporting member banks of the Federal Reserve System as of Oct. 22 this year were $47,467,000,000, an increase of $1,278,000,000 over the corresponding date last year.

Another inflationary factor is the government policy of foreign loans. As early as March 18, 1946, when price control was still in full force, I wrote in The Times: "Our aim should be to halt inflation, not to increase it. Yet increased export trade financed by governmental loans is clearly inflationary." At that time, however, the Administration’s "economic experts" were declaring that "deflation, and not inflation, will be the big problem six months to a year from now." Replying to this contention in The Times of June 17, 1946, I wrote: "It is precisely groundless fears of deflation, combined with a complacent assumption that inflation is no longer a danger, that help to increase the inflationary danger." I concluded that "the prospect is still inflation."

Even today, however, Mr. Truman insists: "An attempt has been made to place the blame [for higher prices] upon our foreign-aid program, but this is not borne out by the facts." Yet it ought to be as clear as daylight that the abnormal foreign demand for our goods, coming on top of the demands of our own people, is the marginal factor that has been chiefly responsible
for the further rise in American prices. This may not be a reason for refusing help, but the Administration should at least be candid with the American people as to what the real situation is. It is a glaring self-contradiction to impose emergency “food-saving programs” and to urge us daily to make great sacrifices to supply the European demand, and in the same breath to pooh-pooh this European demand as a factor in raising American food prices.

Yet this is what Mr. Truman did in his radio address of Oct. 24, and this is apparently to be the Administration line in the special session of Congress.

**Export Demand Lifts Prices**
November 17, 1947

In his radio address of Oct. 24, President Truman declared: “An attempt has been made to place the blame [for higher prices] upon our foreign aid program, but this is not borne out by the facts.” His own economic agencies think otherwise. The Bureau of Agricultural Economics tells us that export demands have “generally helped to hold up” farm prices. The Council of Economic Advisers admits that “the increase in exports” in the second quarter of 1947 “undoubtedly affected the price level during this period.” It adds that “the large foreign requirements have undoubtedly been a factor in the price rise” not merely of grains but of livestock and other food products. That our export and foreign aid program has raised food prices here, therefore, ought to be beyond controversy.

But for how much of the rise has export demand been responsible? Here is a more difficult question. It cannot be answered merely by citing statistics. In the 1946–47 fiscal year our exports of wheat amounted to 34 percent of our 1946 production. The wholesale price between May 1946 and May 1947 increased 47 percent. But in the same period (according to the National Industrial Conference Board) our exports of all meats amounted to only a little more than 2 percent of our production. And their average wholesale price jumped 85 percent. Does this mean that our export program was irrelevant to the jump in meat prices?

Only those who are unfamiliar both with foodstuff markets and with the way in which supply and demand are really related will draw such a conclusion. If 100 houses are wanted by only 99 families, one house must go empty; if they are wanted by 101 families, one family may be left in the cold. The demand will have gone up only 2 percent; but the consequent increase in rents may be 20, 50, or even 100 percent. A collector at an auction may pick up a painting, if no one else there particularly wants it, for $100; but other determined bidders may force him to pay $1,000. He gets the whole painting; he does not share any percentage of it whatever with the other bidders. Yet their bidding has forced up the price on him by 900 percent.

In less extreme degree these principles apply to the present situation in meat. It is impossible to tell from the actual percentage of exports what the real effect of export demand has been on the price. Meat prices, moreover, depend not merely on meat exports but on grain exports. When prices of feed-stuffs are forced up prices of meat must soon or late rise also. Grain is fed to animals only insofar as that remains a profitable procedure. Again, expected future exports of grains and meat are as much a factor in present prices as past exports. Finally, to produce our export surplus, wages and profits are paid out which can only be used to bid up prices of the goods that remain at home.

The President’s Council of Economic Advisers tries to belittle the effect of the export surplus by comparing it with the gross national product. It declares that “the high foreign demand has added to the inflationary pressure on prices, but the much larger domestic demand has been the principal cause of the upward pressure.” But such statements leave the real question unanswered. They are like saying, in our rent illustration, that the first 99 families have more effect on rents than the last two families. Such a statement would doubtless be true enough even if the marginal addition of the last two families raised rents, as it might, by 50 percent or more. But the real question now is: Would food and other prices have gone up at all in the last nine months, or would they have gone up even half as much as they did in that period, if it had not been for the unprecedented export demand financed by our foreign aid program?

No one can answer such a question with exact percentages. But I submit that our unparalleled export surplus, two-thirds of which has been paid for by our own government, is a major inflationary force at the present moment. It is not a service to the American people to attempt to present it as a negligible factor.

**Must We Subsidize Socialism?**
November 24, 1947

“Shall We Say: ‘No Aid for Socialism’?” So asks the leading piece in The New York Times Magazine of Nov. 9. It answers that if we don’t make unconditional loans and gifts to socialistic governments we will be “stultifying
our own assertion that we believe in democracy, and will destroy the foreign democracies themselves.”

The author of this extraordinary piece is James W. Angell, professor of economics at Columbia. Mr. Angell actually finds it “hard to see much difference in principle” between the “type of threatened coercion” practiced by Hitler on his victims and the type involved in our own government’s not making unconditional loans or gifts to foreign countries. Applying this to individuals, the professor would presumably find it “hard to see much difference in principle” between a thug’s threat to beat, blackmail, rob, or murder a businessman and a banker’s reluctance to make the same businessman a loan or a gift unless the latter first sobered up or agreed to run his business in a less wasteful and reckless manner. Both, in the professor’s abstract vocabulary, are “threatened coercion.” Either the definition of “coercion” is being stretched extremely thin or Mr. Angell’s capacity for detecting differences is alarmingly undeveloped. What he appears to be saying is that you “coerce” everybody to whom you don’t give money, and on the asker’s own terms.

Mr. Angell, who teaches economics, puts aside economic considerations as mere irrelevance, and rests his case on political grounds. He seems to feel that, as a “democracy,” we are obliged willy-nilly to pour the American taxpayer’s money into other “democracies.” The shakiness of his standards becomes evident when he explains why Russia and its “so-called” satellite states are not democratic. “This is true not because they have adopted Communist forms of economic organization [his italics], but principally because they are governed by minorities which have ruthlessly suppressed opposition parties and individual free speech.” One implication here is that if majorities instead of minorities were doing the ruthless suppression it wouldn’t be so bad.

Even more extraordinary is the implication that Communism’s “economic organization” and its suppression of individual freedom are quite separate things which perhaps exist together in Russia only by accident. The professor seems capable of believing, in brief, that under an economic organization in which the rulers directly control every job and every medium of expression it is only a sort of unlucky coincidence that individual freedom should not exist.

“It is perfectly true,” confesses Mr. Angell, that certain European governments that have come to us for help “have nationalized some of their industries, and that a number of them have set up state trading monopolies of various sorts. But—so what?” If we treat this taunt as a serious question, we might begin by pointing out that the professor’s statement not only minimizes the extent of socialism and threatened socialism, but ignores altogether the currency chaos cited by the Harriman committee and the appalling network of economic restrictions that today disorganize and throttle European production. The uneasiness in Congress and the country about subsidizing socialistic governments Mr. Angell dismisses as “based on the allegation that socialism is somehow ‘a bad thing’ and morally reprehensible.” It “is not based,” he assures us blandly, “on the ground (quite possibly valid) that socialized economies are somehow less productive.”

The uneasiness, someone ought to inform him, is based precisely on that ground. The fully justified fear of many in this country is that, exactly as has already happened with our loan to Britain, any further help we pour into Europe will be more than nullified and offset by the wastage of socialistic systems that have destroyed the price mechanism and its incentives to production.

This, in fact, is the central dilemma of foreign aid. For the internal economic policies of Europe are immeasurably more important to its production and recovery than any dollars we can supply.

Back to Police-State Controls?

December 1, 1947

As a result of the shortages brought about primarily by their own economic policies, the nations of Europe have turned to the United States, the last great free market in the world, to make up the deficiency. Yet in asking Congress to aid them, President Truman proposes that we imitate over here the very network of allocations, rationing, licensing, trade controls, wage controls, and price controls that has precipitated the present European crisis.

This major irony involves minor ironies. Mr. Truman wants price controls and allocations because “grain, for example, is too badly needed to permit wasteful feeding to livestock.” Yet it is precisely government price control in France which, by underpricing wheat, has caused wasteful feeding of wheat to livestock and intensified the very wheat shortage that we are now asked to make up. It was precisely price control by our own wartime OPA that caused wasteful feeding of wheat to livestock as well as over-fattening of hogs because the OPA did not know how to set up the right corn-hog ratio.

Price fixing here, as in Europe, could only intensify shortages. American producers and consumers can solve these problems through a free market incomparably
better than any army of bureaucrats bossing them around.

Mr. Truman wants legislation permitting his new price-fixer to "impose price ceilings on vital commodities in short supply that basically affect the cost of living." He thinks that this would not at all involve "staple food and clothing items not in short supply or . . . any delicacies or luxuries." "Vital commodities" and "short supply," however, are both a matter of arbitrary definition. It is difficult to imagine the future Chester Bowles making his list a short one. No producer would know when his own product was going to be added to the list.

Holding down or reducing the prices of "vital commodities" in "short supply," moreover, would reduce the comparative profit margins on such commodities and reduce their output. The price controller and the CIO would then protest that producers were making luxuries and not necessities because the profit margin on luxuries was greater. They would demand a return to the very "overall wartime price control" which Mr. Truman says he is avoiding. It is precisely on such grounds that the OPA continued to fix the prices of Cadillacs, caviar, and mink coats, not only during the war, but after V-J Day.

Mr. Truman is trying to stop inflation by all the wrong remedies because he has forgotten its causes. When he declares that "price inflation threatens our entire program of foreign aid" he reverses cause and effect. It is the huge program of foreign aid, adding to purchasing power in this market and reducing our supply of essential goods, which has been the marginal cause of the present price rise. The basic cause of inflation here has, of course, been the increase in money and bank credit brought on by the government’s own fiscal policies. Mr. Truman wants new powers by the Federal Reserve authorities over consumer credit and the banks. But he does not tell us why they have failed to use (except in order to increase the inflation) their traditional and more than adequate powers over open market operations, rediscount rates, and reserve ratios.

The spectacle of a government’s assuming to protect us from the consequences of its own policies by asking for more powers against “speculators,” producers, and “profiteers” is not novel. Writing a century ago, John Stuart Mill declared: “It is not, however, so much the general or average price of food, as its occasional high price in times of emergency, which governments have studied to reduce. In some cases, as for example the famous ‘maximum’ of the [French] revolutionary government of 1793, the compulsory regulation was an attempt by the ruling powers to counteract the necessary consequences of their own acts; to scatter an indefinite abundance of the circulating medium with one hand, and keep down prices with the other; a thing manifestly impossible under any regime except one of unmitigated terror.”

Cheap Money Means Inflation
December 8, 1947

The Administration valiantly continues its efforts to protect the American people against the consequences of the inflation that its own policies have brought about. While it lectures “businessmen, bankers, labor leaders, farmers, and consumers”—in short, all the rest of us—on what we should do by our own “voluntary efforts” to “hold prices down,” while it asks for still further powers to crack down on alleged “speculators” and “profiteers,” it blandly continues to feed the fires of inflation by its own acts. It can do this because most laymen do not understand the consequences.

For generations economists and bankers have recognized that artificially low interest rates—i.e., cheap money policies—are inflationary. The chain of causation is simple. Artificially low interest rates increase the demand for loans. Increased bank loans mean a corresponding increase in bank deposits. Increased bank deposits (against which checks are drawn) are just another name for an increase in the money supply. An increase in the volume of money is only another name for an increase in monetary purchasing power pushing up the prices of goods. A cheap money policy, in brief, is the keystone, the central support, of an inflationary policy.

This fact is too patent even to escape the attention of our monetary managers. They concede it in left-handed ways. Testifying on the President’s “anti-inflation” program before the House Banking Committee, Secretary Snyder declared: “To minimize bank credit expansion, restrictive measures have been applied to the money market by the Federal Reserve System and the Treasury. This has been reflected by a rise in interest rates.”

Here is an admission of the close causal connection between low interest rates and bank credit expansion, on the one hand, and between bank credit restriction and higher interest rates on the other. It is an admission that low interest rates are inflationary. Yet in reply to a question the Secretary declared that the Treasury did “definitely not” contemplate any policy that would cause a rise in the present infra-low interest rates. This is tantamount to saying that the Treasury definitely intends to continue this basic inflationary policy at the same
time as it presses for ineffective and dangerous “anti-inflation” measures.

There are several reasons for this glaring self-contradiction. The Administration wants to eat its cake and have it too. It wants all the popular benefits of an inflationary boom with none of its unpopular embarrassments. Its most immediate fear is that higher interest rates would cause a decline in the price of government bonds. A fall in government bond prices would, of course, unless some special provision were made, adversely affect the banks of the country that are loaded up with these bonds.

There is not space here to discuss the possible ways of extricating ourselves from this dilemma. It is precisely because a cheap money policy creates such grave problems, indeed, that it ought not to have been recklessly embarked upon in the first place. To continue such a policy would merely intensify the danger and the later difficulty of arresting or reversing it.

In defending the continuance of an inflationary low interest policy, Secretary Snyder declares that “an increase of ½ of 1 percent in the average cost of carrying the public debt, for example, would mean an added burden of $1,250,000,000 a year on the taxpayer.” This is obviously a narrow and shortsighted way to look at the problem. Against this saving we must count the inflationary cost to the American people, both as taxpayers and as consumers, of a policy of not raising interest rates to curb inflation. This annual saving of $1,250,000,000 to the taxpayers in government bond interest could be far more than wiped out by a forced inflationary increase of $5,000,000,000 or more in all other government expenditures, including those for materials, wages, and salaries, or by a $20,000,000,000 increase or more (here it is impossible to set definite limits) to what American consumers would have to pay to keep the same standard of living that they have now.

Can We Buy Off Communism?
December 15, 1947

The program of huge loans and grants from our own to foreign governments is supported by a variety of motives, but the dominant if not determining purpose today is “to stop Communism.” The recent statement of Senator Ives that “all of Europe is apt to go Communist within a relatively short time without outside aid” is typical of a widespread Congressional attitude.

I certainly do not wish to minimize the Communist danger, but rather to raise the question whether turning a large amount of the American taxpayers’ money over to unsteady European governments representing various shades of socialism is really the most appropriate or effective means to combat that danger. Apparently the reasoning behind the belief that we can buy off Communism with foreign loans or gifts is that nations embrace Communism because they are poor or in economic distress. It seems to be assumed that if we throw in enough American funds or goods to raise their standard of living, these nations will be “strong enough” to reject Communism and perhaps even to adopt free enterprise.

The faultiness of this reasoning should become clear at the moment we confront an actual situation. The Communist-led strikes in Italy and France can nullify our aid, but our aid cannot nullify the strikes. If the French and Italian Governments, for whatever reason, cannot prevent these disruptions to output, far more production will be destroyed within France and Italy than imports from us can make up. We accomplish nothing merely by paying for French and Italian strikes. To combat Russian aggression and world Communism requires far harder decisions than the comparatively easy and somewhat evasive one of merely giving away more American dollars.

We have been confusing cause and effect. It is not true that the nations of Europe are in danger of Communism today primarily because they have run into a series of economic crises. They have run into these crises, rather, mainly because they have adopted monetary inflation, dictated economies, and socialist controls which have destroyed the price mechanism and its incentives. In brief, it is not true that Europe needs an economic recovery before it can return to ideological soundness. It needs the ideological recovery first, before it can hope for the economic recovery. And until the ideological recovery takes place, the internal policies of Europe will more than nullify, as the case of England has proved, any help we can pour in.

One very hopeful sign of reform is the action of Italy in permitting its currency unit to seek its approximate market level. This meant immediately cutting the official rate of the lira from 350 to the dollar to about 589. The effect must be to stimulate Italy’s export trade, by making its prices more attractive in terms of other currencies. If this is accompanied by other moves toward free markets, and not offset by Communist disturbances, it could bring a dramatic recovery.

On the other side, unfortunately, has been the strengthening of the Labor party’s hold on the British economy through the Gravesend by-election. This was probably brought about, ironically enough, by President Truman’s appeal for the reimposition of price and other
controls here. A week before the election took place The New York Times reported from England that Mr. Truman’s appeal had become “a major factor” in the Gravesend campaign, and that the Labor party’s prospects had been “perceptibly improved” by it. “Do you stand with Attlee and Truman on the controls issue,” asked the Labor candidate, “or with Churchill and the price racketeers?”

The argument that Europe has had to adopt “distress socialism” until its economic condition improves rests on the assumption that free enterprise is a luxury that only a rich or already recovered country can afford. The truth is that free markets, with their unrivaled incentives, will bring a faster revival of balanced production than any other system. It is precisely because Europe is in distress that it needs free enterprise now.

Our Inflationary Bond Standard
December 22, 1947

Any return to a system of government wage and price fixing would dislocate profit margins, dampen incentives, and disorganize production. And proposals for such a system, by centering public attention on false remedies and on symptoms instead of causes, tend to divert that attention from the real causes of inflation and the real remedies for it.

The basic cause of inflation, always and everywhere, lies in the field of money and credit. It is unfortunately assumed that money and credit inflation can safely be ignored today because the Federal budget, for the first time in sixteen years, is balanced. This is like assuming that a river reaches high-water mark the moment the rain has stopped. On the contrary, it keeps rising because it continues to be fed from a thousand swollen rivulets and flooded fields.

Chairman Eccles of the Federal Reserve Board has testified before a Congressional committee that “under present and prospective conditions, it is not only desirable but essential, in the opinion of the Treasury and of the Reserve System, that the established 2½ percent rate on long-term marketable government securities be maintained.” This means, as Mr. Eccles does not hesitate to make clear, that the Federal Reserve will continue to stand ready to buy all government securities offered to it at par or present prices. It is pegging the price. “Such sales have to be met [my italics] by Federal Reserve support of the prices of marketable government bonds so as to protect the 2½ percent rate on long-term issues.” And “the result of these support operations is to increase bank reserves and thus to support further inflation.”

How much inflation? Mr. Eccles is disarmingly frank about that, too, “Commercial banks currently hold about $70,000,000,000 of government securities. This sum is about 50 percent of their total deposits. If they should sell half of these securities and the Federal Reserve System, in providing the ultimate market, should buy them, the banks could acquire an equivalent volume of new reserves. On the basis of these reserves, the banks could expand credit by about six times, or by more than $200,000,000,000.” We have, in short, the testimony of our highest banking official that as long as the Federal Reserve Board continues its policy, the country faces a huge potential further inflation.

How do the Treasury and the Federal Reserve propose to deal with this danger? They refuse to take the one step that could bring it to a halt. That would be to stop providing an automatic market at current interest rates for government securities. What Mr. Eccles asks for, instead, is power to set up a “special reserve” of a maximum of 25 percent on demand deposits of all commercial banks. This “reserve” would be composed not primarily of cash but of “Treasury bills, certificates, and notes.” Of course, to call this a “reserve” is a misnomer. It could not be paid out to depositors demanding cash. It would be, in fact, a requirement that a minimum proportion of the commercial banks’ loans and investments be in short-term government securities. It is an attempt to establish another automatic market for such securities.

It is an attempt, in Mr. Eccles’s own words, to “divorce the market for private debt from the market for government securities.” In the long run such an attempt could not succeed. If the yield on other securities went up while that on government securities stayed down, such a plan would merely drive all government securities into the banking system, where they would become the basis for further credit. On Mr. Eccles’s own testimony his plan would allow a potential credit expansion two and a half times as great as the government securities held.

The United States today is not on a gold standard, except in a Pickwickian sense. It is, as the economist Melchior Palyi has put it, on an inflationary bond standard, the essential feature of which is the automatic monetization of the national debt. And attention is merely diverted by the Administration from this potentially explosive reality when it asks for power to dictate wages and prices.
In his message to the special session of Congress, President Truman correctly declared: “We already have an alarming degree of inflation; and, even more alarming, it is getting worse.” Yet like the present leaders of most other countries, Mr. Truman and his economic advisers refuse to attack inflation at its source by halting the further expansion of money and bank credit.

The chief reason for this failure to attack fundamentals is not merely that the public in general does not understand the real cause and cure for inflation, but that it presents no united front against inflation. Its feelings about it are confused and ambivalent. And this is because inflation, like Janus, has two opposite faces. Whether we welcome or fear it depends upon the face we happen to look at. Or, putting the matter another way, we are each of us sometimes Dr. Jekyll and sometimes Mr. Hyde in our attitude toward inflation, depending upon how it seems to affect our personal interest at the moment.

All this is vividly illustrated by Mr. Truman himself. He points with pride to the results of inflation at one moment and denounces them the next moment. He claims credit for its popular consequences and blames the Republicans for its unpopular consequences. Like the rest of us, the President wants to have his shoes small on the outside and large on the inside.

For it should be obvious that high prices, which everybody affects to deplore, and high money incomes, which everyone wants to achieve, are two sides of the same thing. Given the same amount of production, if you double the price level you double the national income. When the President boasted last July that we had “surpassed previous high records” with a gross national product of $225,000,000,000, he was boasting in large part of the higher dollar totals you get when you multiply volume of output by higher dollar prices.

At one point in his “anti-inflation” message Mr. Truman declared: “In terms of actual purchasing power, the average income of individuals after taxes has risen [since 1929] 39 percent.” But a little later he was asking, inconsistently, how “the cost of living can be brought and held in reasonable relationship to the incomes of the people.” Yet if the incomes of the people have in fact already risen so much faster than living costs that the individual can buy nearly 40 percent more goods than he could before, in what does the present “emergency” consist?

“Rents are rising,” complained Mr. Truman at another point, “at the rate of about 1 percent a month,” and such a rise imposes an “intolerable strain” upon the family budget. But as the average weekly earnings of factory workers have gone up 112 percent since 1939, while rents have gone up only 9 percent, the average worker pays, in fact, a far smaller percentage of his income for rent than he did before the war.

“The harsh effects of price inflation,” said Mr. Truman at still another point, “are felt by wage earners, farmers, and businessmen.” Clearly this cannot refer to the inflation of their own prices, but of somebody else’s. It is not the prices they get for their own goods and services, but the prices they pay for the goods and services of others, that they must regard as “harsh.” Why, of all groups, does Mr. Truman now shed tears over the farmer? It should be pointed out that the wholesale price of farm products has gone up 191 percent from the 1939 level as compared with an average of 107 percent in all commodities.

The real evil of inflation is that it redistributes wealth and income in a wanton fashion often unrelated to the contribution of different groups and individuals to production. All those who gain through inflation on net balance necessarily do so at the expense of others who lose through it on net balance. It is an illusion to suppose that the losers can ever be brought abreast of the gainers except by setting the gainers back. And it is often the biggest gainers by inflation who cry the loudest that they are its chief victims. Inflation is a twisted magnifying lens through which everything is confused, distorted, and out of focus, so that few men are any longer able to see realities in their true proportions.
The Uncalculated Risk
January 5, 1948

It has become fashionable to say that while the Marshall Plan does not guarantee European recovery or a peaceful victory over Communism it would be cheap even at $17,000,000,000 if it did bring these results. We are told that we are asked to take no more than a “calculated risk”—a gamble for tremendous stakes in which the odds are heavily in our favor. This argument, however, begs the central question. It takes it for granted that the European Recovery Program, in the form now proposed by the President, could do only good and no harm.

Yet Europe’s economic crisis today is only partly the result of war destruction or of bad weather. It has been brought on mainly by Europe’s own economic policies, which have destroyed the free-market mechanism and its incentives. Nearly everyone seems to assume that if this self-imposed crisis deepens, or if controls intensify shortages, Europe will turn in desperation to still more drastic controls and even to Communism. The Marshall Plan, it is thought, will prevent this by making the situation better.

It never seems to occur to those who hold this view that a deepening of this self-imposed crisis could lead to a demand in Europe, not for Communism but for a return to economic freedom. Yet there are already encouraging signs of this. Italy has restored relative freedom of foreign exchange. France has dropped some important controls. Former Premier Daladier recently declared in debate that inflation cannot be overcome in France as long as a managed economy prevails. In Britain the public faith in the managed economy has been visibly slipping. Is there not a real risk that the funds and goods supplied by the Marshall Plan, by making the situation more tolerable than it otherwise would be, could delay or prevent a return in Europe to free markets and free enterprise? Will the Marshall Plan be in fact so framed and administered as to save socialistic Europe from Communism? Or will it be so framed and administered as to save Europe from capitalism?

At present, certainly, these questions cannot be answered with confidence. In his message to Congress on the Marshall Plan President Truman admitted that our proposed $17,000,000,000 of help to sixteen European nations would constitute only some 5 percent of their total national production. Yet he declared the “two purposes” of our help to Europe to be “to lift the standard of living in Europe closer to a decent level, and at the same time to enlarge European capacity for production.” Would a 5 percent difference in its standard of living decide socialistic Europe to return to capitalism instead of driving on to Communism? “To enlarge European capacity for production” is to supply Europe with capital goods. To the extent that we do this we must necessarily defer our own capital expansion. Are we going to do it while Europe continues to follow the policies that systematically throttle its own capital production and investment—price fixing and profit control which discourage the output of capital goods and plant expansion; drastic income taxes that dry up the sources of capital accumulation; threatened socialization and seizures that discourage or prevent private investment?

Yet in the President’s message there was not one serious word of criticism of the economic policies now being followed by European governments. There was not one hint that these policies have been in any way responsible for the present European crisis. Nothing was said of the effect of overvalued currencies in discouraging exports. European promises for the future were taken as the equivalent of accomplished facts. Mr. Truman warned Americans against the consequences of providing “only halfhearted and halfway help.” He said nothing of the consequences of half-hearted and halfway self-help in Europe. Yet on the President’s own estimate what Europe does to increase its own production will be at least twenty times as important as the American contribution.

It is clear that the risks of the Marshall Plan, in the form in which it has been presented to Congress, have not yet been soberly calculated.

A Century of Communism
January 12, 1948

It may come as a shock to many people to realize that socialism and Communism as we know them today—the Marxist brand—are now officially a hundred years old. For it was in January 1848 that the manuscript of the Communist Manifesto—by far the most influential single document of the cause—was written by Marx and Engels.

In the century since its publication it has proved its viability as a masterpiece of pamphleteering and propaganda. From its opening sentence: “A specter is haunting Europe—the specter of Communism,” to its famous
way for revolution. In his list of ten such measures he placed second “a vigorously graduated income tax.” Surely his ghost must gloat as it reads the American and British income-tax schedules of today.

Marx had a genius for destruction. He knew that capitalism could not long survive a system of confiscatory taxes which dry up incentives and the sources of private capital accumulation and investment. Like his disciple Lenin—who declared that the best way to destroy the capitalist system was to debase the currency—he probably would have seen that the undermining effects of the present “vigorously graduated” income tax are merely being concealed for the moment by the effects of monetary inflation. In the end, he knew, this “despotic inroad upon the rights of property” must do its destructive revolutionary work.

Blueprint for Disruption
January 19, 1948

President Truman’s annual message to Congress was primarily a campaign document. It seems to have been written chiefly in fear of losing extreme leftist votes to Henry Wallace. The basic philosophy it embodies is unmistakable. It is the philosophy of the welfare state, the doctrine of salvation through bureaucracy. Free enterprise, free markets, and free prices are no longer to be trusted to stimulate and guide production and consumption. Everything is to be in charge of omniscient and omnipotent bureaucrats.

Everyone is promised economic security, regardless of what he contributes to production. We are to have bigger job insurance, bigger old-age benefits, bigger survivors’ benefits, bigger education. The government is to subsidize our medical care and our housing. It is also to reclaim land, replant forests, build more TVA’s. On top of this, it is to spend in fifteen months on European aid alone as much as it used to spend in the same period before the war for all its purposes combined.

Mr. Truman, by some miracle, is at the same time for “economy.” “Government expenditures have been and must continue to be held to the lowest safe levels.” But the proposals he makes would immeasurably increase even present expenditures. And the Federal government is already spending in one year as much as it took it five years to spend just before the war. Of course all this money is to be taken in taxes only from “the rich.”
What Mr. Truman forgets is that the entire wealth and welfare of the country depends upon production. The total amount of the national product is far more important to the average family than any possible redistribution of it. Yet Mr. Truman’s schemes and taxes would undermine, discourage, and disrupt production. It would destroy incentives. The producers would not be permitted to enjoy the fruits of their production, and others would be handed the fruits whether they produced anything or not.

Mr. Truman’s speech is a tissue of self-contradictions. He is for “free enterprise” and “free competition,” but demands price fixing. He wants to “continue price supports for major farm commodities.” But he declares that the price of food is too high and that it must be reduced by government edict. While prices are to be held down, costs of production are to be forced up. The minimum wage is to be increased from 40 to 75 cents an hour. This would be a wage boost of 87½ percent. All workers above the minimum would of course insist on the maintenance of their existing differentials. Production costs and prices would be forced up enormously, and this might cause heavy unemployment even in spite of monetary inflation. If we can raise wages just by passing a law, and do it without such harmful consequences, why not $1 an hour or $2 an hour? Why stop anywhere?

We must enlarge our industrial capacity, continues Mr. Truman: “At least $50,000,000,000 should be invested by industry to improve and expand our productive facilities over the next few years.” But such funds could only be provided out of past profits and would only be invested if there were an inviting prospect of future profits. Yet Mr. Truman is shocked by existing profits, even though, as a percentage of the national income (especially when proper allowance is made for depreciation and inventory replacement) corporate profits today are not at all abnormally high. Mr. Truman wishes to increase taxes precisely where the increase would do most damage to production—on the corporations that are the very means of the workers’ livelihood. He would do this in order to free some 10,000,000 voters in an election year from all income taxes, and to create the short-lived illusion that present enormous government expenditures can be paid for only by a minority, by “the rich,” by “somebody else.”

Candidate Truman’s program is demagogy run riot. It is a blueprint for disruption. He asks this country to imitate slavishly all the disastrous economic policies that have brought Europe to its present critical state, and he wants us to call this process American “leadership.”

---

**Marshall Plan Pro and Con**

January 26, 1948

Henry Hazlitt and Ernest K. Lindley

LINDLEY: U. S. DOLLARS NOW OR AMERICAN LIVES LATER

No discussion of the Marshall program should lose sight of the central question: Is Western Europe to survive as a community of free nations?

Western Europe is the world’s second greatest workshop. Its 270,000,000 people have ways of life and ideals similar to ours. Most of them (Germany is the most important temporary exception) live under freely elected governments, all of which are at present non-Communist. Several of these nations are, moreover, the hearts of commonwealth and colonial systems embracing large parts of the earth.

The crumbling of Western Europe would be catastrophic for us. Without our support, Germany, Italy, and Greece almost certainly would go Communist quickly. In some of the other Continental nations, the first turn might be to the right—not to the free enterprise right, but of necessity to more or less totalitarian regimes. These could not stand in the long run, however, without our support, military as well as economic: The British position would be worsened immeasurably, at great added cost to us.

In two-and-one-half years since the war, Western Europe has made substantial recovery. Production in Britain, France, and seven other Marshall-Plan nations is up to or above prewar. Why, then, is further aid from the United States needed?

Before the war, Europe paid for one-fourth of all its imports by income from shipping, foreign investments, and other invisible exports. It got dollars also from the sale of colonial products to the United States. These sources of income have not yet been fully restored; parts of them are gone forever.

Some of Europe’s imports and production since the war have had to be used to repair war damage, a job which is far from complete. The population of Western Europe is 25,000,000 above prewar. There are other factors, but these, plus the lag in Germany, are enough to explain why, in spite of substantial recovery, Western Europe generally has not yet achieved either a tolerable standard of living for its people or the capacity to make its own way.

A critical juncture has now been reached. Without further aid from us, Europe will slide back, instead of going forward, simply because it is not yet able to pay for all the food, fuel, and raw materials it must import to keep its plant going, and for the fertilizer
and equipment it must have to restore and enlarge its production.

The Marshall Plan is designed to enable Western Europe to push on to the point where it is once again self-supporting. The American contribution is calculated to provide only the indispensable margin of outside aid. This is not large in relation to the resources either of Europe or the United States. The first year, which should be the most expensive, will cost less than we spent in three weeks of war. It does not impose a new or increased strain on our economy. The rate of export called for is below that of last spring. And it is estimated that, even with the full Marshall program, our total excess of exports over imports will be smaller in 1948 than in 1947.

We will have to do without some food, fertilizer, and other things that we could use, but we will have more left, over all, for ourselves than ever before. The assertion that we can’t stand this relatively small call on our resources is preposterous. The burden is small compared with the war, with the huge outlays for defense that will be imperative if Europe crumbles, not to mention another war.

To get the maximum benefit from this program—indeed to give it a fair chance to succeed—we must give the European partners assurance that we intend to see it through. This can best be done, I think, by authorizing the administrative machinery for at least four years. An adequate initial appropriation is also essential. A niggardly sum would not generate the economic and political forces necessary to full recovery. The European partners must, of course, be required to live up to their pledges to put their internal finances in order, to lower artificial trade barriers, etc.

If we do not extend to Western Europe the relatively small amount of help it must have for the next few years if it is to survive as a community of free peoples, we will pay an infinitely greater price later—a price which almost certainly will have to be reckoned not only in goods and dollars, but in American lives.

HAZLITT’S REBUTTAL:
Whether Western Europe survives as a community of free nations (which Lindley rightly considers the “central question”) will depend chiefly upon two things: first, the economic and political policies followed by the nations of Western Europe; and second, the diplomatic and military policies followed by them and by our own government in relation to Russia.

In this situation the Marshall Plan becomes secondary and almost an irrelevance. Yet it is being used by the Administration as a substitute for the hard diplomatic decisions that will finally have to be made. We are now challenged by Russia diplomatically and militarily on three chief fronts: China, Greece, and Berlin. If we are to prevent further catastrophes, our diplomatic policy on all three must be firm and unmistakable. It is in fact uncertain and ambiguous. The pleasant illusion that we can buy off the Russian nightmare merely by turning a few billions more of the American taxpayers’ dollars over to socialistic European governments cannot much longer be maintained.

We cannot even buy European recovery with it, any more than we bought British recovery with our $3,750,000,000 loan to Great Britain, because Europe is not following the policies that can bring about such recovery. Our postwar loans and grants so far have largely gone into subsidizing and prolonging price control, exchange control, and socialism that directly hinder European recovery. There is no guarantee that the continuance of our largess under the Marshall Plan will not make this situation worse.

Lindley stresses the loss of Europe’s invisible exports. The total net loss in Britain’s income from foreign investments, shipping, and other invisible items since the war (disregarding its foreign occupation costs) has been about £118,000,000. Those who are impressed by the calculation that the Marshall Plan would cost us less than 3 percent of our own national income, might remind themselves that Britain’s loss in invisible exports as compared with 1938 is only ½ percent of its 1946 national income. For those who are impressed by percentages this is hardly a substantial lowering of its standard of living.

HAZLITT: WE CANNOT BUY OFF THE RUSSIAN NIGHTMARE
My misgivings about the Marshall Plan are not based on “isolationist” but on international premises. The proponents of the plan are right, as I have previously pointed out in this column, in believing that there is an economic crisis in Europe. They are right in realizing that our own economic and political future will be deeply affected by the fate of Europe. They are right in urging that we should do anything we can that promises to increase Europe’s welfare without imperiling our own.

But the all-or-nothing advocates of the Marshall Plan harbor serious misconceptions both of major economic facts and of major economic principles. They overestimate both the shortages of Europe and the resources of the United States. In his testimony before the Senate Foreign Relations Committee, to cite a single example, Secretary Marshall made the astonishing statement that the war “destroyed livestock herds” in Europe. Yet volume two of the report of the sixteen nations, published by the Department of State, shows
that cattle on the hoof in those nations is in excess of 64,000,000, as compared with an average of less than 62,700,000 in the four years before the war.

The all-or-nothing advocates of the Marshall Plan, on the other hand, greatly overestimate American food resources. Before the war this country produced less than 9 percent of the world’s food supply. Even today it produces only 12 percent, or about one-eighth. Most of us have forgotten that before the war we were on net balance a food importing country. We think, for example, of the wheat we sold abroad; we forget that we bought from abroad several times as much sugar. From 1936 to 1940, we exported an average of $294,000,000 of foodstuffs a year: we imported an average of $665,000,000 worth.

Another misconception of the all-or-nothing Marshall Planners arises out of invalid comparisons with the national-income figures. From the President down, they have belittled the huge burden of the Marshall Plan by declaring that “it will cost less than 3 percent of our national income during the life of the program.” Passing over the question of how reliable our national income estimates really are, such a comparison is meaningless. In 1939 the value of our entire wheat and cotton crops added together was less than ½ percent of the then national income. The entire annual coal output of this country, bituminous and anthracite, is valued at less than ½ of 1 percent of the national income. But if this coal output were suddenly to stop, or if it were all shipped to Europe, we would not retain the other 99½ percent of our national income. The greater part of American industry would simply come to a halt.

Our economy is a closely interdependent living organism. If a man loses his right hand or his left lung you do not console him by measuring the loss merely as a percentage of his total weight. Shylock’s little joke was that his single pound of flesh was to be taken “nearest the heart.”

Our exports under the Marshall Plan must be measured, not in terms of abstract percentages, but in terms of where they impinge and on what they will do to our entire economy. We are not shipping out 2 or 3 percent of our wheat crop, but 40 percent. Such shipments have sent wheat prices and food prices skyrocketing, have boosted everyone’s cost of living, and have already put great distortions and strains on our internal economic relationships. It is time we heard the last of this belittling and meaningless 3 percent figure.

I must return, finally, to the general point I have made repeatedly both in previous columns and in my book Will Dollars Save the World? The Marshall Plan is based on the mistaken belief that the present economic troubles of Europe are chiefly the result of war destruction.

But the truth is that Europe’s economic crisis today is chiefly the result of its own postwar collectivist and inflationary policies. So long as its governments continue these policies, no aid that America could grant would be adequate to bring recovery. But if Europe returns to free markets and sound money, a dramatic revival could take place even without any further government financial aid from us, except food till the next crop comes in.

LINDLEY’S REBUTTAL:
The patient is recovering from compound fractures of all limbs, concussion, and double pneumonia, in an underheated room and on an inadequate diet. Hazlitt’s diagnosis is: boils and incomplete mastication. He rebukes the patient and prescribes: no more food until you have proved that you have learned how to chew it thoroughly. The result of this “cure” can only be death.

There is general agreement about some of the financial and economic steps that should be taken in Western Europe. The most important are pledged or inherent in the Marshall Plan. But even if Hazlitt’s advice were followed to the last tittle, it would be fantasy to suppose that Western Europe could become self-supporting without a further infusion of working capital. I have cited some of the important reasons. There are many others, including Russian control of Eastern Europe and Communist activities within Western Europe.

To support his thesis that we cannot afford ERP, Hazlitt takes as an example food, especially wheat. There is no intention of continuing the wheat exports at this year’s exceptionally high level, occasioned by the worst crop weather Western Europe has had in decades. Wheat exports scheduled under ERP are much smaller—300,000,000 bushels at the highest, as against the 500,000,000 in this crop year.

Overall food exports projected under ERP are lower in recent years. And, literally, they do not include for Europe a single pound of edible flesh, except horse meat.

In this space I can touch on only one more point. Hazlitt appears to feel no basic difference between Communists and Socialists. Even if the latter are wrongheaded in their economics, they are on our side in the critical struggle to save Europe as a community of free peoples. They stand as a bulwark against Soviet Communist ambitions. That is why Cominform assails Attlee, Bevin, Blum, and others so ferociously as enemies of the working class, just as it assails others who support the Marshall Plan but not those who, like Hazlitt, are against it. ✲
How to Get Rid of Rent Control
February 2, 1947

The politicians insist that this country needs most of all new and better rental housing. To encourage this, they penalize and punish most of all precisely the people who have supplied us with the rental housing we already have. Rents are today only 15 percent above the 1935–39 level, though clothing is 90 percent above and food 103 percent above. All items together average 65 percent above. Compared with the increase of 15 percent in rents, average weekly wages of factory workers have increased 127 percent. In short, the average worker’s rent is a smaller percentage of his income than ever before. Yet President Truman recently called the rent rise an “intolerable strain” on family budgets. And if Washington seems agreed upon any one thing, it is that rent control must be extended unimpaired.

The defense offered for rent control is that the supply of housing is “inelastic,” and that higher rents, except those permitted on new housing, do nothing to encourage the construction of new housing. (Though we were once insane enough to put rent ceilings even on housing not yet built.) This defense overlooks the fact that compulsory low rents on old housing do two things. They encourage wasteful use of space by tenants already in possession, and so intensify the housing shortage for people unlucky enough to be caught outside. And they remove both the incentives and the funds to improve old houses or even to keep them in repair.

The classic illustration of these consequences today is in France. France has now had rent control for 33 years. Tenants in France now pay from 5 percent down to as little as 1 percent of their annual incomes for rent. The result is that houses in France are in a wretched state of disrepair and decay, inside and out. And their condition steadily grows worse. It is true that newly built houses are not subject to rent control. But builders no longer trust the government not to change its mind about that after the houses are up.

Moreover, though rents in France average only five times as high as in 1914, building costs are 65 times as high. New buildings, therefore, would have to rent for something like ten times the rent of old buildings. A public habituated to ridiculously low rents would resent this as an outrage. So the new houses are not built.

The longer rent control is retained, the greater its problems become; and the greater the problem of ever getting rid of it. How can we keep ourselves from going the way of France?

This is a political problem. Congress is now certain to extend rent controls. When it does it should at least provide that on and after March 1 any state in the union, or even any home-ruled town or city, will be permitted to take over rent control from the Federal government at its own request. That would relieve Congress from a frightful future headache. More importantly, for those to whom such things still matter, it is the only constitutional thing to do. There is not in the American Constitution a single clause that could possibly be interpreted to give the Federal government the right to regulate rents in peacetime. If rents are not essentially local, nothing on earth is local. Houses and apartments don’t wander across state lines.

To discourage individual states and cities from keeping rent control indefinitely, as in France, Congress might provide or recommend that any community taking over rent control should taper it off in not more than five years under some such formula as this: In 1949 it should allow rents to be raised at least 20 percent as much above the 1941 level as all other items on the official consumers’ price index had gone up as of Sept. 15 of this year; in 1950 it should allow rents to go up 40 percent as much as other items; in 1951, 60 percent as much; in 1952, 80 percent as much, and in 1953 just as much, with a termination of rent control thereafter.

This, of course, for five years would be obviously unfair to landlords as compared with other producers or sellers, but not as unfair as retention of the present system. And it would get us back to free rents at least eventually, on a definite schedule, and with a minimum jolt to tenants.

France at the Crossroads
February 9, 1948

On Jan. 25, the French Government slashed the official value of the franc from 119 to the dollar to 214. At least the same time it also permitted the establishment of a free market in the franc in terms of the American dollar.

This step brought consternation to British Government circles and to the International Monetary Fund. For it will expose not only the weakness of the pound, but the unworkability of the whole system of world exchange control that the fund was set up to maintain.

The fund declared that it did not object to the devaluation of the franc to a more “realistic” rate, but that it did object to “a discriminatory multiple currency prac-

tice.” It admitted, however, that it had “serious reservations regarding a system involving fluctuating rates.” This was equivalent to saying that it doesn’t like a free market.
The fund is based on a false concept of what constitutes “stability.” The only real stability for exchange rates is one that rests on confidence. This was provided by the old world gold standard. When each currency unit was convertible into a fixed quantity of gold, the value of each currency unit could be expressed as a fixed ratio of every other. When the world gold standard was abandoned, nothing was left but pieces of engraved paper within each country, which necessarily bore an uncertain and constantly fluctuating relationship to the value of the other pieces of paper. The fund was set up to maintain the colossal fiction that each currency is worth, in terms of other currencies, what the government that prints it says it is worth. Instead of real stability resting on confidence, the fund and its members have tried to substitute the fiction of stability resting on coercion. The governments fix the values of their currencies by fiat: and then call out the police to put anybody in jail who dares to express through his purchases and sales a different opinion.

Of course mere paper currencies, constantly fluctuating in the market, are far from an ideal system of foreign exchange. But a free fluctuating market is at least incomparably better than the mere fiction of stability maintained by the police power. A free market adjusts supply and demand. It daily tells the world what different currencies are really worth. It would end the so-called dollar scarcity. It would end inconvertibility, and with it the present hocus-pocus about “hard” currency areas and “soft” currency areas. It would restore the balance of imports and exports. It would restore multilateral world trade. The British could get dollars by selling to France or China, for example, just as easily as by selling direct to us. And only free markets could guide governments in finding the level on which they could finally stabilize their currencies on a solid gold basis.

British officials are dismayed by the French action because it exposes the pretenses of the pound. The pound isn’t worth $4. This is the bitter truth that the British Government has so far refused to face. The present fictitious value for the pound is not merely exposed but imperiled by the French free market.

How will the British be able, without French help, to continue to finance under the Marshall Plan—the chronic deficit in European trade which these overvalued currencies bring about.

The French action is the first major crack in the present world system of exchange control. This system is the keystone of the present controlled and dictated economies. France will soon find that it must either retreat to strict exchange control and economic totalitarianism, or push on farther toward a free economy. Its decision may be crucial for the world. ✶

**Significance of the Break in Prices**

February 16, 1948

Last week’s break in commodity prices was not mysterious. The key was wheat. In recent weeks the prospects of the world’s wheat crops, at home and in Europe, had been steadily brightening, and the crops being harvested in the Argentine and in Australia had proved greater than expected. The good news was reflected in prices belatedly, because the world had formed the habit of thinking only in terms of shortages.

Nor was it mysterious that the break, when it came, should have been violent. So was the rise. When March wheat sold at $3.15 a bushel in Chicago in mid-January, that price compared with only $2.06 a year before. Even last week’s break brought the price down only to $2.56.

The demand for wheat has always been highly inelastic. Gregory King in the seventeenth century estimated that price compared with only $2.06 a year before. Even last week’s break brought the price down only to $2.56. The demand for wheat has always been highly inelastic. Gregory King in the seventeenth century estimated that a deficiency in the wheat harvest of one, two, three, four, and five tenths would raise the price three, eight, sixteen, 28 and 45 tenths respectively. Just as a world shortage (combined with our foreign-aid policy) brought a disproportionate rise in price, so the prospect of alleviation of the shortage brought a substantial fall.

For physical, financial, and psychological reasons, the break in wheat precipitated the break in other farm commodities, and even in stocks and metals. Wheat can substitute for corn as a feed. Meat is extremely sensitive to the price of feedstuffs. The meat industry, moreover, had been having its own troubles.

Retail sales had been falling off. Stocks in storage had mounted from 554,000,000 pounds a year ago to 857,000,000 on Jan. 1 last. This was brought about in large part by the Administration’s predictions of a still greater meat shortage and still higher meat prices, used to bolster its demand for rationing powers. The moment a Senate subcommittee turned down the meat-rationing proposal, wholesalers started to unload. This was one more example of the way in which government controls,
or threats of them, have exactly the opposite result from the one the planners are trying to bring about.

On the very day when prices were sensationally collapsing all around him, President Truman was lecturing the White House reporters, with the help of charts, on the dangers of further “really alarming” price rises. Just as he and his planners were fearing “deflation” two years ago, he now chose to get really alarmed about inflation in the midst of the greatest postwar price decline. To add to this record of spectacular mistiming, he predicted a possible “crash.” In such a situation particularly this was reckless and irresponsible.

That the general price decline will in any way parallel the great collapse of 1920 seems quite unlikely. The fact that money and bank credit have more than tripled since the start of the war should alone prevent any such consequence. Rightly handled, the fall in the price of foods could prove wholesome. It could restore a more normal relationship to other prices. It could reduce the pressure for a third round of wage increases. It could bury the foolish proposal for a return to price fixing.

The real danger at this time, in fact, is not a continued precipitous general fall in prices. It is rather that Washington may now feel falsely assured that the inflationary threat is definitely passed, and that the politicians may once again return to their always more congenial theme that they really need to protect us from “deflation.” Even before last week’s break the political situation had become demoralized. Republicans and Democrats were competing with each other in adopting policies that could only mean further inflation. The Administration had brought in a budget of $40,000,000,000; it was proposing more than $9,000,000,000 for foreign aid alone; it was determined to keep down interest rates by supporting government bonds. Congress, on its side, was shoveling out still bigger grants to veterans while proposing to cut taxes $6,500,000,000. Most of these things were being done with a bad conscience. The danger of the price fall is that it may be made the occasion for rationalizing such reckless inflationary measures as a patriotic “anti-deflation” policy. ✻

Inconsistencies of European Aid
February 23, 1948

Nothing could be more disheartening than Secretary Marshall’s defense even at this late day of the continued dismantling of German industrial plants. Mr. Marshall himself declared only a few months ago that the restoration of Germany, “the heart of Europe’s economic life,” was essential to European recovery. The New York Times points out that of the 918 plants scheduled for dismantling, including those of the French zone, nearly 600 are in no sense war plants, but include facilities for urgently needed farm machinery, tractors, mining machinery, and locomotives. The Dutch Government has vigorously opposed the dismantling of German plants which can be used to produce peacetime goods. The Harriman Committee declared that the situation in Western Germany, “the most disorganized area in Western Europe,” called for “radical reforms of the policies which the United States has been sponsoring.” The Herter subcommittee of the House has asked that we suspend wholesale dismantling of German industry. In his report to President Truman last March, former President Hoover declared that “the removal and destruction of plants (except direct arms plants) should stop. . . . We can keep Germany in its economic chains, but it will also keep Europe in rags.”

At best the continued dismantling and “transfer” of German plants require scarce labor and bring to an absolute halt, for the months or years that the process requires, the production of which the dismantled factories were capable. And this production is never in fact restored. Industrial machines and plants cannot be casually torn from their foundations and shipped around a continent like so many trailers. They are parts of a much greater integrated whole, vitally tied to each other, to localities, to markets, to sources of raw materials and means of transportation, and manned by trained and specialized local labor and management.

It is senseless to defend this preposterous policy of dismantling by an appeal to the Potsdam Agreement, which Russia has repeatedly violated. Even under that agreement, in fact, all dismantlings and removals were to be completed by Feb. 2 of this year. It is even more senseless to argue that we must continue this idiocy because Britain and France insist on it. It is we, we in America, who are paying the bill. It is we who are pouring hundreds of millions a year into Germany and are scheduled to pour in billions of dollars more to make up for the destruction that we ourselves help to carry on. It is we who are being asked to pour $17,000,000,000 more of the American taxpayer’s money into Europe, largely to make up for the consequences of this destruction not merely to Germany but to the whole European Continent of which it is an inseparable economic part.

The very least we should require of the British and French Governments in return for our help is to abandon their shortsighted insistence on this policy of destruction. We cannot reestablish a solvent and productive
Europe without a solvent and productive Germany. We must put revival before reparations. And in any case we will get most reparations out of the income from current German production. Let us take a reasonable percentage of the golden eggs instead of stupidly ripping the insides out of what was once the most productive goose in Europe.

It is not only in Germany that we are shoveling out the American taxpayer's money for recovery with one hand and imposing economic strangulation with the other. That is merely our most fantastic inconsistency. We are also paying for recovery in France at the same time as the French Government itself is trying to bring about what it calls "a controlled slump." With what is left of our loan, with the resources of the International [Monetary] Fund, and with additional billions of proposed Marshall dollars, we are helping the British to maintain an artificial level for the pound and an exchange control which systematically strangle multilateral trade, free enterprise, and world recovery. American resources are not merely being thrown away. They are being used to throttle production.

Who Advises the Advisers?
March 1, 1948

In this column of Jan. 12, concerning the 100th anniversary of the Communist Manifesto, incidental attention was called to the striking similarity between the theory in that document that capital accumulation, the use of machinery, increases "the burden of labor" and "forces wages down almost everywhere," and this sentence from the second annual report of the President's Council of Economic Advisers: "The accumulations of capital over the years have in fact involved deprivations of the rank-and-file worker."

It ought not to be necessary at this late day to point out why this Marxist doctrine is nonsensical. It is not the worker, but the capitalist, who is deprived of that much current consumption when the latter puts aside savings to invest them. And the effect of this investment, as illustrated above all in America, has been enormously to increase the quantity and improve the quality of the tools at the disposal of the worker, enormously to increase his productivity, and hence enormously to increase his wages and the goods available for all of us as consumers.

The real question we have to ask ourselves is how such an unadulterated Marxist doctrine got into the report of the Economic Advisers. This was no accidental sentence. It was part of a report which reveals throughout an underlying distrust of precisely that "free competitive enterprise" system which the council was specifically created by law to "foster and promote."

Neither is the slurring reference in the report to "the so-called free market" accidental. Neither is the doctrine—also Marxist in origin—that the "cream" of American industrial production has "in large measure gone to the relatively few"; that the rest have been "sub-sitting on skim milk"; that "the small number of the well-to-do will not be able to absorb the possible output of consumers' goods; nor can they go on indefinitely accumulating ownership of the surplus above their consumption needs and investing it in ever-enlarging plant for future expansion of goods for some restricted part of the population." This is blandly written in an official document in the United States of 1948 which has achieved the greatest mass market in human history for food, clothing, automobiles, radios, refrigerators, and a thousand luxuries and refinements that a king could not have dreamed of owning a century ago.

This annual report of the Economic Advisers must be read in connection with the recent Economic Report of the President, which under the law the advisers "assist and advise" him in preparing. In neither is there any serious grappling with the central economic problem that now confronts the country—inflation. The word, of course, appears often enough. But nowhere is there any frank admission that the dominant cause of inflation has been the tripling of the nation's money supply—its currency and bank credit—since the outbreak of the war. The references to inflation are self-contradictory. "The nature of the inflation from which we are suffering," says the President at one point, "arises in part from the total excess of buying power over the available supply of goods." But a few pages farther on he demands "enough buying power to absorb the output," and declares: "For balanced expansion, our economy requires a larger flow of income to consumers." In other words, more inflation.

Throughout both reports the blame for almost everything that has gone wrong or could go wrong is by implication put on the American businessman. "I strongly urged businessmen," writes Mr. Truman, "to bring prices into line. . . . Business should reduce prices wherever possible." And so on. Yet he does not complain that farm prices are too high though the official statistics show that farm prices had risen in the week his report was issued 208 percent above 1939, whereas manufactured products were up only 96 percent.

The Council of Economic Advisers has dissipated whatever reputation for detachment or objectivity it may once have enjoyed. It now apparently regards its function as no better than that of providing, at the
taxpayer’s expense, a “scientific” veneer for Candidate Truman’s campaign arguments.

**Communism and the Marshall Plan**  
**March 8, 1948**

Whenever it is shown that, unless Europe abandons inflation and collectivism, the Marshall Plan is unlikely to bring the economic revival that its supporters expect of it, one of them is sure to reply that it is not to be judged primarily as an economic but as a political plan. Politics is somewhat outside of this column’s province. Yet it has always seemed to me that it is precisely as a political program that the Marshall Plan most obviously falls short. It seems to rest on the pleasant illusion that if we pour enough of the American taxpayer’s money into Europe we need never make the hard diplomatic decisions, or take the unequivocal and unyielding stand, that might otherwise seem the only reply to relentless Russian aggression. It helps to support the fatal assumption that dollars can buy anything, including liberty, democracy, and peace.

Surely the fate of Czechoslovakia and Finland ought to destroy these iridescent illusions forever. It has been officially estimated that the funds we are asked to contribute under the Marshall Plan would be equivalent to 3 to 5 percent of the national production of the sixteen recipient nations. Suppose that the plan had already been in operation, that Czechoslovakia had been a beneficiary under it, and that its living standards had been raised 3 to 5 percent, or even 10 to 20 percent, above the levels that they actually reached. Does anyone seriously think that the present tragedy would have been averted? In fact, as The New York Times has pointed out: “It is an ironic sidelight on postwar history that Russia’s latest prize was put on its feet by nearly a quarter of a billion dollars advanced by the United States.” The theory that Communism takes over poverty-stricken countries, but is powerless elsewhere, no more explains the fate of Czechoslovakia than it does the Wallace vote in the Bronx.

Is it not clear at last that far sterner means than “economic aid” are needed to combat world Communism? At the very least, the fate of Czechoslovakia ought to expose forever the futility of trying to appease Stalin, of “trusting” him, or trying to “do business” with him. Yet we continue to pour goods into one end of Austria while Stalin pulls them out of the other. We are still anxiously trying to get his worthless signature to still more worthless agreements.

As for the purely economic aspects of the Marshall Plan, it is becoming increasingly evident that Europe’s need is less than has been represented. While its need for foodstuffs is still serious, its new crops, expected to be far superior to last year’s, will be harvested five or six months from now. As for most other needs, The *New York Times* published a dispatch from Geneva on Feb. 2 which declared: “In every case, experts [of the United Nations Economic Commission] have found that the European shortages—both over all and country by country—were much less than the governments alleged and less than expected a few months ago. . . . It has been known for a long time that several, some think most, countries in Europe now have a greater total of goods and services available for consumption and investment purposes than before the war.”

Another warning comes from Roy Harrod, an economist at Oxford and author of a recent volume called “Are These Hardships Necessary?” In *The London Banker* for December he writes: “There is a fallacy which has taken root in Europe which may be very dangerous precisely because it has a strong appeal for Americans. This is that large-scale capital reconstruction is necessary for the revival of the economies. . . . We must seek to disillusion the Americans of the idea that Europe cannot survive unless she embarks upon a large-scale capital modernization program. This is likely to waste American assistance and intensify all the specific difficulties which arise from the inflationary pressure throughout Europe. It will defer recovery in the vital matters of currency reform, the restoration of circulating capital, and the revival of productive effort.”

**For a Customs Union**  
**March 15, 1948**

The strength of the Marshall Plan is its strength as a symbol. It is a token of America’s generosity and good intentions, of our concern for the future of Europe, of our desire to halt the spread of Russian Communist aggression. The weakness of the Marshall Plan is that it is not in fact the appropriate means for securing its intended aims.

Now that the political realities are at last becoming obvious to all, it is clear that further disasters can be halted only by a union of Western Europe. Probably most Americans now favor this. But we still fail to recognize that such a union can be effective only with our own participation and unequivocal military guarantees.

Our present attitude toward collective security illustrates our national habit of smugly prescribing for
others medicine that we do not dream of taking ourselves. Another illustration is our attitude toward customs unions. We praise Benelux. We urge other free nations of Europe to form such unions. But never at any time do we seriously suggest that we ourselves join such a union.

Yet we should seriously consider joining a customs union, if only for the educational value of such an idea. From the moment we considered doing this ourselves, we would have a better understanding of the obstacles and hesitations in Europe. At home a hundred vested interests would rise in protest. And their protests could not be lightly dismissed, even if we considered the matter solely from the standpoint of the general welfare.

For under the cover of tariff protection there has grown up in this country a specific structure of production, a certain relationship of the size of each industry to every other. A customs union would mean an eventual increase in efficiency, production, and consumer welfare. But it would also mean a substantial alteration of our own structure of production, with attendant heartaches and tragedies for particular producers and workers. If we wished to soften the shock and minimize the costs of transition, the customs union could not be put into full effect except by gradual stages.

Clearly, also, the wider we attempted to make such a union, the greater would be its difficulties. The problem would be difficult enough if we proposed a union with Canada alone. It would be much more complicated if we attempted also to include Great Britain or the whole British Commonwealth. It might seem insuperable if we tried to bring in Europe or Latin America.

But all this is no reason for not making a start. For the benefits to efficiency and trade, enormous as these were, would be perhaps the least of the benefits of a customs union. They would be exceeded by the value of the economic and political by-products. A customs union would be impossible without many other reforms. It could not work unless the currencies of the member countries were freely convertible into each other in any amounts at fixed rates; and this in practice would mean that these countries must be on a free gold standard. It would not work if any member government imposed price control, or if one imposed different prices from another, or if prices in one nation differed from those in another except by costs of transportation.

This means in practice that the member countries would either have to form a complete political union or that they would have to permit free markets. And this would mean that no member government could impose the present fashionable strangling network of price controls, rationing, allocations, exchange control, blocked currencies, bilateralism, prohibitions on capital export, import and export licensing, crushing and confiscatory taxation, constant threats of government expropriation, and all the rest. For the moment one member government adopted any part of this network, the customs union would either break down or become in fact a pretense and a fraud. A customs union is the most important single step that could be taken, apart from a military alliance, to bring that federation of free nations which is the only alternative to disaster. ♦

The Cost of ‘Soaking the Rich’
March 22, 1948

If the Republicans and Democrats in Congress were not mainly engaged in trying to outmaneuver each other for votes, and if they understood the real economic situation that confronts them, they would be debating an entirely different measure from the present tax bill. They would try to apply the ax first of all not to taxes but to expenditures. If they concluded that overall spending could not in fact be substantially cut, they would not be planning an inflationary slash in taxes of $4,800,000,000 to $6,500,000,000.

But they might be considering, not how many voters could be exempted completely from income taxes in order to support a short-lived illusion that the present enormous tax burden can be borne by a minority, but how far excessive tax rates on high incomes should be reduced to restore incentives to production and investment. For the funds that the present income-tax structure takes are precisely those that would have gone principally into investment—that is, into improved machines and new factories to provide that increased labor productivity which is the only permanent and continuous means of increasing wages. An even more important effect of taking so much of the taxpayer’s earnings, in fact, has been to diminish or remove the incentives to bring such earnings into existence.

About a year ago in this column (April 7, 1947) I presented a table, based on income-tax returns, which brought out some striking facts. In the period between the three years 1926–28 and the year 1942, our total national income increased 58 percent. But total incomes over $300,000 fell in that period by 77 percent. If individual incomes in each group had risen by the same percentage as the national income, total incomes over $300,000 would have risen by a much greater percentage (because all incomes previously above $190,000 would in 1942 have been counted among incomes over $300,000). Yet even if the aggregate of such $300,000
incomes had simply risen in proportion to the whole national income, the total of such incomes in 1942 would have been seven times greater than it actually was. The top rate applicable to incomes over $300,000 in 1926–28 was 25 percent. The top rate in 1942 was 88 percent. We are justified in assuming that the main cause of the shrinkage in incomes over $300,000 was precisely this increase in the top rates. If the upper income brackets had continued to be taxed at only 25 percent, and if these incomes had increased in the aggregate no more than the national average, the yield to the Treasury would have been about 50 percent greater than it actually was at a tax rate of 88 percent.

In other words, the extremely high income-tax rates are self-defeating. Few people realize how drastically revenues from the high incomes have shrunk. Today the combined normal and surtax rate (after the 5 percent reduction) is 50 percent on all net income between $18,000 and $20,000. Suppose the combined rate stopped at this level, instead of mounting progressively on higher income brackets to a maximum of 86½ percent. What would be the effect on total revenues? Calculations furnished to me by the Tax Foundation indicate that the loss of revenue—if incomes above $18,000 remained unaffected—would be about $1,095,000,000 for the fiscal year 1948–49. This would be less than 5 percent of total individual income-tax revenues and less than 2½ percent of total budget receipts.

Obviously, however, incomes above $18,000 would not remain unaffected by such a drastic cut in top-bracket rates. Such incomes would expand far beyond what they otherwise would be. Treasury revenues would actually be higher with a top rate of 50 percent than with a top rate of 86½ percent.

But far more important than the effect on Treasury revenues would be the effect on national welfare. The national income would be higher not because the high incomes themselves would be larger; but mainly because the lower rates would both permit and encourage high investment. It is this investment that would raise national production and real wages. In our efforts to soak the present rich we have been soaking the future poor.

**Steel as a Scapegoat**

March 29, 1948

The February increase in steel prices was badly timed and ineptly handled. But the most disturbing result was the nature and violence of the political reaction.

What had happened? A price rise of about 10 percent had been put into effect on less than 10 percent of the total output. The result was an average composite increase in steel prices of about 1 percent. Yet this increase touched off a deluge of denunciations and investigations.

The report of the Department of Commerce to the President helps to set the matter in its true perspective. The composite index of quoted prices for finished steel, it points out, has risen about 40 percent above the level of 1939. As compared with this, average hourly earnings of steelworkers in the same period increased 80 percent. The cost of the steel scrap that the companies must buy increased 150 percent. The cost of coking coal went up 136 percent. Where the wholesale price of steel mill products had risen in February by 43 percent above the level of 1939, all commodities at wholesale had risen 108 percent. Farm products alone, even after their break from January, had risen 179 percent.

The report points out that the rate of return on stockholders’ investment in leading steel companies declined in 1947 from that of 1929 while that of all manufacturing corporations increased. “The rate of return on sales for the primary iron and steel producers was lower in 1947 than in the '20s generally and was only one-half of the 1929 ratio. It was also somewhat below the years 1937, 1940, and 1941.” Moreover: “The retained earnings of the steel producers have been below the amount necessary to cover their net plant and equipment expenditures.”

The Council of Economic Advisers, on the other hand, seems determined to make the steel industry a scapegoat. As a result its report is full of inconsistencies and non sequiturs. It admits the industry’s “moderation in price making,” but blames it for adding to “inflationary pressures.” It admits that “our rate of economic growth will suffer if the steel industry does not find it possible or profitable to improve and expand with the rest of the economy.” But the effort to modernize and expand the steel industry, it fears, would increase inflation; therefore, one gathers, the industry shouldn't modernize or expand now and shouldn't be allowed to earn enough now to modernize and expand later.

“It is futile,” the council continues, “for the steel industry to issue a call for restraint in the matter of wage negotiations at the same time that it is itself raising prices.” This seems a tip-off to the steel unions that the council would regard them as justified in asking for a further wage increase, particularly as it neglects to reiterate that even when we include the recent ½ percent steel price rise, steel wages have already risen since 1939 twice as much as steel prices.
The political reaction to the steel price rise represents, with a few honorable exceptions, the triumph of demagogy over objective analysis. Though wages and wheat have risen far more than steel, politicians still talk up wages and wheat while denouncing the steel industry for an awkward effort to catch up. Higher wages and higher farm income are treated as virtuous and welcome, but higher profits as a disaster and a sin. There is little recognition of the function of profits both as an incentive to production and a source of capital expansion. Industrial prices are discussed as if businessmen fixed them arbitrarily, depending upon how much they felt like restraining their greed. Inflation is blamed on private industry. The report of the Economic Advisers does not even mention the basic cause of inflation, which is the tripling of the money supply since the outbreak of war and the government's continued cheap-money policy.

The council distrusts the free market. It wants a return of price control—on the assumption, no doubt, that if the economic system were put completely in the hands of the bureaucrats everything would be as perfect here as it is in England.

Fallacies of the Third Round
April 5, 1948

Demands for a third round of wage increases are based on the argument that the rise in living costs has outstripped the rise in wages. Official figures show, on the contrary, that between 1939 and February of this year average hourly earnings of manufacturing workers increased 104 percent, and average weekly earnings 119 percent, while the cost of living went up only 69 percent. Only by selecting as a base of comparison June 1946, when the relationship of wages to the cost-of-living index was most favorable, can the union leaders show a slightly greater rise in living costs than in wages. And we must remember even here that the cost-of-living index under price control was largely fictional. It made no adequate allowance for black markets, unobtainable goods, and deterioration in quality.

It is, moreover, precisely the labor unions already best off that now take the lead in demanding further gains. Average weekly earnings in 25 manufacturing industries in December were $52.74. But in the iron and steel industry they were $58.20; in meat packing, $61.57; in the printing trades, $63.57; in the automobile industry, $65.47; in anthracite mining, $67.42, and in bituminous-coal mining, $75.22. Incidentally, weekly wages in the soft-coal fields were 211 percent above their 1939 level.

Such comparisons call attention to the fallacy of lump thinking about wages. That fallacy is made graphically clear in a study of the “Behavior of Wages” just completed by Jules Backman and M.R. Gainsbrugh for the National Industrial Conference Board. This study reveals not only that it is undesirable to try to impose blanket wage increases on the American economy, but that, contrary to common belief, we have never actually had such uniform increases, even in the recent past. It is widely believed that the first round of postwar wage increases was a uniform advance of 18½ cents an hour. A survey of 153 industries, however, in the period from September 1945 to February 1947, shows advances ranging from only 5 cents an hour in some industries to 30 cents in others. Out of 15,800,000 workers, only 3,700,000, in fact, were in industries which received average increases ranging between 17.5 cents and 20 cents an hour. Some 6,000,000 workers received less and some 6,000,000 received more.

From 1929 to 1939, to cite another illustration, 25 manufacturing industries show an average increase of 22 percent in hourly earnings. But the average rise was different in every one of these 25 industries, ranging from 3.6 percent in the lowest to 37.1 percent in the highest. The diversity is similar no matter what period we take.

We must remember, finally, that the wage-increase figure for each industry is itself an average. It conceals the diversity of increases among individual firms in that industry. The average increase in each firm, again, conceals the diversity among individual wage increases.

Today efforts are being made everywhere to impose an arbitrary uniformity on wages. All such efforts impede the functioning of a free economy. When a union imposes uniform wages within a single firm, regardless of differences between individual workers in merit, skill and output, it reduces or destroys individual incentives to improvement and production. When industrywide unions impose uniform national wage scales they retard or prevent the growth of industry in the South and in small towns. When government seeks to impose a national uniform increase in wages, it destroys the free market mechanism of fluid adjustment of prices, wages, and synchronized production. It prevents expanding industries from attracting workers by offering relatively higher wages while it forces violent adjustments on less profitable industries.

An attempt to impose a blanket third round of wage increases now would bring further distortions in our economy. Unless it were offset by still more monetary
To Improve the Taft-Hartley Law
April 12, 1948

In spite of the persistent smear campaign against the Taft-Hartley Act, experience has shown it to be incomparably superior to the Wagner Act that it supplanted. Strikes have been fewer, most union demands more moderate, and union leaders less highhanded. The improvement is so great that it takes the appearance of some new crisis, like the walkout in the coal fields, to remind us how defective our labor legislation still remains. Yet the way toward labor peace is not through more laws and more government coercions, but through more freedom.

The Taft-Hartley Act is after all only an amendment to the Wagner Act. It retains what was centrally unsound in the original law. It keeps nearly all the Wagner Act’s legal compulsions on employers, but tries to balance them by equivalent legal compulsions on unions. When this fails to bring the results desired, sponsors of the Taft-Hartley Act can only think of additional compulsions. Thus Congressman Hartley himself wants to make violence in labor strikes a Federal offense. It would be difficult to imagine a worse remedy. It is clearly unconstitutional. It would usurp the police functions of the states and cities.

It is clear, on the other hand, that the continued arrogance of John L. Lewis, his continued power, which he seems eager to demonstrate afresh each year, to bring the country’s industry to a slowdown or a halt by merely knitting his bushy brows, is not a power that he possesses in spite of existing Federal law but because of it. John L. Lewis is a Frankenstein monster blown up to his present size by Federal protection. He was not always so big. The Lewis coal strikes of 1927 and 1932 collapsed completely. The result of Lewis’s recklessness in those years was to leave his mine union shattered and prostrate—until he and it were put back on their feet, first by the NRA and then by the Wagner Act of 1935.

The mighty monopolistic weapon which the Wagner-Taft-Hartley Act has placed in the hands of the Lewises, Murrays, Reuthers, and Petrillos is the legal compulsion on the employer to recognize and bargain with huge industrywide unions no matter how contemptuous their conduct or fantastic their demands. All that is needed is to withdraw this compulsion. This would not illegalize industrywide or nationwide unions. Such unions would then occupy the same status under the law that foremen’s unions now occupy under the Taft-Hartley Act. They could continue to exist, but the employer would not be legally compelled to recognize or bargain with them. Section 9 (b) of the existing law provides that the labor board “shall decide in each case whether . . . the [employee] unit appropriate for the purposes of collective bargaining shall be the employer unit, craft unit, plant unit, or subdivision thereof.” The mere removal of the two words “craft unit” would not illegalize such units; it would merely take from the board its power to force employers to recognize and bargain with such industrywide units.

Two other changes in the law are necessary. One would remove the legal requirement on the employer to continue to recognize or bargain with a union that resorted to mass picketing, threats, and violence. The Federal authorities should make no effort to stop these. That should be left wholly to the local police. But at least the Federal government should remove the implied sanction it now gives to such tactics when it continues to make it obligatory on an employer to bargain with unions that resort to them.

Finally, the compulsion should be removed from the Wagner-Taft-Hartley law which in effect prevents employers from discharging strikers. The Federal government should not illegalize strikes; but neither should it encourage them by removing the risks involved.

If these coercions on employers were modified or removed, the Taft-Hartley Act could also modify or remove the ill-advised coercions it has imposed on unions—in connection, for example with political expenditures and 80-day waiting periods. In spite of the present Federal injunction against John L. Lewis, it is doubtful whether most of these coercions can be enforced.

Britain’s Collectivism vs. ERP
April 19, 1948

Two days after the Marshall Plan was safely enacted the Economic Commission for Europe released “the most complete and thorough study” on European recovery. This report, according to a Geneva dispatch to The New York Times, “contains the facts and analyses that Congress wanted before acting on ERP but could not get because they did not exist. It contains powerful
ammunition for those who believe that many of the troubles of Western Europe are due to the pursuit by governments of domestic policies encouraging a continuation of the dollar shortage . . . rather than industrial weakness or even losses and changes due to war.”

The report shows that total commodities available for home use in Europe as a whole, excluding Germany, had reached 96 percent of the prewar level on a per capita basis by 1947. Six European countries had more goods per capita than in 1938. All this did not prevent the cartoonists who were supporting the Marshall Plan here from invariably picturing present-day Europe as a starving old woman in rags, waiting to be rescued from death while pompous congressmen had the callousness to debate the problem.

“With the exception of Britain’s, every [European] country’s foreign balance of payments has been moving steadily away from equilibrium largely as a result, the survey finds, of continuous inflationary pressure combined with artificially overvalued exchange rates.” Even the exception of Great Britain here hardly seems to harmonize with the recent statement of The London Economist that the British economy “is now using up its last reserves.”

Yet what are the British doing—or being allowed to do—to help themselves? In Sir Stafford Cripps’s budget message we have part of the answer. It is a new graduated tax upon the portion of a man’s income derived from investments. For example, a man with an income of £50,000, all derived from investments (whether in real estate, stocks, or even government securities), would pay a special tax of £24,000 in addition to his ordinary income tax of £45,000—making a total tax of £69,000 or £19,000 more than his total income.

Such a tax will destroy capital values and further disorganize British production. It will not only prevent saving and investment but force dissaving and disinvestment. In the long run this must reduce productivity and real wages. It seems highly unlikely that the amount of American capital which we can contribute under the Marshall Plan will be enough to offset the amount of home private capital that the British Government is destroying.

Meanwhile, even if Britain’s production should recover in spite of everything its government is doing to prevent it, this would not necessarily solve the immediate crisis, which consists in the gap in its international balance of payments. The British bureaucracy can see this problem, as it can see every other economic problem, only in collectivist terms. It has completely forgotten that individual consumers and producers, acting in accordance with free market forces, automatically solved in the past the kind of problems its own policies are now creating. It thinks bureaucrats must set “targets” for the output, import, and export of everything.

The British trade deficit is certain to be chronic as long as the government maintains exchange control with an overvalued pound. The mere attempt to offset the distortions which such exchange control brings about must lead to increasing regimentation of the rest of British economic life. Under exchange control a free economy is impossible. The only solution is to let the pound be freely bought and sold at the prices established in a free market. But this is the one solution which the Socialist doctrinaires now in control of the British economy are determined never to permit. Meanwhile our government has virtually committed itself to support this Schachtian device for four years, and to drain American capitalism for funds for British zealots to use in destroying capitalism and production in Britain.

An Anti-Inflation Program
April 26, 1948

Marriner Eccles, making his exit as spokesman for the Federal Reserve Board, recommended to the Joint Committee on the Economic Report an increase in reserve requirements for Federal Reserve member banks and the extension of reserve requirements even to nonmember banks. Senator Taft, the committee chairman, told reporters that added authority of this sort was not likely at this session of Congress.

Inaction on this subject, however, would be a mistake not only from the national standpoint, but even from the standpoint of Republican prospects in November. Unless the Republican majority in Congress itself frames and passes a positive anti-inflation program, its criticisms of President Truman’s policies will seem very unconvincing by election day if inflation resumes its progress in the next six months.

This does not mean that such a program should take the precise form that Mr. Eccles recommends. His particular recommendations are too vulnerable. But he is right on his central point, which is that inflation is primarily a consequence of money and credit expansion. A Congressional anti-inflation program should include four main provisions:

1—It should at least authorize the Federal Reserve Board, if it does not direct it, to restore the former legal requirements for 35 and 40 percent reserves in
the Federal Reserve Banks instead of the present 25 percent reserve requirement.

2—It should authorize the Federal Reserve Board, as Mr. Eccles suggests, to increase the reserve ratios of member banks. Present maximum legal reserve requirements are 26 percent for member banks in New York and Chicago, 20 percent in other reserve city banks, and 14 percent in so-called country banks. Mr. Eccles suggests that these be raised to about 35, 30, and 25 percent respectively. But if something like this is authorized, Congress should stipulate that the board cannot order any increase in member-bank reserve ratios until it has first restored the previous Federal Reserve Bank ratios. Only such a provision can halt the continuous efforts of Federal Reserve officials to restrict the lending powers of the member banks at the same time as they increase the far more inflationary lending powers of the Federal Reserve System itself.

3—A comprehensive program should terminate some inflationary measures still on the books. It should repeal the Thomas greenback amendment. It should repeal sections 8 and 9 of the Gold Reserve Act of 1934, which gave the Secretary of the Treasury the power, with the approval of the President, to purchase and sell gold “at such rates and upon such terms and conditions as he may deem most advantageous to the public interest.” It might tidy up our present hodgepodge currency system by repealing the Silver Purchase Act of 1934, and by providing for the prompt retirement of Federal Reserve Bank notes and the gradual retirement of national bank notes and United States greenbacks.

4—Most important of all, an anti-inflation measure should contain a general declaration of policy on the part of Congress. This should direct the Federal Reserve Board to follow policies designed to bring a halt to any further inflationary expansion of money and bank credit. The board should be instructed to do this with care, to avoid precipitating any sudden or severe contraction of credit that could have serious deflationary consequences.

Only by such a comprehensive measure (combined with sounder expenditure and tax policies) can Congress prevent the present inflation from going farther. Only by such a measure can it take the offensive in the battle against inflation and center public attention on the fact that it is, above all, government fiscal and credit policy that creates inflation. Otherwise President Truman will continue inflationary monetary policies while declaring, as in his speech to the American Society of Newspaper Editors, that the only cure for inflation is to give him power to fix prices. ❅

---

How Not to Cure Inflation
May 3, 1948

Last week, suggesting a positive anti-inflation program, I referred to President Truman’s April 17 speech before the American Society of Newspaper Editors in Washington. This speech so gravely misconceives the causes of inflation and the remedies for it as to call for some line-by-line comment.

“I cannot sit by silently while inflation continues to creep up on the American people.” It is precisely the fiscal and credit policies his own Administration has followed that have caused the inflation he wishes to combat.

“I have repeatedly urged businessmen to exercise voluntary restraint in setting prices.” Once more the effort to blame business. High prices are the consequence of inflation, not the cause.

“By last fall, it had become clear that we could not place our main reliance on voluntary methods.” The totalitarian touch: lack of faith in freedom; government coercion as the sovereign cure. Secretary of Agriculture Anderson assured the House Banking Committee on Dec. 3 that without price controls meat might reach “fantastic prices” by April or May. Meat prices on the hoof are now lower than when his prediction was made.

“The total demand for goods is still outrunning production.” Why, with production at record levels? Because “demand” means monetary demand. Whose policies have been responsible for the added money and bank credit?

“Some key prices have been increased, unwisely and unnecessarily. The outstanding case was, of course, the increase in some important steel prices.” A discredited myth. The February increase (averaging about 1 percent) left steel prices—as the report of the President’s Department of Commerce showed—43 percent above the 1939 level, compared with an increase of 80 percent in hourly steel wages, of 108 percent in all wholesale commodities, and of 179 percent in farm products. Last week’s price cuts by United States Steel virtually wiped out its earlier price increases.

“In addition to these price increases, inflation has been encouraged by some unnecessary interruptions to production. The outstanding example, of course, was the work stoppage in the coal industry.” Mr. Truman neglects to add that he was all in favor of the Wagner Act, which gave John L. Lewis power to stop the coal industry; and that he denounced and vetoed the Taft-Hartley amendments, which enabled the government to get production going again.

“Another new factor making for inflation is the bill recently enacted by the Congress reducing government
revenues by $5,000,000,000." A valid point. But Mr. Truman neglected to remind his listeners that he himself favored a tax-reduction bill more cynically political than the one passed over his veto.

[Both foreign aid and increased national defense] “can add to inflation.” Correct.

“The anti-inflation program I recommended to the Congress last November should be enacted at once. . . . It includes measures to reduce the excessive amounts of money and credit which are lifting prices.” It includes no measure to stop the government’s cheap money policy that feeds inflation: no measure to restore the former legal reserve ratio of the Federal Reserve Banks, or to repeal old inflationary legislation.

“It includes measures to deal directly with specific high prices . . . designed to hold prices down while keeping production up.” Holding prices down by coercion and ukase has proved to be the surest of all ways of holding down production. “Selective” price fixing reduces most of the production of precisely the goods that are most wanted.

It is disheartening that the President has learned nothing not only from our own postwar experience in price fixing, but from the appalling consequences of existing price control in Europe. The most important thing America can do today is to continue to demonstrate to the world the enormous production possible through free prices and free enterprise. We must not cripple ourselves by imitating the very controls that have forced Europe to turn to us for help. ✫

The Fallacy of Exchange Control
May 10, 1948

Nobody can for a moment doubt that it is far from the intention of the leading democratic countries to consider as a permanent arrangement the exchange control which, contrary to the fundamental character of their peacetime economy, they have introduced today. To do so in peacetime would in fact carry their political and economic life irresistibly down the slippery slope of collectivist authoritarian totalitarianism.

These words were written in wartime, in 1942, by the European economist Wilhelm Röpke, in his book *International Economic Disintegration*. His faith in the strength of the liberal tradition proved in this respect sadly misplaced. Surely the British, for example, must believe that they are getting something very substantial in return for the coercion of both producers and consumers, and the sacrifices of economic freedom, that exchange control involves. Are the supposed gains in fact delusive?

At the official rate of $4.03, the pound today is overvalued. This was shown by the quick collapse of sterling convertibility (at $4.03) last summer. Convertibility will continue to be a one-way street as long as British bureaucracy insists that sterling must be bought and sold above the value that the importers, exporters, bankers, and traders of the world in fact attach to it. Wherever in the world black or free markets appear they show rates for pound notes in the neighborhood of $2.60 and for the transferable sterling in the neighborhood of $3.25.

The British bureaucrats believe that they cannot afford to allow a free market rate for the pound. It would, they say, increase the cost of imports. It would certainly do so in terms of pounds but not of dollars. And what they complain of is not a pound shortage but a dollar shortage. If the pound on a free market sold as low as $3, then a million bushels of wheat would cost British consumers, say, £800,000 instead of only £600,000 as at present. But it would still cost Britain, as before, only $2,400,000 of its dollar reserves.

The British bureaucrats argue, on the export side, that if they let the pound fall to its market level Britain would get less for its exports. This is an outright fallacy. What the British exporter gets (or in a free system would get) for his exports to our market, for example, is determined by the price he can get for them in dollars in America. In the long run this has nothing to do with the rate for the pound. If a British exporter sells 2,400,000 yards of cloth in New York at $1 a yard, he gets $2,400,000 for it. If this exporter in a free exchange market got only $3 instead of $4 for each pound, he would quickly compensate for this by an exactly proportionate increase in the number of pounds he got for the same volume of exports. Where he now, at $4, gets only £600,000 for his 2,400,000 yards of cloth, he would at $3 get £800,000 for it.

So keeping the pound coercively at $4 helps Britain not at all in solving its dollar problem. On the contrary, it is the very thing that creates the problem. For the relative cheapness with which British citizens can buy American imports in terms of their own currency unduly encourages imports. This encouragement must then be offset by discriminatory bureaucratic prohibitions against the import of specific articles.

The overvalued pound, on the other hand, discourages and reduces exports. It wipes out the price premium that the British manufacturer might otherwise have had as an incentive to export instead of selling at home. It either puts a price premium on domestic sales
or compels him to overprice his exports (in terms of foreign currencies) and hence to lose potential sales in foreign markets and end up with fewer dollars.

When such consequences are pointed out, the British bureaucrats reply that as a matter of fact British manufacturers are today selling abroad all that they are physically able to produce for export. But they complain in the very next breath that their foreign-trade position is desperate. On closer inspection they will find that this is largely because, and not in spite of, exchange control.

**Rewarding Railway Strikers**

May 17, 1948

For many years the Railway Labor Act of 1926 was popularly regarded as a model labor law. It had bought peace and prevented strikes. What the general public did not see was that this peace had been bought at an exorbitant price, not merely in open wage increases, but in government-sponsored growth of the most fantastic set of featherbed rules to be found anywhere.

Beginning seven years ago the elaborate machinery of mediation, arbitration, and “fact finding” in the act was repudiated by the very railroad labor unions in whose interest it had been set up. First President Roosevelt and then President Truman conspired to undermine the prestige of that machinery and to render it useless.

The crucial precedent was established in 1941. The railway unions then rejected the pay-increase recommendations of President Roosevelt’s emergency fact-finding board. In an editorial in The New York Times, the present writer posed the question: “If either the managements or the President under the threat of a strike grant the railway workers more than the President’s fact-finding board recommended, what will be the use of such boards in future?” President Roosevelt was at least aware of this dilemma and made a technical effort to escape it by referring the question to the board a second time. Ostensibly it was asked to reconsider its decision because of “new evidence,” but everyone knew that in reality the most important piece of new evidence was that the unions had rejected the first award of the board and had threatened to strike. As the present writer commented after the decision had been changed upward:

“Government boards have once more been put on notice that if they want to keep the appearance of prestige, they had better bring in the first time a decision that the union leaders are going to like. . . .

“This whole incident has proved once again that not only as against employers but as against governmental recommendations it is not a disadvantage for a union to threaten to strike, but an advantage. The railway unions were not penalized for threatening to hold up the national defense; they profited by that threat.”

The pattern was repeated with minor variations in 1943. This time, confronted with another strike threat, President Roosevelt did not even bother to resort to the fiction of “reconsideration” by the board. He simply by-passed and outbid all his own officials by personally granting the railway unions bigger increases than either his own emergency board or his own Stabilization Administrator had offered them. He thereby destroyed the authority of his own appointees and encouraged the unions to ignore them altogether in the future.

As a result of such government surrenders, the railway unions really began to feel their oats. In 1946 they not only rejected as a matter of course the decision of President Truman’s fact-finding board, but they even rejected the President’s personal offer of better terms. The final outcome of that episode was commonly described at the time as a “defeat” for the striking unions. But the union members themselves noticed that they were better off as a result of their strike and defiance than they would have been without it.

So here we are at the 1948 pattern. President Truman’s emergency board, after hearing evidence for 33 days, has recommended a wage increase of 15½ cents an hour. Three railway unions—the engineers, firemen, and switchmen—refused to accept this decision and voted to strike.

The only solution open to the President, if he wished to retain the Railway Labor Act, was to warn these unions that the government had no further concession to make; that if they struck railway management would be free to discharge them and to hire other permanent workers to take their place; and that essential trains would be kept running. The melodramatic, unnecessary, and dangerous device of government seizure, so often regarded as a “strong” action, has usually served in the past merely as a cloak for government surrender to union demands.

**Price Fixing into Famine**

May 24, 1948

The principal cause of the present world economic crisis, with its chronic shortages of food, coal, steel, and dollars, has not been the physical destruction of the war, great as that was, but the worldwide mania for
government economic controls. Striking confirmation of this in the realm of food appears in a forthcoming article by three agricultural economists (F.A. Pearson, W.I. Myers, and E.E. Vial) in the periodical *Farm Economics* published at Cornell University. The facts it presents speak for themselves:

The Argentine Government sells wheat for export at $5 or more a bushel in United States dollars. It pays the Argentine farmer the equivalent of $1.59 to $1.83 a bushel and pockets the difference. The Canadian farmer is allowed only $1.35 a bushel plus a “participation certificate” worth about 20 cents. The United States farmer gets a free market price of about $2.80 a bushel. (Prices cited are those prevailing when the article was written.)

What has been the consequence of these policies? In spite of the desperate world shortage of wheat, the 1947 acreage of wheat in Argentina was 22 percent below the 1935–39 level. In Canada the 1947 acreage of wheat was also 7 percent below prewar. Neither decrease can be blamed on the weather: in both countries the acreage for the two preceding years was also below the prewar level. In the United States, on the other hand, wheat acreage expanded as prices rose, and in 1947 was 29 percent above the prewar level. In brief, farmers in this hemisphere responded to price incentives or their absence rather than to verbal exhortations. The farmers obliged to take low wheat prices contracted their acreage; the farmers permitted high prices expanded it.

The article finds it “difficult to generalize about Europe with its divergent price policies, varying degrees of devastation, etc.” The only European country it specifically cites is bizonal Germany, in which the 1947 acreage of food grains was 20 percent below prewar level. I shall therefore add some supplementary material from other sources.

It is the official French doctrine that the disastrous shrinkage of the French wheat crop last year was caused solely by unprecedented frost and drought. Bad weather undoubtedly accounts for a great deal. But comparative statistics are instructive. Whereas in 1947 the French acreage harvested of the bread crops wheat and rye was 37 percent below average prewar levels, the acreage of the feed grains (barley, oats, corn, etc.) was only 14 percent below. It is hard to escape the suspicion that this contrast has something to do with the fact, pointed out by the French economist Jacques Rueff in the April issue of *Foreign Affairs*, that the official price of wheat in France is fixed relatively lower than that for other cereals, and that stricter measures are adopted to make the official price respected. In contrast to the government-controlled price of wheat in Canada, for example, the Winnipeg price of rye is free. On Dec. 30, 1947, rye was $4.05 a bushel, compared with the controlled wheat price of about $1.55. Result: The 1947 acreage of rye was 42 percent above the prewar level, while wheat acreage was 7 percent below.

Finally, as the economist Wilhelm Röpke writes from Switzerland in the April 29 issue of *The Commercial and Financial Chronicle*: In Germany “a lady’s hat may be freely sold at the equivalent of more than one ton of wheat. We can hardly expect the German farmer to sell his products forever at official prices which not only mean that he is practically giving them away, but also that he cannot go on producing them since he cannot buy with his paper money what he needs on his farm.”

In brief, the fantastic collectivist controls imposed by our own American bureaucracy in Germany have put a tremendous premium on not producing food. And in spite of its appalling results in bringing world food scarcity, President Truman insists on a restoration of price control here. That would complete the disaster. ✡

### The Incubus of Exchange Control

May 31, 1948

The National Advisory Council, composed of Cabinet-level officials headed by Secretary Snyder, reminds Marshall-Plan countries that their exchange rates “will require adjustment.” Paul Hoffman, head of the ECA, thinks it “quite obvious that there should be more realistic rates of exchange.”

It is gratifying to have at last this official recognition of exchange realities, even though the NAC still fails to draw some of the most important logical conclusions from this recognition.

The British pound is the key example. It was pointed out in this column on May 10 how exchange control with an overvalued pound systematically encourages imports, discourages exports, and brings a chronic trade deficit, which the United States is then called upon to make up. If the pound were allowed to decline to its free-market value the result, it is true, would be a substantial increase in Britain’s internal price level. For in terms of pounds imports would cost more. And British consumers (in the absence of watertight allocations) would be forced to pay higher prices to hold their share of goods at home against the increased price in pounds obtainable for exports.

But the only way that Britain in the long run could avoid this result is by an internal deflation. This could be brought about by slashing government expenditures, particularly on capital projects and on food subsidies,
by increasing the purchase tax, by abandoning the infra-low interest rate policy, and by warning British labor that it must keep its wage rates low enough to meet world competition at a $4 rate for sterling. One has merely to cite these conditions to recognize how improbable they are politically under the present Labor government.

The British Government, in short, has a choice of free foreign-exchange markets, of official devaluation, or of rigorous internal deflation: and it is unwilling to embrace any one. This “forces” it to impose direct import controls. But as the Canadian economist Donald B. Marsh points out, it has “a basic predilection for controls combined with a policy that, by deepening the crisis, makes the removal of controls unthinkable.” As he adds: “In a country as dependent as Great Britain on external trade, exchange control provides the ultimate in governmental control of private business. Whether exercised or not, the government’s power under exchange control is literally the power of life and death over firms and industries dependent upon imports.”

The British bureaucrats are convinced that the only cure for the trade deficit is a great overall increase in British production. All that is really needed, however, is a change in the internal structure of consumption and production sufficient to correct the trade balance. This task is not herculean. What is involved is a total annual trade deficit officially estimated at £250,000,000. This is less than 3 percent of Britain’s present national income. It could be corrected either by raising British production 3 percent (less than the actual increase of 1947 over 1946) or by lowering British consumption 3 percent.

But analysis shows that instead of devoting the resources released by the cessation of the war to export production, these have been chiefly reabsorbed by other activities. And it is government controls that have prevented readjustment. Only when free exchange rates and free prices are reestablished will imports and domestic output readjust themselves to the proportions necessary to cure the trade deficit.

As long as other currencies also remain overvalued and inconvertible, it is true, the British cannot correct their balance of payments by sales to “soft-currency areas.” But British and above all American leadership could get the leading countries of the world simultaneously to abandon the whole vicious Schachtian network of exchange control. It is fantastic for America to be draining its resources in order to subsidize and prolong a totalitarian device that disintegrates and strangles international trade, makes free enterprise impossible, retards European recovery, and intensifies and perpetuates the very “dollar shortage” that it pretends to cure. ❧

The GM Wage Pattern
June 7, 1948

The General Motors wage settlement last week transformed the country’s business outlook over night. It marked the formal opening of the third round. Unions everywhere will seize upon the precedent.

The GM settlement will be all the more influential because of a certain prima-facie reasonableness. In addition to providing an initial increase of 11 cents an hour (8 cents for a “cost-of-living adjustment” and 3 cents for an “annual improvement factor”), it provides for quarterly adjustments for further changes in the official government consumers’ price index and for an additional 3 cents an hour as an “annual improvement” factor.

On closer examination, however, the flexible features of the GM settlement are found to be virtually all one way. No matter how much cost of living should fall, the downward adjustment on that account cannot exceed 5 cents an hour. But there is no corresponding upward limit if the cost of living should rise. The “adjustment” has a floor but no ceiling. And the 3-cents-an-hour “annual improvement” increase is to be granted whether or not man-hour productivity is in fact increased correspondingly.

General Motors, the biggest industrial corporation in the country, can presumably afford this type of wage contract. But American industry in general can certainly not afford to begin with still another “cost-of-living” increase. Official statistics already show, in fact, that whereas the consumers’ price index has increased 69 percent compared with the 1935–39 level, average hourly industrial earnings have increased 115 percent. On this prewar base, therefore, the first “cost-of-living” adjustment, instead of being 8 cents an hour upward, would have to be an average of 27 cents an hour downward!

We must remember, again, that the consumers’ price index represents an average of many different prices. If companies whose products have risen in price much less than the average were nonetheless compelled to pay wage increases equal to the average, they would either be forced out of business or forced to raise prices. If the price index were thus forced up, this would of course in turn require still further upward cost-of-living wage adjustments. And the uniform application of the
GM cost-of-living formula would also prevent the kind of constantly changing variations among different wage rates that are necessary to draw workers into growing industries and out of declining industries.

The same sort of consequences would follow any automatic, uniform “annual-improvement” wage increases. Owing to new machinery and methods, the productivity of the average American worker has in fact in recent times been increasing at the rate of 2 to 2½ percent a year. But here again it must be kept in mind that this is an average, both of many years and of many different industries. An investigation by the United States Bureau of Labor Statistics shows that the physical output per man-hour dropped in the boot and shoe industry from an index number of 113.2 in 1941 to 105.9 in 1944, in the cement industry from 108.3 in 1941 to 83.8 in 1944, and in nonferrous metal refining from 108 in 1940 to 95.9 in 1945. How can industries or firms in which man-hour productivity is actually declining afford to pay automatic “annual improvement” increases?

Finally, it must be remembered that this long-run average increase in labor productivity has not been automatic. Its continuance cannot be taken for granted. It has taken place in America because capital accumulation has been steadily raising man-hour productivity on the average by putting more or better tools into the hands of the workers. But this capital accumulation has been made possible by sufficiently high profits to enable corporations to plow new capital back into plant expansion. If corporate profit margins are reduced by taxation or excessive wage increases to where they are dangerously narrow, “annual improvement” increases, even on the average, will no longer be possible. Labor will then find itself moving into lower instead of higher living standards.

**Who Started the Third Round?**

June 14, 1948

As pointed out in this column last week, any widespread application of the General Motors wage-settlement formula would put further strains on our economy. It would either force the creation of enough additional inflationary bank credit to meet higher payrolls and support higher prices, or it would result in unemployment.

A third round of wage increases being so harmful to the economy and to the long-run interests of labor itself, who started it? Other employers, big and small, privately blame General Motors for capitulating to the union demands. But the causation must be traced farther back. Who is it, or what is it, that made it almost inevitable from the start that employers would capitulate to a third round?

Part of the answer can be found in the White House. President Truman and his advisers always affect to deplore something they call “inflation.” But this always turns out to be primarily an objection to high industrial prices. They ignore the basic fiscal and monetary causes of inflation, for which they themselves are largely responsible, and the high prices of farm products that their own policies have helped to bring about. And they have never been willing to put wages in the same category as prices. Prices are to be held down, controlled, frozen, rolled back; but in wages it appears that there are always “inequities” still to be adjusted—of course never by lowering any wage, but always by raising the wages that are still “submarginal” or have not yet “caught up.”

Mr. Truman has again and again intervened to push up wage rates. He did so in late 1945 and early 1946 by imposing a thinly disguised form of unilateral compulsory arbitration when he appointed a “fact-finding” board that in effect ordered General Motors to pay an increase of 19½ cents an hour. Later, without even waiting for a report from his own fact-finding board, he rewarded Philip Murray for tying up the nation’s steel industry by recommending an increase of 18½ cents an hour in wages in that industry.

Then he set aside the 16-cent-an-hour increase for railway engineers and trainmen, recommended after a month’s study by his own fact-finding board, and awarded them 18½ cents. When John L. Lewis scorned even an 18½-cent-an-hour increase and struck, Mr. Truman stepped in, seized the coal mines, and made the government itself grant wage increases, royalty payments, and other benefits to Mr. Lewis’s union far in excess of Mr. Truman’s own previously announced “wage line.”

Mr. Truman is still not cured. On the very day that General Motors made public its latest wage boost, he again urged Congress to raise legal minimum wages from 40 to 75 cents an hour. This would be an increase of 87½ percent. And union insistence on maintenance of existing wage differentials would put further upward pressure on wages all along the line. Congress, however, must share responsibility for inflationary wages. For the Wagner Act, though improved by the Taft-Hartley amendments, is still retained in essence. It builds up and greatly strengthens industrywide unions. It compels employers to bargain with the leaders of those unions, no matter how extravagant their demands. If those unions resort to mass picketing, intimidation, or
Let us compare living standards in America, which Mr. Truman still seems to find so deplorable, and living standards in Communist Russia. Has Mr. Truman ever read the report of the Department of Labor, showing that the average worker in Russia is about one-tenth as well off as the American worker in terms of what his wages will buy? Will we be inviting Communism until we produce a living standard here eleven times as high as Russia’s instead of only ten times as high?

No doubt our housing conditions are not all they might be. But shouldn’t someone tell Mr. Truman that in Moscow, even before the Nazi invasion, only one family in seventeen occupied more than a single room? In America nearly three out of every four families has an automobile. Will we be inviting Communism until three out of every four families also has a yacht and an airplane?

As for political liberty, what sort of mentality is it that, because full political rights may in a few sections and cases be abridged here, prefers the sort of completely terrorized “elections” which were recently held in Czechoslovakia, and longs for the horrors of the Russian slave camps? Must everything be absolutely perfect here, must we produce a paradise on earth, to keep people from clamoring for the Communist hell?

Let us continue to improve economic conditions by all means. That, in fact, is what capitalism has been steadily doing for years, for generations. It has done it so well that its miraculous achievement is taken for granted, as if it were something that would occur automatically under any system. So Mr. Truman wants more houses, not through free enterprise, but through legislation and government subsidies. He wants higher wages, not through increased production, but through more coercion on employers. He wants to control inflation, not by reforming the government’s own monetary and fiscal policies, but by the power to dictate prices—though the choking of production by price control abroad is one of the main reasons why capitalist America now supports planned and socialized Europe.

The way to combat Communism is to teach our people, and especially our political leaders, how infinitely superior capitalism has already shown itself to be. Certainly we are never going to win the struggle with Communism if we begin by accepting its basic principles and deserting our own, if we abandon our faith in personal liberty and free enterprise to embrace the Communist faith in government planning and government ownership, in bureaucratic omniscience and complete domination by the state.
It is fortunate that the publishers have so promptly made available an American edition of the most forthright and powerful attack on government economic planning that has appeared in England since the publication of F. A. Hayek's *The Road to Serfdom*. The new book is called *Ordeal by Planning*.

Its author is John Jewkes, professor of economics in the University of Manchester and a wartime member of the British bureaucracy. *Ordeal by Planning* should appeal to an even wider audience than *The Road to Serfdom*. While it lacks some of the philosophic penetration and depth of the Hayek book, it is much more explicit and concrete. Its style is lively, sparkling, and witty. It hits hard. It is difficult to see how any but the most fanatic government planners can fail to be shaken by it.

Mr. Jewkes assails central economic planning in all its aspects. He exposes the economic fallacies behind it; he ridicules its scientific pretensions; he points to its international, political, and moral dangers. He beautifully dissects planners as a species.

As one specific case, he cites the British coal and power crisis of February 1947—“the classic example of a planning crisis.” In the preceding October the Minister of Fuel and Power himself had said with an irony that backfired: “Everybody knows that there is going to be a serious crisis in the coal industry—except the Minister of Fuel and Power.” When the crisis arrived, “a government pledged to planning and economic stability was compelled to order, at a moment’s notice, the closing down of about two-thirds of British industry.”

“No country,” Mr. Jewkes points out, “has ever suffered from a more sudden or catastrophic economic seizure. . . . The price system brings about gradual and continuous readjustment in a changing economic world; the central planning technique means that, from time to time, the economic system must be kicked downstairs.”

“I believe,” he continues, “that the recent melancholy decline of Great Britain is largely of our own making. . . . At the root of our troubles lies the fallacy that the best way of ordering economic affairs is to place the responsibility for all crucial decisions in the hands of the state.” He lists the fateful errors made in foreign economic policy, the mistake of exchange control, the false alibis, the effort to put the blame on America. “Export planning,” he concludes, “reduces exports.”

But though he shows again and again how planning leads toward national impoverishment, his most powerful indictment of it rests on its destruction of freedom: “When Sir Stafford Cripps declared in the House of Commons on Feb. 28, 1946, that no country in the world has yet succeeded in carrying through a planned economy without compulsion of labor, he might, with equal truth, have gone much further and admitted that no planned economy has yet operated without suppressing free speech, destroying representative government, robbing the consumer of free choice, and virtually abolishing private property. This is no accident. . . . It is due to the logical incompatibility of a planned economy and freedom for the individual.”

This book has so many merits and presents its case with such cumulative force that I regret to have to mention one serious flaw. Mr. Jewkes surprisingly accepts the Keynesian theory that “mass unemployment is due to a deficiency of demand for goods and services,” and that when it threatens, the state must intervene “either to spend more money itself or to put its citizens in the way of spending more.”

This superficial doctrine is merely one of the countless disguises of the immemorial gospel of inflation. It is government planning in the field of money and credit: and its application in practice must inevitably involve the same sort of slapdash economic guesswork and shabby political abuse that Mr. Jewkes so brilliantly exposes in government planning in other fields. Rejection of the Keynesian fallacies is essential to the preservation of free enterprise.

---

**Republican Platform Economics**

July 5, 1948

The typical party platform is thrown together in a few hours by people who have little to do with carrying it out. It must compromise conflicting views within the party. It must lose nobody’s vote. It must find verbal formulas that can mean all things to all men.

From this standpoint the 1948 Republican platform is a triumph of draftsmanship. It promises “elimination of waste” and of “unnecessary bureaus.” It pledges “healthy” Federal finances, “stimulation of production,” and a “sound” currency. Such planks can be opposed only by those who believe in waste, who want bureaus they admit to be unnecessary, who are eager to discourage production, and who favor unhealthy Federal finances and an unsound currency.

The platform endorses irreconcilable economic policies. It favors our “competitive system.” But far from wishing to leave farm prices to this competitive system, it thinks they should be “supported on a just basis.”

The platform favors “progressive reduction of the cost
of government.” But it demands an increase of social security and veterans’ benefits “to a more realistic level.”

The platform promises to “assist other peace-loving nations to restore their economic independence”; but “only within the prudent limits of our own economic welfare.”

Everyone must decide for himself just how many billions this means. The platform promises to “support the system of reciprocal trade and encourage international commerce,” while, however, “at all times safeguarding our own industry and agriculture.” Everyone must decide for himself whether this means lower tariffs or higher tariffs. The platform thinks “housing can best be supplied and financed by private enterprise; but government can and should encourage the building of better homes at less cost.” Everyone must decide for himself whether the Republican Party is for or against large-scale government-subsidized housing.

We should not be too surprised to find in one of the major party platforms four years from now some such plank as this: “We favor a sound and prudent Communism, consistent with our free-enterprise system and traditional American liberties, and imposing only such reasonable and democratic controls as are necessary to make a wise and conservative Communist dictatorship fully effective.”

The platform favors “equal pay for equal work, regardless of sex.” Why not also regardless of race, color, religion, age, looks, or geographical location? Who is to decide whether or not the work of any two or more persons is in fact “equal”? A law to carry out this plank would in practice be merely one more abridgement of management’s right to manage.

One could discourse at length about the things that are not in the platform. It pledges “an attack upon the basic causes of inflation,” but does not clearly point out that the basic cause is the increase in the volume of money and bank credit. It says nothing whatever about the government’s cheap-money policy or about legal reserve ratios. It pledges “a sound currency,” but is silent about what constitutes soundness. It does not mention a return to a real gold standard. It is silent about the coercions and distortions of exchange control.

It says nothing about the European price fixing, planning, and Socialism that create the world shortages which the American taxpayer is called upon to make up. It does not even say clearly that it is against a return to price fixing here, or that it believes in free markets and free enterprise.

But there are worse things than silence or ambiguity. Platforms are seldom anything but an embarrassment anyway, particularly when they get specific. They force the candidate into either an insincere lip service to every plank or an open repudiation.

It is hard to say which is worse—to make the right pledge and break it, or to make the wrong pledge and keep it—to violate outright, say, the 1932 Democratic platform pledges of “a saving of not less than 25 percent in the cost of Federal government” and “a Federal budget annually balanced,” or, as with the Labor Party in England today, to drive grimly ahead with more nationalization, in spite of demonstrated damage to the country, in the name of a party promise.

**Dangers of Dollar Diplomacy**

July 12, 1948

Perhaps the chief danger of the Marshall Plan is that it deflects public attention from the real political and economic problems that confront the world, while providing the illusion that something is being done to meet those problems. The crack within the Communist bloc is immensely encouraging, but the real question remains whether Washington will know how to make use of it. A continuation of our ambiguous postwar foreign policy, constantly wavering between firmness and appeasement, plainly cannot succeed. Whenever and wherever we appease him or give way to him, Stalin assumes—indeed the people behind the Iron Curtain and the people of Western Europe themselves assume—that we must be afraid of him. Every unrebuked insult or successful aggression can only encourage him to further insults and aggressions. His immediate aim has recently been to drive us out of Berlin; but his broader aim is to show the world who is master.

It follows from this that the true American warmongers are the appeasers, the Wallaces who think that they can buy peace by still more dangerous and humiliating concessions than those we have already made. The only possible way to assure peace, on the contrary, is by unyielding firmness before Stalin has been tempted to the ultimate reckless act.

What this means on the political side is clear. Against a great land power like Russia we could not possibly act on the European Continent alone. We could act only as an ally of Western Europe democracies resolved to defend their economic and political freedom. And we can secure such an alliance against Russian aggression only by willingness to give unequivocal military guarantees. We must be willing to guarantee the nations of the Western European union against any invasion of their territory or political integrity that
they themselves are prepared to resist. If any one of the European governments is too timid to accept our guarantee or to defend the integrity of its own country, then the sooner we find that out the better. It is folly to pour billions of American dollars into any country that is not clearly determined even to defend itself.

From the political side the central defect of the Marshall Plan is that it is not the implementation of a real foreign policy but an attempted substitute for a foreign policy. It originally appealed to many of its supporters because it looked like an effective measure for halting Communist expansion “short of war.” It was an attempt to buy European friendship with dollars. Such good effects as it had lay chiefly in its announcement. It was a way of saying to Western Europe: “We are with you.” But it was a needlessly expensive way; and in the long run it will prove an ineffective way.

For the Marshall Plan misconceives the economic disease from which Europe is suffering and misconceives the cure, which is not American dollars but internal reform. Except in Holland, and to some extent in Italy, there are few signs in Western Europe that economic reforms along the right lines are taking place. Promises of reform we have received in exchange for ERP are vague and rhetorical; and we appear satisfied with rhetoric rather than performance.

Virtually everything continues—the government planning, the allocations, rationing, price fixing, exchange control, overvalued currencies, and expanding socialism—that tends to make chronic the European shortages and trade deficits we are trying to cure. A French observer, Bertrand de Jouvenel, points out in the British magazine Time and Tide that “the largest drain on the French Treasury” and “the chief remaining source of inflation” is the deficit in the state-owned industries, which has been swelling day by day. It is this socialist deficit that American capitalism has now undertaken to finance. It is not surprising that European recovery does not take place.

Military aid, in return for a dependable united European front, would be a rational American foreign policy. But we are turning over billions of dollars to Europe in return for something so indefinite that no one seems quite to know what it is. ✽

**Collectivism on Relief**

July 19, 1948

The Marshall Plan is now in operation; and one of the chief misgivings of its critics is already being realized. This is that America would pour money into Europe without getting in return reforms that would really bring European recovery.

Nothing in the agreements concluded between the ECA and participating countries promises any real change from the ruinous postwar economic policies that these countries have been following. The British Government agrees, for example (and there are only minor differences in the French and other agreements), to “use its best endeavors” to make “efficient and practical use of all the resources available to it”; to think up “practicable projects for increased production of coal, steel, transportation facilities and food; to stabilize its currency, establish or maintain a valid rate of exchange, balance its governmental budget, create or maintain internal financial stability, and generally restore or maintain confidence in its monetary system; and to cooperate with other participating countries in facilitating and stimulating an increasing interchange of goods and services.”

Most of these promises are so vague as to be practically meaningless. They refer to ends, not means. Of course every government wants to use its resources efficiently: Of course it wants economic recovery, increased production, and a stable currency. It does not need to be bribed to want any of these things. The real question is: Has it been following or will it follow the policies likely to bring them?

In the opinion of the British authorities themselves, nothing in the agreement they have signed will require them to change their present collectivist course. As the London financial correspondent of The New York Times cabled: “Britain is, in fact, already doing its utmost to achieve these objectives. . . . On the question of early revision of the exchange value of the pound sterling, there is nothing in the agreement to suggest that this is at all likely or is at all necessary.”

So that’s that. Yet the simple truth is that European exchange control and overvalued currencies have not only brought about a chronic European trade deficit, which the American taxpayer is subsidizing, but have jammed up international trade and made such trade all but impossible even within Europe.

A recent Associated Press dispatch from London opened with the statement: “Trade in Western Europe is on the decline because most of the countries are too poor to buy from each other.” This is nonsense. The people within each of these countries are obviously not too poor to buy from each other. Countries that have things to sell to each other can obviously exchange them with each other. But when they set up a nightmarish system of bilateral quotas and import licenses for every transaction; when they insist on a pegged value for their own

In the opinion of the British authorities themselves, nothing in the agreement they have signed will require them to change their present collectivist course. As the London financial correspondent of The New York Times cabled: “Britain is, in fact, already doing its utmost to achieve these objectives. . . . On the question of early revision of the exchange value of the pound sterling, there is nothing in the agreement to suggest that this is at all likely or is at all necessary.”

So that’s that. Yet the simple truth is that European exchange control and overvalued currencies have not only brought about a chronic European trade deficit, which the American taxpayer is subsidizing, but have jammed up international trade and made such trade all but impossible even within Europe.

A recent Associated Press dispatch from London opened with the statement: “Trade in Western Europe is on the decline because most of the countries are too poor to buy from each other.” This is nonsense. The people within each of these countries are obviously not too poor to buy from each other. Countries that have things to sell to each other can obviously exchange them with each other. But when they set up a nightmarish system of bilateral quotas and import licenses for every transaction; when they insist on a pegged value for their own
The ideal that emerges from the Democratic platform is the complete paternalistic state. Less and less are the people to do anything for themselves. More and more are the bureaucrats to do everything for them—insure their health, federalize their education, build their homes, boost their wages, raise the prices at which they sell and lower the prices at which they buy. Everybody is expected to owe everything to the officeholders in Washington. Everybody is expected to forget that the cause of inflation is the absence of price control, exchange control, and government planning that are everywhere choking production and trade. Even the requirement for balanced budgets is rendered meaningless by exempting “deficits over a short period”—the length of which is nowhere specified. As for the interpretation of these pledges, is Britain helping to “maintain confidence” in its own money when it prohibits anyone from bringing more than £5 of it back into the country? The Marshall Plan was put forward to aid participating nations “through their own individual and concerted efforts.” It is in fact a costly relief program that is not getting in return the only reforms that would make a real and lasting recovery possible.

Democratic Platform Economics
July 26, 1948

The ideal that emerges from the Democratic platform is the complete paternalistic state. Less and less are the people to do anything for themselves. More and more are the bureaucrats to do everything for them—insure their health, federalize their education, build their homes, boost their wages, raise the prices at which they sell and lower the prices at which they buy. Everybody is expected to owe everything to the officeholders in Washington. Everybody is expected to forget that the officeholders can give nothing to B and C and D unless they have first taken it from A. A is the taxpayer, the forgotten man. The effect of confiscatory taxation on his incentives and on the national production is ignored. Spend and spend, tax and tax, and—elect and elect?

The sheer effrontery of some of the economic planks in the Democratic platform makes them read like intentional humor. “The Republican 80th Congress is directly responsible for the existing and ever-increasing cost of living.” Why? Because it refused to give Mr. Truman power to dictate prices. Mr. Truman thinks that the cause of inflation is the absence of price control. Nowhere in the Democratic platform are the real causes of inflation so much as whispered. Nothing is said about the threefold increase since 1939, brought about by Democratic fiscal and monetary policies, in the volume of money and credit. No connection is pointed out between all the foodstuffs being shipped abroad under the Marshall Plan and the consequent rise of food prices here.

The platform, in fact, demands still higher Federal spending on everything—social security, education, housing, veterans, public works, TVA’s, school lunches. Though the American taxpayers stagger under the greatest absolute peacetime burden of expenditures that the taxpayers of this or any nation have ever been asked to bear, they are calmly informed that their expenditures are still “inadequate.”

Affecting to deplore high prices on one hand, the platform boasts of them on the other. It is stuffed with figures on the increase of wage income, farm income, business and professional income. It never once seems to have occurred to those who inserted these figures that they are simply high prices looked at from the other side. If the Republican Congress is responsible for the high prices that consumers pay, then it should also get credit for the high prices that producers receive. They are precisely the same prices. But the Democrats blame the first on the Republicans and grab credit for the second themselves.

Indeed, they want to boost prices and costs still higher. They insist on jacking up minimum wages from 40 to 75 cents an hour—an increase of 87½ percent. This would, of course, push up wages all along the line, for skilled workers would insist on the maintenance of existing differentials. Pushing up costs further would push up prices further.

The platform insists on still more direct ways of increasing prices. Though in one section it complains that food is becoming too expensive for the average wage earner “and the prospects are more frightening each day,” it demands at another point “a permanent system of flexible price supports for agricultural products”—to make the prospect still more frightening. If a permanent system of price supports for agricultural commodities, why not a permanent system of price supports for all commodities? Why the discrimination? Could a shabby and unprincipled scramble for votes have anything to do with the matter? Yet while demanding that the prices of unionists and farmers be pushed up by law, and that the prices of nearly everybody else be pushed down by law, the platform blandly declares itself in favor of “free enterprise” and opposed to any “arbitrary and discriminatory restrictions.”

On labor relations the platform is even more inconsistent, if that is possible. It demands “the repeal of the
The Phony War against Inflation
August 2, 1948

It is one of the supreme ironies of the political situation that not only President Truman but many editorial writers, and even a number of Republicans themselves believe that he has put responsibility for inflation squarely in the Republican lap unless they give him price-fixing powers. Nothing could more clearly reveal the appalling confusion of thought in the country concerning the real nature, causes, and cure of inflation.

The truth is that Mr. Truman and his government have been following a reckless inflationary policy. The Democratic platform insists on an even more reckless inflationary policy. The Republicans do share responsibility for inflation, but chiefly because they have done so little to stop him. The special session on which he has insisted gives them the opportunity to make up for past negligence.

In this column of April 26 I suggested the form that a Congressional anti-inflation program might take. I pointed out then that “inaction on this subject would be a mistake not only from the national standpoint, but even from the standpoint of Republican prospects in November. Unless the Republican majority in Congress itself frames and passes a positive anti-inflation program,” I continued, “its criticisms of President Truman’s policies will seem very unconvincing by election day if inflation resumes its progress in the next six months.”

The four-point program that I suggested is, in summary: (1) Congress should authorize or direct the Federal Reserve Board to restore the former legal requirements of 35 and 40 percent reserves in the Federal Reserve Banks instead of the present 25 percent reserve requirement. (2) It might authorize the Federal Reserve Board to increase the reserve ratios of member banks, but only after the board had first restored the Reserve Bank ratios. (3) It should terminate inflationary monetary measures still on the books. (4) It should make a general declaration of policy directing the Federal Reserve Board to stop further inflationary expansion of money and bank credit. “Only by such a comprehensive measure (combined with sounder expenditure and tax policies),” I concluded in the April 26 column, “can Congress prevent the present inflation from going farther. Only by such a measure can it take the offensive in the battle against inflation and center public attention on the fact that it is, above all, government fiscal and credit policy that creates inflation. Otherwise President Truman will continue inflationary monetary policies while declaring, as in his speech to the American Society of Newspaper Editors, that the only cure for inflation is to give him power to fix prices.”

As Mr. Truman has followed precisely this course and as inflation has resumed its progress, something must be said about the new demands for rationing and price-fixing, particularly with regard to meat. Nothing could be more illogical or hypocritical than these demands in view of all the other government policies that are being followed. The price of meat is inescapably linked to the price of feedstuffs. When we ship feedstuffs abroad in great quantities, when we put high government support prices under them, we inevitably increase the price of meat. Rationing and price fixing are not merely irrelevant but fraudulent cures. They intensify the evil they seek to remedy. If we legally push down the price of meat, while bolstering up the price of feedstuffs, we remove the incentives for feeding and growing meat and so still further reduce the meat supply.

In following inflationary policies and then demanding price-fixing powers to stop inflation, Mr. Truman is like a man who throws a child into the water and then tears off his coat and proclaims himself to be the ideal and only possible rescuer. The one sensible reply that Congress can make is to order the culprit to arrest himself. If Congress passes a program that goes to the heart of the monetary cause, it will put Mr. Truman on the spot. If he vetoes the bill the phony nature of his demand for an end to inflation would be exposed and if he accepts it inflation could really be stopped.

Will Inflation Stop Inflation?
August 9, 1948

More than any other single man, President Truman is responsible for the inflation that has developed here since the end of the war. Yet no one seems more blissfully unaware of this fact than Mr. Truman himself. Let us look at his new eight-point “anti-inflation” program:

1—An excess-profits tax “to provide a Treasury surplus” and “a brake on inflation.” This cannot be taken
An excess-profits tax would reduce and unbalance production and increase inflation.

2—Consumer credit controls. Mr. Truman wants the government itself to extend more inflationary credit to build and buy houses, but wants to curb private credit to buy refrigerators to put in the houses.

3—More authority to the Federal Reserve Board to “regulate inflationary bank credit.” The board keeps demanding new powers while refusing to use those it already has. It wants power to raise legal reserve ratios of member banks. It should first be granted the power—for which it has not asked—to restore the former legal reserve ratios of the Federal Reserve Banks themselves. Reserve-bank credit is far more inflationary than member-bank credit.

4—Power to “regulate speculation on the commodity exchanges.” Speculation smoothes out price fluctuations and continuously adjusts demand to supply. Speculators do not do this perfectly, because no one can perfectly foresee the future; but they do it incomparably better than could politically motivated politicians.

5—“Allocation and inventory control of scarce commodities.” Free markets can do this far better than any government. Government allocation breeds political favoritism and corruption.

6—“Strengthening” of rent controls. Rent controls have intensified the housing shortage by encouraging existing tenants to use space wastefully, and by discouraging repairs, improvements, and new construction.

7—“Stand-by” powers to ration products “in short supply.” To the extent that rationing really does cut down demand and lower prices, it also lowers production of the rationed product. It intensifies the very shortage it is designed to counter.

8—Price control for scarce commodities. This is the very thing that makes them scarcer, by lowering the relative profit margin in producing them. Mr. Truman would approve “non-inflationary wage increases”—a wonderful phrase. Mr. Truman is sure in advance that many wage increases can be “absorbed within the price ceilings.” This means that he would boost wages further at the expense of profit margins and give officeholders life-and-death powers to determine the profits of every industry and firm. The totalitarian nature of price fixing should be clear.

Mr. Truman does think that the government should have power “to limit wage adjustments which would force a break in the price ceiling.” But he would even break price ceilings “to correct [wage] inequities.” This lip service to wage control should deceive no one who remembers our experience before Congress took price-fixing powers away from Mr. Truman.

After this eight-point “anti-inflation” program, Mr. Truman recommends every inflationary measure in the book. He wants an inflationary minimum-wage increase, which would raise production costs throughout the economy. He wants more Federal expenditures for housing projects, education, electricity, and a further boost in Federal salaries. Not once does he stop to announce or even to express any interest in how much these new inflationary expenditures would raise our already fantastically inflated Federal budget. He never mentions the budget deficit predicted even before these demands by his own Secretary of the Treasury. It is deficits that make inflation.

The cure for the evils of inflation, he thinks, is more inflation. ✧

Dollar Shortage Forever
August 16, 1948

This title over a recent article in the London Economist raised for a fleeting instant the hope that that distinguished journal at last recognized the elementary truth that the [so-called] world “dollar shortage” will continue just as long as governments refuse to permit their citizens to pay the world market price for dollars. But, alas, the article merely embraced every hoary mercantilist fallacy from Colbert to Keynes.

The Economist believes, for example, that the spectacular successes of the free market in the nineteenth century occurred “only because there was in the world a natural equilibrium.” This is nonsense. Equilibrium between supply and demand, between exports and imports, is brought about not by nature but by prices—by free prices in free markets.

“The continental United States,” continues The Economist, “unlike the tiny British Isles, can produce all the food and most of the raw materials it needs. . . . America does not, as Britain did even in the days of its ascendancy, inevitably buy as much abroad as it sells there. . . . It seems overwhelmingly probable that the dollar shortage will last for a generation to come.”

One hardly knows where to take hold of anything so wrong. We are not economically self-contained. We depend on foreign sources for our sugar, coffee, tea, cocoa, wool, natural rubber, and other items too numerous to mention. And in any case we must inevitably buy as much abroad as we sell there, for the simple
reason that the only alternative is to give our goods away. To “lend” foreign countries the dollars to “buy” our goods, and never to get repaid, is just a disguised way of giving. This is not lack of equilibrium, but lack of sense.

The “dollar shortage” of which Europe and the rest of the world today complain is not the result of some singular self-containment on the part of the United States. It is the result solely of overvalued currencies under exchange control. When a government overvalues its paper money and then calls out the police to prevent its own citizens from buying or selling their own or foreign money at the rates at which they want to buy and sell, it systematically strangles its foreign trade. Exchange control, overvalued currencies—and the whole system of import and export licenses, bilateralism, quotas, allocations, price controls, and government planning that goes with it—have finally jammed up practically everything but government subsidized trade, not only between Europe and the United States but even inside Europe itself.

And now—under government sponsorship, of course—we are about to teach British businessmen their business. On the theory that they wouldn’t do it for themselves, our government is going to prod them into becoming more efficient and giving us tougher competition for world markets. One defect of this plan is that it is entirely irrelevant to the problem we are trying to solve. That problem is the trade deficit. Even if we succeeded in increasing British production by our patronage, it would not cure the British trade deficit. On the contrary, with an overvalued pound, increasing British production would increase the British trade deficit, Britain would have to import more raw materials for its industries; and British consumers, with more income in pounds, would want to buy more British products as well as more food, tobacco, refrigerators, and automobiles from us, or whatever else their bureaucrats would let them have.

A correction of the British (or French or Dutch or Norwegian) trade balance could be forced practically overnight, however, by simply allowing exchange rates to find their own market levels. This would discourage imports and encourage exports; it would make all currencies automatically convertible in any amount desired; and the “dollar shortage,” in the sense in which the phrase is now used, would disappear. Any nation will have a trade deficit as long as it insists on overvaluing its currency. The world dollar shortage will last as long as world exchange control. And the American taxpayer will continue to foot the bill.

---

**Hypocrisy about Inflation**

*August 23, 1948*

When we keep in mind the demagogic bombardment to which it was subjected by the President, the record of the special session of Congress was far better than might have been expected. Its virtues consisted chiefly in what it did not do. It ignored most of what would have been the disastrous program proposed by Mr. Truman.

It did pass a modified housing bill, not inflationary enough to satisfy Mr. Truman, of course, but nonetheless inflationary. Mr. Truman himself pointed out in his recent economic report that the present “volume of residential construction is already straining the capacities of the construction industry” and “competing with other primary national needs.” The further doses of government credit made available in the new housing law, therefore, are not likely to increase the volume of the nation’s new housing, but merely the cost of that housing.

The controls that Congress reissued on consumer installment credit touch only the fringes of inflation. Many consumers will simply draw down their savings accounts or sell Series E bonds to make their purchases. To the extent that installment credit controls really are effective, they will simply shift buying away from durable products like automobiles, refrigerators, and furniture into more perishable goods. For installment credit does nothing in the long run to increase the total volume of consumer buying. The $50 a month that a family puts aside to meet installment payments cannot be spent on books, sundaes, cigarettes, or movies. Finally, one must point out once more the glaring inconsistency of liberalizing government mortgage credit for homes while tightening private credit for furnishings to put in the homes.

Nor did Congress accomplish anything important when it gave the Federal Reserve Board power to increase reserve requirements of member banks by 4 percentage points against demand deposits and 1½ percentage points against time deposits. For under present conditions the member banks can simply rediscount or sell their government securities to the Federal Reserve Banks, which stand ready to receive them at guaranteed minimum prices.

The one really important anti-inflation step that the House took was thrown out by the Senate. This was the provision restoring reserve ratios of the Federal Reserve Banks themselves to the legal requirements, which existed up to 1945, of 35 percent against deposits.
and 40 percent against notes, compared with the present “emergency” requirement of only 25 percent.

The mutually contradictory reasons which were put forward for rejecting this revealed the appalling confusion and hypocrisy that still exist in Washington regarding inflation. Some opponents dismissed it as “meaningless,” on the ground that Federal Reserve Bank reserves are already above 35 and 40 percent. These critics, in other words, believe that we shouldn’t lock the stable until after the horse has been stolen. It is precisely because reserve-bank ratios are still above 35 and 40 percent that we could safely restore the legal requirements now without monetary disturbance. The purpose would not be to roll back present inflation but to limit future inflation. The Secretary of the Treasury and the representatives of the Federal Reserve System who appeared before Congress realized this. They opposed the provision precisely on the ground that it would ultimately prevent the Federal Reserve Banks from continuing to inflate by supporting and monetizing government securities.

Congress should have forced the Federal Reserve authorities to put their own house in order before giving them more powers over member banks and installment credit. It should not only have restored the original reserve-bank reserve ratios, but required the reserve board to add at least one additional percentage point to the Federal Reserve Bank reserve ratios for every additional point that the board thought necessary to add to member-bank reserve ratios. But Congress merely gave the authorities more power to prevent others from inflating, while leaving them free to continue to inflate recklessly themselves. *}

A Bear by the Tail
August 30, 1948

On Aug. 9 the Treasury announced that interest rates on its one-year certificates would be raised to 1¼ percent from the then-existing rate of 1⅛. Three days later Federal Reserve Banks in nine of the twelve districts raised their rediscount rate from 1¼ to 1½ percent. These were belated moves.

Secretary Snyder described the government’s action as a “further anti-inflationary move.” This was overstating the case. No inflation on record has ever been stopped with a rediscount rate of 1½ percent or short-term rates to private borrowers running as low as 2 percent. It is only because we have become accustomed in late years to infinitesimal short-term interest rates of a fraction of 1 percent that rates of 1½ and 2 percent can be solemnly described as “anti-inflationary.”

The importance of the increase is purely symbolic and psychological. As Thomas B. McCabe, the new chairman of the Federal Reserve Board, put it: “Each increase in the rediscount rate repeats the warning that credit is in need of continued restraint.”

But what the Administration is at last doing in the realm of tightening interest rates is inconsistent with what it has been doing in the government bond market. In the year ending Aug. 18 the Federal Reserve Banks bought $6,690,000,000 additional government bonds. The effect of such purchases was described by Chairman McCabe in his recent testimony before the Senate Banking and Currency Committee:

“The result of these purchases of government securities by the Federal Reserve Banks is to supply additional reserve funds to banks. . . . These new reserves in turn provide the basis for an increase in bank credit that may be many times the amount of new reserves obtained. . . . The effect has been to increase significantly, and it may be dangerously, the money supply. . . . If the policy of maintaining the 2½-percent yield level on long-term Treasury bonds is continued . . . additional reserve funds would be made available to banks which, unless otherwise offset, could sustain a further very large inflationary expansion of bank credit. . . . Further credit expansion will add to the pressure for rising prices. Continued credit expansion will store up trouble for the future and make the inevitable adjustment more dangerous for the stability of the economy.”

When the support of government securities at present levels is admitted to be so dangerously inflationary, why is it continued? Why did the Federal Reserve authorities even oppose a restoration of the former Federal Reserve Bank reserve ratios of 35 and 40 percent, which would have put a future curb on such support? Chairman McCabe explains: “The system has made a public commitment to support the 2½-percent yield level on long-term Treasury bonds for the foreseeable future.” Why did it make this commitment? Well, it is always politically embarrassing to have government bonds selling below par. More important, the banking system is loaded up with government bonds. Many fear that its very solvency would be threatened if these bonds were allowed to fall below a moderate discount in the market. There are various ways in which this problem might be dealt with. I hope to discuss them here in a later article. But I can reveal in advance
Repressed Inflation
September 6, 1948

In *Kyklos*, a quarterly published in Bern, Switzerland, the European economist Wilhelm Röpke in 1947 diagnosed the central economic disease of Europe as "repressed inflation." The truth of this diagnosis has become increasingly clear. The disease it describes prevails today not only in Europe but in Asia, Africa, and Latin America. It has been imposed on postwar Germany and Japan with the energetic cooperation of our American administrators. It is the disease which President Truman would unwittingly impose on the United States itself. We should do well, therefore, to study the nature, origins, symptoms, prognosis, and cure of this malady.

Repressed inflation begins, like open inflation, by printing too much money in relation to goods. This may be caused by a war, by an occupation, by a cheap-money or a so-called "full-employment" policy, or by some combination of these. Under an open inflation the effect of too much money would be a general increase of incomes, prices, costs, and foreign exchanges. The government wishes to avoid these soaring internal prices and foreign exchanges, but it refuses to abandon the inflationary fiscal and monetary policies that cause them.

Therefore it *forbids* the excess of monetary demand to result in increased prices, costs, and exchange rates. For free markets it tries to substitute a system of ceiling prices combined with rationing, allocations, import prohibitions, and exchange control—in short, a network of coercions, all under the euphemistic name of "planning."

Every economic transaction becomes politicized. Even money no longer has any definite value except when combined with ration coupons or some discriminatory license. An open inflation, it is true, causes crying injustices and leads to unbalanced production. But a repressed inflation is even worse. It adds stagnation to unbalanced production and unjust distribution.

Under repressed inflation the budget usually remains unbalanced. Low interest rates are arbitrarily maintained. These encourage excessive borrowing and further monetization of the public debt. To counter its own inflation the government is constantly compelled to increase its counterpressure or repression.

The whole system of compulsory values becomes constantly more fictitious. Unbalanced production, chaos, and stagnation assume more alarming proportions. The population reacts by mounting discontent, distrust, disobedience, and bewilderment. The government is finally left with no choice but to admit its defeat or to resort to complete totalitarianism. The bureaucrats argue that they must keep their coercive controls until production has increased enough to relieve the pressure of inflation and to enable them to dismantle the control machinery. They think they can close the gap between money and goods by increased production. But they fail to recognize that it is exactly their repressive controls that are stifling production. They refuse either to mop up the previous surplus of money that has caused the inflation or to balance their budget and discontinue their cheap-money policies. So the gap between goods and money tends to become greater rather than less.

Most of the advocates of repressed inflation still talk as if their country were a besieged fortress where a given amount of goods had to be distributed equally. They cling to the melancholy ideal of a "poorhouse socialism." They overlook the fact that their real problem is to increase production. And they adopt precisely the measures that prevent this. Their policies finally force the emergence of black markets.

Economically (though not politically) the cure for repressed inflation is simple. It is, on one side, to mop up surplus money, to balance the budget, and to halt the further expansion of money and bank credit. On the other side, it is to throw out price and exchange controls and to let prices and production be determined by free markets and free competition. This is the only way to get maximum balanced production of goods consumers want.
Does Stalin Want War?
September 13, 1948

Does Stalin want war? This is not only the most fateful political question that confronts the world today, but the most fateful economic question. Economically, it overshadows inflation, for the extent of inflationary pressure will itself depend in large part on the issue of war or peace. War dictates the level of taxation and the whole structure of production. The recent diplomatic tension has been a major influence on our commodity and security markets, on business sentiment and business plans.

If it takes two to make a war, it also takes two to keep the peace. And whatever Stalin wants today, he does not primarily want peace. No one who sincerely yearns for peace would turn loose every organ of propaganda against us; would order a daily barrage of vilification; would daily trump up new accusations and new lies against us; would systematically sow suspicion and hatred against the Western democracies; would use his consulates and embassies abroad as propaganda centers and espionage nests against the countries that harbor them; would daily raise new issues, think up new insults, create new crises; would cut off rail access to Berlin, “buzz” our supplying planes, arrest our representatives—do everything, in short, calculated to provoke an incident that might touch off a war.

In 1946, at Fulton, Mo., Winston Churchill said he did not believe that the Soviet leaders wanted war: what they wanted were the fruits of war. But as the London weekly Time and Tide has put it, the Soviet leaders have since shown that “they are determined to have what they want by almost any means, and perhaps by any means.”

In the New Leader of July 24, David J. Dallin, the author of “Soviet Russia’s Foreign Policy,” declared that “the Kremlin no longer questions the conclusion that war is bound to come—if not tomorrow, then the day after.” Dallin interprets its present policy as an effort to create incidents or situations that will provoke us into shooting first, “so as to enable Moscow to place the guilt for the first shot squarely on Pennsylvania Avenue and Downing Street.”

But whether or not Stalin really wants a shooting war, he obviously means to continue his cold war. He will use every economic weapon. In the countries that he takes over, he will continue to confiscate savings, to destroy private initiative, to nationalize, collectivize, and regiment. And he will continue to thwart or sabotage every measure designed to restore or rebuild the world economy.

Fortunately, whatever Stalin’s intentions, our own proper counteraction is clear. It must be a policy of absolute firmness. Whether Stalin is bluffing or whether he really wants war, we have nothing to gain and everything to lose by continuing the course of feeble concession and appeasement we have followed for the last three years. Whenever we capitulate, we not only weaken our position, but we confirm Stalin’s opinion that we are already weak and afraid of him. We embolden him to new aggressions.

The chief reason we have been losing the cold war with Russia is that we have remained purely on the defensive. Paradoxical as it may seem to some, our one hope now of preventing a shooting war is to seize the offensive in the cold war that Stalin has been waging against us.

We must offer unequivocal military guarantees to the Western European union. We must support China in its fight against the Communists, economic chaos, and Soviet aggression. We must keep probing for Stalin’s weak spots. And we must embark upon a positive and relentless propaganda campaign of our own, not merely on political disputes but on the unworkability and slavery of Communism and on the freedom and productivity under capitalism.

The most serious obstacle to this program is that our present officeholders do not know how to present the case for capitalism. They have, in fact, no real understanding of it and no real faith in it. This is the real weakness of the West.

The Ethics of Capitalism
September 20, 1948

The “Christian Church,” concluded the original draft of a report to the World Council of Churches, “should reject the ideologies of both Communism and capitalism, and should seek to draw men away from the false assumption that these are the only alternatives.”

The implication of this sentence is that Communism and capitalism are about on a par as major evils. But the means of production must either be owned by private individuals, which is capitalism, or by the state, which is Communism or socialism. Dr. John C. Bennett, who drafted this plague-on-both-your-houses, has admitted that British “democratic socialism” comes closest to what he had in mind as the undisclosed Third Way, the “new creative solution.”

Now the belief that we can have socialism and still retain human liberty and avert state despotism has proved to be the great delusion of the present age.
For when the state controls everyone’s means of livelihood, it inevitably uses this power to suppress freedom of speech. It is naive to suppose that the individual will in fact be free to criticize the rulers who can decide what job he will take or whether he can have a job at all.

The Stalins and Titos have in fact used such power not merely to suppress all criticism but to compel the most abject and nauseating flattery. But Communism is merely the name for what happens when socialism becomes complete, or nearly so. Liberty shrinks in direct proportion as socialism advances.

As a result of protests, the final version of the report to the World Council of Churches put the modifier “laissez-faire” in front of “capitalism”—but apparently only in the sentence I have quoted. It is difficult to measure the precise effect of this change. Much depends upon the interpretation of “laissez-faire.” It has long been used as little more than a term of abuse, synonymous with anarchy. Only the unregenerate and depraved are thought still to believe in it. When used by the classical economists, however, the phrase presupposed a framework of law and order, under which the state illegalized force, theft, fraud and the breaking of contractual promises, but otherwise permitted free markets and refrained from detailed economic restrictionism.

To reject “laissez-faire capitalism,” therefore, is by implication to reject free markets and presumably to endorse some sort of state “planning.” This euphemism for collectivist coercions and compulsions ought by now to have been sufficiently discredited by what is happening in England, France, and a score of other countries, where the collapse of state planning has led to increasing dependence on capitalist America, to chronic shortages, black markets, and moral cynicism.

A churchman remains within his spiritual province as long as he criticizes economic systems purely on ethical grounds. But he cannot competently do this unless he really understands the economic system he is presuming to judge. And this understanding requires more arduous study than the authors of the World Council of Churches report appear to have devoted to it.

What, for example, is “justice” in an economic system? Is it the equalization of rewards regardless of the contribution that anyone makes or fails to make to the social product? To many of us a system under which the talented and skilled and industrious received no more than the incompetent and shiftless and lazy, and which equalized rewards irrespective of effort, would be not only unjust but, what is worse, unproductive. Most of us, if we thought that were the only alternative, would prefer an enormously productive if not ideally just system to one which provided a perfectly “just” distribution of scarcity and poverty.

Fortunately, a free capitalism not only provides both more liberty and welfare than any other system, but more economic justice. Under it most of us, in spite of exceptions, get approximately the economic value that we ourselves contribute to the total social product. That is how the system provides incentives. Keep improving it, certainly; but don’t “reject” it. ⚫

The Fetish of Bond Parity
September 27, 1948

The support of the government bond market by the Federal Reserve System, in order to hold the price at par, is today the principal inflationary factor in our economy. Chairman McCabe of the Federal Reserve Board virtually conceded this in his recent testimony before the Senate Banking and Currency Committee: “If the policy of maintaining the 2 ½ percent yield level on long-term Treasury bonds is continued . . . additional reserve funds would be made available to banks which . . . could sustain a further very large inflationary expansion of bank credit.”

Yet the policy has not only been continued since he spoke, but continued on an increased scale. The Treasury and the Federal Reserve authorities, in short, prefer to risk a reckless inflation to doing anything to halt or curb the present policy of pegging government bonds at par. Perpetual parity for the outstanding government long-term bonds has become sacrosanct and untouchable. It is a fetish to which all other economic aims are now subordinated.

Yet the reasons for this policy, when ventilated, turn out to be far from convincing. The most important of them is that, if the government bonds were left to a free market, they would fall to a discount that would threaten the solvency of our banking system. I shall postpone to a subsequent column discussion of the possible ways of preventing such a consequence. The fallacy in the argument that the government must hold down interest rates “to reduce the burden on the taxpayer” I have already pointed out in a previous column “Cheap Money Means Inflation” (Newsweek, Dec. 8, 1947).

But perhaps the greatest irony of the inflationary bond buying policy is that even its supposed direct beneficiary, the government bondholder himself, is not protected by it. On the contrary, he is a victim of it.

There is a widespread notion that the government “broke faith” with its bond buyers of the first world war because Liberty bonds were allowed to fall at one time
The present pegging of the government bond market for the cost of living had risen 26 percent from the May of 1920, their owners were certainly not happy. It adversely affected merely the few who were forced to hold on to them until they were redeemed in 1933 were not only paid off 100 cents on the dollar, but had the added advantage of a decline in living costs. For every dollar he had invested in the bonds the buyer then had a net purchasing power of only 65 cents. But this situation lasted for only a few months. It adversely affected merely the few who were forced to dispose of their bonds in that short period. Those who held on to them until they were redeemed in 1933 were not only paid off 100 cents on the dollar, but had the added advantage of a decline in living costs. For every dollar he had invested the buyer received in return (in addition to the interest in the meantime) a purchasing power of $1.28.

True, the present war bonds have been maintained on the market at par—in terms of dollars. But in order to keep the bonds at par the debt has been monetized, inflation has been increased, and the purchasing power of the dollar itself has been lowered. Though the war bonds issued in November 1942, for example, still sell around par, their purchasing power at par, in terms of living costs, is now only 69 percent of what it was when the bonds were bought.

The holder of these bonds, in other words, has not only suffered a decline of some 30 percent in the purchasing power of his bonds if he has to sell them now, but he is destined to suffer an even greater decline if an even higher price level prevails at the time of redemption. And an even higher price level surely will prevail if the present bond support policy is continued. So far as the interests of the bondholders are concerned, in short, the mere dollar “parity” maintained by present inflationary support policy is a delusion.

**Bond Parity without Inflation**

October 4, 1948

The present pegging of the government bond market by the Federal Reserve Banks, in order to hold the price up to par and keep the yield down to 2½ percent, is today the principal inflationary danger in our economy. The most important argument of those who insist on continuing this inflationary support policy is that if government bonds were left to a free market they would fall to a discount that would threaten the solvency of our banking system. Insofar as this fear has substance, there are several ways in which such a consequence could be prevented.

A substantial budget surplus and a continuous retirement of the public debt (at an average rate, certainly, of not less than $2,500,000,000 annually over the next decade) is at least an essential part of any solution of the government-bond problem. But it is far from the whole solution.

The economist Benjamin M. Anderson has proposed that the outstanding debt should be funded by offering private investors new long-term government bonds at rates of interest “that will really attract them.” To protect the banks in this change of policy, he suggests that banks holding long-term government bonds be allowed to exchange them for new issues at the higher rates of interest, at a discount of, say, 2 percent as compared with cash subscribers, leaving them with some loss but not with losses that would ruin their depositors.” One drawback to this proposal is that the Treasury could not know in advance precisely what long-term rate of interest would be most economical and yet high enough to prevent the specter of a substantial discount on bank-held government bonds from arising all over again at a later time.

This difficulty is not insurmountable. One way of meeting it would be for the Treasury to allow the exchange of outstanding long-term bonds for coupon bonds with an*fluctuating* rate of interest. Such bonds would provide, for example, that at the beginning of each six-month interest period the coupon rate would be changed to correspond to, say, the nearest eighth of 1 percent to the actual yield on the bonds at their market price at the end of the preceding six-month interest period. By this automatic device the new bonds could always be held very close to par. Their market value, in fact, ought not to fluctuate in a much wider range than those of six-month certificates.

On such a bond, it is true, the Treasury could not know in advance precisely what average interest rate it would have to pay over the following fiscal year. This uncertainty, however, would be no greater than that already attached to the Treasury’s short-term financing. And the risk that the government would be obliged to pay higher interest rates is a very minor evil compared with the further inflation that a continued effort to avoid paying higher interest would inevitably produce.

Such variable-coupon bonds, of course, would not be offered to raise new funds but only as a conversion...
Suppressing Free Markets
October 11, 1948

At a few points the annual report of the International Monetary Fund touches reality. It declares that “the European countries must themselves place their economies on a self-sustaining basis.” It recognizes that government economic controls have at least “in certain instances . . . hampered production and weakened the incentive to work.” It points out that in most countries today “the most important consideration is the termination . . . of domestic inflation.” It concedes, finally, that in at least some—unspecified—countries “an adjustment of the exchange rate may sooner or later be necessary.”

But in spite of these assertions, the main argument of the 124-page report is thrown heavily on the side of retaining overvalued exchange rates, keeping exchange controls, prolonging all the internal controls that this necessitates, and even “temporarily” tightening and extending such controls. In brief, the report on net balance supports not the philosophy of freedom but the philosophy of collectivist planning. Its recommendations, which in the main contradict those just mentioned, would not hasten world recovery but retard or prevent it. They would drain the American economy farther in an effort to support the insupportable.

The chief reason for the chronic European trade deficits that we are trying desperately to make up by ECA grants is precisely the overvaluation of European currencies through exchange control. But though the Fund’s report admits that exchange-rate “adjustments” may be necessary “sooner or later,” it proceeds to offer all sorts of excuses for not making them now.

These excuses are often inconsistent. Thus on page 2 we are told that “by the end of 1947 nearly all the European countries had reached or exceeded their pre-war outputs.” But on page 8 we learn that “the capacity of these countries to export has been severely reduced.” On page 23 we are told that “so long as an exchange rate does not hamper a country’s exports, there is little to be said in present world conditions for altering it.” Yet an excessive exchange rate must necessarily hamper a country’s exports by overpricing its goods in foreign markets.

The Fund’s standard ignores, moreover, the effect of an excessive exchange rate in unduly encouraging imports. Yet this consequence gets a sort of backdoor recognition on page 28, when the Fund declares: “Until the abnormal demand for imports can be checked by other means, some countries may have to use penalty rates of exchange for this purpose.” In other words, in order to defend an excessive exchange rate for exports, the Fund is forced to recommend a different exchange rate for imports. Yet it elsewhere professes to deplore precisely such “multiple currency practices.”

The Fund is alarmed by what it calls “premium prices” on gold. It wants an even more complete government suppression of private transactions in gold. Yet the real offense of gold “premium prices” is that they expose the fraudulence of existing official paper-money valuations.

The fact is that its basic premises drive the Fund to advocate not free enterprise but an international system of collectivist and coercive state “planning” as the only way to world recovery. On page 25 it declares flatly that “the fundamental conditions which would make possible the abandonment of trade and exchange restrictions are . . . entirely absent today in most of the world.”

The Fund complains about the inconvertibility of currencies, which has finally made it all but impossible for European countries to trade even with each other. But it never seems to occur to the authors of the report that inconvertibility is merely the inevitable consequences of preventing currencies from being bought and sold at their free-market rates. In a free market any currency could be converted at any amount into any other. In fact, it never occurs to the authors that the suppression of free markets—in currencies, exports,
imports, investment, domestic prices, and domestic trade—is the main cause of the present world economic crisis.

Cheap Money Causes Inflation
October 18, 1948

Artificially low interest rates are a direct and major cause of inflation. I tried to point this out in a previous article, “Cheap Money Means Inflation” (Newsweek, Dec. 8, 1947). But the proposition is frequently denied by government monetary managers who want to maintain cheap money for political purposes. Not until the causation is so well and so widely understood that it can no longer be successfully disputed will inflation be halted abroad or at home.

The interest rate is a price like any other. Free prices balance the supply of and demand for commodities. Free interest rates balance the supply of and demand for loanable capital. When government edict holds a commodity below its free market price, an increased amount of that commodity is demanded. Exactly the same thing happens with credit. Artificially low interest rates increase both the number of borrowers and the amount that each of them wants to borrow.

People are confused by some experiences that seem on the surface to contradict this. They point out that interest rates can sometimes fall almost to nothing and still fail to stimulate borrowing, and can at other times rise very high before they discourage borrowing. But this is simply because the demand for loanable funds is largely a derived demand. It is a joint demand with other things. Interest rates are merely part of a composite cost of production.

The case is no different in principle from the demand for bricks. When all other costs are too high in relation to the price at which new houses can be sold, brickmakers might not increase their sales even if they offered their bricks for next to nothing. On the other hand, a 100 percent increase in price of bricks might mean, say, less than a 10 percent increase in the overall cost of building. So in good times a sharp rise in the price of bricks alone might not appreciably cut down the demand for housing or the derived demand for bricks.

But on the supply side there is a profound difference between credit and commodities. An excessively low price cuts down the supply of a commodity because it cuts profits and drives marginal producers out of business. But the creation of new credit has practically no cost of production. When a bank makes a new loan to a customer, it simply enters a deposit credit on its books for the amount. It creates new money with a stroke of the pen. Artificially low interest rates increase the demand for bank loans; increased bank loans mean increased bank deposits; increased deposits mean an increased volume of money; an increased volume of money means an increased monetary purchasing power pushing up the prices of goods. Cheap money means inflation.

Conversely, an accelerative increase in the creation of new credit and new money is necessary to keep interest rates down artificially.

This chain of causation is denied by our present monetary managers. Or rather, they admit its application to private credit, but not to government credit. They admit its application to the Federal Reserve member banks, but not to the Federal Reserve Banks themselves. Hence we have the preposterous situation in which the Federal Reserve authorities, in a “disinflationary” gesture, crack down on member-bank excess reserves under $1,000,000,000 (near a minimum working level), while the Federal Reserve Banks themselves hold government securities of more than $23,000,000,000. In the last year the Federal Reserve Banks have bought $8,800,000,000 of government bonds, of which $3,300,000,000 were bought in the last three months alone.

All this is the result of trying to hold down the interest yield on long-term government bonds to 2½ percent. As the Committee on Public Debt Policy declared in its final report last week: “Central banks and treasuries . . . cannot exercise controls over excessive credit expansion and at the same time keep money excessively cheap for government borrowing. When a Federal Reserve Bank buys government bonds to peg the price, Federal Reserve money flows out and increases the money supply. This is wholly inconsistent with the effort to fight inflation by reducing the money supply in other ways.”

Cripptic Economics
October 25, 1948

Before the National Press Club in Washington on his recent visit, Sir Stafford Cripps, Britain’s Chancellor of the Exchequer, declared that the Labor government had “no idea whatever” of devaluing the pound sterling. He added that devaluation would “increase the price of our imports and decrease the price of exports, which is exactly the opposite of what we are trying to accomplish.” Later he explained that what he meant was that devaluation of the pound would swing the “terms of
An overvalued pound unduly encourages imports both with the pound pegged at $4, they will cost the British £72. But it would not cost the British any more in $36 a bolt. At a $4 pound, the British exporter gets £9 on the contrary, it would get more. A nation cannot alter the terms of trade in its favor merely by manipulating its exchange rate.

Let us look at the matter first from the side of imports. If wheat is selling here at $2.16 a bushel, then a hundred bushels of wheat will cost the British $216. With the pound pegged at $4, they will cost the British buyer (ignoring subsidies) £54. If the pound fell to $3, the same wheat, it is true, would cost the British buyer £72. But it would not cost the British any more in dollars. And what Britain now complains of is not a pound shortage but a dollar shortage. The British Government can print all the pounds it wants. One of its troubles is that it has already printed too many.

Now let us look at the matter from the side of exports. The British sell cloth in our market, say, at $36 a bolt. At a $4 pound, the British exporter gets £9 for it. But if the pound fell to $3, the exporter would still be able to get $36 a bolt here. Therefore he would get £12 a bolt instead of £9. His sterling profits from export, and his incentive to export, would be that much greater.

Sir Stafford’s belief, therefore, that sterling devaluation would “increase the price of our imports and decrease the price of exports” is not true at all if we look at these prices in terms of dollars. And it is the supply of dollars about which the British bureaucrats are always complaining. If we look at these prices in terms of pounds, it is true that the price of Britain’s imports would be greater in pounds, but the exact opposite of the truth that it would get fewer pounds for its exports. On the contrary, it would get more.

It is the insistence of the British Government on keeping the pound above its free market value that is chiefly responsible for the chronic British trade deficit. An overvalued pound unduly encourages imports both of necessities and of luxuries. This forces the British bureaucrats to hold down imports by license, quota, and prohibition. And where the overvalued pound does not force British exporters to price themselves out of foreign markets, it makes the profit margin on their foreign sales so unattractive as compared with what they could get from domestic sales that the British Government has to order manufacturers to sell abroad, has to allocate goods for export, and has to forbid its own citizens from buying more British products than some arbitrary domestic allotment. Thus foreign trade is carried on by a series of compulsions on buyers and sellers, consumers and producers.

It is only Marshall-Plan aid that enables this system to keep going at all, by forcing the American taxpayer to pay for the trade deficit that the system creates. The European trade deficit could quickly be solved by free markets and free exchange rates, which would enormously stimulate exports at the same time as they would discourage imports. But most of the governments of Europe have no faith in free markets, do not understand their function, and will not permit them to operate. In addition, most European governments wish to conceal their inflations by holding down internal price levels by edict.

Texas Grows and Votes
November 1, 1948

DALLAS—Inside the American boom Texas has a super-boom. Inside the Texas super-boom is the Houston super-duper-boom. It has been on for a long time. A town of less than 2,400 population in 1850, and 385,000 in 1940, Houston claims 495,000 today. Since 1939 the number of its manufacturing plants has almost doubled and its industrial employment has more than trebled. Such growth is no flash in the pan. It is Manifest Destiny.

There are many reasons for the incredible prosperity and industrial expansion of Texas. The chief one is oil. This one state produces more than 44 percent of the nation’s whole output of crude oil. It holds 55 percent of the nation’s entire proven oil reserves. In fact, the Texas oil rush of 1948 is reminiscent of the California gold rush of 1849. The state seems crowded with millionaires who were broke a few years ago and then struck oil. One hears of a dozen men worth more than $50,000,000 each, of half a dozen more worth more than $100,000,000 each.

But such estimates, true or false, give a distorted overall picture. There are more than 100,000 oil wells in Texas, and new ones are being drilled at a rate of 10,000 a year. But thousands of these turn out to be dry holes. As in a lottery, one is apt to hear only about the winners. One hears little about the huge misdirection and waste of capital and labor in the quests for oil that fail. Yet more than four out of every five of the
wildcat wells drilled in Texas turn out to be dry. It is significant that the big companies are content to leave the gamble of exploration work largely to wildcatters and independents, and to buy the wells or fields after they have been proven.

But oil is only part of the Texas story. The state has a record cotton crop at high prices. It has been selling its cattle for record prices. It is the fastest growing center for chemical industries. It is a chief beneficiary of the decentralization of industry and of the new defense program. Everything seems to be working for Texas.

Politically the state is boiling. The Democrats are deeply and bitterly split. To the division between conservatives, States' Righters, and New Dealers has been added the feud between the supporters of former Gov. Coke Stevenson and of Rep. Lyndon B. Johnson that arose from the Senatorial primary race. In the run-off Johnson ran ahead of Stevenson by only 87 votes out of a total of 988,295. The vote turned in from some of “the valley” counties was deeply suspicious. Stevenson supporters have charged fraudulent voting and counting. Johnson and his lieutenants have opposed investigation. Stevenson himself, on the issue of honest elections, has thrown his support to the Republican Senatorial candidate, Jack Porter.

Some political experts believe that the total vote in the Texas Senatorial race will be bigger than in the Presidential, and that Porter may run ahead of Dewey and Warren. Johnson, however, is expected to win. A serious question may then arise whether the Senate will seat him. If the new Senate majority is Republican, or even more if the Republicans need a majority of one to organize, then it is believed that Johnson’s right to a seat him. If the new Senate majority is Republican, or even more if the Republicans need a majority of one to organize, then it is believed that Johnson’s right to a seat will be challenged. So the Texas Senatorial imbroglio could have a decisive national consequence.

That Dewey can capture the Texas electoral vote is regarded by most observers as at best an outside possibility. The range of most guesses is that Truman will get between 50 and 60 percent of the popular vote, Dewey between 25 and 35 percent, Thurmond around 10 percent, and Wallace 3 to 5 percent. Even this, however, would be a remarkable Republican showing for Texas, and a still more remarkable anti-Democratic showing. For the first time on record prominent Texas newspapers, such as The Houston Chronicle, The Houston Post, and The Dallas News, have come out for the Republican ticket. Texas voters by the thousands are publicly and defiantly stripping off their life-long Democratic brass collars. One permanent result of the present revolt may be to make Texas a two-party state.*

How Free Will Our Economy Be?
November 8, 1948

The democratic victory will have a crucial effect on the future freedom of the American economy. True, neither of the Presidential candidates supported what any of us would have called a free economy twenty years ago. And Governor Dewey, during the course of the campaign, supported farm parity prices, higher minimum wage rates and, by implication, government cheap money policies. But President Truman has gone farther. After the election of 1946 he steadily drifted in the direction of demanding further government controls, especially price fixing.

In trying to guess whether our future economy is likely to be “free” or not, it may help to clarify our ideas if we ask ourselves just how free our present economy actually is. All the rest of the world refers to us as a free economy, but, this is only a comparative term. If we assume, for purposes of definition (and not necessarily for endorsement), that a free economy would be one with no economic legislation except that embodied more or less in the common law against force, coercion, theft, fraud, and the enforcement of contracts, plus anti-monopoly legislation, we would find that we are already a remarkably controlled economy. We might divide present regulations and restrictions into three chief groups depending on the time of origin: (1) pre-New Deal regulations; (2) New Deal regulations; and (3) wartime controls.

Under pre-New Deal regulations the main item would be the protective tariff. Others would be the ICC regulation of railroad rates; local regulation of public-utility rates; Federal Reserve and local banking requirements, and immigration restrictions.

Under the still retained New Deal regulations we include: The Wagner Act (as modified by the Taft-Hartley amendment) which restricts the employer’s right to hire, fire, promote, demote, bargain individually or collectively (but under the Taft-Hartley Act puts some corresponding obligations on unions). The Norris-LaGuardia Act, which prevents the employer from getting court injunctions in strikes (though this was passed in 1932). The Wage-Hour Act, which prescribes a minimum wage of 40 cents an hour and 50 percent overtime above 40 hours, thus in effect controlling nearly all wage earners. The elaborate set of rules and regulations by the Securities and Exchange Commission for publicity, for offering securities, etc. The laws breaking up public-utility-holding companies. The creation of TVAs with their government-subsidized competition with private utilities. The “parity"
payments and postwar price floors for agriculture products, together with the government loans and storage that these require. The social insurance laws with their accompanying taxes and record-keeping obligations; unemployment insurance; old-age and survivor’s insurance; old-age and disability assistance, etc. The Robinson-Patman Act. Federal mortgage financing of housing.

Present controls which are in the main a holdover from the war include: Rent control. Steeply progressive income taxes; heavy corporation taxes; the development of the withholding tax. Export or import controls, requiring special licenses. Government-imposed stock speculation margin requirements; government grain-market regulations. Consumer installment-credit regulations. “Fair-employment-practice” acts in New York and other states, which prevent the employer from discriminating in employment on grounds of race, sex, color, religion, etc. Direct government purchase of grain for the foreign-aid program. The ECA itself. “Voluntary” allocations of scarce products. Artificial low-interest rates, and the government-bond-support program.

This rather haphazard inventory of the regulations already imposed shows how far we have come from the “free economy” of which we still boast. And certainly neither the arguments of Mr. Truman in the campaign nor its overall outcome are such as to encourage the hope that the tendency in the next four years will be toward a return to a free economy. On the contrary, the drive is toward more statism.

Where Was the Opposition?
November 15, 1948

It is Jules Verne, I think, who somewhere tells the story about how the inhabitants of the earth agreed that on a given night and minute they would all raise a mighty shout in unison, in the hope that this terrific noise would be heard on the moon. When the appointed night and moment arrived, there was an unprecedented silence. Everybody, out of curiosity, had decided to keep still so that he might be the one listener to this historic marvel.

Something like that seems to have happened on Nov. 2. The complete unanimity of the polls and predictions made many voters regard the election as a preordained event that they personally could do nothing to determine. It was going to determine itself. So luke-warm supporters of Dewey stayed home, and others even gave President Truman, as the hopeless underdog, a token vote of sympathy for his plucky fight—only to be astounded, on Wednesday morning, at the collective result of what they had done.

Speaking more seriously—though I think there is at least some truth in the foregoing explanation—it was Dewey, not Mr. Truman, who was the real victim of the opinion polls. Dewey believed in them and based his whole campaign strategy upon them. He assumed that he already had a comfortable and even overwhelming lead, that the way to hold it was simply not to make any mistakes, and that the way not to make any mistakes was not to take any stand that would cost him any of his supporters. The result was that he repeated tediously high-sounding truisms about national unity and that he failed to debate the merits of a single major issue. He avoided all the little errors only by making the one tremendous error that defeated him.

Never in our history has a candidate been offered a more tempting profusion of crucial issues to debate. Never did a candidate throw them all away as disdainfully and systematically as did Dewey. He never troubled to explain to the voters just why the President’s Vinson appeasement gesture would have been so disastrous. He never hinted, except in the vaguest generalities, how he would halt inflation. On New Deal policies such as farm parity payments, social security, public housing, and Federal minimum wages he adopted a me-too attitude that many of his opponents thought was insincere and that many of his supporters hoped was insincere.

The outstanding example of his failure was the way he dealt with the Taft-Hartley Act. Here was a law passed by the overwhelming majority of Republicans in both Houses. The Republican Presidential candidate, therefore, was bound in the interest of his party to defend it. President Truman, moreover, was in an extremely vulnerable position on the act. A majority even of the Democrats in Congress had voted for it over his veto. None of his dreadful veto predictions about its consequences had been borne out by events. He had himself made use of its provisions repeatedly to combat major strikes.

Most of all, whatever its shortcomings, the Taft-Hartley Act was and is immensely superior to the Wagner Act that it displaced. It is not an “anti-labor” law but a pro-labor law. It protects the interests of the rank-and-file union member against the labor bosses. Mr. Truman blasted this law from beginning to end of his campaign. And Governor Dewey defended it with obvious reluctance, in a few apologetic sentences, chiefly emphasizing that it could be improved. Small wonder he was defeated on it.
Everybody is trying to figure why the polls were wrong. My guess is that they were probably right, as of the time they were taken, but that a sufficient number of voters (which did not have to mean more than three or four in every hundred) changed their minds in the last few days to reverse the result. With all respect to Mr. Truman’s unflagging fight, this was mainly, I think, the final consequence of Dewey’s say-nothing campaign.

The net result is that we are drifting into further inflation and collectivist planning by political default.

### Pitfalls of Forecasting
November 22, 1948

From time to time readers of this column suggest that I should forecast the future of business—tell whether we are headed for a boom or a bust, and exactly when it will come, how high or deep it will go, and how long it will last. I have refrained from such crystal gazing. The fate of the political experts who predicted the certain election of Dewey will help to explain why.

The economic future, like the political future, will be determined by future human behavior and decisions. That is why it is uncertain. And in spite of the enormous and constantly growing literature on business cycles, business forecasting will never, any more than opinion polls, become an exact science.

The reasons for this ought to be clear. The future of business never depends on any single factor. It depends on a combination of countless factors. None of us is near enough to omniscience to keep track of them all and to give each its exact weight. The typical professional business forecaster tends to assume that he can make a chart of past price movements, past volume of sales, past wage payments, or whatnot, and somehow pull out of it automatically the answer to the future. We ought to have learned by this time that he can’t. All statistics, even the most recent, necessarily refer to past situations. It is true that the past and the present, when carefully studied, can throw great light on future probabilities. That is how we must study them. But they can never tell us future certainties.

The factors from the past or present that we select to study are arbitrarily selected. To know even completely the situation about inventories, say, a few weeks ago, was not to know that Mr. Truman, and not Dewey, was going to be our next President. And to know completely the state of inventories today is not to know what Mr. Truman is now going to do, what Phil Murray is now going to advise or demand, what Stalin’s next move will be, or what will happen in Britain, France, or China. Yet such countless developments all go to determine the future state of business.

In brief, a full knowledge even of all business statistics put together cannot give the full answer to the business future. For the future of business is today affected even more by what happens “outside” of business than by what happens “inside.”

There is one more reason why business forecasting is so hazardous. When astronomers calculate the orbit and appearance of a comet, their predictions do not influence the comet. In human affairs, on the other hand, predictions about the future influence that future and change that future. It may have been precisely because Dewey’s political victory was so generally taken for granted that he was defeated. For it led him to make a disastrously wrong type of campaign and it led his supporters to relax their efforts.

In business, a general belief that there will be a rise in prices tends to bring about that rise. If, on the other hand, the business community were to become convinced that prices would be stable until next February and then start to break, it would start to act on that assumption immediately. Therefore the expected break would come not in February but right away. For what each of us is seeking as an individual consumer, speculator, or producer is not primarily to be right about the future but to be right sooner than anybody else. That is how exceptional gains are made. But that is something that can only be achieved exceptionally and individually, and not collectively.

I do not mean to disparage all efforts at business forecasting. All of us, no matter what our occupations, are forced constantly to make guesses about the future, and to act on them. We must try to make them as well in informed as possible. But we will save ourselves from some of the worst jolts if we frankly recognize that our guesses are only guesses, and that we cannot reduce the human future to a scientific certainty.

### Meat and the Price System
November 29, 1948

A few weeks ago, in Texas, I visited the stockyards at Fort Worth. A close-up view of a great cattle market like this throws a brilliant light on the function of free markets in our economy.

The market in meat is as competitive as a market can get. Cattle are raised on 80 percent of the farms of this country. This means some 4,500,000 separate
producers. This fact alone shows how silly were the leftist charges of a "producers’ strike" when meat ceilings were reimposed in the summer of 1946. And as meat in its finished form is bought by practically all the consumers of the nation, the frequent headlines about "buyers’ strikes" are equally silly.

There is virtually no possibility of collusive price fixing at either end, nor any evidence of monopolistic pricing in the middle. In 1947 the Big Four meat packers averaged only ½ cents profit on every dollar of sales. The buyers for the big packers not only have to bid against each other and against the smaller packers, but against thousands of ranchmen and feed-lot owners. For only about half of the thousands of cattle that are poured into Fort Worth every day from motor trucks and freight cars are destined to go immediately to the slaughterhouse. A large part are bought for other ranges, and still another part for pen feeding and fattening.

And it is here that prices, and above all the relationships of prices to each other, play a most significant role. For whether steers are slaughtered or bought for further feeding, and whether for range feeding or pen feeding, depends on the relationship of the price obtainable for steers as meat to range costs and the price of feed. It is the present relative prices of meat in the butcher shops to meat on the hoof, of hogs to corn, of corn to hay and wheat, of hay and corn to steers, of steers to calves, hogs, and sheep, of the price of each of these to their expected future prices, and to the expected future prices of all the others—it is this incredibly intricate maze of relationships which determines how much corn and wheat will be planted, how many hogs will be raised, how many steers will be slaughtered now, how many held for further feeding, whether on ranges or in pens, for just how long, to just what weights, and so on.

It is not merely that the prices of corn and hogs and wheat and hay and steers are all tied to each other. The intimate connexity of prices run through the whole economy. It is the relation of the prices of thousands of different commodities to each other that determines the relative amounts produced of each of these commodities.

It is not surprising, in view of these intricate interrelationships, that government price fixing always upsets the balance of production. The real surprise would come if it did anything else. It takes, for example, about 10 bushels of corn to produce 100 pounds of hogs. Normally, in a free market, the prices of corn and hogs oscillate around a ratio at which (because of other costs) about 12 bushels of corn would buy 100 pounds of live hogs. The OPA price fixers forgot even this simple two-commodity ratio. If, through price-fixing, pork is underpriced in relation to corn, or beef in relation to corn or grazing costs, a shortage of meat soon develops.

Yet free markets solve these and enormously more complicated problems of balance quasi-automatics through the price system. Small wonder that Friedrich A. Hayek, in his new book Individualism and Economic Order, declares that if the free-market mechanism had been the result of deliberate human invention, it "would have been acclaimed as one of the greatest triumphs of the human mind."

That meat prices are actually not too high in relation to the enlarged monetary income of the country is clearly shown by the fact that the per capita consumption of meat in 1947 was 155 pounds, compared with an average of 126 pounds from 1935 to 1939.

**Exchange Control in Peru**

**December 6, 1948**

LIMA, PERU—"Let observation with extensive view, survey mankind from China to Peru." So wrote Samuel Johnson in the eighteenth century, and his advice is still good today, especially to a student of the world currency chaos. In China he can see what happens when inflation runs wild and when it takes many millions of the monetary unit to buy as much as one American dollar. And in Peru he can see what happens when an attempt is made to prevent the effects of inflation not by stopping its cause—the increase of money and credit—but by the strangulating device of exchange control.

This is not to imply that there is anything unique about inflation and exchange control in Peru. What is most instructive about Peruvian inflation and exchange control is precisely its typicality.

In a small country like this—with a relatively simple economy almost wholly dependent on foreign trade, a country that must import or die and export or die—the effects of exchange control stand out in startling relief. It has been the subject of daily battles carried on in clamorous headlines between the two leading Lima newspapers. All over its front page, with charts, statistics, and letters from exporters, La Prensa demands the abolition of exchange control while El Comercio, supporting the importers, demands that “the dollar must be held at 6.50 soles.”

The Peruvian crisis is instructive above all for the light it throws on the so-called world dollar shortage.
European beneficiaries of the Marshall Plan have convinced American officialdom that their dollar shortage is the result of the destruction and dislocation of the war. But Latin American experience serves to remind us that any nation can have a dollar shortage and that an overvalued currency supported by exchange control is the certain way to get it.

The official rate for the sol is 6.50 to the dollar. This official rate has been retained in spite of mounting internal inflation. In August this year the total money supply in Peru was about five times the supply in 1940. Yet the 1947 physical output of Peru was in most products below 1940. The result is reflected in a rise in living costs by this September to 379 percent of the 1934–36 level and in wholesale prices to 437 percent of that level.

Even these figures understate the rise. For since January this year government authorities have been calculating the index number on the basis of official price ceilings and not on actual prices prevailing in the free or black market. In the legal free market here the sol has been selling around fifteen to the dollar. Until this September, however, exporters, with the exception of exporters of gold bars, were required to turn over to the government all their dollar exchange receipts at the official 6.50. By a decree of Sept. 6 exporters were required to turn over to the government after export taxes only 65 percent of their dollar receipts at the 6.50 rate. They were allowed to keep “exchange certificates” for the remaining 35 percent which they could use for imports or sell in the open market for about fifteen soles. Even with this partial relief exporters have been squeezed between mounting domestic costs and the requirement to sell most of their dollars to the government, in effect at 40 cents apiece.

The result has been inevitable. In spite of a record world price for most of Peru’s exports—consisting chiefly of cotton, sugar, petroleum, copper, lead, zinc, silver, and gold and record exports measured in soles, many of Peru’s chief exports have been declining in actual quantities. Because of this and the abnormal incentive given to imports by the overvalued sol (i.e., by the privilege of buying the dollar at 40 cents), Peru has managed in 1947 to achieve the first unfavorable balance of trade in its history.

Exchange control has intensified the very dollar shortage it was designed to cure. It has been dislocating and strangling Peruvian production. This is the background of the present agitation for return to a free-exchange system.

LIMA, PERU—Gen. Manuel A. Odria, the new President of Peru who took power by a military coup Oct. 29, is a short man. But he has dignity and poise and gives an impression of strength. In the course of an interview he granted me I was also struck by a quality one would hardly expect in a man who had just come to power by revolutionary means—caution. This was particularly evident in his reply to my question about his policy on exchange control.

There are two schools of thought in Peru, he answered. One is in favor of keeping controls and one is in favor of abolishing them. “The government,” he declared cryptically, “has chosen the path that is best for the economy.”

The new exchange decree of Dec. 4 is a half-hearted compromise between the Bustamante decree and free exchanges. It will allow the exporter to retain 55 instead of 35 percent of his dollar receipts in certificates that he can sell in the free market; but he must still turn over 45 (instead of the previous 65) percent of his dollar receipts to the government at the official rate of 6.50 soles. Whatever relief this brings will be more than offset by the new decree forcing employers to give workers a 30 percent share in profits.

Free prices, free interest rates, and free exchange rates are the traditional way of preserving or restoring the trade balance between nations. Exchange control with the overvalued Peruvian sol has reversed the normal price incentives. It has systematically discouraged exports and encouraged imports. To compel an exporter to surrender most of the dollars he earns for 6.50 soles apiece instead of allowing him to get the market rate of about 15 soles is a way of imposing a huge concealed tax on the exporter in addition to the very heavy open tax on exports from Peru.

In metal mines this huge double tax has prevented the working of marginal ores and halted exploration and development. It has been primarily responsible for a falling acreage and production of cotton, Peru’s greatest single source of dollars. On the other hand, when the market rate for the sol is about 15 to the dollar, a license to import at the 6.50 rate is a huge but disguised subsidy to the importer.

This totalitarian system gives the government life-and-death powers over individual concerns. When administered by modestly paid minor officials who have discretionary power to grant or withhold import licenses, or even to expedite or delay them, and when the decisions of such minor officials may make a
difference of millions of soles to an individual business concern, the emergence of wholesale bribery and corruption becomes inevitable.

This corruption spreads through the business community. There has been a flourishing black market in import licenses. There has been a rapid growth in the practice of fraudulent or double invoicing.

Nor has exchange control in Peru helped the consumer. Only a totalitarian and completely effective system of price control straight up to the retail level could do this. As things are, with few exceptions the benefits of the 6.50 import rate go merely to increase the profit margin of the favored importer, wholesaler, or retailer—who bases his selling price not on the cost to him but on short local supply and inflated domestic monetary demand.

Not only in Peru but everywhere, exchange control with an overvalued currency is a concealed tax on exporters to pay a disguised subsidy to the importers. It rests on the assumption that the producer can with impunity be forced to subsidize the consumer; that the volume of exports is practically automatic regardless of government policies, who bases his selling price not on the cost to him but on short local supply and inflated domestic monetary demand.

All these assumptions are false. Peruvian experience underlines their falsity. You cannot penalize the producer and exporter without drying up the very stream of foreign-exchange receipts upon which the importer and the consumer depend.

**The Myth of Dollar Shortage**

December 20, 1948

Over the last two years this column has constantly returned to the theme that the so-called world dollar shortage is a myth; that it is merely another name for the effort of most countries to live beyond their means; and that the alleged shortage results directly from the insistence of foreign countries on maintaining an excessive valuation for their currencies by the totalitarian device of exchange control. This was the burden of my columns of Aug. 18 and Sept. 22, 1947, of May 10 and Aug. 16, 1948, and those in the last two weeks from Peru.

Yet there is hardly a finance minister in the world who acknowledges this truth publicly. The International Monetary Fund admits it only in a timid, left-handed, and inconsistent way. Those in charge of our ECA do not even seem to know that they are using American dollars mainly to prolong and subsidize the very system of exchange control and the very overvaluations that impede world recovery and lead toward further chaos in world trade. And the professors of economic theory, from whom one might hope for intellectual leadership in these matters, pile up a thousand subtleties, qualifications, and distinctions and end by understanding everything, in fact, but the main point.

It is consoling, in all this, to find a few honorable exceptions. Here, Ludwig von Mises has always seen the matter clearly. So has Wilhelm Röpke in Switzerland. In October a year ago Roy Harrod of Oxford had the courage to declare in his pamphlet “Are These Hardships Necessary?” that the “dollar famine” is “one of the most absurd phrases ever coined,” and that:

“This allegation of a world ‘dollar shortage’ is surely one of the most brazen pieces of collective effrontery that has ever been uttered.”

And now, by his contribution “Dollar Shortage?” to a symposium published by the Harvard University Press, we must add the name of Gottfried Haberler. Dr. Haberler is the author of “The Theory of International Trade.” He is an economist of world reputation and was appointed by the League of Nations to make a study of business cycles, first published in 1936.

Some readers may recall that in a column entitled “Dollar Shortage Forever” on Aug. 16, 1943, I tried to explain why the dollar-shortage theory of the distinguished London Economist was nonsense. I am happy to find this judgment confirmed by Dr. Haberler. He quotes this from The Economist of as long ago as Dec. 4, 1943:

“It may be, in fact, that the [dollar] problem . . . should be looked upon as the result of a set of economic circumstances never contemplated by the textbooks—namely, the existence of a country [the U. S.] which, all policy apart, needs so little from the rest of the world, while the rest of the world requires so much from it, that an equilibrium of accounts can be brought about by no means available to a free or even a tolerably free market.”

Dr. Haberler calls this doctrine “entirely fallacious.”

“Evidently,” he continues, “even in the land of Adam Smith, Ricardo, Marshall, and Keynes it is necessary to point out again and again that trade is governed by comparative not by absolute cost!” The theory that the United States will out-compete and undersell the rest of the world all along the line, he observes, is “high praise for the productive power of capitalism and free enterprise. But the economics is unacceptable nonetheless!”

Regarding the failure of the shortlived sterling convertibility experiment in the summer of 1947, he points out that: “In a state of repressed inflation with a fancy exchange rate, convertibility could not work. . . . Far
from disproving the classical theory of international trade, the failure of convertibility could have been deduced in advance from the most elementary principles of classical or even preclassical (Sir Thomas Gresham, 1519–1579) economics.”

*Foreign Economic Policy for the United States. Edited by Seymour E. Harris (490 pages. $6).

Are Profits Too High?

December 27, 1948

Congressional leaders are planning a new boost in corporate taxes. They seem to be divided only concerning whether this should take the form of an increase in the regular corporate tax rate or an “excess-profits” tax. Few voices are being raised to point out that either type of increase now would retard future American production. Corporate taxes are already harmfully high. They represent a form of double income taxation that directly discourages venture capital and industrial growth.

In dollar terms, present corporation profits seem high. Labor leaders charge that the corporations are “gouging” the public. But all this is simply a consequence of monetary inflation. As Keynes pointed out 28 years ago (see my column “Lenin Was Right,” Sept. 22, 1947), when the currency unit is debased by governmental policy high corporate profits “are a consequence and not a cause of rising prices.”

Moreover, the profits resulting from inflation are in large part illusory. In my column of Oct. 25, 1947, I pointed out that they were being greatly exaggerated, because sufficient allowance was not made either for unreal inventory profits, for inadequate depreciation charges, or for the shrunken purchasing power of final net dollar profits even after these had been correctly calculated.

The illusory nature of the profits resulting from inflation is no sudden new discovery, even though only a few are just becoming aware of it in this country. It was clearly pointed out by the Austrian economist Carl Menger as early as 1892. But from the recent hearings before a Congressional committee we are indebted to two economists, Sumner H. Slichter of Harvard and William A. Paton of the University of Michigan, for powerful restatement of the point.

“During the last three years,” Professor Slichter calculates, “American corporations have overstated their profits by approximately $16,400,000,000. This is the amount by which the reported statements of profits exaggerate the amount of income available to pay dividends, to expand plant, to increase wages, or to reduce prices.” While reported profits for 1948 will be between $20,000,000,000 and $21,000,000,000, Slichter estimates that real profits will be only about $16,000,000,000.

These wide discrepancies between real and reported profits come from two principal inaccuracies. “One arises from the fact that most corporations still insist on counting a rise in the cost of replacing inventories as profits. The other is that more corporations count the rise in the cost of replacing plant and equipment as profits. It is obviously ridiculous to count a rise in costs as profits and yet most corporations do it, and pay stiff taxes on the amount so reported.”

Are profits “excessive”? “The answer to this question depends upon how fast the community wishes industry to expand. If profits are causing industry to expand faster than the community would like to have it expand, they are excessive. If profits fail to bring as rapid an expansion of productive capacity as the community would like to have, profits are inadequate.”

Not merely present but prospective profits, in short, must be great enough to “induce the investment of capital at the present cost of construction and at the present prices of equipment.” This inducement, so far as the American public is concerned, doesn’t seem to be very great. In 1946, 1947, and the first half of 1948 “less than one-tenth of all personal savings went into corporate securities.” New financing through issue of common stocks has only been a trickle for years. This situation, as Professor Paton comments, “does not suggest that now is the time to try to pick a little more meat from the stockholder’s bones.”

On the contrary, it suggests that by overreaching themselves now, both labor leaders and our taxing authorities will retard the capital investment upon which the country depends to provide new factories and tools, to increase future real wages, and to enlarge future government revenues.
1949
We Impose Collectivism
January 3, 1949

The White Paper on the British Government’s four-year recovery program is significant not only for what it tells about that government’s policies but for what it tells about our own. The Marshall Plan was put forward as a plan to combat Communism by helping the world to return to free enterprise. By almost imperceptible stages this objective has been reversed. We now insist that no country can get financial aid from us unless it rejects free enterprise in favor of government planning and collectivist controls.

This startling transformation has come about not by anybody’s conscious plot. It has come about because the basic assumptions of those in charge of the EGA are unconsciously collectivist.

The British White Paper makes this clear. The “general framework” of its four-year plan, it points out, “was one prescribed by OEEC [Organization for European Economic Cooperation] for all its members.” Last August “each member country was invited [by the OEEC] to prepare a statement showing how it proposed to reach the objective” of restoring “a satisfactory level of economic activity.” In asking for this the OEEC was in effect asking for a government plan. In asking for a government plan it was in effect asking for the suppression of free markets and free enterprise.

For government planning means central control. Where you have central control you cannot at the same time have private or individual control. One excludes the other. If the government is going to say exactly how much steel, coal, oil, electricity, chemicals, and textiles are going to be produced in the next four years, then individual firms cannot make their own decisions on how much they are going to produce of these things. If the government is going to plan just how great imports and exports and the trade deficit are going to be four years from now (a palpable absurdity anyway), then these things are not going to be left to the play of market forces.

Suppose, in reply to our demand for its “program” for economic recovery in the next four years, one European government had had the courage and intelligence to reply simply: “Our program is to restore a free economy,” period. In all likelihood the EGA would have told that country that this was no program at all—that it was (in the fashionable patter of the moment) merely a proposal “to sit idly by and do nothing.”

Yet what is America’s four-year production plan? Unless something is just about to be sprung on us. “America,” unlike “England” and “France,” has no plan at all. True, General Motors, United States Steel, the firms making television sets, the wheat grower in Kansas, the drugstore owner on Main Street have their own individual plan. So do most consumers—the family planning to build a home, to buy a car or a washing machine. But an overall government plan displaces such individual plans. In Britain the industrialists are told who is going to be allowed how much to expand what. The consumers are told how much of what they will be allowed to buy. The workers are told where and at what they can work. These four-year plans are obviously inspired by Russia’s five-year plans, paying Communism the sincerest flattery of imitation. And they are now being imposed by us on the Marshall-Plan nations under the pretense that we are not “interfering” in their economies at all. But when our officials are asked to insist on the conditions that would really bring recovery, such as the restoration of free exchanges and free markets, they reply that this would constitute “interference.” They dare not recommend a free economy for Europe, but they insist on continued collectivist planning.

As a result, the official summary of the British White Paper contains not a single word about the real cause of the British and the general European trade deficit. That cause is exchange control. Europe will continue to be “short” of dollars just as long as Europeans are not permitted to pay the real market price for dollars.

Rent Control in France
January 10, 1949

In this column of Feb. 2, 1948, I cited the rent-control situation in France as an example of the future we ourselves are heading for unless we begin quickly to work our way back to freedom. The Foundation for Economic Education at Irvington, N. Y., has now published a pamphlet by an eminent French writer, Bertrand de Jouvenel, explaining in detail the situation to which rent control in France has led. Here are his main facts:

A dollar a month will pay a wage earner’s rent in Paris. (All figures are stated in dollars at roughly 300 francs to the dollar.) Rent on the average makes up 1.4 percent of the French wage earner’s expenses. A month’s rent for a family of six costs no more than eleven packages of cigarettes. Even rents paid by important officials or executives are no more than $4 to $10 a month. Parisians spend on shows every month far more than they pay for three months’ rent.
This may seem desirable for tenants lucky enough to be in possession. Those in search of lodgings, however, cannot legally find them at any price. There are no vacancies. Deaths are the only opportunity. Tottering old people out to sun themselves in public gardens will be shadowed back to their flat by an eager young wife who will strike a bargain with the janitor to be warned first when the death occurs. Buying one’s way into an apartment costs anywhere from $500 to $1,500 a room.

As a result of these fantastically low rents no new lodgings are being built. Practically none have been built, in fact, for the last twelve years. Of the 84,000 buildings for habitation in Paris, 27 percent are more than 98 years old. Almost 90 percent were built before the first world war.

Even a very lenient officialdom estimates that there are about 16,000 buildings in such disrepair that there is nothing else to do but pull them down. A fifth of the Paris population does not even have running water in their lodgings. More than half the population must go out of their lodgings to find a lavatory. More than four-fifths of the population have no bath or shower. Disrepair constantly increases. Owners are not in a financial position to allow them to keep up their buildings, let alone improve them. Their expenses commonly exceed their income. In fact, while rents since 1914 have been at the outside multiplied less than seven times, taxes have been multiplied thirteen times and the cost of repairs has been multiplied from 120 to 150 times. “An outsider,” comments M. de Jouvenel, “may be tempted to think that only an incredible amount of folly can have led us to this. But it is not so. We got there by easy, almost unnoticed stages, slipping down the gentle slope of rent control.” A fantastically complicated new rent law went into effect the first of this year, but it is unlikely to change the basic situation.

New houses put up in France today are legally free from rent ceilings. Why aren’t they being built? There are two main reasons. New apartments would have to rent for prices representing from ten to thirteen times present rent ceilings, in order to repay the costs of construction and reward the capital invested. But it would be psychologically impossible to find customers at these rents, when it is still possible for them to double up (at great inconvenience, of course) at less than one tenth these figures.

Moreover, those who had been foolish enough to trust the government before the second world war by putting up new apartments exempted from the then-existing rent control now find these buildings also subject to rent ceilings. They are not allowed to get in terms of real income a tenth of what they got in 1939. Prospective housing investors have no assurance that they will not be fooled again.

In sum, such is now the spread between the legal and the economic price of lodgings in France that “even the most fervent advocates of freedom are scared at the prospect of a return to freedom. . . . Rent control is self-perpetuating and culminates in both the physical ruin of housing and the legal dispossession of the owners. . . . The havoc wrought here is not the work of the enemy but of our own measures.”

Paradise on a Platter
January 17, 1949

If there is anything any of us ever dreamed of having that Mr. Truman did not demand in his message to Congress it must have been an oversight. He called for more highways, more electric power, more reclamation, an increase of 87½ percent in minimum wages, “parity” income for farmers, more farm storage space, more rural electrification, more TVAs, more irrigation, bigger social-security benefits, prepaid-medical insurance, more doctors, more hospitals, more nurses, more teachers, more schools, more low-rent public housing, more slum clearance, more farm housing, and also more foreign aid.

What is astonishing, given his premises, is that he stopped where he did. If we are regularly to make a present to millions of people of all or part of their housing and food, why not also their furniture and clothing, stoves and refrigerators, shoes and overcoats, books and musical instruments?

“The number of low-rent public housing units provided for in the legislation should be increased to 1,000,000 units in the next seven years,” declares Mr. Truman. But then he adds: “Even this number of units will not begin to meet our need for new housing.” If it won’t, why not increase it to the number that will? Isn’t it simply a matter of raising a figure in a law? And won’t the only opponents of this increase be the “selfish interests” and “the privileged few”?

And why increase the minimum wage only to a niggardly 75 cents an hour? Why not $1, $2, $5 an hour? Or why not simply pass a law that people must be paid enough to buy whatever they happen to need? Then we could skip all the rest of Mr. Truman’s giveaway program.

Once upon a time, when programs of this sort were proposed (though on a far less grandiose and imaginative scale), a few men of little faith used to inquire timidly where the money was coming from. Such questions
describe those Roosevelt spending years as models of economy at the time.

For national-defense spending alone, not counting foreign aid, Mr. Truman wants nearly $16,000,000,000. This is more than was spent in the entire eighteen-year period from 1922 through 1939. And during nearly half of those years we faced an aggressive Japan and an ever more menacing Germany.

Such comparisons cannot be dismissed with the easy assertion that things cost more now. The Federal budget is a constantly mounting percentage even of our inflated national income.

The real comparisons are even graver. For when the operations of social-security trust funds are included, as they should be (because they involve compulsory tax payments), the proposed annual expenditures are not $42,000,000,000 but $46,000,000,000. Nor does the President’s budget include any allowance for military lend-lease, though he nevertheless declares that he expects “later to request funds” for this.

Apologists for this budget are already falling back on the familiar technique of trying to silence its critics by asking rhetorically: “Where would you cut?” Behind this taunt is the implicit assumption that the burden of proof is on those who wish to economize. The burden of proof, on the contrary, must be placed for each item squarely on the shoulders of those who demand the expenditures. And it is not enough for them to prove, even if they could do so, that everything that these expenditures will buy is “needed.” They must prove that the citizens of the country need each of these things even more than they need the things for which they would spend their own money if it were not taken away from them in taxes.

It is precisely this that Mr. Truman’s economic philosophy overlooks. He wants the government to meet this “need” and that “need.” He tacitly assumes that everything the government pays out is a net addition toward meeting these “needs.” It is nothing of the kind. It is merely a substitution. At best it meets one need only at the cost of making it impossible to meet some other need. The government has not a dollar to hand to A that it does not take from B, or perhaps from A himself. Mr. Truman assumes that A must be protected against his own improvidence and that B must be compelled to use part or most of his earnings to support A’s family instead of his own.

When Mr. Truman demands all sorts of government giveaway programs, and proposes to meet the added expense mainly by even higher taxes on corporations, he is in effect saying that our need for these giveaways is far greater than our need to improve our

Balance Whose Budget?
January 24, 1949

In the fourth year of peace, the President proposes to spend some $42,000,000,000. This is equal to the amount spent in the entire five peacetime years from 1935 to 1939 inclusive. And few people ventured to
industrial plant, equipment, and tools to increase workers productivity, real wages, and the future production of the country.

It is not surprising that his program is riddled with internal contradictions. He wants, for example, to impose still heavier taxes on the steel companies. This will still further reduce their incentive for reinvestment in plant and leave them even less funds for such reinvestment. Then he declares that the need for more steel is so imperative that the government itself must build the plants that the steel companies are discouraged or prevented from building.

He regularly insists that the Federal budget must be balanced to avoid inflation. But he wants to do this not by smaller but by larger expenditures, which can be balanced only by still greater taxation. He can balance such a Federal budget only by an unprecedented peacetime drain on the budgets of all the rest of us. By destroying incentives and preventing capital accumulation, he will reduce the volume of production to be shared among everybody.

Our Discompensated Economy
January 31, 1949

The three bulky documents that President Truman dropped on the new Congress—the annual message, the budget, and the economic report—all preached the same philosophy and made substantially the same recommendations. But of them all the economic report perhaps most clearly revealed the out-and-out statist philosophy that the President has now adopted. In it, as in his other messages, he continued to give lip service to "our system of private enterprise." But every recommendation he made (except, say, those for the renewal of the reciprocal-trade agreements and the repeal of the oleomargarine tax) revealed complete lack of trust in the ability of that system to provide a balanced, orderly, and expanding production.

Our future, he said, must not be left to “chance”—by which he meant that it must not be left to free enterprise. No favorable outcome, he continued, will be realized Automatically—by which he meant that it will not be realized by the self-adjusting processes of free markets. Far from recognizing the role of speculation in reducing price fluctuations, he blamed it for the fluctuations that have taken place. Throughout he demanded “positive” and “affirmative” action—which turned out to mean continuous government intervention in the economic process at every stage and at every point.

Mr. Truman assumed, in brief, not only that bureaucrats know better than the market what the general level of prices ought to be, but that they know better than the market what the relative price of one commodity should be to that of another, what the relative production of each commodity (e.g., steel) ought to be, exactly how high wages, interest, and profits ought to be, and what the proportion ought to be of consumer expenditures to investment expenditures. Last year industry, deducting inadequate depreciation charges, and at the peak of an inflation, reported an average profit of about 5 cents on every dollar of sales. Yet Mr. Truman does not hesitate to say that these profits “are in excess of the levels needed to furnish incentives and equity funds for industrial expansion," What are the grounds for this ipse dixit? The extreme difficulty in recent years of raising new equity capital through the sale of common stock is surely not one of them.

But perhaps what is most disturbing of all in the President’s economic report is his refusal to deal seriously with the problem of inflation, or to recognize that it is primarily the government’s own policies that have been responsible for inflation. On the contrary, he not only defends but insists upon the continuance of the most inflationary policy now being followed—the monetization of the public debt through government bond pegging. This inflationary course is actually praised as a “contribution to the stability of the economy.”

The present situation underlines one of the fallacies behind the long-held New Deal theory of a “compensated economy.” The apostles of this theory insisted that it was the function of government to stabilize the national economy by spending heavily in times of depression and economizing or paying off debt in times of inflation. But even if the “compensated-economy” theory were not confused economically, it is completely unrealistic politically. For it fails to recognize that while nearly every government in power will seize upon any excuse to inflate in times of depression, it will almost never have the courage to deflate, or even to stop inflating, in the midst of an inflationary boom. No officeholder wants to assume responsibility for bringing a boom to a halt. Mr. Truman and his economic advisers today, while paying lip service to the idea of fighting inflation, constantly muddy the waters by pretending that there is an equal danger of deflation. So they advocate, at the top of the present boom, an unparalleled peacetime inflationary spending program.

The “compensated economy," in practice, turns out to be not merely an uncompensated but a discompensated economy, in which the government itself does most to load the scales still further on the inflationary side.
Planned Unemployment
February 7, 1949

Administration forces are all set to drive through an amendment to the Fair Labor Standards Act boosting the national minimum wage from 40 cents an hour to 75. They have even provided for a further administrative boost of the legal minimum to $1 an hour in selected industries.

They are now convinced that they can cure any economic deficiency whatever simply by forbidding it. Wages stand today in this country at the highest levels they have ever reached anywhere on the globe or in the entire history of mankind. But we are about to pass a law to compel them to be higher. Few have the courage to question this proposal. Who wants to be accused of favoring poverty and low wages?

Yet the question to be asked of this proposal is not how good are the intentions of its sponsors, but what will be its effect? Its first effect will be a boost in costs of production all along the line. It will mean an overnight increase in the minimum wage of no less than 87½ percent, and in industries where the $1 minimum is ordered, of no less than 150 percent. Nor will this increase be confined to the part of the labor force now getting less than the new minimums. For other workers will demand the maintenance of their existing differentials. The result must be upward pressure on all wage rates.

One of two results must follow. Marginal firms will find that they cannot afford the higher costs. They will be forced to drop their marginal workers or go out of business entirely. In that case the main result will be shrinking production and growing unemployment. Or the government will resort to still further monetary inflation, in order to enable industry to pay the higher wage rates. In that case the higher money wages will be offset by price increases and will therefore be illusory.

The new minimum-wage proposal ignores the existence and function of geographic wage differentials. It will act as a protective tariff for Northern industry against Southern. It will encourage the concentration of industry by driving it from the South to the North and from the small towns to the big cities.

Yet the Administration is set to force these changes through Congress without adequate study or debate. It seems too much even to hope that in doing so it will repeal the Walsh-Healey Act (which is simply a duplicate minimum-wage law with different standards) or that it will repeal the biggest joker in the existing wage-hour law. This joker is the provision that the employer must pay a 50 percent penalty rate for all hours above 40 a week, no matter what his regular rate of pay.

Under this provision a law ostensibly passed to apply only to marginal workers and their employers controls in practice the wages of nearly all the workers of the country. Out of this provision have sprung all the disruptive portal-to-portal and overtime-on-overtime rulings. The provision penalizes most the employers who are already paying most. It rewards most the workers who are already best off. Under it the employer who pays his workers 40 cents an hour need pay only 20 cents additional for overtime. But the employer who pays his workers $1.90 an hour must pay 95 cents an hour additional for overtime.

The cure for this absurdity would be simple. Those who insist on boosting the regular minimum-wage rate to 75 cents an hour could at least agree to fix the overtime minimum wage rate above 40 hours at $1.12½ an hour. Then both workers and employers would be free to negotiate higher regular or higher overtime wages by individual or collective bargaining.

But it is visionary to expect that the Federal bureaucracy would now agree to reduce the scope of its meddling at any point or consent to throw fewer monkey wrenches into our economic machinery. For every employer must be kept in constant fear of the Federal officeholders, no matter what he pays, and every worker must be made to feel that his welfare is dependent upon governmental favor.

‘Planning’—Ah! Magic Word
February 14, 1949

Few speeches of Mr. Truman’s have revealed as much confusion of thought as his plea before the National Planning Association for a planned economy. He began by making a distinction, which he did not clarify, between a “planned” economy and a “controlled” economy. He implied that a “controlled” economy was totalitarian but a “planned” economy was democratic and free. The distinction is, in fact, purely verbal and semantic. Fundamentally government planning and government control are two words for the same thing. If anything, “control” implies less government in the economy than “planning.”

“I have been interested in planning,” said Mr. Truman, “all my life . . . ever since I was old enough to understand what the word meant. You know that we plan our day’s work. We plan the houses in which we are going to live. . . . But when we talk about planning
the things *we* want to do economically *we* are charged with being Communists and fellow travelers.”

The italics are mine. They call attention to the fact, of which Mr. Truman seems blissfully unaware, that the “we” in his last sentence is a radically different “we” from that in his preceding sentences. When he says that “we” plan our day’s work or our houses, he means that each of us plans his own day’s work or his own house. When he talks about planning the things “we” want to do economically he means the things that the government wants to do—the things that he wants to do.

In making a false distinction Mr. Truman misses the real and vital one. The distinction is not at all between what we want to do “economically” and what we want to do in other ways. To plan your own day’s work or your own house is to plan economically. Nor is the real distinction one between planning and not planning—though it is this confusion that the government planners have chiefly exploited. The real question involved is whose planning.

Who is to plan and for whom? Is each of us to be allowed to plan his own day’s work? Or are bureaucrats to plan it for him? Is each of 2,000,000 large and small business managers to decide what product he is going to make, and how much of it, and how? Or is the government (in the person, say, of Secretary Sawyer) going to tell each of them what to make, and how much of it, and in what way, and at what price? Is each of 6,000,000 farm operators to decide what he shall plant and how much? Or is Secretary Brannan going to tell him? Is each worker going to be allowed to work where be pleases? Or will Secretary Tobin direct labor? Is each consumer going to buy what he wants? Or only what some bureaucrat thinks is good for him?

Anyone who thinks these questions are not real need look no farther than England, where the government decides (partly on American ECA insistence) how much of each product is to be produced in the next three or four years: what its citizens are permitted to import, and from what country; what prices they are permitted to ask or pay for domestic products or for foreign currencies; where and at what workers may take jobs and how much of what consumers are permitted to buy. *That* is what is meant by this euphemism “planning.” It is a simple denial of free markets, of free enterprise, of economic freedom.

All this was most compactly stated by the British economist Lionel Robbins in his book *The Great Depression*, published fifteen years ago; “Socialism is a term which is not universally popular. But ‘planning’—ah! magic word—who would not plan? . . . But if it were to be true to its name, it could not acknowledge the substance of ownership, the right of individual disposal of the actual instruments of production. For ‘planning’ involves central control. And central control excludes the right of individual disposal. Nothing but intellectual confusion can result from a failure to realize that Planning and Socialism are fundamentally the same. Now the leaders of opinion want planning.”

---

**‘Me Too—But Not as Much’**

February 21, 1949

Governor Dewey’s Lincoln Day speech in Washington underlined one major reason why he was twice defeated for the Presidency. It is his lack of a coherent political and economic philosophy, his lack of great convictions on great issues. Many voters complained during the campaign that they did not know where Dewey stood. As the campaign wore on, their perplexity turned to misgiving. He started as a sure winner. By the second of October he had defeated the prospects of a Republican Congress, and by the second of November he had defeated even himself.

Now that he has spoken again, it is harder than ever to tell where he stands. He begins by asserting that “the Republican Party is split wide open.” (Such an announcement, on the part of the “titular head,” is certainly the way to split it wide open or to widen any split.) He goes on to picture the party as consisting on one side of extremists against all “progress” and on the other side of extremists “who seem to embrace the entire New Deal and want to go far beyond it. . . . Both courses are fatal to our party.” What he fails to see is that the most fatal course of all is precisely the sort of “middle road” he recommends—one in which the Republicans accept the basic premises of the New Deal but allow themselves to be outbid in their application.

Surely he should have learned this from the last campaign. He accepted the principle of farm price supports. This prevented him from pointing out that farm price supports raise the cost of food for city workers. So he lost potential votes in the cities and even votes of the farmers themselves. For his belated and half-hearted acceptance of the “parity” nonsense made them suspect that he and the Republicans would offer them less of the taxpayer’s money than Mr. Truman. Can the Republicans hope to win if they endorse the principle of Federal minimum-wage laws but offer only 65 cents an hour instead of 75 or only 75 instead of $1? Can they hope to win if they come out belatedly for building private housing at public expense but offer only 500,000 units instead of Mr. Truman’s 1,000,000? Why so little
of a wonderful thing? In the first half of his speech Mr. Dewey seems to be for social security without reservation. In the second half he expresses concern about “a system where everything man gets from cradle to grave is doled out to him by a ruling clique.” But he does not tell us on what principle he decides how much social security is very, very good and how much more makes it sinister and bad. He does not tell us how, once we embark upon compulsory social security, we can prevent politicians of all parties from outbidding each other till the system has become a crushing burden. Does Mr. Dewey know that in France the cost to the employer of social benefits in 1947 was placed at some 36 percent over and above the wages in the metal industries and some 47 percent in the electrical industries?

In the admirable second half of his speech Mr. Dewey points out that our free system produces more than all the rest of the world together of steel, automobiles, and telephones. He properly ridicules “a little nationalizing” as “like putting just one drop of strychnine in a glass of perfectly good milk.” But his speech as a whole, like the 1948 Republican platform that he praises, is a tissue of self-contradictions (see this column, Newsweek, July 5, 1948).

Mr. Dewey wants to eat his cake and have it too. He wants a planned economy and a free one. He wants to face both ways. He is trying both to accept and reject the New Deal. His program, in six words, is: “Me too—but not as much.” Such a program could only lead to a third disastrous defeat.

The choice before the world today is nothing less than the choice between private enterprise and collectivist planning, between capitalism and socialism, between economic freedom and totalitarian servitude. We must make up our minds. There is no right amount of strychnine in the milk.

What Are We Trying to Do?
February 28, 1949

From the beginning the basic aims of the Marshall Plan have been vague and confused. If anyone pointed to the economic misconceptions behind it, he was told that its aims were primarily political. If he called attention to its political inadequacies, he was told that the plan was primarily economic. Trying to pin down its purposes has been like trying to nail a custard pie against a wall.

Politically the Marshall Plan was an irrelevant way of dealing with the problem that the proposed Atlantic pact would face up to directly. Unfortunately, just at the time when our military assurances to Western Europe, as the President has insisted, should be strong and unmistakable, our leading senators wish to make them weak and ambiguous.

Probably the most influential economic argument for the Marshall Plan a year and a half ago was the plea that Europe was starving. A typical cartoon showed an emaciated woman in rags, labeled “Europe,” begging for a crust of bread while a pompous, overfed windbag, labeled “Congress,” callously debated the matter. While the picture of European starvation was overdrawn and its causes misconceived, the wheat-crop failure in France, for example, was real enough. But now that European crops are good, American crops the greatest in history, and world prices are plunging downward, Administration spokesmen run in all directions at once. They urge us to send more food to a Europe that needs it less, in order to keep up American farm prices. Or they demand “emergency” expansion of storage facilities—when stocks of grain are already at record levels—in order to enable American farmers to withhold still more food from a world that these officials themselves insist is short of food.

It is frequently declared that the purpose of the Marshall Plan is to “raise European living standards.” But it has never been made clear to what level they ought to be raised. Is it conceived to be America’s duty to restore each European country’s living standard to that country’s prewar standard? Why? And what of countries in which industrial-production indexes already exceed the prewar figure—for example, Great Britain, Ireland, the Netherlands, Norway, Sweden, and Denmark? Why must we continue to pour in free help?

Or suppose (what is in fact true) that there are wide prewar and present discrepancies between the average per capita incomes in different European countries. Should we try to equalize the averages and bring the poorer countries up to the richer—perhaps with help from the richer? The National Industrial Conference Board has made a valiant effort to determine the average per capita 1947 national incomes of the ERP beneficiaries. Some results: Greece, $117; Austria, $302; Netherlands, $392; Norway, $448; Belgium, $608; France, $661; Great Britain, $723; Denmark, $730; Sweden, $848.

It is clear that if the primary purpose were to eliminate poverty and to equalize living standards, the distribution of ERP help would be vastly different from what it is. For example, with reciprocal-aid provisions of the ERP, France gets 27.4 percent of the total, Britain 20.5 percent, and Belgium less than 1 percent, though
the Belgium per capita income is already below that of France or Britain.

What the ERP has in fact been trying to do is to pay for each country's foreign-trade deficit. Yet the size of its foreign-trade deficit is unrelated to a country's living standard or total production. A table of comparison might astonish Congress. The truth is that each country’s trade deficit is today brought about mainly by a coercive exchange control combined with a false currency value. But successive Administration witnesses urging a continuation of the Marshall Plan have either treated this cause as negligible or ignored it altogether.

As a nation we have been pouring billions of dollars into Europe and are planning to pour in still more billions, without seriously stopping to ask ourselves just what it is that we are trying to do.

The Case for Private Loans
March 7, 1949

Suppose our government were to halt all its foreign lending programs and turn them back once more to private investors. We can imagine the following conversation between a government official from Ruritania and an American investment banker.

RURITANIAN OFFICIAL: As your government has stopped its giveaway program, we are forced to come to you private bankers. But of course there just aren't enough private funds for world revival.

AMERICAN BANKER: Why not? Our government never gave you anything that it didn't first take from private funds in taxes. Sufficient private funds certainly exist.

RO: But your investors show no desire to put them into Europe.

AB: For excellent reasons. Putting aside the Russian menace, which isn't your fault, your governments have systematically destroyed confidence.

RO: What assurances would restore it?

AB: I've made up a list. In view of the past record of your government, I'm afraid it would now have to pledge itself: (1) Not to seize or nationalize the American investors' capital or the private firms in which it was invested. (2) Not to impose crushing taxation. (3) Against price fixing, wage-increase decrees, or profit controls that would imperil our investment. (4) To impartial enforcement of contracts. (5) Against barriers to the removal of our private funds. (6) To remove exchange controls. (7) To make your currency freely convertible at its free market value. (8) To halt internal inflation by balancing your budget and stopping further expansion of money and credit.

RO: You needn't go on. Our government will never consent to such policy reversals.

AB: Very well. Then American investors will not be interested in risking their capital in your country.

RO: This is economic imperialism! You are trying to dictate to our government! You wish to infringe the sovereignty of Ruritania! We are determined to have socialism! You are interfering in our internal affairs.

AB: Listen, who came to whom for a loan? We're not forcing you to do anything. You can have all the socialism you want. Only you can't expect to find American investors eager to subsidize and prolong it at their expense.

RO: This is ideological prejudice.

AB: Private investors do have a prejudice in favor of government policies that seem likely to insure production, the safety of their principal, and a sufficient profit.

RO: Ah, that's it! Private profit! It's insistence on that that holds up world recovery.

AB: On the contrary, it is the constant search for profit that maximizes and balances production. Profit is, in fact, the best indicator we have of how much production has actually taken place. If a firm in Ruritania manufactures something at a loss, it means that the value of the labor and raw materials put into making the product is greater than the value of the product itself. That isn't production but sheer waste of labor and materials.

RO: Are you contending that repayable private loans help world recovery more than non-repayable government gifts?

AB: Precisely. Take another look at that list of reforms. You will find that they are not only necessary to attract foreign private capital to your country but to the revival of your domestic investment. They would probably encourage your own terrified capital to come out of hiding to such an extent as to make you soon independent of foreign capital altogether. Such assurances are essential.

RO: Why didn't your government officials insist on these assurances?

AB: It wasn't their money. Besides, it would have created dangerous friction between governments. But we private bankers can safely suggest them, because we are after all only middlemen telling you what conditions are necessary to make Ruritanian securities attractive to private American investors.

RO: I appreciate your friendly advice. Perhaps after all.
Rent Control vs. Housing
March 14, 1949

We are all set to prolong rent control for at least another fifteen months. At the end of that period we will no doubt prolong it again. For the Administration means to extend rent control “until the supply of housing has caught up with the demand.” But every student of elementary economics knows that supply and demand are meaningless terms except in relation to a price. It is precisely prices, in fact, that bring supply and demand to a balance. As long as construction, repair, and service costs remain around 1949 levels, while we try to hold rents at prewar levels, supply never can catch up with demand. It is rent control itself that keeps supply from catching up with demand. It perpetuates the very problem it pretends to solve.

With the general cost of living 71 percent above the 1935–39 level, with furniture 96 percent above, clothing 105 percent above, and estimates of construction costs ranging from 80 to 145 percent above, our legislators insist on holding rents down to only 20 percent above. With weekly factory wages 144 percent above the 1935–39 level, the average worker pays for rent a far smaller percentage of his income than he ever did before the war or before the imposition of rent control.

In this column of Jan. 10 I discussed the pamphlet by Bertrand de Jouvenel on the appalling consequences of rent control in France. The British situation differs only in degree. The London Economist of Jan. 8 points out that where it was once considered normal for an English family to spend 20 percent of its income in rent, the proportion under rent control has dropped to the neighborhood of 10 to 12 percent. This decline, comments that journal, “is strange to find in combination with a severe shortage of housing—unless, indeed [as may be much truer than most people imagine] the low relative level of rents is a large part of the cause of the housing shortage.”

I have been receiving recently a number of letters from worried property owners. One that comes from a widow in Evansville, Ind., is typical:

“The majority of landlords are not wealthy people. . . . But today a landlord is apparently a despised citizen, classed with gangsters and criminals, all because he happens to have a house, for which he has worked and saved, and which somebody else now wants to occupy at his expense—namely, the tenant. The law gives it to him, because there are more tenants than landlords and that means more votes. . . . Tighe E. Woods claims that if rents were decontrolled they would go up 55 percent. Perhaps; perhaps not. Ten years ago I could get a room papered for $6; now it would cost me $20. What percentage of increase is that? . . . Naturally tenants want the law continued. If Congress were to pass a law to force grocers to give me groceries at half price I might endorse it myself. . . . ”

If rent control is ever terminated, it will be because people come to recognize that under it old housing rapidly deteriorates and new housing finally ceases to be built. No new private apartments are put up in France today, for example, because they would have to rent at ten to thirteen times present rent ceilings in order to repay the costs of construction. Even in our own country there is already increasing pressure for solving the problem by public-housing schemes—that is, by forcing the taxpayers to subsidize each other as tenants.

To get us out of this government-created crisis I can only renew the type of compromise suggestions I made in this column of Feb. 2, 1948. Permit landlords now to raise rents each month, say, by 2 percent of the percentage that other items in the cost of living have increased since 1935–39. It would then still take 50 months, or more than four years, for the permitted increase in rents to equal the average rise in other items. At the end of that time decontrol could be automatic. Such a program would restore the incentive to maintain and build private rental housing at the same time as it got us tenants back to economic realities without too much of a jolt.

4,000 Years of Price Control
March 21, 1949

Tablets, said to be 200 years older than the Babylonian Code of Hammurabi, have just been translated which show that the ancient kingdom of Eshnunna had wage control and price control. The news ought not to have come as a surprise. For the code of Hammurabi itself (unearthed in 1902), which was promulgated earlier than 2000 B.C., fixed prices, wages, interest rates, and fees. This makes price control at least about 4,000 years old.

The real economic discovery of civilization was the free market. It was Adam Smith, in The Wealth of Nations, published in 1776, who more clearly than any other mind up to his time glimpsed the marvels of the free market. In the first flush of his discovery he compared the system of free prices and free profits and losses to “an invisible hand” that led men pursuing their own interest to promote the welfare of the
whole nation more effectively than when they deliber-
ately tried to promote it.

It was in 1776 also that Gibbon, in *The Decline and
Fall of the Roman Empire*, wrote: “When the luxurious
citizens of Antioch complained of the high price of
poultry and fish . . . the emperor [Julian] ventured on
a very dangerous and doubtful step, of fixing, by legal
authority, the value of corn. He enacted that, in a time
of scarcity, it should be sold at a price which had sel-
dom been known in the most plentiful years. . . . The
consequences might have been foreseen, and were soon
felt . . . The proprietors of land or of corn withheld from
the city the accustomed supply; and the small quanti-
ties that appeared in the market were secretly sold at an
advanced and illegal price.”

Sixty years prior to Julian’s venture, Emperor
Diocletian, in A.D. 301, had issued a famous edict fix-
ing prices and wages. The punishment for exceeding the
prices fixed was death or deportation. “The edict was
well-intended but abortive,” comments the *Encyclopedia
Britannica*. “The actual effect was disastrous.”

Let our history skip now to 1793, when the lead-
ers of the French Revolution, in a desperate effort to
offset the consequences of their own reckless overissue
of paper money, passed a law imposing price ceilings.
It was in some respects more reasonable than our own
OPA. It allowed prices to be one-third higher than
in 1790; it permitted the addition of a 5 percent profit
for the wholesaler and 10 percent for the retailer. But
as Andrew D. White wrote in 1876: “The first result
of the Maximum [price law] was that every means was
taken to evade the fixed price imposed, and the farm-
ers brought in as little produce as they possibly could.
This increased the scarcity, and the people of the large
cities were put on an allowance. Tickets were issued
authorizing the bearer to obtain at the official prices
a certain amount of bread or sugar or soap or wood or
coil to cover immediate necessities.”

But even with this early rationing system the law
“could not be enforced.” Shopkeepers “could not sell
such goods without ruin. The result was that very many
went out of business and the remainder forced buyers
to pay enormous charges under the very natural excuse
that the seller risked his life in trading at all. That this
excuse was valid is easily seen by the daily lists of those
condemned to the guillotine, in which not infrequently
figure the names of men charged with violating the
Maximum [price] laws.” Within a little more than a year
the law had to be repealed.

The moral of our little history is familiar. It is that
“those who cannot remember the past are condemned to
repeat it.” For this is what our “modern” governments
do today all over the world. Ironically, it is those who
now wish to return to this ancient totalitarian device
who are fondest of calling themselves “progressives.”
They are also fond of saying that those who believe in
economic liberty “are living in the nineteenth century.”
These controlists have yet to learn that they themselves
are still living, as the discoveries in Babylonia attest, in
the nineteenth century—B.C.!”

### Sense Instead of Dollars

**March 28, 1949**

The Marshall Plan has now become sacrosanct and
apparently impervious to argument or facts. Even when
a high official of the British Government blurts out in
an official speech that Britain has now achieved com-
plete recovery, he raises only a few eyebrows in Congress,
and these are promptly lowered by the hasty assurance
of other officials that the first one spoke out of turn. Yet
Undersecretary Mayhew’s statement is confirmed by
the official indexes of Great Britain, and for that mat-
ter of Ireland, the Netherlands, Norway, Sweden, and
Denmark, which show that industrial production in all
these countries is now above the prewar level.

When this is pointed out, the reply is: “True; but
our country still has an unfavorable balance of trade;
and of course it is the American taxpayer’s duty to pay
for it. And he may as well know that we intend to go on
buying more than we sell even beyond 1952.”

In brief, in spite of the fact that these countries are
now producing more than they produced before the war,
they announce that they will continue to live beyond
their means. They will continue to consume more than
they produce. They will continue to buy more than they
expect to pay for. They present figures showing what
their foreign-trade deficit is going to be in future years.
They talk as if a foreign-trade deficit were something
foreordained, some malign fate, instead of something
that they bring about by their own policies.

It is not merely the former European belligerents
but our Latin American neighbors, and in fact nearly
all the former neutrals, who now complain of a “dollar
shortage.” The primary cause of these chronic foreign-
trade deficits and dollar shortages is not mysterious. It
is exchange control. Every government that imposes
exchange control contends that it is forced to do so by
the dollar shortage. The truth is the reverse. It is the
exchange control itself that causes and perpetuates the
dollar shortage.

It is needless to spell out here all over again just how
and why it does this. I have explained the reasons in my
Military vs. Economic Aid

April 4, 1949

The purpose of the Atlantic Pact is twofold. It is to strengthen the democracies of Europe to maintain their integrity and independence. And it is to give the clearest possible warning to Stalin of the consequences of any threat on his part to that integrity and independence. The Atlantic Pact is not merely the strongest single measure to assure the world’s peace today; it is perhaps our only hope of peace.

The pact can achieve its purpose only if its pledges are unmistakable. For the clearer we make these pledges, the less likely we are ever to be called upon to meet them. The weaker and more ambiguous the pledges, the more liable we are to tempt the Kremlin to gamble on our indecision. In short, a weak and ambiguous commitment on our part would actually be more dangerous than a firm and unequivocal one.

The Senate, therefore, should not only ratify the pact promptly, so that the masters of Russia will not be tempted to exploit any interval of indecision, but whatever uncertainties are left by the language of the pact itself should be removed by the declarations of senators, by interpretations of the pact by the President and the State Department, and even (though this is constitutionally supererogatory) by a strong resolution of endorsement on the part of the House.

These political steps will clear the way for reconsideration of the economic phases of our foreign policy. The strange assumption has grown up in this country that the extent of our “international cooperation” is something to be measured primarily by the number of dollars we are willing to give away. It is taken for granted that our participation in the Atlantic Pact must necessarily cost us at least a couple of billions more on top of the $5,580,000,000 already asked for continuation of the ERP. If it were really necessary for us to contribute a couple of billions to help rearm Europe, these funds could easily be taken out of this $5,580,000,000 for “recovery.”

Not only is there no need for us to pay for European rearmament, however, but with our participation in the Atlantic Pact the last excuse for the continuance of the ERP in its present form has disappeared. The economic arguments for the ERP, as I have tried to point out in previous articles (e.g., Newsweek, Feb. 28) are hopelessly confused. Now the political raison d’être of the Marshall Plan has disappeared. For politically the Atlantic Pact does directly what the Marshall Plan did only symbolically.

The European democracies have in fact the resources to rearm themselves. And if they lack determination to do this, any monetary contribution we make to their rearmament will be worse than futile. For there is no way in which we can insure that either the money or the equipment we contribute will actually result in a net increase of European armament by that amount.

It will do no good, in other words, to earmark our contributions to make sure that they are used for rearmament. Suppose, for example, that Ruritania decides that it is essential to provide $x$ millions of dollars for
defense. It will spend this amount by taking it out of other potential expenditures, whether we make any contribution or not. But if American instead of Ruritanian taxpayers contribute this $x million dollars, there is no assurance that Ruritania will spend our $x million dollars in addition to the amount of money it would have spent for defense anyway.

It is far more probable that our contribution would simply release Ruritanian resources for spending in other directions. Ruritania, freed from necessity for military spending, has just that much more available for bigger social security schemes, bigger food subsidies, bigger nationalization deficits, or whatnot.

This simple economic principle of substitution has been ignored in all the proposals for American rearmament of Europe as well as in the “special accounts” and similar futile efforts of the ECA to check the use in Europe of our specific ERP dollars.

Whose Bold New Program?
April 11, 1949

In his inaugural address President Truman announced what has now become the famous “fourth point”—“a bold new program” for “underdeveloped areas,” a program to “foster capital investment in areas needing development,” to “greatly increase the industrial activity in other nations,” and to “raise substantially their standards of living.”

No sooner was this announced than the brains of Washington bureaucrats began to bubble with grandiose schemes for giving away still more of the American taxpayer’s money to foreign lands. Our government representative put the idea before the Economic and Social Council of the United Nations, which adopted a resolution approving it. Now the ECA has set up a “colonial development division.” And Deputy Administrator Bruce says that this new division is intended to carry out “point four.”

Before we go farther with this idea it may be instructive to look into its origin. I do not know who sold the idea to Mr. Truman. But at least the record shows clearly where the idea came from in the first place. The following quotations are from a book published in 1944:

“America can underwrite a gigantic program of the industrialization of Africa, to be launched immediately. . . . It must initiate a general and steady rise in the standard of life of the African peoples. . . .

“Closely related socially, economically, and politically with Africa are the Near Eastern countries of Arabia, Iraq, Iran, Syria, Lebanon, Palestine, and Trans-Jordan. . . . Here also a broad regional program of economic development is called for. . . .

“What is clearly demanded by the situation is that the United States take the lead in proposing a common program of economic development of the Latin American countries. . . . For Latin America [such a program] opens the door for an immense leap ahead in progress. . . .

“For the United States especially it contributes a large part of the answer to that all-important question as to whether we shall be able to keep our national economy in operation. . . .

“The government can do it, if ‘free enterprise’ fails to meet the challenge and bogs down on the job.

“Our government can create a series of giant industrial development corporations, each in partnership with some other government or group of governments, and set them to work upon large-scale plans of railroad and highway building, agricultural and industrial development, and all-round modernization in all the devastated and undeveloped areas of the world. America has the skilled technicians capable of producing the plans for such projects, sufficient to get them under way, within a six-month period of time after a decision is made. . . .

“On a world scale the combined projects could be self-liquidating in the period of a generation. They would become the best investments the American capitalist class had ever made in its whole history.”

The book in which this proposal appeared five years ago was Teheran: Our Path in War and Peace (International Publishers). And the name of the author was Earl Browder, then still officially head of the American branch of the Communist Party (temporarily calling itself the Communist Political Association).

We need not point out here everything that is wrong with this proposal on political and economic grounds. We need not point out, for example, that every million dollars of capital we send abroad sets back our own capital development by just that much. And this at a time when President Truman himself insists that “at least $50,000,000,000 should be invested by industry to improve and expand our [own] productive facilities over the next few years,” and when he complains that our own steel, oil, and electrical industries are not being expanded fast enough to suit him.

It is enough to point out for the moment that the idea for the “bold new program” comes straight out of the book of the then head of the Communist Party in this country.
Bankruptcy of the Welfare State
April 18, 1949

The harsh realities of the new British budget were anticipated by the London Economist. As that weekly pointed out in its issue of March 19:

“The price of government in Great Britain today is 40 percent of the total of all incomes. . . . This is the hideous prospect that faces the British people. Even though every item of government expenditure is approved in detail . . . any such rate of taxation, if continued for long, will be disastrous to the national economy. . . . A state that taxes away 40 percent of all incomes, and much more of the incomes of the successful and the energetic, is killing the motive power that keeps it alive. . . .

“If taxation remains at 40 percent, it will be impossible for the community to generate enough savings to maintain its capital. . . . The long continuance of taxation of anything like 40 percent of the national income will ruin the country. It will not do so spectacularly in any one year or the next—there might be more hope if it would. . . .

“The lamentable thing is that it is very difficult, to the point of impossibility, to see how we can escape from the vise in which we are caught. . . . It is still official policy that the food subsidies—or most of them—are temporary, but it requires a sanguine temperament to believe that any government will ever dare actually to take them off. . . . There will have to be outright repeal of one or more major social schemes. Which is it to be? Education? The health service? Unemployment insurance? Old-age pensions? Housing subsidies? The whole face of British politics would have to suffer a complete change before any one of these became possible. It is a lamentable truth, but an inescapable one, that the British democracy would rather ruin itself than give up any one of its major spending projects. . . . Unless the price of government is reduced, the British economy will gradually strangle itself.”

All of which was confirmed by Sir Stafford Cripps in his budget speech. “How then are we going to get along with all this load of expense on our backs? By producing more.” But he neglected to point out that the tax load itself erodes the incentives and capital that increase production.

The amount of our own national income being taken by our Federal and local governments is about 25 percent. Some may think this moderate compared with the more clearly ruinous British 40 percent; but it is in fact dangerously excessive. The British, at least, still have part of their capital deficiency made up for them by our ERP. There will be no one to do that for us.

Yet not a day passes without a new government spending scheme being put forward in Washington, or in the states and cities. President Truman will soon propose a new multi-billion-dollar national health program. We are being asked to throw still more billions into Europe for armament. Our Secretary of Agriculture wants a new and more extensive type of multibillion-dollar farm subsidy. The public housing advocates are vociferous. The education lobby demands $10,000,000,000 in the next ten years for new school buildings.

All of these people talk as if the funds they were demanding were created by the government out of thin air, or could be taken out of some mysterious but inexhaustible idle reserve somewhere. They haven’t yet learned arithmetic. They still refuse to recognize that every dollar appropriated for them or their schemes leaves just one less dollar to the family who has earned it to spend for its own food or housing or clothing, or save for education or travel.

Our government spending zealots have not yet learned that the American tax burden is already excessive. The additional funds they think can most easily be seized for taxes are precisely the most basic and most vital funds of all. They are the funds that would otherwise go into investment—into improving and increasing the tools and equipment in the hands of the workers, increasing their individual productivity, their real wages, and the national production on which all social progress depends.

The Welfare State Runs Wild
April 25, 1949

Secretary Charles F. Brannan’s new farm subsidy scheme at least admits what the Administration has hitherto denied—that the present farm price support program raises the cost of food to consumers. Inadvertently it also betrays the completely one-sided operation of the present program. The present “parity” was based on the contention that the 1909-14 relationship of farm to nonfarm prices (one of the most favorable to farm prices in our entire history) was the “normal” and “fair” one. But last year, Mr. Brannan concedes, “farmers received 160 percent of the theoretical parity income.” This is only another way of saying that industrial income or prices last year were 37½ percent below “parity.” But no farm lobbyist demanded relief for industry or even urged farmers to turn back subsidies to the government. Farm “relief” marched on.

Secretary Brannan now wants to change the system not because it pays farmers too much but because he
Brannan’s scheme is a glaring illustration of what happens once we reject free markets, destroy the connection between income received and value produced, and accept the premises of the pressure-group welfare state.

Legally Certified Monopolists
May 2, 1949

The Taft-Hartley Act is essentially nothing more than an amended Wagner Act. Like that act, it in effect turns the government itself into a union-organizing agency. It is no accident that under the Taft-Hartley Act union membership has been at peak levels and that wage rates have gone up faster either than living costs or man-hour productivity.

Like the Wagner Act, the Taft-Hartley Act abridges management’s freedom to manage. It compels the employer to “bargain collectively” with a particular union leader, no matter how unreasonable his demands may be. This requirement to “bargain” has never been precisely defined. In spite of specific limiting clauses introduced by the Taft-Hartley Act, and specific denials by the Labor Board, this phrase has been in practice interpreted to mean the making of concessions. For if the employer, in response to union demands, simply says “No,” or simply proposes, say, in response to a demand for a wage increase of 15 percent, a wage reduction of 15 percent, and then sits tight, how can he be said to be bargaining “in good faith”?

More importantly, if he cannot reach an agreement with the particular leader of the union certified by the NLRB, there is no one else with whom he is legally permitted to reach an agreement. What would we expect the result to be if a manufacturer were legally permitted to bargain with only one supplier of a raw material, and were legally forbidden to negotiate with any other supplier if he could not reach a workable agreement with that one?

It is this exclusive bargaining provision, common to the Wagner and the Taft-Hartley Acts, and to the Administration and Wood bills, that has built up the tremendous economic and political power of the Lewises and Murrays, the Greens and Petrillos. These men have been turned into huge legally certified monopolists. They have been made, in effect, legal arms of the Government in their negotiations with management.
Instead of reexamining the dubious economic and legal principle behind this provision, the authors of the Taft-Hartley Act retained it, and then tried to limit and offset its most obviously harmful effects. The Wagner Act enormously increased the power and use of the strike weapon. For it took most of the risks out of strikes and deprived the employer of most of his previous economic power to combat strikes. The authors of the Taft-Hartley Act sought to offset this by putting in the hands of the government some of the anti-strike powers that had been stricken from the hands of the employer. And they sought to “balance” some of the coercions on the employer by corresponding coercions on the unions. For example, they made it “an unfair labor practice” for a union as well as an employer “to refuse to bargain collectively.”

But the moment an effort was made to put any limits whatever on the power of union officials, these officials, who had not only acquiesced in but demanded the one-sided government coercions on employers, denounced the two-sided provisions as a “slave labor” law. Therefore the present servile Administration bill, while continuing to impose upon employers a compulsory duty to bargain collectively with unions, would once more exempt unions from any corresponding obligation. “In short,” as the House minority report correctly sums it up, the Administration bill “would have the effect of encouraging, fostering, and nurturing uncontrolled union monopolies in the U.S., and of conferring upon union officials unbridled and unconfined monopolistic power.”

But that the Administration bill is so much worse than the Taft-Hartley Act does not mean that even the latter is good. By retaining the Wagner Act basic principles, it has in fact encouraged and made it possible for unions to impose excessive wage and other demands. These have already led to unemployment in some lines and threaten to bring it in others. There is little prospect that pending legislation will change this situation.

Salvation through Squandering?
May 9, 1949

We are now being told that our prosperity has been kept going in the last few years by our huge government spending, particularly on armaments and foreign aid. Any decline in this spending, we are now warned, would bring a recession. We are told, in fact, that if further signs of recession develop the Government must spend still more to keep the boom whipped up.

This doctrine is completely false. Assuming a balanced budget, an increase in government spending does not on net balance stimulate business activity at all. For every dollar that the government spends, the tax-payers have been deprived of a dollar to spend. All that a heavy government spending program can do is to divert spending from one channel into another. If we give Europeans more money to buy American goods, we have just that much less money left to buy our own goods. If we spend more for armament, we have just that much less left for television sets, refrigerators, or food. Even the Nazis knew they were choosing between guns and butter.

A huge government spending program with a balanced budget not only fails to stimulate economic activity but greatly reduces economic welfare. A $15,300,000,000 armament program, regardless of its military justification, leaves us just that much less resources to build new housing or to increase or improve our tools of production for civilian goods. Whether or not our new $5,000,000,000 ERP donation is now needed in Europe, it must obviously force us either to reduce our own consumption or to retard our own capital development by that amount. We cannot give our cake away and eat it too.

The more sophisticated advocates of a “compensated economy” recognize that huge government expenditures do not in themselves create prosperity. They put their emphasis on the amount of monetary purchasing power that government spending adds. This, they point out, is determined by the excess of government expenditures over tax collections. Put more bluntly, the prosperity would be brought about by government deficits. It is not the total size of the government expenditures but the size of the deficits that “adds to purchasing power.” But when the compensated-economy doctrine is clearly stated in this form it has implications that its proponents have never clearly recognized. The official estimate of government receipts for the 1950 fiscal year is $41,000,000,000. Suppose it were decided that what was necessary to keep the boom whirling was a deficit of $5,000,000,000. This could, of course, be achieved by spending $46,000,000,000 (Mr. Truman has already put forward more than enough schemes to do that easily). But the inflationary deficit could be achieved just as well by holding expenditures to $41,000,000,000 and reducing taxes to $36,000,000,000. Or even by reducing expenditures to $36,000,000,000 and reducing taxes to $31,000,000,000. We could cut expenditures...
Business Tides

126

So when most union leaders insist on the unbridled right to strike, they are insisting not merely on the right of union members to quit work but on their right to prevent others from taking the jobs they have vacated. They assert the right to prevent others from working. It is a merit of the Taft-Hartley Act that it at least partly and indirectly takes cognizance of this. It makes it (section 8b) “an unfair labor practice for a labor organization or its agents to restrain or coerce employees in the exercise of the rights guaranteed in section 7.”

In the case of the Smith Cabinet Manufacturing Co. the Labor Board found, for example, that the following conduct of the United Furniture Workers of America, Local 309, CIO, constituted such restraint and coercion: “(1) the carrying of sticks by the pickets on the picket line; (2) the open piling of bricks for use by the pickets; (3) the blocking of plant entrance by railroad ties, automobiles, raised gutter plates, and tacks; (4) the threat of violence to the nonstriking employees over the loudspeaker . . . (7) the warning given nonstriking employees that ‘when we get in with the union you old fellows won’t have a job’; (8) the placing of pickets in such a manner as to prevent nonstriking employees from performing their work; (9) the goon-squad mass assaults upon various nonstriking employees . . . (12) the barring from the plant of Superintendent Simpson and Foreman McKinney by force and intimidation . . .” And so on.

Mr. Truman would have been on strong ground, economically and legally, if he had asked simply for the repeal of the Taft-Hartley Act, period. But he tried to force a return, with the Lesinski bill, to the intolerable conditions under the one-sided Wagner Act in which the Labor Board was not authorized to take cognizance of the kind of outrages just outlined, though it compelled the employer to recognize and “bargain” with unions that practiced such outrages.

If a Federal labor relations act, therefore, is to be retained, not only must it keep the substance of Taft-Hartley section 8b but one of the most important additions would be an explicit declaration that mass picketing is prima facie evidence of intimidation and that any union resorting to it would forfeit the privilege of using the facilities of the Labor Board.

Such a provision would be far sounder than all the present dubious efforts to illegalize strikes as such. We must never lose sight of the vital difference between the real right to quit work peaceably and the spurious right forcibly to prevent others from working. From time immemorial most union leaders have tried to tie

The Right to Strike

May 16, 1949

The right to strike is commonly defended as if it were identical with the right of the individual to quit work. To limit the right to strike, it is therefore asserted, is to impose economic “slavery.”

But just as there are qualifications (as reflected in our libel and obscenity laws) even to the right of free speech, so there are qualifications even to the right to quit work individually. A surgeon who quit in the middle of an operation, a railroad engineer who left his train and passengers at a deserted place, or a ship captain who left a sinking ship before the passengers or crew, would be held guilty of criminal neglect of duty.

Moreover, the attempt to treat the right to strike as identical with the right of the individual to give up his job must be set down as either confused or hypocritical. It is not merely that in a strike the workers quit simultaneously and collusively. The difference goes much deeper. For the strikers are not in fact giving up their jobs. On the contrary, they want to keep those very jobs—on better terms. They insist, in fact, that they have property rights in these jobs. They often resort to intimidation, coercion, and violence in order to prevent others from taking the jobs that they themselves have voluntarily abandoned.

So when most union leaders insist on the unbridled right to strike, they are insisting not merely on the right of union members to quit work but on their right to prevent others from taking the jobs they have vacated. They assert the right to prevent others from working. It is a merit of the Taft-Hartley Act that it at least partly and indirectly takes cognizance of this. It makes it (section 8b) “an unfair labor practice for a labor organization or its agents to restrain or coerce employees in the exercise of the rights guaranteed in section 7.”

In the case of the Smith Cabinet Manufacturing Co. the Labor Board found, for example, that the following conduct of the United Furniture Workers of America, Local 309, CIO, constituted such restraint and coercion: “(1) the carrying of sticks by the pickets on the picket line; (2) the open piling of bricks for use by the pickets; (3) the blocking of plant entrance by railroad ties, automobiles, raised gutter plates, and tacks; (4) the threat of violence to the nonstriking employees over the loudspeaker . . . (7) the warning given nonstriking employees that ‘when we get in with the union you old fellows won’t have a job’; (8) the placing of pickets in such a manner as to prevent nonstriking employees from performing their work; (9) the goon-squad mass assaults upon various nonstriking employees . . . (12) the barring from the plant of Superintendent Simpson and Foreman McKinney by force and intimidation . . .” And so on.

Mr. Truman would have been on strong ground, economically and legally, if he had asked simply for the repeal of the Taft-Hartley Act, period. But he tried to force a return, with the Lesinski bill, to the intolerable conditions under the one-sided Wagner Act in which the Labor Board was not authorized to take cognizance of the kind of outrages just outlined, though it compelled the employer to recognize and “bargain” with unions that practiced such outrages.

If a Federal labor relations act, therefore, is to be retained, not only must it keep the substance of Taft-Hartley section 8b but one of the most important additions would be an explicit declaration that mass picketing is prima facie evidence of intimidation and that any union resorting to it would forfeit the privilege of using the facilities of the Labor Board.

Such a provision would be far sounder than all the present dubious efforts to illegalize strikes as such. We must never lose sight of the vital difference between the real right to quit work peaceably and the spurious right forcibly to prevent others from working. From time immemorial most union leaders have tried to tie
the two together in the same package, and to practice the second in the name of the first.

But the right to work is as sacred as the right to quit work, and no less in need of protection.

Our Irresponsible Budget

May 23, 1949

In a series of five articles in Newsweek running from Jan. 10 through Feb. 7 Raymond Moley called attention to the “colossal failure” of our Presidential budget system. In line with the recommendations of the Hoover report, he suggested reforms of the Bureau of the Budget and the General Accounting Office to make these the real watchdogs they were originally intended to be when they were set up in 1921.

The budget reforms suggested by Moley seem to me to represent a minimum program. Even if they were adopted I fear that we would still be far from a really responsible budget. These reforms would help the President to watch and control the spending of his executive agencies. They would help Congress to watch and control the spending of the President. But who would watch and control the spending of Congress? And who would prevent the President, the House, and the Senate from trying to outbid each other in a three-sided competition to reach into the Treasury to spend the people’s money to curry favor with special group interests?

This problem has been with us since the birth of the nation. But it has now acquired unparalleled dimensions and gravity. For three years Congress has failed so ignominiously to abide by the self-imposed legislative budget requirements of its own Reorganization Act of 1946 that it is preparing to abandon them. And with shocking irresponsibility the House seems to be about to vote still another handout to veterans that would cost $9,000,000,000 at a “rough estimate.” This would be casually thrown on top of the most staggering peacetime expenditures ever made by this or any other government in the history of the world.

There can be no fiscal responsibility at Washington as long as Congress exercises the power to make appropriations not even asked for by the President. The British Parliament can make no expenditure that “the government” does not request. One result of this wholesome rule is that the Chancellor of the Exchequer is forced to present a responsible budget. When it accepts that budget, Parliament in effect authorizes all the proposed expenditures and proposed taxes at a single stroke. It is shown the budgetary situation as a whole. It acts simultaneously on both sides of it. Our own Federal “budget,” by comparison, is a meaningless bit of window dressing. Congress neither accepts nor rejects it. It plays by ear, making its real decisions on numberless individual and unrelated appropriation bills as it goes along. Appropriations and taxes are left to different committees not responsible to each other.

This chaos will never really be cured until the House and Senate themselves ask for a self-denying constitutional amendment under which, say, the House could not make any appropriation not requested by the President and the Senate could not increase any appropriation above that made by the House. Only this could end our three-sided spending competition. The House would still be free to cut the expenditures proposed by the President. The Senate would still be free to reduce the appropriations of the House. Unable to raise, they would at last exercise their power to reduce. As Henry Jones Ford pointed out: “There is no propensity of human nature more marked than jealousy of opportunities that one does not share.”

Historically, “the power of the purse” in the hands of the people’s representatives meant the power to withhold the purse from the sovereign executive. The House and Senate can never be expected properly to exercise the vital function of guardians of the public Treasury as long as they themselves are allowed to put their hands in the Treasury.

Arms and the Money

May 30, 1949

The commitment we have made to defend the integrity of Western Europe has been forced upon us by the Russian threat. It is a grave and tremendous commitment. In return for it, our negotiators had both the right and duty to ask heavy quid pro quos. Instead, they assumed that they had to promise monetary and military aid in addition in order to bribe Western European governments to accept the tremendous pledge from us for which they have been begging ever since 1914!

If Western Europe has a will to defend itself, it will have little trouble in finding the means. The $1,130,000,000 grant that we have promised them for the first year is after all only 3 percent of the present
total governmental expenditures of the Atlantic Pact nations. They can easily make that up by cutting less essential things out of their swollen governmental budgets.

On the other hand, as I pointed out in a Newsweek article of April 4, there is no way in which we can insure that either the money or the equipment we contribute would actually result in a net increase of European armament by that amount. To the extent that we free European governments from the necessity for military spending, we release just that much more of their resources for bigger social-security schemes, bigger food subsidies, bigger nationalization deficits, or whatnot.

It is now being argued that we can solve this dilemma by insisting that each beneficiary European government spend on armaments in the next fiscal year, say, at least as much as we contribute, in addition to the amount it has already been spending in the current fiscal year. But it is dubious policy to try to force any country to spend more on defense than it thinks it ought to spend. This could easily give rise to the unwholesome belief in that country that it was spending large sums on defense, not for its own self-preservation but as a favor to us. It might also tend to encourage bookkeeping fictions under which government expenditures were charged to the military budget that did not in fact belong under that budget.

If our Administration is nonetheless determined to go ahead with its $1,130,000,000 military-aid program, then Congress, instead of adding this to the already dangerous burden upon our taxpayers, should take it out either of our proposed military budget of $15,300,000,000 or of the $5,430,000,000 authorized for the ERP.

Consider the military budget first. For a single year it already equals the military expenditures for the entire nineteen years from 1922 through 1940. Must our military budget now be larger still? Does it make any sense to assume that our military expenditures with the Atlantic Pact must be actually higher than without the Atlantic Pact? Even if we do not assume that the Atlantic Pact in effect adds the existing military expenditures of Western Europe to our own, can we not assume that if we transfer a billion dollars of our defense expenditures to Europe, it at least removes the necessity of spending that billion dollars here?

Finally, if the Administration refuses to take this $1,130,000,000 out of the home military budget, Congress could take the whole amount out of the $5,430,000,000 authorized for the ERP. It could simply authorize the beneficiary European governments to use up to this amount of their ERP funds for buying armament from us instead of other things. As it is, we are about to throw most of this $5,430,000,000 away anyhow.

We are turning it over to European governments to meet a trade deficit that they themselves have brought about by exchange control with overvalued currencies. Our ERP funds, in short, are being used in the main to subsidize and prolong a vicious totalitarian device that strait-jackets economies, retards recovery, and makes impossible the free multilateral flow of world trade.

The further burden on our budget involved in the proposed European armament-aid program is without logic or excuse.

World Statism in Wheat
June 6, 1948

The International Wheat Agreement, now before the Senate, is briefly described by Secretary Brannan as “a multilateral four-year contract in which each of the five exporting nations [principally Canada, the United States, and Australia] agrees to sell a stated quantity of wheat at $1.80 a bushel if requested to do so by the importing countries. . . . Each of the 36 importing countries, in turn, agrees to buy a stated quantity of wheat at the floor price if requested to do so by the exporting countries. The floor begins at $1.50 and drops 10 cents a year to $1.20 the fourth year.”

The purposes of the agreement, in its own words, are “to assure supplies of wheat to importing countries and markets for wheat to exporting countries at equitable and stable prices.”

Now if world market prices throughout the four-year period never dropped below the floor or rose above the ceiling prices, then the agreement would do no harm. But in that case it would also be quite unnecessary. If the market price of wheat during the four years, however, falls below the agreement’s floor price, the taxpayers of the importing countries will be forced to take an unnecessary loss. If, on the other hand, the world market price of wheat rises substantially above $1.80 a bushel, the farmers or taxpayers of the exporting countries must take an unnecessary loss. Both sides can’t win. Either the exporting or the importing nations are deceiving themselves about the benefits of this agreement. Either the exporting or the importing nations will later regret their bargain, and some of them may try to wiggle through the escape clauses.

The specious argument that the agreement will “stabilize” wheat is precisely the same argument that was put forward in favor of the ill-fated Japanese silk
and British rubber restrictions and our own cotton schemes. What the bureaucrats always overlook is that a forced stability in prices brings instability in production and discrepancies between supply and demand. It is precisely free markets and free prices that signal the existence and relative gravity of shortages and surpluses and that bring continuous self-adjustment. Abnormally high prices stimulate more production and bring economies in consumption. Abnormally low prices encourage more consumption and discourage the production of surpluses.

In this way the relative production of thousands of commodities and services is synchronized and balanced. When this free movement of prices is prevented or bypassed by government action, productive adjustments are also prevented or postponed. They must be all the more violent when they are finally and inevitably made.

To sell the wheat agreement here, a great bribe has been held out to our farmers. Listen to Secretary Brannan: “In years of ample supply the price of wheat to the U.S. farmer will largely be governed by domestic price-support policies. In years of short supply, nothing in the agreement will operate to impede the free movement of domestic prices above the price-support level.” So domestically the farmer wins both ways, heads or tails, either at the expense of the taxpayer or at the expense of the consumer.

But the wheat agreement, in addition, “will require a subsidy whenever U.S. prices for wheat are over the maximum prices.” So it doesn’t concern the farmer at all if the maximum agreement price of $1.80 turns out to be below the market. It is the American taxpayer who will be required to dig in his pocket for the difference.

The International Wheat Agreement represents just one more typical mesh in the net of spurious “internationalism” that is being woven by the bureaucrats of the world around their own nationals. What they offer is not the real internationalism of free trade and free markets. It is something ominously different. It is international controls, international statism, government-to-government bulk sales, state buying and selling—in brief, a flattering imitation of the very economic devices of the Iron Curtain countries that they profess to deplore.

What Are We Paying For?
June 13, 1949

Suppose a relative who keeps a pleasure car comes to you and tells you that he hasn’t enough money to feed his family. You suggest that he sell the car. He replies that the car is essential for his morale and to keep his family from going communistic. He adds that it is not for you to interfere in his private affairs or tell him what his family can have or not have. He assures you, however, that the particular dollars you contribute will go only for his family’s food.

Such an assurance will satisfy you only if you are an idiot. In that case you will merely insist that he deposit all the money you give him in a special bank account, that the checks he draws against this shall be only for his family’s food, and that he send you a regular accounting to prove this.

But if you have a grain of common sense left, you will know that all this is meaningless make-believe. You will know that you are in fact paying for his pleasure car and his other extravagances. You will know that when you pay for his family’s food, he doesn’t have to use his own income for this and can therefore spend it on luxuries. You will know that it is pointless to make him keep this segregated account, that you are in fact adding to his total spending income, and that what his family spends on luxuries is in effect the money you have contributed.

But if you are an official of the ECA or of the State Department, in charge of giving away other people’s money, you won’t know any of these things. You will solemnly set up special earmarked accounts, checks, “counterpart funds,” and other such pointless paraphernalia. And if anyone points to the appalling deficits in nationalized industries that are being paid for by the socialistic governments that you are helping to support, you will bring out your little account books to prove that it isn’t our funds that they are spending for this, because our funds are used only to buy food or machinery or other austerely necessary things.

I have already pointed out several times in this column that there is no way in which we can insure that either the money or the equipment we contribute under an arms aid program would actually result in a net increase of European armament by that amount. For to the extent that we free European governments from the necessity for military spending, we release just that much more of their own resources for such things as bigger social-security schemes or bigger nationalization deficits.

Now this principle of substitution also works the other way round. Our officials forget that we are already helping to rearm Europe with our ERP funds. For to the extent that we have supplied European governments with other things, we have freed just that amount of their own money and resources for armament.
The Ideological War

June 20, 1949

In a recent speech General Clay warned the American people that the struggle between collectivism and democracy would continue “for years to come.” We can hope to win this struggle between collectivism and individualism, between socialism (and/or Communism) and capitalism, between totalitarianism and freedom, only if we frankly recognize its existence. The struggle will go on, in fact, until one system succumbs.

Our own befuddled “liberals” and wishful thinkers are loath to believe this. They are fond of saying that there is no reason why Communism and capitalism cannot live peaceably together in the same world. This is because they know nothing of the real nature of Communism and Communists. The Communists are committed to a war on capitalism until they have totally destroyed it everywhere.

This is the reason for the cold war that the masters of Russia have been relentlessly waging against us. And, with minor setbacks, they have been winning that war in the last five or six years because they knew it was being fought and we did not. That is why our leaders threw away at Yalta and Teheran and Potsdam the fruits of a military victory won at unparalleled cost of blood and treasure. That is why, through inaction, confusion, or actual cooperation, our leaders helped Stalin to dominate, subdue, and communize Poland, the Baltics, the Balkans, Czechoslovakia, and China and didn’t even secure for themselves a tenable foothold in Berlin.

What we still do not recognize is that even if the cold war should break out into a shooting war our main weapon, if we hoped not only to win but to have our victory mean anything for the happiness and peace of mankind, would not be the atom bomb but ideas. This ideological war would cost incomparably less in dollars than any military war. But it would have to be above all informed and intelligent. Who would fight it? Who knows how to fight it? Certainly not the present Administration. Whether Mr. Truman realizes it or not, he is today fighting at every turn, not for free enterprise, but for controlism, for statism, for socialism, for policies that must undermine, sabotage, and in the end destroy free enterprise. We can pay money for a Voice of America program. But can we get it to say the right things? Our officials pay lip service to free enterprise. But when they become specific, they praise above all such things as our social-security program, our farm subsidies, our housing subsidies, our TVA’s. All these are collectivist. Incidentally they are all dependent on free enterprise. They are supported by the taxes drawn from the profits and incomes created by free enterprise. They are all, in short, parasitic on free enterprise. But it is these parasitic devices that our officials praise, while they ignore or apologize for the private enterprise that supports them.

It is not surprising that the Russians are not converted to capitalism when our own propagandists praise the collectivist elements in our economy rather than the free-enterprise elements. The astounding idea has arisen in the Western world that the way to fight Communism is to embrace socialism—that is to say, to move at least halfway to Communism.

The Communists themselves have a clearer view. William Z. Foster, in recently laying down the latest line for the American Communist Party, declared: “What will its [American capitalism’s] power of resistance to socialism be when, as may be likely, the vast bulk of the rest of the world has ’gone socialist’? . . . It may well turn out that it will be far easier for the American working class, in the midst of an overwhelmingly socialist world, to establish socialism in this country than now appears to be the case.”

In short, we cannot win the ideological war for free enterprise unless we have a genuine faith in free enterprise, unless we have a real understanding of how it
works, and of why Marxist socialism and Communism are fallacious. To grope bewilderedly for a “middle road”—which is to assume that Communism must be at least half right—is to take the certain path to defeat and surrender. ✹

**Private Enterprise Regained**

*June 27, 1949*

I am indebted to Betty Knowles Hunt for sending me a column she contributed to The New Hampshire Morning Union quoting from Governor Bradford’s own history of the Plymouth Bay Colony over which he presided. It is a story that deserves to be far better known, particularly in an age that has acquired a mania for socialism and Communism, regards them as peculiarly “progressive” and entirely new, and is sure that they represent “the wave of the future.”

Most of us have forgotten that when the Pilgrim Fathers landed on the shores of Massachusetts they established a Communist system. Out of their common product and storehouse they set up a system of rationing, though it came to “but a quarter of a pound of bread a day to each person.” Even when harvest came, “it arose to but a little.” A vicious circle seemed to set in. The people complained that they were too weak from want of food to tend the crops as they should. Deeply religious though they were, they took to stealing from each other, “So as it well appeared,” writes Governor Bradford, “that famine must still issue the next year also, if not some way prevented.”

So the colonists, he continues, “begane to thinke how they might raise as much corne as they could, and obteaine a beter crope than they had done, that they might not still thus languish in miserie, At length [in 1623] after much debate of things, the Gov. (with the advise of the cheefest amongst them) gave way that they should set corne every man for his owne perticular, and in that regard trust to them selves. . . . And so assigned to every family a parcell of land . . .

“This had very good success; for it made all hands very industrious, so as much more corne was planted than other wise would have bene by any means the Gov. or any other could use, and saved him a great deall of trouble, and gave farr better contente.

“The women now wente willingly into the feild, and tooke their little-ons with them to set corne, which before would aledg weakness, and inabilitie; whom to have compelled would have bene thought great tiranie and oppression.

“The experience that was had in this commone course and condition, tried sundrie years, and that amongst godly and sober men, may well evince the vanitie of that conceite of Platos and other ancients, applauded by some of later times;—that the taking away of propertie, and bringing in communitie into a comone wealth, would make them happy and florishing; as if they were wiser than God. For this communitie (so farr as it was) was found to breed much confusion and discontent, and retard much imployment that would have been to their benefite and comforte.

“For the yong-men that were most able and fitte for labour and service did repine that they should spend their time and streingth to worke for other mens wives and children, with out any recompense. The strong, or man of parts, had no more in devission of victails and cloaths, than he that was weake and not able to doe a quarter the other could; this was thought injustice. . . .

“And for men’s wives to be commanded to doe servise for other men, as dressing their meate, washing their cloaths, etc., they deemd it a kind of slaverie, neiher could many husbands well brooke it. . . .

“By this time harvest was come, and instead of famine, now God gave them plentie, and the face of things was changed, to the rejoysing of the harts of many, for which they blessed God. And the effect of their particuler [private] planting was well seene, for all had, one way and other, pretty well to bring the year aboute, and some of the abler sorte and more industrious had to spare, and sell to others, so as any generall wante or famine hath not been amongst them since to this day.”

The moral is too obvious to need elaboration. ✹

**Self-Perpetuating Pump Priming**

*July 4, 1949*

Especially since its espousal in 1936 by John Maynard Keynes in his book The General Theory of Employment, Interest and Money, the doctrine of the “compensated economy” through government spending has played an ominous role. It has become a formidable weapon in the hands of the spenders and the statists. These are in fact the same people. For wherever you find a man who wants more government power, you find a man who urges more government spending. And wherever you find a man who urges more government spending, you also find a man who believes in more government power.

In view of the dangerous “antirecession” spending schemes now being put forward, it is worth repeating the point made in this column of May 9, that even if
it were true that an inflationary budget deficit acted as a business stimulant, then producing that deficit through tax reduction would be at once more flexible, more effective, and less dangerous than producing it through higher government spending. Schemes for higher government spending always involve delays and lags both in getting them started and in getting them ended. Before new public-housing projects can be started, for example, there must be elaborate drawing up of plans and blueprints, selection of sites, condemnation proceedings or buying up of land, etc.

Once any government spending project has been started, moreover, it tends to become self-perpetuating. Let us suppose that the desired level of full activity and full employment has been achieved by government spending, so that any further government spending would simply bring price inflation. Nevertheless, the government just can’t abandon a bridge half-suspended or a housing project at the halfway stage, without the roofs on. These projects must be finished, regardless of the economic effect of finishing them.

But the situation is usually far more serious than this. All those who have been employed on these projects, and above all the officials who have been put in charge of their direction and who have been handed more imposing jobs than they ever held before, will fight tooth and nail, night and day, for the retention of these jobs, offices, powers, and earnings. They will lay down a constant barrage of official propaganda calculated to drown out all disinterested criticism.

All these added government expenditures, ostensibly undertaken to give a transient spurt to business activity, then become permanent. The proportion of government to private jobs steadily increases. This is the history of European socialism and of present disorganized European budgets. It will also be our own history if we embark on still more reckless government spending now on the excuse of countering the existing recession.

If, however, the government were to try to make its “compensation” by reducing taxes, taxes could be reduced immediately. Moreover, Congress could easily provide in advance automatic standards under which taxes could be restored again the moment the stimulation of a tax cut was no longer necessary.

Even Keynesians and other government spenders will probably admit that cutting the taxes of the lower-income groups will result in these groups spending more money on consumption goods. But they will argue that this will not be at all the effect of reducing corporate taxes or the taxes of higher-income groups. These groups, they will contend, instead of spending these “forgiven” taxes on consumption goods or investing them in expansion, will simply hoard the money.

But if there were any real prospect that these groups would hoard money instead of spending or investing it, wouldn’t it be a good idea to go on to ask why they would hoard? They would hoard either because existing price-cost relationships were making business unprofitable or because impending or existing governmental policies had undermined confidence in the future profitability of business.

The Folly of Point Four: I
July 11, 1949

A speech that Secretary George C. Marshall made at Harvard a couple of years ago will cost us some $17,000,000,000 before we are through. And Point Four, added as a final touch to President Truman’s inaugural address to give it a little oomph, will cost us billions still incalculable.

In this column of April 11 I called attention to the striking parallel between Point Four and the proposal five years ago by Earl Browder, then head of the American Communists. This similarity is not accidental. Whether or not the proposals of Point Four stem directly from Browder’s, they embody the same basic collectivist and statist assumptions.

There is nothing new in the belief that sound international investment promotes world production. The only thing “new” in the “bold new program” is the paternalistic assumption that this process of international investment must not be undertaken, as hitherto in modern times, by private investors at their own risk, to private borrowers who have proved their responsibility, but must be nursed, spoon-fed, furnished with crutches, and guided at every step by government.

Mr. Truman, following Earl Browder, assumes that it is our duty to raise the standards of living of the so-called “underdeveloped areas” all over the world. What he never mentions, and does not seem to realize, is that we can do this only by lowering our own standards of living, compared with what they would otherwise be. If our taxpayers are forced to contribute x millions of dollars for hydroelectric plants in Africa, they will obviously have that much less for more hydroelectric plants here. If we contribute x millions of dollars for a housing project in Uruguay, we will have just that much less left for housing, or any other equivalent, at home.

This simple principle that we cannot give our cake away and eat it too has been utterly ignored in the whole hullabaloo about Point Four. If the American people
are being urged to undertake Point Four primarily for charitable and humanitarian reasons, then they ought to be told in all candor that this charity will make them poorer and not richer. It is misleading to pretend that Point Four is at once a great charity and a shrewd way of selling more goods.

Yet Mr. Truman talks constantly as if we would grow richer by giving our capital away. “Our experience shows that the volume of our foreign trade is far greater with highly developed countries than it is with countries having a low standard of living and inadequate industry. To increase the output and the national income of the less developed regions is to increase our own economic stability.” Now Tiffany’s has also made the amazing discovery that it sells more to the rich than to the poor. But it has not yet occurred to the managers of that firm that it would increase its profits either by giving the poor the money to buy its jewelry or by making bad loans to them.

Another fallacy in Mr. Truman’s message on Point Four is his assumption that investment in backward or “underdeveloped areas” must necessarily increase world production or wealth more than the same investment in advanced areas. On the contrary, advanced industrial countries can more often utilize still more capital far more productively and efficiently than backward countries can utilize it.

Under free markets investors put their money wherever they see the prospect of greatest safety and greatest profitability. When private investors who are risking their own money are free to make their own decisions, that capital is likely to be placed where it is most efficient and productive. But if government officials or technicians, who will not be risking their own money but somebody else’s, are going to decide just where our foreign investments ought to be placed, they cannot be expected to pay scrupulous attention either to the security or the relative profitability of the loans they advocate. On the contrary, if experience is any guide, their recommendations will be determined primarily by political considerations. ✍

The Folly of Point Four: II
July 18, 1949

The basic assumptions of Point Four, like those of the Communist proposal by Earl Browder which it imitates, are collectivist and statist. This is evident throughout the text of Mr. Truman’s message. It allows a role for private capital, but it is the role of a junior partner. Point Four “will call upon private enterprise . . . as well as the government. . . . It will be necessary to utilize not only be resources of international agencies and the United States Government, but also the facilities and experience of private business,” etc.

Private enterprise, which has now learned to be grateful for any role in Mr. Truman’s great plans, is to be “encouraged.” How? By authorizing the Export-Import Bank to “guarantee United States private capital . . . against the risks peculiar to those [foreign] investments. . . . Some investments may require only a guarantee against the danger of expropriation, others may need protection against the danger of expropriation and other dangers as well.”

What is Mr. Truman here proposing? He is proposing that in order to induce American private investors to risk their funds abroad, we are to allow these private investors to keep the profits of their investments, but to force the American taxpayers to assume the losses. Such a proposition needs merely to be stated plainly to show that it would be preposterous and intolerable. The private investors and investment bankers who applaud this proposition are shortsighted beyond belief. It could only lead to the eventual nationalization of all foreign investment.

Such an arrangement, moreover, would not remove or in the least reduce the risks of foreign investment. It would merely transfer those risks from the investor to the taxpayer. Point Four exists on the assumption that government could do more to reduce such risks than private investors could. This is the exact reverse of the truth.

“We are negotiating agreements with other countries,” says Mr. Truman, “to protect the American investor from unwarranted or discriminatory treatment under the laws of the country in which he makes his investment.” If a foreign government is prepared to deal honestly and fairly with private investment, foreign or domestic, we do not need such an agreement. If it is not, it will in one way or another violate or wriggle out of the agreement.

And what will our government do then? We do not need to ask. The history of the EGA already tells us. It will be afraid to do practically anything at all. For the most timid and delicate hints on the part of our government representatives will be denounced as outrageous “pressure” on the borrowing government, as interference in its internal affairs, as an effort to halt its glorious socialist planning, to reimpose a discredited capitalism, and so on.

Private investors, lending at their own risk, have a more effective way of dealing with such matters. They
do not dictate. They do not interfere. But as long as a foreign government levies confiscatory taxes, expropriates private property, socializes, nationalizes, imposes a strangling network of exchange and trade controls, or forbids its own nationals to repay their honest debts, private investors respectfully decline to make loans. They are not impressed by elaborate signed agreements to be honest, but only by an actual record of honesty.

It remains to be pointed out, finally, that our own government is itself heavily biased in favor of statist and socialism. Mr. Truman wants the Export-Import Bank to guarantee private capital against the risks of foreign lending. But the loans of that bank have been overwhelmingly government-to-government loans, or loans to government agencies, or loans with a government guarantee, and often for government projects directly competitive with private enterprise.

The Point Four program would inevitably drive the world farther into national socialism.

More Inflation to the Rescue
July 25, 1949

In his economic report of six months ago President Truman insisted on a further increase of taxes by $4,000,000,000 a year. Today he declares: "No major increase in taxes should be undertaken at this time." In January he demanded stand-by price and wage controls, allocation of scarce materials, extension of bank-credit and installment-buying controls, and government construction of more steel capacity if private capital refused. The new report abandons these demands.

Mr. Truman’s dramatic reversals are an admission that he was wrong on many things in January. But they do not necessarily prove that he is right now. In January he thought quite rightly that a budget surplus was "essential to sound fiscal policy." Today he thinks quite wrongly that "we cannot expect to achieve a budget surplus in a declining national economy." This implies that the cure for every recession is a new dose of deficit financing.

I cannot join those, therefore, who regard the abandonment of the $4,000,000,000 tax demand as "reassuring." It would really have been reassuring if accompanied by a proposal for at least an equal cut in Federal expenditures. So would the proposals for repealing the tax on the transport of goods and for liberalizing the carry-over of losses by corporations. But as they stand, these proposals are merely part of a program to give the American economy still another inflationary shot in the arm.

The President talks of his “anti-inflation program” of last January. This is an illusion. He never had an anti-inflation program. All he had was a program for more government controls to try to conceal the unpopular symptoms and consequences of monetary inflation. Even when Mr. Truman was “fighting inflation” by rhetoric, the government was conducting a highly inflationary bond-pegging program. As a corollary of this, it was following an inflationary cheap-money policy. The Federal Reserve authorities, though they wanted to control everyone else, fought tooth and nail the suggestion that Congress restore the reserve banks’ own reserve ratio to its former 40 percent instead of the “emergency” 25 percent. And even when Mr. Truman was ostensibly “fighting inflation,” he insisted on the biggest peacetime spending ever embarked upon by any nation in the history of the world.

But monetary inflation can keep a boom at its peak only if it goes on at an accelerative rate. There was a lull in our monetary inflation, and there then set in a “stabilization crisis,” though so far a mild one. And the only answer that Mr. Truman and his advisers can think of is another inflationary spree. Though Mr. Truman claims that we are “still operating at high levels of employment and production,” he nonetheless wants to embark on more deficit financing. Government economy is “out of the question.” “Nothing could represent greater economic folly,” in fact, than to cut government spending now.

Mr. Truman blandly tells us that a $42,000,000,000 annual budget, five times the peacetime budget even of the Roosevelt regime, is a “minimum.” He praises government extravagance: “The fact that public expenditures of Federal, state, and local governments are running at a rate of close to $60,000,000,000 a year is itself an element of great stability in the present situation.” Public expenditures of $120,000,000,000 one gathers, would provide twice as much stability.

The President and his advisers fail to recognize the elementary fact that the more the government spends the less the individual taxpayer has left to spend. Their public spending programs make no addition to real spending power. These programs can seem to work only as long as they create government deficits financed by printing more money. This leads to the higher living costs that Mr. Truman and his advisers affect to deplore.

Mr. Truman’s midyear economic report reflects throughout a super-Keynesian, inflationist, controlist, and statist philosophy. And that is not “reassuring.”
President Truman has now been persuaded that the only way to cure even a mild recession is to start still another orgy of government spending and monetary inflation. “The fact,” he declares, “that public expenditures of Federal, state, and local governments are running at a rate of close to $60,000,000,000 a year is itself an element of great stability in the present situation.” The fact is that these fantastic expenditures are precisely the greatest element of instability in the present domestic situation. When the Federal government has a balanced budget, its expenditures obviously create no new purchasing power of any kind. Before it spends $40,000,000,000 a year, it must first of all take this amount from the nation’s taxpayers. When politically favored groups have $20,000,000,000 more to spend, the taxpayers who earned it have $20,000,000,000 less.

Not only does huge government spending fail to stimulate real purchasing power and production: it destroys them. For the drastic taxes inevitably penalize precisely the productive elements in the nation. Such taxes not only destroy the incentive to produce and invest; they destroy even the ability to invest by seizing the very funds available for investment.

The government can, of course, as Mr. Truman suggests, deliberately resume deficit financing. This could create more monetary purchasing power, but only by printing more money. Debauching the currency is the oldest and most discredited trick in the world. And this is all there is to the much-touted “Keynesian revolution” when you take its sophisticated clothes off.

False remedies always divert attention from real remedies. The present is no exception. When business becomes stagnant, when unemployment sets in, it is usually because disequilibrium and distortions have developed within the cost-price structure. Some goods have been forced up to price levels where consumers will no longer buy them in the former volume. Production therefore declines: workers are laid off. These high price levels are commonly the result of high costs, the most important of which are wages. Excessive wage levels must force unemployment.

It is typical of Mr. Truman’s spend-and-spend program that he wants to pour government money into the industries and sections where unemployment exists without even stopping to inquire how that unemployment came about. Instead of asking, for example, whether new private housing is being priced out of a full-volume market because of excessive wages and unproductive labor in the building trades, Mr. Truman simply demands that the taxpayers be forced to subsidize these unprecedented wages through public-housing subsidies.

When excessive wage costs in other lines are forcing slowdowns in those lines, Mr. Truman’s solution is to force up their labor costs still further. He wants to increase minimum wages overnight by 87½ percent. As workers above the minimum will insist on the maintenance of existing differentials, this would force up wages all along the line. And, finally, he has forced the steel companies to go before a “fact-finding” board which if it follows the precedents of all his previous boards, will recommend still another boost in wages. And this will set a new national pattern for a fourth round.

Monetary inflation gets its vaunted “full employment” results only as long as it keeps selling prices soaring far enough ahead of wages to increase or retain profit incentives. Its essential trick is to increase monetary wages while decreasing real wages. If the Truman Administration now launches on another monetary inflation, but tries to offset the resulting price rises by still faster boosts in wages, there is no telling where the seesaw race will eventually carry us.

There was no real economic crisis in this country until Mr. Truman insisted on policies that would present us with one. The chief thing we have to fear is his “cure” itself.

The Economics of Arms Aid
August 8, 1949

If we may judge from the history of the ECA, it is not likely that the economic side of the proposed Foreign Military Assistance Act will be intelligently or adequately considered. Yet in spite of its military and political aspects, the whole proposal rests on the essentially economic argument that the other nations in the Atlantic Pact are unable to pay for their own armament. And this contention is not supported either by common sense or by the facts.

Mr. Truman offers Congress the very fragmentary piece of information that eight out of the eleven nations in the Atlantic Pact now have total annual military expenditures equivalent to $5,500,000,000. “This,” he insists, “is the maximum amount they are able to spend” without self-injury. How does he know that? His own country alone is already spending nearly three times as much on armament as these eight nations combined—in other words, about as much as 22 such nations. Yet Mr. Truman still doesn’t consider this a maximum for
Wrong Diagnosis, Wrong Remedy
August 15, 1949

The Administration’s diagnosis of this (and every other) recession and its suggested cure are based on an ultra-Keynesian ideology. Recessions or depressions, the Administration now implies (following Keynes, who was following Marx), are caused by a falling off or deficiency of consumer buying power, especially of worker buying power. Therefore the cure is simple. Have the government pump more buying power into the system: force up wage rates further, launch still more “public works,” spend the taxpayers’ money lavishly, run into deficits, expand credit, and print more money.

The government’s own official statistics now discredit its analysis and its remedies. What happened in the first half of this year? Did workers’ incomes drop? No, concedes Mr. Truman in his midyear economic report: “Real earnings generally were maintained.” Then did total consumer income drop? No, again: “Personal income of consumers after taxes decreased only about 1 percent from the level of the last half of 1948. Since consumers’ prices dropped 2 percent, real income did not change significantly.”

Did the government neglect to run into deficits? Still no. “Cash payments by the Federal government ran at a rate more than 20 percent higher than in the first half of 1948. . . . All governmental units combined showed a cash deficit in the first half of 1949 at a seasonably adjusted annual rate of $2,400,000,000, in contrast to a surplus at a rate of $12,100,000,000 in the corresponding period of 1948.”

Yet the government’s proposed remedies today are a still further boost in wages “to maintain the purchasing power of workers,” “positive actions . . . to enlarge consumer purchasing power,” bigger government spending, and bigger deficits. Cuts are to be made at only two points—prices and profits. “While price reductions are desirable,” says Mr. Truman, “they should not be attained at the expense of wage cutting. . . . Businessmen have a great opportunity to maintain production and sales volume by adjusting prices downward, even at the cost of temporarily reduced profits.”
The Administration, in short, has two distinct sets of economic principles—one for prices and the exact reverse for wages. It sees that excessive prices reduce volume of sales. But it refuses to admit that for precisely the same reasons excessive wage rates create unemployment. As the leading element in costs, excessive wage rates must either force up prices to the point where sales volume drops, or wipe out profit margins.

In the first three months of this year profits of manufacturing corporations after taxes averaged about 6 cents in every dollar of sales. Not a very fat margin to tamper with, even if it were uniform. But this 6 cent average concealed a variation between industries ranging from 10.3 cents in petroleum and coal products down to 2.2 cents in leather products. And it concealed, of course, far wider variations among particular firms.

When profits are reduced, therefore, even “temporarily,” it doesn’t mean that businessmen accept a narrower uniform profit margin. It means that the profits of the marginal firms are wiped out altogether. They turn into losses. Losses force shutdowns. It is this that creates unemployment. This unemployment means that the total income and purchasing power of the wage earners is not increased but drastically reduced by excessively high wage rates. The Administration’s wage-boosting policy can only intensify the very unemployment and recession that it is supposed to combat.

“The only ultimate source of sustained profits,” says the President, “is sustained employment and purchasing power.” This puts the cart before the horse. The truth the Administration has forgotten is that the only ultimate source of sustained employment and purchasing power is sustained profits. You do not achieve full employment by destroying the rewards and incentives of the very people who provide employment. *

**Legislating Unemployment**
August 22, 1949

The best prices are the prices that enable the largest possible volume of goods to be produced and sold. The best wage rates are the highest wage rates under which full employment is possible. In some lines wage rates have already been forced above this level. That is largely why we now have an estimated unemployment of about 4,000,000.

But exactly at this time the Administration seems bent on forcing still more unemployment by forcing wage rates still higher. Its theory is that higher wage rates under no matter what circumstances increase the income of labor and increase prosperity by increasing labor’s “purchasing power.” This belief is political in origin. No one holds it about other prices. There it is clearly recognized that excessive prices cause goods to remain unsold.

But in the same way excessive wage rates, which mean prohibitive production costs, force employers to drop workers or to shut down altogether. Those workers fortunate enough to be kept on may, it is true, individually get more income and purchasing power than before. But greater unemployment means that the body of workers as a whole has less income and purchasing power.

Present unemployment is a caution sign, a danger signal. But the Administration treats it as a signal to drive full speed ahead toward still higher wage rates. It is encouraging a fourth round. And Congress is in the process of boosting the Federal minimum wage from the present 40 cents an hour to 75. This would mean an overnight increase of 87½ percent. Indirectly this measure will boost wages all along the line; for workers above the minimum will insist on the maintenance of their existing differentials.

On top of this Secretary of Labor Tobin, ostensibly acting under the Walsh-Healey Act, is forcing wages in special regions and industries to levels undreamed of even by the supporters of the new minimum-wage bill. He recently fixed a minimum of $1.23 an hour, for example, in Northern steel mills working on government contracts.

Now it makes no sense from any standpoint to have two Federal minimum-wage laws, under one of which a minimum wage can be fixed 207½ percent higher than under the other. (This $1.23 rate would still be 64 percent higher even if a 75-cent general minimum were enacted.) Under what social or equalitarian theory does the government bestow such glaring favoritism on the workers of firms who happen to get government contracts and discriminate so grossly against the workers of firms that do not?

If it didn’t seem too much to hope for under the prevailing ideology, one might suggest that Congress could considerably mitigate the harm it is about to do with a 75-cent minimum wage law by inserting at least two major amendments. The first would completely repeal the needless and mischievous Walsh-Healey Act. The second would remove the joker in the present law under which employers are penalized 50 percent for overtime above 40 hours a week, no matter what regular wage rate they pay. Under this joker precisely those employers are penalized most who already pay most, and precisely those workers are rewarded most who already get most. It is this joker that has brought all workers, and
not merely marginal workers, under Federal control. It has led to all the mischievous portal-to-portal and overtime-on-over-time rulings and decisions.

All this costly nonsense could be ended if Congress simply fixed the legal minimum overtime rate 50 percent higher than the legal minimum straight-time wage—instead of, as now, 50 percent higher than whatever straight-time rate a particular employer happens to pay. For example, if the new legal minimum straight-time rate is raised to 75 cents an hour, then the legal minimum overtime rate would be fixed at a flat $1.12½ an hour. Any wages above these minimums would be determined by free bargaining. ✶

When Government Fixes Wages
August 29, 1949

The Taft-Hartley Act specifically provides that “whenever, in the opinion of the President . . . a threatened or actual strike . . . will, if permitted to occur or continue, imperil the national health or safety, he may appoint a board of inquiry to inquire into the issues involved in the dispute and to make a written report to him within such time as he shall prescribe. Such report shall include a statement of the facts . . . but shall not contain any recommendations.” In the face of this explicit direction, President Truman insisted on appointing a board of inquiry that would make recommendations.

Naïve faith in the value of government “fact-finding” boards in wage disputes begins to dissolve as soon as we ask what facts there are to find. The facts of the past or present, regarding comparative living costs, wage rates, profits, and so on, are already known before any board is appointed.

Thus, according to already extant government statistics, we know that weekly wages in the steel industry averaged $63.14 in May, more than $10 above the general average for all manufacturing industries. We know that average hourly wages in steelworks in May were $1.63, about 26 cents higher than the average in all manufacturing industries. We know that weekly steel wages in May were 111 percent higher than the average for 1939 and the cost-of-living index only 70 percent higher, so that “real” weekly steel wages this May were 24 percent higher than the 1939 average. We know that steel prices in June had advanced only 72 percent over 1939, compared with a 100 percent rise for all commodities. We know that steel profits are fickle and that in 1948 they averaged after taxes about 7½ cents per dollar of sales.

These are past and present facts. They do not make a fourth-round steel wage increase seem imperative. But whether the steel industry can afford a still further wage increase depends not upon past but upon future facts. And these are precisely the facts that no government board can know.

It might guess, of course. On the basis of past performance, it might judge which guesses seem reasonable and which seem absurd. Robert R. Nathan guesses that the steel industry could break even when operating at only 33 percent of capacity under June 1949 conditions. Let’s see. In the second quarter of this year steel operations dropped to an average of 91 percent of capacity (and to 82 percent in June). Yet Jones & Laughlin’s profits, as compared with the first quarter, dropped 46 percent, Crucible’s dropped 86 percent, and Allegheny Ludlum’s dropped 99 percent. We can only conclude that on its face Nathan’s guess is preposterous.

But how can any government board know just how much any given wage increase will cut future profits in steel? Or precisely how it will affect individual companies? Or exactly how much it will force up steel prices? Or just how much any given increase in steel prices will reduce sales and output? Or just how much unemployment this reduction will cause in the steel and other industries? Or how much all this will affect the ability of the industry to maintain or expand its plant, or the future willingness of new investors to risk their funds in any expansion of steel capacity?

All these questions are asked on the assumption that such boards would act with complete economic objectivity and not, as in the past, merely to buy off a strike, or to hold the labor vote, or to pay a political debt.

“Fact finding” and “recommendations” by government boards are intended to bring such pressure on the parties to a labor dispute, particularly the employers, as to amount in effect to compulsory arbitration. This in turn is only another name for government wage fixing. If government boards know how to set steel wages, then they know how to set all wages and all prices; and we may as well embrace totalitarianism now, with our eyes open, as stumble into it half-blindly, while mumbling lip service to free enterprise. ✶

Abolish Exchange Control
September 5, 1949

The first need today of Britain and every other country that complains of a “dollar shortage” is the abolition of exchange control. This single step would put an end virtually overnight to the whole so-called “dollar crisis.”
Yet this crisis is being discussed today in an incredible atmosphere of unreality. The bureaucrats of the world can think of nothing but more “austerity” or more and bigger American handouts. Not a single one of them proposes to repeal the measure primarily responsible for the whole exchange nightmare—the exchange controls that they themselves have imposed in order to maintain a fictitious value for their own currencies.

The British socialists, for example, insist on maintaining at all costs the fiction that the pound sterling is worth $4.03. They have made it a crime for their own citizens to buy or sell sterling below this rate. They forbid their own consumers to buy the foreign goods (or even the British goods) they want, but only what the bureaucrats tell them they can have. They compel British manufacturers to set aside for export minimum British item that now sells in this market for $4 could then afford to sell it for $3. He would still get £1 for it, as before. If $4 prices the item out of the American market, $3 might price it back in again.

Suppose the whole worldwide exchange-control mechanism were simply dismantled and the pound allowed to sell for what it would bring in free markets. It would fall, let us say, to around $3. The exporter of a British item that now sells in this market for $4 could then afford to sell it for $3. He would still get £1.33 for it and so would make a profit of £0.23. In short, a lower price for the pound in dollars would increase not only the incentive of American consumers to buy British goods here but the incentive and ability of British producers to sell them here.

British imports, it is true, would cost more—but in pounds, not in dollars. Higher prices in pounds would cause British consumers automatically to cut down on their purchases of foreign goods. They would no longer need coercive import quotas and prohibitions to make them “conserve dollars.”

Yet instead of merely returning to the system of free exchanges that prevailed immemorially and almost universally (outside of Stalinist Russia and Hitlerite Germany) until ten years ago, the bureaucrats of the world now hotly urge still more false remedies for this crisis of their own creation.

It is fashionable even for British Conservatives and American officials to say today, for example, that what Britain is suffering from is excessive production costs and that these must be brought down for Britain to “compete.” But this disregards the prohibitive price handicap now put on British exports by the fictitious $4 pound. And it also ignores the law of comparative costs, which one used to suppose that every economist since Ricardo understood. Under free-exchange rates high British production costs would be compensated by a lower quotation for the pound. For Britain to try to adjust its whole cost and price level to its spurious exchange rate would be (to borrow a simile from Wilhelm Röpke) like shoving a grand piano over to a misplaced stool instead of adjusting the stool to the piano.

It is correct to say that British collectivism and controls are responsible for Britain’s present crisis. But the keystone of this collectivism is exchange control. And that is why exchange control is the last thing that Sir Stafford Cripps is willing to surrender.

[* Decimal-pound amounts were shown as shillings and pence in the original.—Ed.]

Collapse of a Trick Solution
September 12, 1949

Exchange control is a totalitarian device adopted by Communist Russia and systematized by Nazi Germany. As a general practice it is less than ten years old. Yet it is now so much taken for granted that commentators on the sterling crisis ignore its existence. Those who insist that the main solution is for Britain to cut its production costs in order to compete abroad overlook the enormous price barrier to export caused by a fictitious value for the pound. They want to saw off the piano legs instead of adjusting the height of the stool.

A similar false solution, whose proponents likewise pride themselves on their “realism,” is that Britain must “increase its production.” But if official statistics are trustworthy, this is what it is already doing. Britain’s index of industrial production advanced from 101 in 1935–38 and 100 in 1946 to 121 in 1948 and 133 in May of this year. As contrasted with such gains, our dollar aid to Britain under the Marshall Plan in the last fiscal year was only about 2½ percent of the total British national income.

Why should Marshall-Plan aid of only £245,000,000 a year count for so much, and the officially estimated increase in Britain’s national income of
But that’s another story. We must do first things first. Abolish exchange control.

The Case for Capitalism
September 19, 1949

There has just been published by the Yale University Press a book that is destined to become a landmark in the progress of economies. Its title is *Human Action*, and its author is Ludwig von Mises. It is the consummation of half a century of experience, study, and rigorous thought.

No living writer has a more thorough knowledge of the history and literature of economics than Mises, and yet no living writer has been to more pains to take no solution of any problem on faith, but to think out each solution, step by step, for himself. The result is a work of great originality written in a great tradition. Although it builds on what was sound in the classical economists and on the revolutionary revision of Menger, Böhm-Bawerk, Jevons, Clark, and Wicksteed, it extends beyond any previous work the logical unity and precision of modern economic analysis.

I know of no other work, in fact, which conveys to the reader so clear an insight into the intimate interconnectedness of all economic phenomena. It makes us recognize why it is impossible to study or understand “collective bargaining” or “labor problems” in isolation; or to understand wages apart from prices or from interest rates or from profits and losses, or to understand any of these apart from all the rest, or the price of any one thing apart from the prices of other things.

So far is Mises’s approach from that of the specialist that he treats economics itself as merely part (though the hitherto best-elaborated part) of a more universal science, “praxeology,” or “the science of every kind of human action.” This is the key to his title and to his 889 comprehensive pages.

Mises is so concerned to lay foundations of his work with unassailable solidity that he devotes the first 142 pages to a discussion of “epistemological” problems alone. This is apt to discourage all but the most serious students of the subject. Yet there is nothing pretentious or pedantic in Mises’s writing. His sentences and vocabulary are as simple and clear as his profundity and closely woven logic will permit. Once his more abstract
Theoretical foundations have been laid his chapters are models of lucidity and vigor.

Outstanding among his many original contributions are his “circulation credit” theory of business cycles, which emphasizes the harm of cheap-money policies, and his demonstration that partial socialism is parasitic on capitalism and that a complete socialism would not even know how to solve the problem of economic calculation.

This book is in fact, as the publishers declare, the counterweight of Marx’s Das Kapital, of Lord Keynes’s General Theory, and of countless other books recommending socialization, collectivist planning, credit expansion, and similar panaceas. Mises recognizes inflationism under its most sophisticated disguises. He demonstrates repeatedly how statist interventions in the market economy bring about consequences which even from the standpoint of those who originally advocated the interventions, are worse than the state of affairs they were designed to improve.

*Human Action* is, in short, at once the most uncompromising and the most rigorously reasoned statement of the case for capitalism that has yet appeared. If any single book can turn the ideological tide that has been running in recent years so heavily toward statism, socialism, and totalitarianism, *Human Action* is that book. It should become the leading text of everyone who believes in freedom, in individualism, and in the ability of a free-market economy not only to outdistance any government planned system in the production of goods and services for the masses, but to promote and safeguard, as no collectivist tyranny can ever do, those intellectual, cultural, and moral values upon which all civilization ultimately rests.

**Camouflaged Fourth Round**

September 26, 1949

The report of the President’s special Steel Industry Board was an adroit political document. For those who were content to bounce along the headlines, it carried a fine air of “impartiality.” It is not surprising that so many editorial writers hastened to acclaim the board for its “statesmanship.”

The board did, indeed, make some unexpected concessions to the industry’s case. It admitted that its profits were “volatile.” It pointed out a number of fallacies in the unions’ “productivity” and “purchasing power” arguments. It found that “there are no inequities of steelworkers at present which require redress through a general wage-rate increase.” And on the ground that “it seems desirable at this time to stabilize the level of wage rates,” it rejected the union’s demands for a straight wage increase.

But the board then immediately turned around and approved pension and insurance benefits which by its own admissions were equivalent to a wage increase of from 8 to 10 cents an hour. Just why it would be so bad for the steelworkers to get another pay boost in the form of a straightforward hourly increase, and just why it would be so good for them to be forced to take it only in the form of pension and insurance benefits, the report never made clear. Following a befuddled argument, it rejected a “general increase in rates of pay” for the puzzling reason that it is “just as likely to affect output and employment unfavorably as it is to affect them favorably.” One would suppose from this that if the chances were equal, the steelworkers should be entitled to the benefit of the doubt.

The real argument against a fourth round pay increase is, of course, that to force a further increase in production costs now would tend only to reduce output and employment. But this argument is just as strong against an insurance and pension boost equivalent to 8 to 10 cents an hour. It is, in fact, stronger. For the moment the companies could no longer supply every worker with at least a 2,000 hour work year, the hourly cost of the insurance-pension plan would mount even higher. This would raise breakeven points even more than a straight wage increase and would intensify the cost problem of the companies in a recession. And even more serious, insurance-pension plans, as the board admits, “once installed, become more or less permanent.” In fact, if experience with John L. Lewis is any guide, forced pension plans to which employees do not contribute—and it is precisely such a plan that the board wishes to impose—are worked up to ever more costly and extravagant levels.

It is impossible to call attention here to all the *non sequiturs*, inconsistencies, and self-contradictions with which the report is riddled. Some random examples will have to do.

The board turns down a straightforward wage increase on the implied (though never clearly stated) ground that it would force price increases. But when it insists that the companies must add the equivalent of 8 to 10 cents an hour to their payrolls for insurance-pension plans, it not only assumes that this would be no excuse for a steel price increase, but implies that it would somehow be followed by “higher profits.” And if these “do not result in benefit to the consumer in the form of lower prices, there would be justification for the union to renew its demand for increase of wage rates!”
In other words, if one payroll boost doesn’t bring down steel prices, try, try, again.

The board finds that a “social obligation . . . rests upon industry to provide insurance against the economic hazards of modern industrial life,” but doesn’t tell us who is going to insure industry itself against the economic hazards of modern industrial life.

The strangest paragraphs in the report are those in which the board affects to deplore “the habit of turning to government” to settle labor disputes “instead of arguing it out in collective bargaining.” Now who on earth do you suppose appointed the board and forced the companies to go before it?

The World Monetary Earthquake
October 3, 1949

Within a single week 25 nations have deliberately slashed the values of their currencies. Nothing quite comparable with this has ever happened before in the history of the world.

This world monetary earthquake will carry many lessons. It ought to destroy forever the superstitious modern faith in the wisdom of governmental economic planners and monetary managers. This sudden and violent reversal proves that the monetary bureaucrats did not understand what they were doing in the preceding five years. Unfortunately it gives no good ground for supposing that they understand what they are doing now.

This column has been insisting for years, with perhaps tiresome reiteration, on the evil consequences of overvalued currencies. On Dec. 18, 1946, the International Monetary Fund contended that the trade deficits of European countries “would not be appreciably narrowed by changes in their currency parities.” I wrote in Newsweek of March 3, 1947: “It is precisely because their currencies are ridiculously overvalued that the imports of these countries are overencouraged and their export industries cannot get started.” In the issue of Sept. 8, 1947, as well as in my book Will Dollars Save the World? I wrote: “Nearly every currency in the world (with a few exceptions like the Swiss franc) is overvalued in terms of the dollar. It is precisely this overvaluation which brings about the so-called dollar scarcity.”

Yet until Sept. 18 of this year the European bureaucrats continued to insist that their currencies were not overvalued and that even if they were this had nothing to do, or negligibly little to do, with their trade deficits and the “dollar shortage” that they continued to blame on America. And the tragedy was that former Secretary of State Marshall, the President, and Congress, completely misunderstanding the real situation, accepted this European theory and poured billions of the American taxpayers’ dollars into the hands of European governments to finance the trade deficits that they themselves were bringing about by their socialism and exchange controls with overvalued currencies.

In time the managers of the Monetary Fund learned half the lesson. They recognized that most European currencies were overvalued. They recognized that this overvaluation was a real factor in causing the so-called “dollar shortage” and unbalancing and choking world trade. But they proposed the wrong cure.

They did not ask for the simple abolition of exchange controls. (Their own organization in its very origin was tied up with the maintenance of exchange controls.) They proposed instead that official currency valuations be made “realistic.” But the only “realistic” currency valuation (as long as a currency is not made freely convertible into a definite weight of gold) is the valuation that a free market would place upon it. Free-market rates are the only rates that keep demand and supply constantly in balance. They are the only rates that permit full and free convertibility of paper currencies into each other at all times.

Sir Stafford Cripps fought to the last against the idea that the rate of the pound had anything to do with the deepening British crisis. Trying to look and talk as much like God as possible, he dismissed all such contentions with celestial disdain. But at the eleventh hour he underwent an intellectual conversion that was almost appallingly complete. We “must try and create conditions,” he said, “in which the sterling area is not prevented from earning the dollars we need. This change in the rate of exchange is one of those conditions and the most important one” (my italics). And on the theory that what’s worth doing is worth overdoing, he slashed the par value of the pound overnight from $4.03 to $2.80.

There are strong reasons (which space does not permit me to spell out at this time) for concluding that the new pound parity he adopted was well below what the real free-market level of widely usable sterling was or would have been on the day he made the change. What he did, in other words, was not merely to adjust the pound to its market value as of Sept. 18 but to make a real devaluation.

The first consequence was to let loose a world scramble for competitive devaluation far beyond anything witnessed in the ’30s. Most nations fixed new rates lower than their existing real price and cost levels called for. These countries, therefore, will now undergo
still another epidemic of suppressed inflation. Their internal prices and living costs will start to soar. Unions will strike for higher wages. And if the past (or Sir Stafford’s Sept. 18 talk) is any guide, the governments will try to combat this by more internal price-fixing and rationing, continued or increased food subsidies, unbalanced budgets, and wage fixing.

In this country, on the contrary, the tendency will be to drag down our price level somewhat by lowering the dollar price of imported commodities and forcing reductions in the dollar price of export commodities. This will increase our problems at a time when the unions are pressing for a wage increase in the camouflage form of insurance-pension benefits.

It will be necessary to reexamine our whole foreign economic policy in the light of the new exchange rates. Marshall-Plan aid with overvalued European currencies was largely futile; Marshall-Plan aid with undervalued European currencies should be unnecessary. In fact, we may soon witness the reversal of the world flow of gold. For the first time since 1933 (if we omit the war years 1944 and 1945) gold may move away from, instead of toward, our shores.

But getting rid of overvalued currencies, even in the wrong way, is nonetheless a tremendous gain. The chief barrier that has held up a two-way flow of world trade in the last five years has at last been broken. The chief excuses for maintaining the strangling worldwide network of trade restrictions and controls have at last been destroyed. Were it not for the echoes of the atomic explosion in Russia, the outlook for world economic freedom would at last be brighter.

The best British comment I have read since the devaluation comes from The London Daily Express: “Let every foreign country pay what it thinks the pound is worth. . . . But the socialists will never consent to free the pound. It would mean abandonment of their system of controls. . . . If you set money free you set the people free.”

**Fourth Round in a False Face**

October 10, 1949

The report of the President’s steel-industry fact-finding board was a crazy quilt of self-contradictions.

The central self-contradiction consisted in rejecting another wage increase while accepting insurance and pension benefits that by the board’s own admission were the equivalent of an increase of 8 to 10 cents in hourly wage rates.

The arithmetic and logic of the case ought to be as plain as daylight. If at this time the steel companies can’t afford another wage increase, they can’t afford the added burden of an insurance and pension plan. If our economy as a whole can’t afford another round of wage increases, it can’t afford a new insurance-pension plan. If a wage increase would be “unstabilizing” now in the frank form of an increase in the hourly rate, it would be just as unstabilizing in the disguised form of an insurance-pension plan. If, on the other hand, the steel industry, or industry in general, can afford now to take on the added burden of an insurance-pension plan costing 10 cents an hour, it can just as well afford to take on a straight fourth-round wage increase of 10 cents an hour.

Why did the board’s decision fly in the face of such elementary arithmetic? For purely political reasons? Because it wanted to grant a fourth-round wage increase but didn’t want it to look like a fourth-round wage increase?

The board might have handed down one of two self-consistent decisions. It might have said to the union leaders: “The steel workers are at present earning an average of about $1.65 an hour. We find that the steel industry cannot afford any further pay increase. It would only result in a rise of prices and a decline of sales, output, and employment. But you believe in compulsory insurance and pensions. So do we. Therefore we recommend that wage rates in the steel industry be reduced to $1.55 cents an hour and that the companies set aside the 10-cent difference for a workers insurance and pension plan.”

If any such decision had been handed down, the union leaders would have yelled bloody murder. Yet it would have carried out the implied premises of the board. It would have carried out logically, also, the sordid analogy drawn by the board and the union leaders between insurance and pension plans for workers and depreciation charges for machines. For companies do not pay out to stockholders the entire current earnings of machines; they withhold part of those earnings for depreciation and replacement.

Another self-consistent decision the board might have made is this: “The steel workers are now getting an average of $1.65 an hour. We find that the companies, without bringing on higher prices, disruption, or unemployment, could pay as high as the equivalent of $1.75 an hour. It is up to the members of your unions whether they want to take the 10-cent addition in the form of a straight hourly wage boost or of insurance and pension benefits. It certainly isn’t for us to force them to take it in one form rather than another.” If this had
been the decision, would all the union members have chosen insurance and pension benefits?

Some companies have misconceived the central issue as one between contributory and noncontributory pension plans. They are right in believing that contributory plans, which are less subject to various abuses, are generally sounder than noncontributory. But this is a secondary issue.

The central issue now raised is this: Will the total cost burden placed on the steel and other industries by an insurance and pension plan, thrown on top of present wage rates, force up prices and so reduce sales, output, and employment?

The workers cannot in the long run get more than they produce. Whatever they get in insurance and pension benefits must in the long run be at the expense of their wage rates. In their new pension propaganda the union leaders may pull every stop in the emotional organ. But they cannot escape from arithmetic.

Illusions of ‘Social Security’
October 17, 1949

Let’s consider a few more self-contradictions in the President’s steel fact-finding board report.

On page 61 we learn: “As to old age and unemployment . . . the government itself has stepped in to provide a minimum of protection.” But two paragraphs later we are told: “No one seriously contends that those sums can’t provide a minimum standard of living even back in 1935 when they were fixed.” So they provided a minimum and they didn’t.

Obviously those sums can’t provide a minimum standard today, the board continues, “with the cost of living some 70 percent higher than in 1935.” One might have expected the logical moral that so-called social-security schemes financed or accompanied by inflationary governmental policies are a cruel deception. No such moral is drawn.

Then the board turns angrily on the Federal government that created it. It appears that the existing pensions provided by that government are “un-American.” Further: “Even if the increases now being discussed in the Congress were enacted, they would still not materially increase the purchasing power of the workers’ pensions over the original purchasing power provided in 1935.” In other words, they would still be un-American.

Turn now to page 62: “So long as government does not provide the security at all, we believe that industry should. So long as government fails to provide an adequate amount, industry should take up the slack.” This

lily seems too lovely to gild. For sixteen years the New Dealers have been telling us that if industry doesn’t live up to its “social responsibilities” government must do the job. Now they tell us that “no thoughtful citizen . . . can expect labor to wait patiently by until government makes up its mind.” So private industry must take over these “social responsibilities” if government won’t! This is statism biting its own tail.

Still on page 62: “Social insurance, at least in its minimal form, should be founded on a universal base for all workers in the United States.” The board talks of “the danger of unbalanced, overlapping, and competing programs.” It finds it a “cause of great concern” that “there is growing up haphazardly all over the country this large number of unequal and uncoordinated insurance funds, with little or no public control.” All this would lead logically to a recommendation that the existing universal, “nationwide, compulsory” government insurance plan should be made “American” and “adequate.” Instead, the board recommends still more unbalanced, overlapping, competing, haphazard, unequal, and uncoordinated private-insurance funds!

The government’s social-insurance system is based on worker contributions. The board ignores this. For 67 pages it insists that the sole cost of pensions and insurance must be paid by the employer. But on page 68, in its eagerness to argue that such employer funds would not be raided or abused, it slips into a fatal admission: “So long as the cost of the plan is integrated into the labor cost structure . . . the worker will know that he is in fact paying for his own insurance.” He must do so for the simple reason that he cannot in the long run be paid more than he earns. But then why deceive him? Why try to tell him in all the rest of the report that the burden of his insurance can in fact be shifted entirely on employers?

In this sudden emotional flim-flam about pensions little attention has been paid to the experience of Britain and France. The British cradle-to-grave social services are far more comprehensive, far more expensive, and provide a far greater percentage of the worker’s real income than our own. In France the cost to the employer of social benefits has now reached a basic amount of 29 percent over and above wages, with even higher costs for particular firms and industries. But this crippling burden is precisely one of the reasons why the total income of the British or French worker is so much smaller than the American’s.

One of the primary causes of the grave social insecurity of our time is this fetish called “social security.”
Power of Industrywide Unions
October 24, 1949

Let’s see just how we got into this. The President’s steel fact-finding board handed down a proposed settlement not only unsound in itself but riddled with inconsistencies. Its central self-contradiction was to deny a straight hourly wage increase on the ground that this “might well cause price dislocations”—and then insist on a pension-insurance plan costing 8 or 10 cents an hour which would have the same economic effects as such a wage increase.

Soon or late the present industrywide steel and coal strikes will be settled. But any terms now acceptable to the unions are almost certain to increase production costs and to put further strains on the economy. They will either result in unemployment or in more inflation to make the higher costs payable.

The trouble is not merely that the President’s board handed down a bad report, but that we cannot have government wage-fixing in this or any other disguise and still keep a free economic system.

Why was such a board appointed? In the fear that the industrywide steel union would otherwise bring the steel industry of the nation to a halt. And now that the steel industry and the soft-coal industry have both been brought to a halt by their respective industrywide unions, our whole economy is in danger of paralysis.

Let’s go back a little farther. How did we get into the position where there are industrywide unions? How did we get to the point where individual unions have become so powerful that they can paralyze the entire economic life of the country unless their terms are met? We got there precisely because the government helped to put us there. We got there precisely because the Federal government itself, through the Norris-LaGuardia and Wagner Acts, and continuing with the Taft-Hartley Act, deliberately turned itself into a union organizing agency, built up industrywide unions, and encouraged strikes by taking practically all the risks out of strikes.

One reason why the employers must now deal with the Murrays and Reuthers and Petrillos and Lewises, no matter how unreasonable or disrupting the demands of the latter may be is that they are forced to deal with them under the law. We deliberately grant a handful of union leaders the power to paralyze the nation’s economic life, and then become surprised and indignant when they use the power.

As long as this legal grotesquery remains, we will have threats of economic paralysis until union leadership at last makes it impossible for a free system to operate at all.

The straightforward solution would be the complete repeal of the Taft-Hartley Act (including, of course, the Wagner Act which it amends) and the repeal or drastic revision of the Norris-LaGuardia Act.

But no amount of economic disruption now seems sufficient to convince Congress that its predecessors made serious mistakes in 1932 and 1935. From the standpoint of creating a workable economic system or of bringing about industrial peace, the Norris-LaGuardia and Wagner Acts were not great forward steps but great backward steps. Yet even the timid Taft-Hartley revisions in 1947 have been denounced by Mr. Truman.

In this atmosphere any real solution seems impossible. But a minimum reform, if a free economic system is to be allowed to function, would be an amendment removing the present legal compulsion on employers to recognize and “bargain” with industrywide unions. Such an amendment was in the original 1947 House bill, which was passed by an overwhelming majority. It failed in the Senate by a single vote, and only because of the fear of a Presidential veto. If Mr. Truman were to recommend such an amendment now, he could get it immediately. Until he does, the country will remain in the power of industrywide unions, of these Frankenstein monsters given a special license to paralyze the nation’s economic life if they don’t get exactly what their leaders want.

Devaluation Instead of Freedom
October 31, 1949

Serious signs are appearing that sterling devaluation is not going to have the good results for which Sir Stafford Cripps had hoped. And the chief reason for this is that he will not permit free markets to function.

His first mistake was “devaluation” itself. What was called for, as Winston Churchill has hinted, was not an arbitrary slash in the “official” value of the pound but a return to free exchange rates.

Under a system of free rates, with Britons and foreigners exchanging pounds against other currencies at the relative valuations that they mutually agreed upon, the only way in which a government could sustain the value of its currency would be by taking the measures necessary to win confidence in it. But Sir Stafford preferred to have the value of the pound fixed, not by the people who trade in it, but by himself; not by confidence, but by fiat, coercion, and command.
Even this mistake would not have been irremedi-able if he had been willing to allow the new rate to produce its natural economic consequences. But it is precisely these consequences that he seems determined to prevent. “Nothing,” he says, “—and I mean literally nothing—should be done to increase personal incomes arising out of profits, wages, or salaries.” And again: No one must “try and profit or improve [his] relative position compared to [his] fellow citizens.” Sir Stafford wishes to retain what the British Socialists are fond of calling “fair shares for all.”

Now it is in fact only by the relative changes in prices, profits, and wages brought about by the new price of the pound that labor and capital could be voluntarily diverted from domestic production into export production. British manufacturers will produce more for export and less for home consumption only if they see a better prospect for profits in the foreign than in the domestic market. Manufacturers can bid labor away from domestic to export production only if they are able to offer, and permitted to offer, higher wages for export than for home production. This is precisely what a free market under the new sterling rate would enable them to do. This is how a free market works.

Sir Stafford either does not understand this or finds it abhorrent. He prefers government price fixing and government wage fixing. And like most govern-ment planners, he thinks of prices en bloc and of wages en bloc. He will not permit the thousands of necessary relative adjustments to be brought about by the free play of prices, profits, and wages in the market, with their corresponding effect on relative deterrents and incentives. Therefore he is forced to try to substitute the incomparably clumsier and less effective method of exhortations and compulsions. He forbids free-market incentives and then tries to substitute the paternalistic statist incentive of taxpayers’ guarantees against exporters’ losses.

It is open to doubt whether Sir Stafford understands even the direct market mechanics of devaluation. The only illustration he offered in his radio speech announc-ing devaluation assumed that a British export’s price in pounds remained fixed and that the full adjustment to the new pound rate was made by a lower price in dollars. If this were general, the British exporter’s advantage would be very slight. He would get no more pounds from a given volume of sales than before, and exporters collectively would have to sell 44 percent more goods in volume for Britain to earn the same number of dollars. But where the exporter could sell for the same dollar price as before, he could get 44 percent more pounds for the same sales volume—no negligible incentive. In practice, in free markets, the final price adjustment for most exports (or imports) would tend to be made partly through higher sterling prices and partly through lower dollar prices.

In sum, though free exchange rates would be infinitely preferable to “devaluation,” neither free exchange rates nor devaluation can bring their desired results except within the framework of free markets and a free economy.

Collectivism Marches On

November 7, 1949

One of the strange perversions that have crept into our political life is the habit of praising Congress for the amount of legislation it has passed or denouncing it for “dawdling” when it passes little. One would think that the more new laws a Congress put on the books, the more things it meddled in, the more new restrictions and compulsions it put on the citizens, and the more it took from the taxpayers to hand to some special interest, the better.

President Truman called the 80th “the worst Congress ever” because he considered it a “do-nothing” Congress. He was wrong. The 80th Congress put no fewer than 1,363 new laws on the books. True, this was 263 less than the 79th; but it beat the 78th by 206. To catch up with the 80th, Mr. Truman’s more favored 81st will have to enact at least 526 laws more. In the nine-month session just closed it passed 837 bills.

Is it really possible for any President (who must approve or veto each of them) to decide within a few months on the individual merits of more than 800 separate bills? Is it possible for any congressman to do so—though he too is called upon to vote on all? And if no single human mind whatever is capable of judging the individual consequences of each of these hundreds of new laws, not to speak of their composite interaction, how can the net result be called intelligent, coherent, or responsible lawmaking?

So far from denouncing a do-nothing Congress, we might better pray for one. What the country needs is an undo-something Congress.

In trying to judge the record of the last session, we are compelled to center arbitrarily on a handful of items. On the credit side, Congress ratified the Atlantic Pact, extended the reciprocal-trade agreements, and adopted some of the Hoover recommendations for reorganizing the government. It commendably refused to throw out the Taft-Hartley Act in order to substitute something much worse, and it fortunately failed to plunge ahead
with Point Four, or to enact a new grab-bag social-security program, or to rush through compulsory health insurance. On the debit side, the cumulative record was alarming. The session adopted a housing bill that was both collectivist in concept and inflationary in effect. It boosted the legal minimum wage from 40 cents to at least 75 cents an hour. This must either create unemployment for the very people it is intended to benefit, or force further inflation to prevent such a result. The session adopted a “compromise” price-support bill for farm commodities which constituted the most openly cynical and recklessly expensive bid for the farm vote ever made. It provided for additional storage facilities to withhold more foodstuffs from the American public, create artificial scarcities, and force consumers to pay higher prices.

It authorized $5,600,000,000 more Marshall-Plan money without even requiring in return policies to promote freedom and recovery instead of collectivism and crises. It appropriated $1,314,000,000 for arms aid on the false assumption that the recipient governments couldn’t afford to pay for arms themselves. It spent more than $46,000,000,000 and headed toward another deficit of $5,000,000,000 to $10,000,000,000.

In brief, the last session of Congress drove the country still farther toward collectivism and inflation. It assumed that every domestic and foreign problem could be solved simply by seizing still more from the American taxpayer and handing it over to someone else. The mere fact that the last session refused to drive even faster into collectivism should not blind us to how far it actually went.

Yet this Congress, which was so busy thinking of how many better uses it could make of the taxpayer’s money than the taxpayer could, didn’t find time to do anything to curb the power of the industrywide unions that Congress itself has built up. The private power of a handful of union bosses to paralyze the nation’s entire economic life unless their demands are met seemed a matter too trivial for Congressional notice. It considered 700 other things more important.

Government mediators might hail the capitulation of Bethlehem Steel as a triumph for “voluntary procedures.” But when an employer makes such concessions only after his plants have been closed down for a month by a strike, after a Presidential board has put the heat on him by “recommending” just such concessions, and when experience suggests the possibility of government seizure, it becomes hard for most of us to distinguish between such “voluntary” concessions and concessions made under duress.

As a result of the unrestrained power of industrywide unions a new national pattern is being established under which employers will feel virtually compelled to add about 10 cents an hour to their wage costs.

This victory is likely to be a Pyrrhic one for labor itself. On top of the new minimum-wage boost, it will probably either bring about unemployment or force a further monetary inflation to make the higher labor costs payable. And even if that result doesn’t come right now, we may be sure the national union leaders will keep repeating the pattern until it does.

The dangers of industrywide bargaining have been forcibly pointed out in a pamphlet by Prof. Leo Wolman of Columbia.* They are now further emphasized in a book by Prof. Charles E. Lindblom of Yale†. It is Professor Lindblom’s startling thesis that “unionism is destroying the competitive price system.”

“The strike,” he points out, “paralyzes production, and it is dramatic. But the real labor problem is its aftermath. For if wage disputes call a halt to production temporarily, their settlement may disorganize it permanently. Unionism will destroy the price system by what it wins rather than by the struggle to win it. It sabotes the competitive order, not because the economy cannot weather the disturbance of work stoppages but because it cannot produce high output and employment at union-wage rates.”

What are we going to do about it? The first step is to get the public to recognize clearly the real nature of what is now happening. As Professor Wolman has summed it up, the industrywide unions “can today paralyze the economic life of the country or dictate the terms on which they refrain from doing so.” The next step is to stop appointing so-called “fact-finding” boards whose decisions are inevitably political and who impose something close to government wage fixing. And the next step is to take away from any union leader the arbitrary power to bring on the kind of nationwide crisis that creates a demand for direct government intervention.

The original Hartley bill, passed by the House in 1947 by a vote of 308 to 107, removed the compulsion

---

**Union Monopoly vs. Capitalism**

November 14, 1949

It was inevitable from the start that when the steel and coal strikes were settled it would be essentially on the union leaders’ terms. There may have been some doubt as to the exact amount by which they would force up labor costs, but there was never any doubt that would force them up.
on the employer to recognize and deal with industry-wide unions. If a union leader represented the workers of one employer, for example, the Labor Board was not to certify him as eligible to represent the workers of any competing employer, unless each employer regularly employed less than 100 men and the competing plants were less than 50 miles apart. A similar provision failed in the Senate by only a single vote.

If Congress were now to pass such an amendment to the Wagner-Taft-Hartley act, it would not undo, of course, all the damage its bad legislation has done. But it would be an excellent beginning. If even this is not made, we cannot escape Professor Lindblom’s grim conclusion: “Union monopoly destroys the price system because it produces . . . waste, unemployment, inflation, or all combined . . . to a degree which the economy cannot survive.”

What ‘Monetary Management’ Means

November 21, 1949

Before it has faded too far into the past, let’s look at the record.

When Sir Stafford Cripps announced the devaluation of the pound, Winston Churchill pointed out that Cripps had previously denied any such possibility no fewer than nine times. A United Press dispatch of Sept. 18 listed nine such occasions. A haphazard search on my own part has uncovered three more—on Sept. 22 and 28, 1948, and April 30 of this year. Incorporating these in the UP list, we get the following record of denials:

Jan. 26, 1948—“No alteration in the value of sterling is contemplated by the British Government following the devaluation of the franc.”

March 4, 1948—A reported plan to devalue the pound is “complete nonsense.”

May 6, 1948—“The government has no intention of embarking on a program to devalue the pound.”

Sept. 22, 1948—“There will be no devaluation of the pound sterling.”

Sept. 28, 1948—The government has “no idea whatever” of devaluing the pound sterling. Devaluation would “increase the price of our imports and decrease the price of exports, which is exactly the opposite of what we are trying to accomplish.”

Oct. 5, 1948—“Devaluation is neither advisable nor even possible in present conditions.”

Dec. 31, 1948—“No one need fear devaluation of our currency in any circumstances.”

April 30, 1949—“Sterling revaluation is neither necessary nor will it take place.”

June 28, 1949—“There has been no pressure on me by America to devalue the pound.”

July 6, 1949—“The government has not the slightest intention of devaluing the pound.”

July 14, 1949—“No suggestion was made at the conference [with Snyder and Abbott] . . . that sterling be devalued. And that, I hope, is that.”

Sept. 6, 1949—“I will stick to the . . . statement I made [July 14] in the House of Commons.”

In brief, Sir Stafford emphatically denied at least a dozen times that he would do what he did. The excuse has been made for him that naturally he could not afford to admit any such intention in advance because no one would then have accepted sterling at $4.03. This “defense” amounts to saying that unless the government had lied it could not have successfully deceived the buyers of British goods and the holders of sterling.

For this is what “devaluation” means. It is a confession of bankruptcy. To announce that IOU’s hitherto guaranteed to be worth $4.03 are in fact worth only $2.80 is to tell your creditors that their old claims on you are now worth no more than 70 cents on the dollar.

When a private individual announces bankruptcy, he is thought to be disgraced. When a government does so, it acts as if it had brought off a brilliant coup. This is what our own government did in 1933 when it jauntily repudiated its promises to redeem its currency in gold. Here is how the London Bankers’ Magazine describes the recent devaluation of the pound by the British Government: “The political technique for dealing with these issues has worn thin. It consists of strenuous, even vicious repudiation beforehand of any notion of devaluation. It insists that the move would be ineffective and utters portentous warning about the dangers. When the unthinkable happens the public is slapped on the back and congratulated on the best piece of luck it has encountered for years.”

This is what governments have now been doing for a generation. It is the modern equivalent of medieval coin clipping. This is what “monetary management” really means. In practice it is merely a high-sounding euphemism for continuous currency debasement. It consists of constant lying in order to support constant swindling. Instead of automatic currencies based on gold people are forced to take managed currencies based on guile.
Instead of precious metals they hold paper promises whose value falls with every bureaucratic whim. And they are suavely assured that only hopelessly antiquated minds dream of returning to truth and honesty and solvency and gold.

Gold Goes with Freedom
November 28, 1949

The question whether or not it is desirable to return to a real gold standard, and when, and under what conditions, and at what rate, and by precisely what steps, has become so complicated that in spite of its great importance I have hitherto refrained from taking it up in these columns.

Fortunately an excellent take-off point is now provided by the speech of W. Randolph Burgess of the National City Bank of New York, before the American Bankers Association. His position seems to me, with one or two reservations, the most sensible and balanced recently presented. I quote in part:

"Historically one of the best protections of the value of money against the inroads of political spending was the gold standard—the redemption of money in gold on demand. This put a check-rein on the politician. For inflationary spending led to the loss of gold either by exports or by withdrawals by individuals who distrusted government policies. This was a kind of automatic limit on credit expansion. . . ."

"Of course the modern economic planners don’t like the gold standard just because it does put a limit on their powers. . . . I have great confidence that the world will return to the gold standard in some form because the people in so many countries have learned that they need protection from the excesses of their political leaders. . . ."

"There is a group of people today asking for the restoration of the full gold standard immediately in the United States. Today we have a dollar that is convertible into gold for foreign governments and central banks; these people are asking for the same rights to hold gold for our own citizens. In principle I believe these people are right, though I think they are wrong in their timing, and overemphasize the immediate benefits. . . ."

"If you try to force the pace by resuming gold payments before the foundations are laid through government policies on the budget, on credit, and on prices, the gold released may simply move out into hoards and become the tool of the speculator."

"Gold payments are only part of the building of sound money, and they are in a sense the capstone of the arch. . . ."

The great virtue of this statement is not only that it recognizes the central importance of returning to a real gold standard but that it takes account also of the formidable difficulties that our past and present errors and sins have placed in the way.

For the gold standard is not important as an isolated gadget but only as an integral part of a whole economic system. Just as “managed” paper money goes with a statist and collectivist philosophy, with government “planning,” with a coercive economy in which the citizen is always at the mercy of bureaucratic caprice, so the gold standard is an integral part of a free-enterprise economy under which governments respect private property, economize in spending, balance their budgets, keep their promises, and refuse to connive in over-expansion of money or credit. Until our government is prepared to return to this system in its entirety and has given evidence of this intention by its deeds, it is pointless to try to force it to go on a real gold basis. For it would only be off again in a few months. And, as in the past, the gold standard itself, rather than the abuses that destroyed it, would get the popular blame.

Last week I recited the shabby record of Sir Stafford Cripps, not as a personal criticism but as an illustration of what typically, if not inevitably, happens under a “managed” paper-money system. For Sir Stafford is not the lowest type of politician likely to be entrusted to manage the people’s money; he is the highest type. To millions he had been the very symbol of political integrity and courage. “If gold ruste,” as Chaucer asked, “what shal iredo?”

Which reminds us that real gold doesn’t rust. As a currency basis it may lack one or two of the perfections that theorists dream of, but it weighs more and can be kept longer than a politician’s pledge.

Instead of ‘Integration’
December 5, 1949

Two years ago our government made the mistake of supposing that it could buy European recovery merely by pouring dollars into Europe and not even insisting in return on the minimum reforms needed to make recovery possible. Slowly, by the pressure of events, our ECA officials have themselves come to realize that lasting European recovery can come only from the efforts of Europe itself. They know we cannot continue to
The international gold standard was the greatest adventure in economic “integration” that the world has ever seen. Combined with free trade or even with moderate tariffs, it turned the world in effect into a single market.

It may be too much to expect a return to gold immediately. But it is not too much for American taxpayers to expect, in return for the dollars they are daily being forced to pour into Europe, insistence by our ECA officials on at least three minimum reforms: balanced budgets, the end of artificial cheap-money policies, and the abolition of exchange control. The first two reforms would halt the inflation that is undoing all our sacrifices for European stability. The third would allow a reasonable flow of trade, end the dollar shortage, and halt the trend to totalitarianism.

But it would be inconsistent and ridiculous for us to demand even these reforms as long as we ourselves are heading for a deficit of more than $5,000,000,000 and persisting in a recklessly inflationary cheap-money policy.

In Praise of Paper
December 12, 1949

The recent speech of Allan Sproul, president of the Federal Reserve Bank of New York, before the American Bankers Association, was a startling revelation of official doctrine. It has already provoked some excellent answers—notably those of Joseph Stagg Lawrence in the Empire Trust letter and of Prof. Walter E. Spahr in _The Commercial and Financial Chronicle_ of Nov. 10. I have space to make only a few random points.

“I perceive,” said Sproul, “no moral problem involved in this question of gold convertibility.” Let’s help him to perceive one. Prior to the year 1933 our government pledged itself to pay interest and principal on its bonds in gold of a specified weight and fineness. It also pledged the holder of every currency note that it would redeem that note on demand in gold of a specified weight and fineness. It violated its most solemn pledge. It deprived the rightful owners of their gold. And it made the possession of gold by anybody but the thief illegal.

And now we are all being slapped on the back and told how lucky we are at last to have a system at home of irredeemable paper. Sproul sings paens in praise of paper. “We use a paper money,” he says, “which has the supreme attribute of general acceptability.” He neglects to add—at a constantly falling value. The purchasing power of a paper dollar, according to the Department
of Commerce, is now only 52 cents, as measured by wholesale prices, in terms of the 1935–39 dollar.

Sproul resorts to flag waving. “The integrity of our money does not depend on domestic gold convertibility. It depends upon the great productive power of the American economy. . . .” Those who recall the disastrous paper-money inflations of history must shiver at this argument. Listen to Andrew D. White’s report of speeches made in the French Assembly in 1791 to defend the paper assignats: ‘Fear nothing; your currency reposes upon a sound mortgage.’ Then followed a glorification of the patriotism of the French people, which, he asserted, would carry the nation through all its difficulties.”

The nub of Sproul’s defense of our internal irredeemability is that the bureaucrats must be trusted implicitly but that the people cannot be trusted at all. It appears that when you allow the people to redeem their money in gold they always want to do it at the wrong time—i.e., just when it is most embarrassing for the government to meet the demand; in other words, just when the government has connived in an inflationary expansion and issued more paper claims than it is able to honor.

“The principal argument for restoring the circulation of gold coin,” Sproul declares, “seems to be distrust of the money managers and of the fiscal policies of government.” He couldn’t have said it better. What he fails to see is that this mistrust has been richly earned. In addition to the shabby record of Sir Stafford Cripps, we need to remind ourselves that some 30 governments instantly followed the British example. They wiped out overnight, by simple ukase, part of the value of every paper currency unit in the hands of their own people.

Yet in the face of this almost universal record of currency debasement (not to bring up our own sorry record of currency inflation since 1933), Sproul can seriously speak of leaving everything to what he calls “competent and responsible men.” Said Sir Stafford Cripps, in explaining his devaluation record: “Even if we had then had some future intention of altering the rate of exchange, which in fact we had not, no responsible minister could possibly have done otherwise than deny such intention.” Here, then, is an authoritative definition. A “competent and responsible” monetary manager is one who not only lies to his people regarding the future of their currency but even considers it his duty to deceive them.

Sproul’s currency theory may be summed up thus: Put your faith in the monetary managers, who have always fooled you in the past.

The Compensatory Budget
December 19, 1949

A few weeks ago fourteen academic economists, several of whom might be expected to know better, came out in favor of “counter-cyclical fiscal action”—i.e., “surpluses in good times and deficits in bad.” I was forced to pass this by at the time because a worldwide monetary earthquake fell in the same week. But the admirable analysis of the “compensatory budget” theory in the December letter of the National City Bank provides a fresh occasion to take it up.

“Annual budget balancing,” declare the fourteen economists, “is both difficult in practice and unsound in principle.” That it is difficult in practice all history attests. So is any other virtue or worth-while goal. But “maintenance of the national credit by a Federal budget annually balanced” (to quote the pledge of the Democratic platform on which Franklin D. Roosevelt ran in 1932) is an incomparably sounder principle than the foggy alternative offered by the fourteen.

Even they put in a patronizing word for the annually balanced budget. “One great merit it does have: it provides a yardstick. . . . Every government program undertaken has to be paid for in a clear and unequivocal sense . . . This is a principle every citizen can understand.”

And dropping that principle has led and will lead in practice only to fiscal irresponsibility, inflationism, and eventual disaster.

An annually balanced budget has one enormous advantage. Everyone knows exactly how long a year is. Everyone knows on what day it begins and on what day it will end. But nobody knows how long a boom or depression is going to last while we are in it. Even hindsight can’t answer this question exactly. How do we know how far we are above or below normal unless we know what “normal” is? How do we know on just what day even a past depression stopped? Each set of statistics yields a different answer. Which set do we go by? How dependable are the statistics themselves?

The fourteen want to throw away the only real yardstick we have. The decision whether to plan for a surplus or a deficit, and exactly how big a deficit, would then be determined by somebody’s guess about the economic future. “We can, however, reasonably expect that the budget be formulated in the light of economic judgment available.” Whose judgment? Leon Keyserling’s, say? And suppose the economic forecasts of the Administration prove as bad in the future as in the past? Well, better luck next time.
before the encroachments of government power has, in fact, become worldwide.

We need not go into all the reasons here. One is the bribes to immediate self-interest, (jobs, benefit payments, defense contracts) that a government is able to offer particular groups or persons. Another is the dominance of a statist ideology. But most important of all is the fear of government retaliation. This is the chief cause of the paradox that the greater the tyranny of a government, the less complaint there is against it. In Russia today there is no internal complaint at all, but only frantic competition in flattery. We may lay it down as a political principle that the more power a government has already been permitted to seize, the easier it is for it to seize still further power. Businessmen and public-relations advisers rationalize their timidity in the phrase: "Don't stick your neck out!"

All the more honor, therefore, to those writers and businessmen who do have the courage to stick their necks out. That is why it was gratifying to read, a few weeks ago, of the presentation of awards by the Freedoms Foundation at Valley Forge to writers and business firms who "spoke up for freedom" in 1949. Two of the recipients are particularly well known to readers of Newsweek. One is my colleague, Raymond Moley, who received an award for his admirable column on "The Coils of Bureaucracy" (Dec. 13, 1948). The other is Warner & Swasey of Cleveland, whose advertisements in these pages over a period of years in defense of our free-enterprise system have been distinguished for their rare grasp of the virtues of that system and for the compact clarity with which they state those virtues. I wish I had space to refer to other award winners no less deserving.

Unfortunately, however, the majority of business firms seem to be under the illusion that they can sit back and enjoy a free ride while a small courageous minority bears virtually the full burden and expense of defending the private-enterprise system upon which the ultimate prosperity, independence, and existence of every private business firm depends. If this minority, however able, proves too small for the task, the rest will have no one to blame but themselves.

The compensatory-budget theory subordinates or disregards the maladjustments in costs and prices that may be causing stagnation. It especially ignores the relationship of unemployment to excessive wage rates. It assumes that booms or depressions are the purely mechanical result of the volume of money available for spending. It overlooks what Albert Hahn has called the "compensating reactions to compensatory spending"—the chief of which is the destruction of business confidence.

But even if it had none of these economic weaknesses, the political consequences of the "compensatory" budget are alone decisive against it. The budget is to be balanced only when conditions are "normal," and overbalanced only when they are positively booming. At such times the politicians are to increase taxes and reduce expenditures to bring the boom to a halt. This reversal would be politically unpopular and perhaps politically fatal.

Even at the height of an inflationary boom, therefore, the party in power could never be brought to admit that the boom was quite high enough to be halted. We have seen an example of this even within the last twelve months. So even in a year when we count our national income at the second dizziest height it has reached, we face a probable budget deficit of $5,000,000,000 to $8,000,000,000.

The compensatory-spending philosophers merely put into the hands of the inflationists and spendthrift politicians a theory that they can and will use to their own ends.

Voices for Freedom
December 26, 1949

Some weeks ago the Norwegian weekly Farmand carried an editorial called "Why So Timid?" "One of the phenomena of the postwar period in Norway," it declared, "is that business has shown no will to defend its interests against the encroachments of the government. . . . Norwegian businessmen with lamblike meekness and patience have let themselves be tricked, abused, and stepped upon. . . . It is up to the individuals to take the trouble of finding out whether Norwegian citizens still have protection under the courts and the Constitution."

With a few changes in its illustrations, this editorial would apply with striking aptness here. Timidity before the encroachments of government power has, in fact, become worldwide.
If it had existed this year, there would have been some outstanding candidates for awards. I have already reviewed on this page *Human Action*, by Ludwig von Mises (*Newsweek*, Sept. 19). I should like to add here *Economics and the Public Welfare*, by the late Benjamin M. Anderson, which is not only the outstanding financial and economic history of the United States for the period from 1913 to the present, but one of the most powerful expositions of the free-market economy and of the distortions caused by shortsighted government interventions. . . . But now there is space only to add the names of John T. Flynn’s *The Road Ahead*, Felix Morley’s *The Power in the People*, and F.A. Harper’s *Liberty*. ✺
If Foreign Exchanges Were Freed
January 9, 1950

Even those responsible for the devaluation of some 30 currencies since September admit that the results have been disappointing.

Devaluation was, in fact, the wrong remedy. What was called for was not continued exchange control with lower fiat rates, but the restoration of free exchanges. This is a necessary transitional step to eventual return to a full international gold standard. Gold means real stability based on freedom. Exchange control means a fictitious stability based on coercion.

Exchange control subordinates the citizen to the bureaucrat. Free exchange rates subdivide the bureaucrat to the citizen. Under controls the bureaucrat imposes a fiat rate by telly the citizens: “You must buy and sell sterling (or dollars) at this rate or else.” With free rates the bureaucrat is compelled to woo the confidence of the citizen. He must follow policies that will make the citizens of his own and other countries place a high value on the currency and real faith in its stability. Hence freedom promotes fiscal and monetary reform, while exchange control conceals the necessity for it.

Sir Stafford Cripps must bear the chief blame for the fateful decision to devalue, and for the chain reaction that it touched off elsewhere. But responsibility must be shared also by the International Monetary Fund.

The last annual report of the fund was available to Cripps two months before he announced devaluation on Sept. 18. If the report had recommended free exchange rates he would have been forced to give the recommendation great weight. But it never did. It did strongly hint at the need of “an exchange rate adjustment” for “countries with dollar payments difficulties.” It was this hint that Cripps followed.

The fund report wavers between a philosophy of freedom and a philosophy of statism. It depletes, in the abstract, “restrictions and discrimination” and “multiple rates.” It dreads the prospect of world trade “conducted with inconvertible currencies on the basis of bilateral bargains.” But when the fund faces a specific decision, it usually throws its weight on the side of control. Never once has it unequivocally come out for the abandonment of exchange control. It prefers fiat rates to free rates.

When Peru in November adopted a free rate for its currency, and took one of the most promising steps away from exchange control that has been taken by any nation since the war, the fund gave the action a very cool approval. And the November review of Barclay’s Bank of London explains that “to allow sterling to go free would have been against the letter and the spirit of the Bretton Woods agreement”—under which the fund was established.

In the same report in which the fund deplores “restrictions” we find it urging its member nations to place still further restrictions on private transactions in gold—either at “premium prices” or for “illegitimate purposes, particularly hoarding.” Today nearly every government in the world is inflating and debasing its currency unit, cheating its own citizens of their savings. The fund gives its apparent blessing to this process: “Changes in exchange rates can, and under appropriate conditions should, be an instrument of economic policy.”

The real villain, it seems, is not the government that prints and depreciates paper money, but the citizen who tries to protect himself against this depreciation by putting part of his savings in gold.

Yet the fund, in the face of its own record, seems genuinely surprised that the world has not been moving toward freedom. “No member of the fund,” it finds, “which originally availed itself of the provisions permitting exchange restrictions in the transitional period, has subsequently felt itself able to renounce the rights provided.” On the contrary: “In a number of countries, new exchange restrictions have been imposed or existing restrictions expanded.”

The Future of Foreign Aid
January 16, 1950

The Marshall Plan was based on a wrong diagnosis of the sickness of Europe and a wrong conception of its cure. Its sponsors now hail it as a great success. They attribute to it every economic and political improvement in Europe since it was put into effect. Every setback or deterioration, they explain, has been in spite of the Marshall Plan.

This one-way post-hoc-ergo-propter-hoc logic does not seem to be shared by the beneficiaries. In a recent poll conducted for the ECA in Europe, for example, only four Frenchmen in every 100 questioned thought the Marshall Plan had been a factor in French recovery.

On purely economic grounds, it would do no harm to terminate ERP when the present appropriation expires on June 30. Unfortunately, though there was not the slightest good reason for our doing so, we made an implied promise to the European governments that we would continue our Marshall aid for at least four years.
We would only bring on recriminations and charges of
bad faith if we were to terminate it now.

On the other hand, even the ECA now talks of
terminating aid in 1952 and of cutting next year’s
appropriations by 25 percent below that for the cur-
rent year. But if ERP is to run for only two years more,
the logical way to taper off would be to cut the appro-
priation by one third now and by a second third for
the following year. The appropriation for the current
fiscal year was $3,778,000,000. This should be cut to,
say, $2,520,000,000 for the 1951 fiscal year and to
$1,260,000,000 for 1952.

To cut the appropriation by only 25 percent now
would either imply at least a three years’ continuance
or require European governments to make a dispro-
portionate adjustment at the end of the second year.
It seems more reasonable to reduce Marshall aid by
$1,260,000,000 in each of the next three years than to
cut it by only $944,000,000 in the first (and second?)
year and by the remaining $1,890,000,000 in the third.

In tapering off Marshall aid in this simple, pro-
portionate way, Congress should act as soon as pos-
ible—long before the end of the current fiscal year.
And it should authorize now the appropriation both for
1951 and 1952. This would give European governments
plenty of advance notice concerning how much they
could expect to receive from us. It would enable them
to make their plans accordingly. It would also forestall
what would otherwise be constant propaganda for larger
and continuing aid. The truth is that the amount set for
ERP aid has always been an entirely arbitrary figure. To
recognize this frankly would lead to enormous admin-
istrative simplification. Congress could simply direct
that the reduced total sums it appropriated should be
divided among the individual governments in the same
ratio as in the current year. This would take from ECA
officials a burden of decision that should never have
been placed upon them.

In fact, the whole ECA bureaucracy was unnec-
essary from the start. The elaborate ritual of “counter-
part funds” and other such special earmarked accounts
is meaningless as a real control. It merely befuddles
both Europeans and ourselves. All Congress need do
is to authorize the Secretary of the Treasury to pay
checks at regular intervals to the ambassadors of the
recipient European governments. The ineffective but
much-resented interferences of the ECA in the eco-

Such a plan would be far superior to the proposed
new “clearing union” for Europe. This “union” would
be merely one more futile effort to do what the exist-
ning International Monetary Fund is already supposed
to do. It would actually apply “incentives in reverse” by
giving the most to the countries that succeeded in get-
ting themselves the biggest trade deficits.

If we cannot have sound foreign-aid plans we can
at least have simple ones.

The Forgotten Taxpayer
January 23, 1950

“This financial program,” insisted President Truman
in presenting his annual budget, “provides a sound
basis on which to proceed.” He thought his spending
policy one of “prudence and restraint.” “It provides for
essential activities,” he said, “on a minimum basis and
no more.” He spoke of it as if it were an abstemious,
almost a niggardly budget. He had denied “request after
request for additional funds.” In fact, he declared at one
point: “The major question in my mind is not whether
we are doing too much [spending] but . . . too little.”

This budget that Mr. Truman considers to be so
sound, prudent, restrained, a minimum and perhaps
too little, happens to be in simple fact a continuation
of the largest peacetime expenditure ever proposed by
the head of this or any other government in the history
of the world.

The requested 1951 expenditures of $42,440,000,000
would be greater than our total estimated national
income in 1932. They would be more than five times the
annual rate of spending in the peacetime years of the
Roosevelt Administrations. They would be more than
ten times the annual rate of spending in the Hoover
Administration.

The real truth is the exact opposite. Mr. Truman’s
bouquet of fallacies stems from looking solely at what
the expenditures do or appear to do for those to whom
they are given. He forgets that a government cannot
give anything to Paul without taking it from Peter. In
brief, he completely forgets the American taxpayer.
Mr. Truman really does assume that we can eat our cake and have it too. He forgets that the government cannot fill a single “need” without making it impossible for the individual taxpayers to satisfy other needs. He declares that “many Federal expenditures constitute direct supports for important sectors of our economy.” But he forgets that the taxes taken to make these expenditures must constitute at least equal direct depressants on other important sectors of our economy. He sincerely believes that he can pass economic miracles by seizing more and more from the American taxpayer and handing it over to someone else.

Yet you do not help the people to meet their needs by taking away from them the earnings on which they depend to meet those needs. You do not maintain high employment by putting further tax burdens on the industries that provide employment. You do not encourage production by burdening the productive to subsidize the unproductive. You do not create an expanding economy by killing incentives and draining industry of the very capital by which productivity is increased and an economy expanded.

Even with the present unparalleled burden of peacetime taxes the government stands to raise only $37,300,000,000 in revenues. This means that it plans a deficit in the 1951 fiscal year of more than $5,000,000,000. This deficit alone would be greater than the entire expenditures of the Federal government in any year in the Hoover Administration. It would come on top of an estimated deficit of $5,500,000,000 in the current fiscal year, on top of eighteen deficits in the twenty preceding fiscal years, and on top of a national debt of about $259,000,000,000.

What is most ominous is that the President no longer seems to consider deficits anything to worry about. He expects the country to be satisfied with the vague assurance that we are “moving toward budgetary balance in the next few years.” Mr. Truman and his advisers seem to believe that they can keep a perpetual boom going by perpetual deficit financing and perpetual inflation. And that belief, as experience shows, has always ended in disillusion and disaster.

Free Trade or State Domination?
January 30, 1950

In the winter of 1944–45, when we were still fighting Germany and Japan, and before the international fund or bank or the United Nations had become realities, I wrote a piece with the above title in the pages of The American Scholar. It took a dim view of the brave new postwar world then being proposed by the bureaucrats.

“The demand now,” I wrote, “is for International Cooperation. But when the concrete proposals for this international cooperation are examined, it turns out to be something radically different from the international cooperation hoped for by the older liberals. It is not the freedom of the private citizens of any country to trade with the private citizens of any other. It is not primarily the cooperation among private citizens of different countries at all. It is primarily cooperation among governments.”

I went on to express misgivings concerning the way in which this might work out. In analyzing the proposed setup of the International Monetary Fund, for example, I voiced the fear that it might encourage inflationary money policies followed by a wave of devaluations—“the modern euphemism for debasement of the coinage.”

I wish I could report that my misgivings proved to be entirely groundless, and that the devaluations since last September of some 30 national currencies did not in fact occur. But they did.

I confess, however, that I did not foresee the full flowering of international bureaucratism. I did not foresee the innumerable sub agencies of the coming United Nations, with their thousands of bureaucrats daily flooding the world with propaganda in favor of still more bureaucratic controls. I did not foresee, for example, the nightmarish project just proposed by “a group of five outstanding economists” at the request of the United Nations Economic and Social Council.

But I can perhaps provide a useful guide to the reader through the current international bureaucratic maze, He will find that the thousands of international-control schemes resolve themselves, on analysis, into one or more of just three basic schemes:

Scheme One: To seize still more from the American taxpayer and turn it over to foreign bureaucrats.

The Marshall Plan, arms aid, and Point Four are mere beginnings. Thus one of the five economists warns that the United States “must be prepared to abandon the practice of doing too little.” We have, for example, handed out only some $28,000,000,000 to foreigners since June 1945, Do we expect to save the world with chickenfeed?

Scheme Two: Each government is to keep constantly inflating, constantly shooting more paper purchasing power into the economy and constantly debasing its monetary unit. No matter what peak of
inflation it reaches, it is never to permit any decline below that peak.

The recent recession in the United States, for example, is regarded by the five economists as an "ominous signal." All sorts of irresponsible gadgets are proposed by the same economists to keep pumping in this paper purchasing power in "emergencies." Of course, for the record, lip service is also paid to means of curbing excessive inflation, apparently with the calm assurance that no government that values its tenure of office will ever adopt them. The same governments that are to inflate for constant "full employment" are also to help prevent any continuous upward pressure for wage increases."

Scheme Three: Don't permit things to be bought or sold for their real market values, but only for the flat values put on them by the bureaucrats. (Price fixing, wage fixing, profit control, exchange control, etc.) My conclusion of 1944 still stands: "If the planners succeed in tying up the idea of international cooperation with the idea of increased State domination and control over economic life . . . the plain man's living standards will decline with his liberties." ⚫

Our Irresponsible Budget
February 6, 1950

Whatever may be thought of the President's tax message to Congress as a 1950 campaign document, there is only one possible judgment of it as a statement of fiscal policy. It is irresponsible.

In his budget message, for peace time, for a year expected to record one of the three highest national incomes of our history, Mr. Truman planned a deficit of $5,100,000,000. He now joins the popular clamor for reducing excise taxes. He asks Congress to impose compensating taxes, most of which would be even more harmful than the taxes he asks it to reduce. In order to "reduce taxes which burden consumption" he proposes to increase taxes which burden production. But even if all his proposals were carried out, and if the resulting yields came up to his expectations, he would still be recommending a deficit of more than $4,000,000,000.

If there is any fiscal responsibility in Congress itself, its course is clear. It should return his proposed 1951 budget to Mr. Truman without approval, and request him to submit a responsible, balanced budget, with provision for a minimum debt reduction of $600,000,000.

If it agrees that it is desirable to cut excise taxes by, say, $700,000,000, and to allow not less than $600,000,000 for debt reduction, and if it agrees that other taxes are already at if not far beyond the highest levels that our economy can tolerate, Congress should become even more explicit. It should point out to the President that his present proposed expenditures of $42,440,000,000 for 1951 must be slashed by a minimum of $6,440,000,000 to make a responsible, balanced budget possible. The total expenditures under such a responsible budget, in other words, could not exceed $36,000,000,000.

A responsible Congress would further inform the President that he ought not to place upon it the impossible burden of trying to find where all the wastes, inefficiencies, and non-essential items in his budget are; and that if he wishes to avoid what he calls "foolish budget slashes" it is his job to make the cuts himself. Congress should tell the President, in other words, that he will have to learn to get along on a mere $36,000,000,000 in the next fiscal year, even if this is only four or five times the rate at which the Roosevelt Administration spent in peacetime and nine times the rate of spending under the Hoover Administration.

A responsible Congress would go on to demand executive responsibility. The proposals in the President's tax message are extremely vague. Congress should insist that the Administration spell these out in detail; tell exactly what excise rates it wants on what; exactly what new corporate rates it wants; and exactly what new provisions for oil and mine depletion. Congress should ask the Administration, in brief, to draft and submit the complete text of its proposed tax-law changes. Congress is under no obligation to adopt these Administration proposals; but Congress and the country should insist on knowing precisely what they are. That is the only way to get executive responsibility.

Mr. Truman's tax message is honeycombed with contradictions. He persists in declaring, for instance, that the deficit of more than $4,000,000,000 which he plans for the fiscal year 1951 "will be due largely to the shortsighted tax reduction enacted by the 80th Congress." If Mr. Truman really believes what he says, his only consistent course is to recommend immediate restoration of the higher tax rates prevailing before the cut. He actually declares, on the contrary, that "nothing could be more foolhardy than to attempt to bring about a balanced budget in 1951" by "drastic increases in tax rates" or "drastic cuts in essential expenditures." So he denounces the 80th Congress for bringing about a deficit that he insists upon maintaining.

The country is in grave financial peril unless the Administration can be brought to end this political double talk and recognize its responsibilities. ⚫
Take out the Goat
February 13, 1950

A poor peasant, according to an old folk tale, went to the Wise Man of his village for help and advice. The peasant lived in a one-room mud hut with his wife and four children. He was driven to desperation by the noise, the quarreling, the smell, the dirt, the poor scanty food, the poverty, sickness, and squalor in which his family lived.

“I will help you,” said the Wise Man. So the next day he brought a male goat to the peasant’s hut, saying: “You must feed this goat and take him in and let him sleep in the hut.” “Why, O Wise Man?” asked the peasant. “You will see,” replied the Wise Man. “Come back to me at the turn of the moon.

On the night of the new moon the peasant was back. “O Wise Man, my life is unendurable. The noise in the hut is hideous. The smell is beyond belief. The goat knocks down the children and eats us out of hut and home. I am sunk in wretchedness and despair.”

“I will help you,” said the Wise Man. And he came and took away the goat.

A week later the peasant came to him again, his face wreathed in smiles. “O Wise Man,” he said, “my life now is wonderful. You cannot imagine the change since you took away the goat! The hut is quieter. The horrible smell is gone. My family has once more almost enough to eat. How can I ever thank you enough for taking away that goat? How infinitely wise you must be to have thought of such a marvelous plan!”

I keep thinking of this tale as I read about the new plans of the bureaucrats all over the world. They impose an endless network of restrictions, burdens, coercions, and prohibitions on their own peoples; they all but strangle production and trade. And then their most happy solutions consist in removing one or two of the burdens and prohibitions that they themselves have decreed.

The cleverest new scheme of the ERP bureaucrats in Europe, for example, is to remove 60 percent of the import quotas that they themselves imposed. Last September the bureaucrats of some 30 nations hit upon another wonderful scheme. Instead of forcing people to buy and sell currencies at rates ridiculously above their real market values, and so damming up the flow of international trade, the bureaucrats now force people to buy and sell these currencies at rates much nearer to their real market values. Perhaps an even more brilliant stroke would be to remove all import quotas and allow people to buy and sell currencies freely at whatever rates they could mutually agree upon.

The bureaucrats rightly recognize that there can be no free flow in international trade until currencies are made convertible. To achieve this they now propose complicated “clearing unions” which would provide jobs for still more bureaucrats. They put forward other schemes of wondrous ingenuity. But it hasn’t seemed to occur to a single bureaucrat that the only reason currencies are not now freely convertible into each other is that the bureaucrats themselves are forbidding holders of currencies to buy and sell them freely at market rates. Perhaps the idea of repealing this prohibition will eventually occur to some supergenius.

A few weeks ago the British Labour bureaucrats suddenly increased bacon and candy rations. Though this merely relaxed their own restrictions, the British bureaucrats did this with the air of philanthropists conferring a charity. The step was hailed as still another victory for Planning.

The most brilliant schemes of the planners today consist in tapering off their previous plans.

Even at home our politicians now talk of removing excise taxes. They too are going to confer a great favor by taking out a few of the goats they have forced upon us.

As the demand today is for constructive proposals, this department humbly submits its own. Stop putting needless burdens and coercions on people, production, and trade.

Let the bureaucrats take away their own goats.*

Fifty Billions for Tribute?
February 20, 1950

Sen. Brien McMahon’s proposal that our government contribute $50,000,000,000 over five years for a “global Marshall Plan” is the culmination, the reductio ad absurdum, of the befuddlement on foreign economic policy in which Washington has wandered for the last five years.

Senator McMahon’s proposal is, to put it baldly, a proposal to pay unparalleled tribute. No other word fits. “Tribute” is defined in the dictionary as “a stated sum . . . paid by one sovereign or state to another in acknowledgment of submission or as the price of peace, security, protection, or the like.”

When we were small and considered weak, our minister Charles Pinckney, on being told by Talleyrand that a gift to the Directory might avert war with France, made his famous reply: “Millions for defense, sir, but not one cent for tribute.” Yet today Senator McMahon, at a time when we are by far the strongest nation in the world, proposes that we pay up to $50,000,000,000 as
the price of Stalin’s promise to stop threatening us with atomic or hydrogen bombs.

This mere proposal, by the chairman of the Joint Committee on Atomic Energy, is certain to be taken by the leaders behind the Iron Curtain as a sign of fear and weakness. The leaders of the Iron Curtain countries have already found that they can with impunity plant spies in our midst, blockade us at Berlin, beat or imprison our envoys, and insult and vilify us every day. What further move may they not be encouraged to take by this timorous offer of ransom? Even Secretary Acheson’s emphatic rejection cannot fully offset this blow to our prestige.

The McMahon proposal obviously lacks sense. Would we make ourselves safer by pouring billions of our dollars into Russia, by reducing our economic and military strength to increase hers, by intensifying the problems of our free-enterprise system to mitigate the problems of her Communist system? And if for four years Stalin has unswervingly refused to call off the atomic-bomb race, even when we were far ahead of him, and even at the risk of the annihilation of millions of Russians and of his own regime, does it make sense to suppose that he will reverse his stand now for a mere monetary bribe?

It is time we asked ourselves frankly, in fact, whether an atom-bomb “agreement” might not actually be more dangerous than the present known lack of agreement, by binding us and not the leaders of Russia. These are the same leaders who have broken promise after promise, who live by systematic perfidy. The proposals for international “inspection” of the vast depths of a totalitarian Russia are not realistic. Even if our inspectors finally did catch up with a plant in Russia that had been working on the bomb—after we had poured in our $50,000,000,000 to help finance it—what recourse then?

But the real point of this article is economic. Senator McMahon himself calls his proposal a “global Marshall plan” and casually drops Point Four inside it. It is a supergiveaway program. It is not only politically preposterous, but it rests on the same fundamentally false economic assumptions as the Marshall plan and Point Four. It wrongly assumes that the American capital thrown into such schemes is a net addition to the world’s capital. It is in fact a mere diversion of such capital. And it is a diversion, in the main, from productive private enterprises into far less productive collectivist projects.

Such schemes do not encourage private lending abroad; they discourage such lending. They do not speed up recovery and development of world resources; they retard that recovery and development. For as long as foreign countries can get easy money, seized from our taxpayers, out of the United States Government, they will neither give the assurances nor make the economic reforms that they would have to make to attract private investment.

It is time we called a halt to the giveaway mania.

Future of the Marshall Plan
February 27, 1950

Congress has unwisely committed itself to two more years of the Marshall plan. Because of this, I suggested in this column of Jan. 16 that the simplest way to taper off the plan would be to cut the amount by one-third next year and by a second third for the following year. The simplest way to do this, in turn, would be to abolish the ECA bureaucracy, to divide the sums among individual governments in the same ratios as in the current year, to present the money as a gift, attach no conditions to it, authorize now the appropriations for both years, but put these governments on notice that our aid will definitely terminate at the end of this two-year period.

This plan is the simplest we could adopt. It is least likely to be misunderstood. Politically it would give no ground whatever for the criticism that we were trying to interfere in the “internal” affairs of the governments concerned. Let us call it Plan A.

But Congress may quite properly want to insist on economic and financial reforms in Europe in exchange for our aid. In that case the best plan would still be to abolish the ECA bureaucracy and to turn our aid program over to the Export-Import Bank. The bank should be authorized to make loans guaranteed by European governments that conformed to half a dozen simple but mandatory requirements of eligibility unequivocally laid down by Congress. For example:

1—No loan should be made directly to any government, but only to some specific productive enterprise, private or governmental. Each loan must be fully guaranteed, however, by the government of the borrowing country.

2—If the loan is to a going enterprise, private or governmental, that enterprise must be currently operating at a profit.

3—If the loan is made to start any new enterprise, that enterprise must be private. Native investors must supply equity capital equal to not less than a third of the total capital.

4—The guaranteeing government must itself be operating on a balanced or overbalanced budget.
The immediate cause of the crisis was President Truman’s failure to invoke the injunctive provisions of the Taft-Hartley Act until too late. There was not a shred of excuse for this irretrievable loss of time. The Taft-Hartley Act provides: “Whenever in the opinion of the President . . . a threatened or actual strike or lockout affecting an entire industry or a substantial part thereof . . . will, if permitted to occur or to continue, imperil the national health or safety, he may . . . direct the Attorney General to petition any district court” etc. (My italics.) The threatened emergency was obvious to everybody else weeks and even months before Mr. Truman got around to admitting its existence. By the time he did, our national economic life was already in such peril that John L. Lewis could dictate almost any terms he pleased.

But the causes of the coal crisis go much farther back than Mr. Truman’s procrastination. The Taft-Hartley Act, notwithstanding its injunctive provisions and all the nonsensical charges about its being a “slave labor” law, merely continues the basic provisions of the Wagner Act with a few minor amendments. Like the Wagner Act, it turns the government itself into a union-organizing agency. It legally compels employers to negotiate with a Petrillo or a Murray or a Lewis no matter how unreasonable his demands. It sanctions and builds up industrywide unions. It encourages strikes by taking nearly all the risks out of them. It practically deprives the employer of the right to declare that the strikers have quit their jobs and to offer permanent employment to others to take their place.

Our one-sided laws are in turn the result of a confused ideology which believes that unions can do no wrong and that they can be granted sweeping legal immunities without danger of abuse, including immunity from the antimonopoly laws. The unions are granted a sweeping “right to strike” which is interpreted to include not merely the acknowledged right to the individual to quit his job but the spurious right forcibly to prevent anybody else from taking the job that he has deserted.

Under cover of protecting these spurious “rights” of the unionneers everybody else’s rights are abridged. The railroads were deprived of their right to run coalburning trains and the public of its right to travel on such trains—even when there was still officially no emergency at all. The states and cities suspend the right of private ownership and use of coal, the right to supply or get current or the right to turn on electric lights. And all to protect the precious right of John L. Lewis to paralyze the economic life of the country until he can dictate the terms on which he will refrain from doing so.

The Needless Crisis in Coal
March 6, 1950

By the time this article appears, the legal and economic outcome of the coal strike may be fully known. But the confused ideas and laws which brought on this crisis will condition the terms on which it is settled, and the precedents set may even decide the very nature of our future economy.
The government continued to force the operators to negotiate with Mr. Lewis as the spokesman for the miners after those miners defied his public orders to return to work—which meant that, if his orders were given in good faith, he was no longer their spokesman. Because the government made itself impotent even to enforce its own injunction, it was proposed to seize the mines. Instead of punishing the strikers, it was proposed once more to punish the struck-against. Such action is not only unnecessary and irrelevant, but it erodes the concept of private property and brings us nearer to nationalization by default. Meanwhile miners’ union goon squads are permitted to roam the country and to resort to mass picketing, intimidation, or violence to prevent anybody else from mining coal.

Yet no one proposes to reexamine first principles; no one proposes to enforce the common law against violence, vandalism, and intimidation, and no one proposes simply to repeal the Taft-Hartley Act, period.

The American Giveaway Mania
March 13, 1950

The Administration is now possessed with a mania for “lending” or giving away the American taxpayer’s money to any foreign government that it can coax into taking it. This mania grows by what it feeds on. The Marshall plan is only one channel for it. In addition there are the Export-Import Bank, the International Bank, the International Fund, the arms aid program, and the proposed global catchall. Point Four. Our foreign policy can almost be summed up in four words: “Give ‘em more money!”

If none of these government handouts had been devised, Europeans would still have had great need for American capital. They would have had to apply for private loans. And they could have got these only by restoring the confidence of American private investors. It is not difficult to specify the reforms they would have had to make to inspire such confidence:

1—They would have had to assure anybody who put money into Europe that he could get it out again. This means that they would have had to make their own currencies freely convertible into dollars. They could have done this simply by dismantling their wartime exchange control.

2—They would have had to assure foreigners holding pounds, francs, or lire that these currencies would not depreciate. This means that they would have had to halt monetary inflation. To do this they would have had to return to balanced budgets.

3—To return to balanced budgets European governments would have had to give up nationalization, which has meant huge deficits in the nationalized industries. They would have had to reduce to manageable dimensions food subsidies and overgrown relief and “social security” programs.

4—They would have had to stop threatening still further nationalization, expropriation, and seizure.

5—They would have had to relax or abandon controls over wages, prices, interest rates, and profits.

6—They would have had to reduce excessive taxation.

If Europe had been obliged to attract private capital, such reforms would already have gone far farther than they have. They would have brought not only far more production, but the freer and more balanced trade, the “currency convertibility,” the “multilateralism,” and the “integration” for which our ECA officials have made futile exhortations. The reason for their futility is clear. As long as foreign governments can pick up easy money from our own government they don’t have to make these reforms.

As a result European recovery has not only been slow and precarious, but the recovery that has taken place has been in the wrong direction. Production indexes have gone up; but the added production is not primarily for export, as it should be, but for home consumption. So foreign trade is still unbalanced, and Europe’s self-induced “dollar shortage” remains.

The dilemma of the Marshall plan and of Point Four, the dilemma of every government-to-government handout, is plain. If our government imposes no conditions on its handout, the money is worse than wasted. If it does impose conditions, they provoke foreign resentment.

Our ECA officials vacillate between the horns of this dilemma. First they say that they won’t interfere in the “internal” affairs of these countries. Then, of course, the European governments getting our aid make return none of the economic reforms so desperately needed. The British bureaucrats repay us by discriminating against American motion pictures and American oil companies. The French repay us by threatening the sale of Coca-Cola. Then our ECA officials talk of “getting tough.” But when it comes to a showdown they cannot risk insisting on reforms that would be really effective. So we end by subsidizing foreign-government discrimination against our own industries.

In short, government “loan” and gift programs like the Marshall plan and Point Four do not promote world recovery; they retard it. We are subsidizing and
prolonging statism and socialism abroad, and imperiling our own free-enterprise system to do it.

Where Do We Go from Here?
March 20, 1950

Having himself helped to deliver it one staggering blow after another over the last five years, President Truman is now curious to know why the nation's coal industry is sick.

Even if the kind of commission of inquiry he asks for, mainly appointed by himself, could be nonpolitical and objective, it is not needed. For the essential facts about the coal industry are already known. These facts are that John L. Lewis, aided by Congress and the President, has won too many Pyrrhic victories. As a result, coal labor costs are too high, coal is overpriced, the supply is never dependable, and coal is losing out everywhere to the competition of oil, natural gas, and water. In 1947 coal supplied 50 percent of the nation's energy; last year its contribution was down to 38.5 percent. Of 1,142 new railroad locomotives on order, only twelve will be powered by steam.

It is not the coal industry that needs to be investigated but the President's own incredible labor policy.

Mr. Truman has repeatedly demanded the repeal of the Taft-Hartley Law, called it "unworkable," denounced it as a "slave labor act," and otherwise encouraged Mr. Lewis and other labor leaders to flout it. He failed to act under the injunction provisions of the law until weeks and even months after he should have acted. Then a Federal judge held that though the miners continued to strike after the injunction, they were not in contempt because, don't you see, they were merely acting "as individuals." This made the injunction meaningless and the government impotent. And nobody in the government even drew the logical conclusion that if Mr. Lewis could not get his own back-to-work order respected he should no longer be dealt with as the miners' spokesman.

So, because of the crisis that Mr. Truman himself helped to bring about, he asked Congress for power to seize the mines. Having made the government impotent to deal with the strikers, he threatened to crack down on the struck-against. This seizure threat forced the prompt surrender of the mine operators. If it hadn't, Congress would no doubt have given Mr. Truman his requested legislation.

Yet the legal situation that such a law would create would be fantastic. Thanks to present law Mr. Lewis is dictator of the nation's coal industry. It is considered an infringement of his sacred constitutional rights even to prevent him from ordering three-day weeks to deprive the nation of coal. But under Mr. Truman's seizure law property rights could be abridged every time Mr. Lewis chose to create a crisis. Then the government could step in and dictate wages and profits while it ran the mines. Though this would abridge rights, there is no assurance that it would end strikes. For miners could still refuse to work "as individuals."

Mr. Truman seems to have forgotten entirely that even when he seized the railroads in May of 1946 he did not end the strike that had been declared against the generous wage decision of his own fact-finding board. On that occasion Mr. Truman was finally reduced to proposing that he be given the totalitarian power to throw the strikers into the Army and force them to run the trains that way.

Mr. Truman's labor policy was already bankrupt in 1946, and he has learned absolutely nothing from his experience since then.

The power of industry wide unions was never so menacing as now. The simplest solution would be to repeal the Wagner-Taft-Hartley Act, lock, stock and barrel, and so restore free, two-sided wage bargaining.

If this solution is deemed at the moment politically impossible, then the second best course is to remove the sweeping immunities of the labor unions from the antimonopoly laws, and above all to stop compelling individual employers to deal with industry wide unions. If nationwide unions continue to be imposed on industry by law, they will in time make it impossible for our private-enterprise system to function. This is the alternative that confronts us.

That European Payments Union
March 27, 1950

If Congress wants to save the American taxpayer $600,000,000 it could find no better way of doing it than to reject the ECA proposal that we pour that amount into a "European Payments Union."

This proposed "Payments union" would merely seek to do for Western Europe, and by the same methods, precisely what the International Monetary Fund already seeks to do on a global scale. Assuming that this scheme ought to be carried out at all, why not utilize the already existing IMF to do it? Why not at least place the proposed regional organization inside the existing global fund? Why set up an entirely new, competing, overlapping, and duplicating institution?
But the questions to be raised about this scheme go much deeper than organizational ones. What is proposed is that $600,000,000 more of the American taxpayer's dollars be thrown into a huge kitty, together with fresh and practically automatic loans of the European governments to each other.

The purpose of this is to enable these European countries to buy more goods from each other. There is no reason to suppose that the scheme wouldn't, at least temporarily, achieve this result. Anybody can buy more goods if somebody else gives him the money to do it with.

But at what cost, and at whose expense, will this be done? It is argued that if the European countries are encouraged to buy more from each other they will need to buy less from the United States and the rest of the "dollar area," and so "save dollars." But by the same reasoning (unless they have unemployed resources), if they sell more to each other they will have less left over to sell to the dollar area—and certainly less incentive to sell it. In other words, they will have less incentive to earn dollars.

There are strong reasons for thinking, in fact, that the tendency of the proposed European payments union would be to turn Western Europe and the sterling bloc into one big soft-currency area—and to reduce the trade between this soft-currency area and the rest of the world. For this intra-European trade would be financed by a new dose of easy dollars and inflationary credit. This inflationary credit would tend to raise price levels still further within the area, increase its price incentive for dollar imports, and reduce still further its ability to export competitively into the dollar area. Moreover, though the member nations promise to cut down their quantitative restrictions on imports from each other, the scheme contemplates that they would continue to discriminate against the outside world, and even be encouraged to do so to "save dollars."

In short, the scheme threatens not only to turn Western Europe into a big walled-in soft-currency area, but actually to increase on net balance the dollar deficit of that area. It would tend to delay rather than promote worldwide multilateral trade. It would tend to delay rather than accelerate general currency convertibility, and above all the convertibility of sterling and European currencies into dollars.

The greatest single step toward a free and balanced international trade would be to restore the general convertibility of currencies into each other. This can be done only by the abolition of exchange control. The traders of every country must be allowed once more to buy and sell their own or other currencies at whatever rates are established in free markets.

To prevent currency depreciation and violent fluctuations governments must stop resorting to police methods. They must turn to the restoration of confidence. This will require a halt to inflationary policies and to threats of more socialism and expropriation. Ultimately it will require a return to the international gold standard. For Britain it will require to begin with the blocking or funding of the old overhanging sterling debt. But in general what is needed to promote world recovery and restore world trade is not still more bureaucratic tinkering, but the restoration of economic freedom.

Rent Control Forever?
April 3, 1950

Every year since the end of the war the Administration has asked for the extension of rent control "just for one year more." There is no reason, as I hinted in this place last year (Newsweek, March 14, 1949), why this could not go on forever. For the Administration wants rent control extended "until the supply of housing has caught up with the demand." But "supply" and "demand" are meaningless except in relation to a price. It is rent control itself that keeps supply from catching up with demand. It perpetuates the very problem it pretends to solve.

Rents are out of line with all the rest of the price structure. Weekly factory wages are now 151 percent above the 1935–39 level. Rents are up only 23 percent. The cost of living is 67 percent higher than in 1935–39. Clothing is 85 percent higher; food prices 96 percent higher. Less than 13 percent of wage earners’ spending went for housing in 1949, compared with more than 18 percent in 1935–39. Since 1939, the cost of building has increased between 100 and 140 percent.

Statistics do not indicate a real overall housing shortage. The Census Bureau found that there were both fewer persons per occupied dwelling unit and more rooms per unit in 1947 than in 1940. But rent control itself has brought about the appearance of a housing shortage. For it encourages tenants already in possession to use space wastefully at low rents. And it intensifies the problem for people unlucky enough to be caught without a roof, forcing them to bid high for the little space open to them.

The best solution is to let Federal rent control lapse on June 30. This, no doubt, has drawbacks. In some states and cities it would bring tenants back to economic reality with a sudden jolt. In other states and cities the
local politicians are already taking over rent control on
the purely demagogic principle that tenants have more
votes than landlords, and are entitled to occupy their
present quarters at prewar rents indefinitely—no mat-
ter how much their own incomes have gone up in the
last ten years or so.

One possible political compromise, if there should
be any extension of Federal rent control, would be to
permit landlords in the next three years to raise rents
by no more than 15 percent a year, and to provide for
automatic decontrol thereafter.

One might playfully imagine another compromise,
which might provide a more rapid economic education
than any other. Prohibit the landlord from raising any
rent whatever on his own initiative, but when a lease
expires allow him like an auctioneer to accept the high-
est bid. Then if Paul is occupying an apartment at $50
a month, and John bids $60, Thomas $70, and Peter
$75, Paul will have to meet Peter's bid or surrender his
apartment to Peter.

Under such an arrangement rents would come
almost immediately into line—and into working rela-
tionship—with other prices and incomes. No one could
denounce the landlord for asking an unreasonable or
outrageous rent. He would not be asking any rent at all,
but merely accepting what he was offered. Politicians
could no longer picture the situation as a class struggle
between landlords and tenants. It would be recognized
as essentially the competition of tenants with each other.

Families on the outside would have as much right
to bid for a new lease on an apartment as the particular
family in it. What quarters you occupied, and at what
rent, would no longer be determined by past individ-
ual luck or accident but by present conditions. Living
quarters, like food and clothing, would once more be
rationed by the purse. The economic principle would
once more be emphasized that under competition prices
are not determined by the greed or arbitrary whim of
sellers but by the competitive bidding of buyers. Above
all, rents would go to the level where they would give
the maximum balanced stimulation to private building,
remodeling, and repairs, thereby increasing the quan-
tity and improving the quality of housing for the great-
est number of families.

How We Subsidize Collectivism
April 10, 1950

The action of the House on continuance of ERP does
not indicate that we are going to use any more common
sense in dealing with the European economic problem
in the future than we have in the past.

The Administration has dismissed all critical dis-
cussion of the Marshall plan as "partisan" and "isolat-
tionist." It attempted to drive the new ERP bill through
Congress under a barrage of emotional slogans and
scare words. Though we originally offered Marshall aid
to Communist Russia itself, it is now represented as our
chief weapon for "combating" Communism. Once more
it is implied, by the President, that refusal to vote for
the Administration bill may bring on the third world
war. "Failure to enact its full amount," he writes, "would
do irreparable damage."

Properly resenting these tactics, but without leader-
ship of their own, a bipartisan majority in the House
did have the temerity to cut the authorization by the
moderate amount of $250,000,000. They also cut the
authorization for Point Four by $20,000,000. But they
failed to recognize that in accepting the premise of
Point Four—that the American taxpayer owes the rest
of the world a living—they were letting him in for a
bottomless obligation.

If the Senate is interested in the kind of revision
that is really needed in the ERP program it could not
do better than to read the article by Dr. William Röpke
in the Commercial and Financial Chronicle of March 16.
Writing from his European watch tower in Geneva, Dr.
Röpke says supremely well what some of us have also
been trying to say over here for the last three years. The
present economic troubles of the countries of Western
Europe, he points out, spring mainly from the nation-
listic policies being pursued within those countries:
"It is no longer necessary to define those national
policies. They are familiar ever since Hitler came to
power and, under the guidance of Dr. Schacht, set the
example of a type of national economic policy which
we propose to call National Collectivism. It is the well-
known combination of repressed inflation, collectiv-
ist controls, 'full employment', exchange control, state
monopolies, bilateralism, subsidies, fiscal socialism,
'cheap money' policies, and the strange mixture of the
restriction of private consumption and of public waste
which goes under the name of Austerity. . . .

"With the exception of Switzerland and Belgium,
all European governments still practice National
Collectivism to the extent that they feel compelled to
retain exchange control. It is exchange control, which
is the real keystone of National Collectivism. . . .

"The devaluations certainly eased the strain, and
they were in most countries the indispensable condi-
tion for the removal of exchange control. . . . But the
chance offered by the devaluations has not been used,
which means that the European governments resemble a surgeon who opens the abdomen without removing the inflamed appendix.”

Dr. Röpke then turns to the proposed European Payments Union. “It is being realized by most observers that convertibility of currencies is the cardinal problem. To restore convertibility, however, is tantamount to abolishing exchange control. Not daring to face this thorny issue, many people prefer to believe that there is something ‘almost just as good.’ It is the idea of a European Clearing Union. . . .

“The crucial point, however, is again whether the national governments retain exchange control or not. If they do, then the idea of a European Currency Union has hardly more sense than an American currency system would have if the United States would split into forty-nine systems of state collectivism and of state exchange control. If they abolished exchange control, then we have all the monetary integration we need without the new cumbersome machinery of a European Monetary Union.”

As a result of the evangelistic and intolerant fervor with which its sponsors promote the ERP over here, none of these economic realities is getting any serious attention. ✥

Global Spending Forever?
April 17, 1950

The amendments made up by the Senate Foreign Relations Committee to the House-approved Point Four program are nearly all in the right direction. The real question is whether they go far enough.

Certainly the committee was wise in rejecting the House provision for United States Government guarantees of private investments abroad. Such guarantees mean that we would allow private investors to keep the profits of their investment but would force the American tax-payer to assume the losses. This would be intolerable.

Listen to Secretary Acheson’s defense of this proposal: “Protection from some of the risks [to foreign investment] cannot be provided by treaty no matter how sincere the intentions of the participating governments. Therefore, a bill has been introduced [to guarantee and insure private investors] specifically against expropriation, confiscation and seizure, and against inability to convert local currencies.”

In other words, because these foreign governments sincerely cannot prevent themselves from seizing American property or forbidding currency conversion it is up to the American taxpayer to make good.

Chairman Connally of the Senate Foreign Relations Committee has expressed apprehensions that the initial $45,000,000 sought for the Point Four program for the coming year would be only the start of a more ambitious and costly program. “As time goes on,” he says, “I can feel the pressure coming in the window for big projects.”

So the committee put a five-year limit on Point Four. But will this time limit prevent pressure for further extension five years hence? The ECA, remember, was to last only four years. Of course, Administrator Hoffman reassures us, “ECA aid should be terminated on its schedule date of June 30, 1952. . . . But even with ECA liquidated I doubt if expenditures for foreign aid can be held below $2,000,000,000 annually. “ECA aid,” in other words, will stop; but we are to continue global spending under some other name. “Point Four,” perhaps? And after five years of Point Four, “Point Forever”? It is of the first importance that Congress reject the principle of Point Four. Once we accept the implied premise of that program—that it is the duty of the American taxpayer to subsidize “underdeveloped areas” everywhere, i.e., that the American taxpayer owes the rest of the world a living—we let ourselves in for endless and bottomless responsibilities.

It is impossible in this space to unravel all the fallacies and misconceptions behind the Point Four program. I have myself written a 48-page pamphlet analyzing these in detail.* Here I can merely list some main conclusions:

1—The fact that Point Four so strikingly parallels the proposals of the official head of the Communists in this country in 1944 is at least reason for careful scrutiny.

2—Point Four will not add to the total invested capital of the world. It will at best merely divert that capital from one channel to another—largely from private projects to government or socialistic projects.

3—We cannot give our cake away and eat it too. We can speed up the capital development of other countries only at the expense of our own capital development. We cannot get rich by giving our exports away.

4—The British peanut fiasco and our own Lustron-house loans illustrate in advance what typical Point Four projects would be like.

5—Even if a Point Four program were necessary, the International Bank for Reconstruction and Development and the Export-Import Bank already exist to do precisely what is proposed under Point Four, and are already doing it in ample prudent volume.
productivity increases, prices go down or wages and profits go up, and per capita demand increases with per capita supply.

Because he makes the wrong diagnosis, Mr. Truman proposes the wrong remedy. We need not examine here the real revisions required in unemployment insurance. It is enough to point out that all Mr. Truman's own arguments ignore the salient fact that as we increase the amounts and period of payment of unemployment benefits we encourage an increase in unemployment itself. The more we pay men who are idle, the more we reduce the penalties and increase the incentives for idleness. Mr. Truman wants to pay a man who has been earning $60 a week as high as $42 a week for not working. But if this man is offered another $60 job before his unemployment benefits expire, he may logically ask himself: “Why should I work for only $18 a week?” Or if he is offered a temporary $42 job: “Why should I work for nothing?”

Our national labor policy is, in fact, the equivalent of the farm price support policy. Government support boosts the price of farm products so high that part of the supply must remain unsold. The taxpayer is then forced to hold the unsold surplus. Government and union labor policy, likewise, pushes up wage costs to the point where part of the labor force must remain unemployed. Then the taxpayer must pay unemployment benefits to this idle labor. “Surplus” labor rots in storage like “surplus” eggs, butter, and potatoes.

The present American situation—of high unemployment even at the peak of an inflationary boom—is not unprecedented. Precisely the same anomaly occurred in Germany in 1927, and for the same reasons.*

In 1927 economists like Gustav Cassel warned in vain that the German wage policy was senseless. Will such warnings today, in America, prove equally futile?

How to Buy More Unemployment
April 24, 1950

In the first three months of this year, according to official estimates, there has been an average of nearly 4,500,000 unemployed.

This is paradoxical and premonitory. For this unemployment, the greatest since prewar days, exists not in a depression but in the midst of an inflationary boom. It exists, in fact, in a period when the Administration boasts that personal incomes have reached the highest levels in our history.

Yet this paradox is not inexplicable. It is simply what discerning economists predicted was certain to happen if we continued to push up wage rates and labor costs faster than prices and productivity. And we have kept boosting labor costs recklessly through union policy, pension demands, government “fact-finding” awards, the Wagner-Taft-Hartley Act, and the new law jumping minimum-wage hourly rates from 40 to 75 cents last January.

The presumptive effect of this last factor is striking. Unemployment averaged 3,395,000 throughout 1949 and stood at 3,489,000 in December. This January it shot up to 4,480,000.

Does the Administration recognize the cause of this unemployment? Has it taken warning? On the contrary, it does everything to intensify the problem. In a message to Congress on April 6, President Truman called for a further increase in unemployment benefits. For existing unemployment he offered two explanations, both wrong. He explained that more people have been coming into the labor market every year. But they have been doing that since the beginning of our history, with the annual increase in population. Increased population means not only more people looking for jobs; it also means more consumers and consumer demand.

Mr. Truman's other explanation is that “as new plants and equipment have been added . . . businessmen have been able to produce more with the same number of workers.” This assumes the immemorial fallacy that machinery creates net unemployment. But as man-hour productivity increases, prices go down or wages and profits go up, and per capita demand increases with per capita supply.

For a Responsible Budget
May 1, 1949

The British Labor government is spending $3,248,000,000 a year on social services and food subsidies and only $2,186,000,000 on defense. Yet instead of reducing these “welfare” handouts to leave more to spend on armaments, the British bureaucrats think it is up to the American taxpayer to make good Britain's defense deficiency. Other European bureaucrats think likewise. What they spend on collectivist experiments is none of our business. Our business is merely to make
good the shortage this creates in other directions. Ours not to ask the whys, ours but to subsidize.

In fact, instead of continuing to discuss what is wrong about the British budget, it would be just as well if we drew a moral for ourselves from the one thing that is right about it. It is balanced. For the fiscal year ended March 31 it shows a surplus of $1,537,000,000. For the new year which began April 1 it plans a surplus of $1,240,000,000.

Contrast with this the officially estimated deficit in our own budget of $5,400,000,000 for the current fiscal year and $6,200,000,000 for the coming fiscal year. Congress’s own staff of fiscal experts thinks these will be closer to $6,700,000,000 and $7,300,000,000 respectively.

In all fairness we must not overlook the ironic fact that our own current deficits can be mainly accounted for by ERP and arms aid to Europe, and that the British surpluses can also be largely accounted for by this same ERP and arms aid. Still, it remains remarkable that hard-pressed socialist Britain shows a balanced budget, while rich “capitalist” America, at the peak of its biggest boom, cannot bring its expenditures within its revenues.

The basic explanation is simple. Britain has a responsible budget system. And we have not.

In Britain the executive branch is made completely responsible for the budget. Both sides of it. The Chancellor of the Exchequer not only submits all his proposed expenditures in detail but submits at the same time the detailed taxes and tax rates by which he proposes to raise the revenues.

Parliament cannot tinker with this budget. It cannot increase an expenditure here or reduce a tax there. It must accept or reject the budget as a unified whole. And upon its ability to submit a budget acceptable to Parliament the government stands or falls. Compared with this, our so-called American budget is meaningless make-believe. The President submits his guesses of what expenditures and revenues are going to be. This is not accompanied by any overall tax bill, or by any bill at all. Congress neither accepts nor rejects this “budget.” The President may later propose still more expenditures as an afterthought. Congress may vote still more expenditures on its own initiative or reduce some unpopular tax regardless of the effect in throwing the budget further out of balance. The President and Congress then blame each other, and both deny responsibility.

We shall never approach the fiscal responsibility of the British system until Congress submits a self-denying Constitutional amendment to deprive itself of the power to vote any expenditure not recommended by the President. It must of course retain the power to reduce proposed expenditures. Stripped, like the British Parliament, of the power to raise, it might at last exercise its power to cut. As Henry Jones Ford pointed out: “There is no propensity of human nature more marked than jealousy of opportunities that one does not share.”

Congress can never be expected properly to exercise the vital function of guardian of the people’s purse as long as it is permitted to stick its own hands in that purse. If the President did not fear to be outbid by Congress, he would propose smaller spending in the first place. But as long as three branches of government—President, House, and Senate—are all free to compete with each other in offering handouts to pressure groups with the taxpayer’s money, the taxpayer’s prospects are not bright. Somewhere there must be a restraining hand. And it is most likely to act as such when it has no other power than the power to restrain.

How to Tell a Totalitarian
May 8, 1949

The danger of authoritarianism in this country is increased by the persistent failure of our self-styled liberals to recognize its real source. The leading article in The New York Times Magazine of April 23—“Portrait of the Authoritarian Man,” by Samuel H. Flowerman—typifies this state of affairs.

Flowerman tells us that “social scientists, interviewed and tested more than 2,000 persons” and found a “ready-made ‘authoritarian personality.’” Did they? Pseudo-science notwithstanding, there is no such thing as a typical “authoritarian man” but only an authoritarian ideology. It is the difference in ideology, and not in persons, that basically explains the contrast in political climate between 1950 and, say, 1910.

Flowerman implies that the totalitarian ideology is dominantly conservative. Error. It is dominantly radical. Soviet Russia—the greatest totalitarian power today—ought to be sufficient illustration. True, the Communists once explained Nazism as the last desperate stand of “capitalist conservatism.” But it is impossible to swallow this explanation of a movement that proudly called itself National Socialism and was vehemently anti-banker, anti-gold, anti-creditor, anti-“plutocrat,” and anti-capitalistic in its tirades and decrees.

Flowerman declares that the “opposite” of the “authoritarian personality” is the “extremely democratic personality.” Confusion. The true opposite of the authoritarian is the libertarian. A self-styled “democracy,” or
“people’s government,” like Soviet Russia, that repudiates the principles of liberty is a phony democracy.

Flowerman implies that racial bigotry is an invariable and central characteristic of the authoritarian mind. Again Soviet Russia shows that this is not necessarily so. Totalitarianism, it is true, always needs scapegoats—but not necessarily racial scapegoats. They may be “Jews,” kulaks, “wreckers,” “American spies,” “profiteers,” speculators, employers.

Flowerman thinks it an “offset” to authoritarianism that “Americans traditionally scoff at authority.” Does he mean that we should admire the people who pass red lights, spit in the subway, and rob their neighbors? Those who fail to respect law within its proper bounds do not insure real liberty but imperil it.

“Certainly research findings indicate,” writes Flowerman, “that so far the key to the difference between the authoritarian and democratic personalities lies in the relationship between parents and children. Learning to disagree with one’s parents may be the capstone of a democratic personality.” Some of us had previously supposed that one should learn to seek and believe the truth, even if one’s parents also believed it. The real difference between the authoritarian and his opposite, the traditional liberal or libertarian, is this. The authoritarian has no faith in the people, and unlimited faith in the bureaucrats. The libertarian distrusts excessive power in the bureaucrats, because he has a real faith in the people. That is why he believes that the fundamental liberal institution is the free market. The free market means free voluntary relations between buyer and seller, worker and employer. It means free prices, free wages, free production, free trade. To the authoritarian such freedom means chaos. He distrusts any economic arrangement that is not planned from the center and from the top. He must fix prices, wages, profits, rents, allocate raw materials and labor. He cannot believe that international trade will balance unless he intervenes to balance it. He must control foreign exchanges, restrict travel, license or prohibit imports.

Once embarked upon this “social engineering,” he must keep widening the circle of his prohibitions and coercions until he has wiped out all economic liberty and all other liberty with it. His intolerance of liberty must grow because any liberty whatever will imperil his plan.

It is in this ideology—statist, collectivist, socialist—that the real menace of totalitarianism lies, rather than in children who agree with their parents.

Self-Perpetuating Rent Control
May 15, 1950

President Truman has made his annual plea to Congress to extend rent control for just “another year.” But if his arguments are sound we should logically prolong rent control indefinitely. “Until supply is near enough to demand,” he says, “so that the forces of competition will again operate effectively to protect the tenant, rent control should continue.” This puts the cart before the horse. If the forces of competition were really allowed to operate they would bring rents to a level where supply and demand would balance.

“Supply” and “demand” are meaningless terms except in relation to a price. It is precisely the function of price to bring supply and demand into balance. As long as rents are held arbitrarily below the level to which competitive bidding among renters would bring them, there must be a “shortage” of housing. Rent control perpetuates the very problem it pretends to solve.

It is the strange paradox of rent control that the very dislocations it brings about are triumphantly cited as arguments for its prolongation. “A sudden and simultaneous removal of rent controls,” the President tells Congress, “would precipitate a wave of exorbitant rent increases.” (He nowhere says what he thinks an unexorbitant, or reasonable, increase would be.) “Such increases,” he continues, “would seriously reduce the purchasing power of millions of families.” They would also, of course, increase the purchasing power of other families by an exactly equal amount. This correlative fact he never mentions.

Suppose, for a moment, that clothing prices, instead of rents, had been held down until now to 23 percent above the prewar (1935–39) level, instead of being permitted to rise in a competitive market, as they have, to 85 percent above. If anyone were then to propose that such clothing price control now be ended, it would doubtless be argued in reply that this was premature, because (1) a serious clothing shortage still existed (as under such imagined stiff price control it certainly would), and (2) that if controls on clothing prices were suddenly and simultaneously removed, it would precipitate a wave of price increases averaging perhaps 50 percent, which would seriously reduce the purchasing power of millions of families. The argument could be made with even more force if similar controls had arbitrarily held down food prices.

A control of any sector of the economy, in short, becomes an argument for its own perpetuation. When we turn to a generally controlled economy, hardly anyone has the courage to argue for freedom in any one
sector because of the obvious dislocations this would bring with the controlled sectors. This is strikingly illustrated in an analysis of British rent control by F.W. Paish in the April issue of *Lloyds Bank Review*. Professor Paish finds the British Rent Restriction Acts a “lawyer’s nightmare.” They create inequities between tenant and tenant, tenant and landlord, and above all “between those who are lucky enough to have rent-restricted houses and those who have no houses at all.” They impair the landlords’ ability and incentive to maintain premises in good condition: “Much property is being allowed to degenerate into slums.” They erect grave impediments to the mobility of labor. But as a “solution” to all this, Professor Paish puts forward a scheme more complicated and desperate than rent control itself.

Let us not judge him uncharitably. What man dare suggest isolated freedom of rents in an economy whose other main sectors, including foreign trade, food, and wages, are still under controls? It is impossible to have an economy half-slave and half-free.

The best solution to our own problem is to let Federal rent controls lapse now. If there must be another political compromise, let it be one that at least makes a real start toward nationwide decontrol. It might permit landlords to raise rents by a maximum, say, of 15 percent a year for the next three years, and then expire automatically. “Rent control,” says John H. Williams, “may benefit tenants in the short run, but in the long run it merely reduces the amount of housing.”

### The Giveaway Mania Grows

May 22, 1950

Both houses of Congress have not only voted to continue the ERP program for another year, but in addition—the Senate by the narrow margin of a single vote—to underwrite the indefinite commitment of Point Four. This raises the global giveaway program to a new dimension. In the starry eyes of its proponents there is no discernible limit to this program. When it was first proposed to give billions to Europe, a few tried to point out that most of the arguments for the proposal—such as curing an alleged “dollar famine,” boosting foreign living standards, “combating” Communism, or buying peace—could be just as well used as pretexts for throwing billions of the American taxpayers’ funds all around the world. ERP proponents eventually conceded the logic of this corollary. But instead of reexamining their European policy, they merely demanded its worldwide expansion under the name of Point Four.

The majority in Congress now seems seriously to believe that the real issue is whether the first-year authorization for Point Four should be $25,000,000, as voted by the House, or $45,000,000 as voted by the Senate. This point is, of course, of negligible importance. It is as if the buyer of a $500 television set were to raise a fuss about making a down payment of 45 cents instead of a quarter, when the real object of the seller is to get his name on the contract. The television buyer, at least, is getting definite value for his money, and he knows that there is a definite limit to what he will have to pay. But the taxpayers who will be forced to finance Point Four all over the world know neither what it is that they are buying nor what it will eventually cost them. As the global giveaway expands, the arguments for it become constantly vaguer and more rhetorical. Its advocates talk as if you could buy peace the way you buy potatoes. Isn’t it cheaper, they ask, to spend $20,000,000,000 for peace than $103,000,000,000 a year for another war? If anyone asks whether the ERP program in fact provides any assurance of peace, the usual answer is that of course it doesn’t, but isn’t it worth a calculated gamble? And if anyone goes on to ask whether this particular gamble has been or could in fact be calculated, or whether the whole program doesn’t simply divert attention from the bankruptcy of our talk-tough-but-act-soft, call-names-but-appease policy toward Russia, he is simply dismissed as an “isolationist.”

The economic arguments for ERP as at present set up, and still more for Point Four, cannot stand analysis. But when one points out, for example, that the so-called “dollar gap,” whether in Europe, India, or Argentina, is brought about solely by exchange control and is otherwise pure humbug, the argument, even if understood and accepted, is dismissed as unimportant. The real reasons for the Marshall plan and Point Four, one is told, are not economic but political.

But when we stop to scrutinize these alleged political reasons, we find them even less convincing than the alleged economic reasons. We are fighting socialism and collectivist controls in Europe by subsidizing their continuance (so that the head of Britain’s Board of Trade can now announce, for example, that Britain’s foreign-exchange control will be kept as a “permanent instrument”). We are fighting Communism by financing it in Yugoslavia. Mr. Truman proposes to fight Communism in China by sending food there—though this would directly or indirectly make more food and other supplies available to the Chinese Communist armies and to the
George Fairdeal and his wife, Alice, are having breakfast.

Alice: But if we decide to buy the new house, dear, we'll have to give up that trip to Europe this summer.

George: Why? Why not do both?

Alice: But we've only got $1,000 in the bank. If we use that to take title to the house, we won't have anything left for the trip!

George: You always worry about where the money's coming from. If we have to, we'll borrow it.

Alice: From your brother Bob again? We've been getting more deeply in debt to him every year!

George: Oh, don't talk like a Republican! Bob's one of the family. As I always say to him: "We just owe it to ourselves."

Alice: And how about the money for Jane's singing lessons?

George: Don't worry! My family's going to have everything! The best!

Alice: Now be sensible, dear. What's our income from the store?

George: About $3,500 a year. And that's not bad. It's more than the income of most families in the country today. I was just reading—

Alice: I'm not complaining, dear. But if it's $3,500 then we can't spend $4,500. And if we spend our $1,000 savings in Europe we just won't have it for a new house of our own. We can't get a quart out of a pint jug. That's all I'm trying to say.

George: Raise your sights, Alice! Dream big dreams and plan big plans! Our national income is running today at a rate of $223,000,000,000 a year! Hot diggity! And ten years from now it's going to be $350,000,000,000!

Alice: But we're running into debt, dear—now! Remember? Some day we'll have to pay Bob back. When are we going to start? And how about saving something? Suppose one of us gets sick? And what are we going to live on in our old age?

George: This is the richest nation in the world. The government ought to pay our medical bills. The government ought to give us old-age pensions! They can afford it!

Alice: When you say the government ought to pay our medical bills, George, aren't you really saying that other families ought to pay our medical bills for us?

George: Oh, bosh! The government has plenty of money.

Alice: Where does it get it?

George: Eh—from taxes. And I'm willing to pay my share of increased taxes for socialized medicine!

Alice: But we're an average family. Suppose we have the average amount of sickness and pay the average tax? Then everybody else may be paying our medical bills but we've taken on everybody else's medical bills! We're no better off than when we started. And we can't save for our own old age because we have to pay out the money in taxes to provide for everybody else's old age. It's just silly to think that everybody can be supported at the expense of everybody else!

George: We gotta distribute things fairer. Equalize things!

Alice: Do you mean, dear, that everybody who earns more than we do should have the difference taken away from him? Wouldn't that reduce his incentive to earn? And if his money is spent on those who earn less than we do, won't the people who get the handouts also have less incentive to earn? So wouldn't practically everybody produce less? And wouldn't that leave less of everything to distribute?

George: Don't be an obstructionist, Alice! The government ought to spend more on hospitals—

Alice: But won't that leave less for education, for instance?

George: The country should spend more on both! We must have—

Alice: But won't that leave still less for food or housing or whatever else we're already spending money on? All you're saying, dear, is that every family should be forced through higher taxes to spend its money on the things you think it needs instead of on the things each family itself thinks it needs. The more they spend on one thing the less they have left to—

George: Oh, bicker, bicker. I'm still hungry, Alice. How about some of that coffee cake we had yesterday?

Alice: We ate it, dear.

George: (flabbergasted): We did?
**Toward State-Managed Cartels?**  
June 5, 1950

The Schuman proposal for “pooling” the coal and steel production of France and Germany was followed by a chorus of unqualified praise and endorsement. Nothing in recent months has so clearly illustrated the present matter-of-fact acceptance of a statist and collectivist ideology. The few voices that asked whether this might not mean merely one more state-dominated cartel were hardly heard.

Let us examine the text of the proposal: “The French Government proposes that the entire French-German production of coal and steel be placed under a joint high authority. . . . A president will be chosen by the governments by common agreement; his decisions will be enforceable in France, Germany, and the other member countries. . . . The setting up of the high authority in no way prejudices the question of ownership. . . .”

Now decisions by a “joint high authority” presuppose (1) the nonexistence or cessation of free competition among the individual companies; (2) that major decisions on policy would be made not by the heads of the individual companies, but by a single head; and (3) that the industries as a whole would be directed in the same unified way as a monopoly or a typical international cartel.

The “high authority” who directed the industries would be politically appointed. Such a setup does prejudge the question of ownership because under it the managerial authority that is the usual prerogative of ownership would be held by governments. The profits of the individual companies would necessarily be government-determined. The proposed setup would be, in short, another step toward government management and state socialism.

“The functions entrusted to the joint high authority will be . . . to modernize production and improve its quality. . . .” This implies that the “high authority” will decide what new machines will be installed in which producing units. In short, a politically appointed head will decide the amount, nature, and distribution of investment in the steel and coal industries. The text calls specifically for an overall “production and investment plan” and an overall “reconversion fund to facilitate the rationalization of production.”

The plan envisages “the institution of a mechanism for equalizing prices”—i.e., central price control rather than free competitive markets. Wages would also be “equalized”—i.e., state-controlled and dictated.

“The flow of coal and steel between member countries will be immediately exempted from all customs duties and may not be subject to freight differentials.” Standing by itself, this part of the proposal would merit the highest praise. But what does it mean as merely part of a new quota or allocation system or state-controlled monopoly under which, for example, the more efficient companies would not be permitted to expand production and markets at the expense of the inefficient, high-cost companies?

The plan brings out the ambiguity in the newly fashionable word “integration.” What is proposed is a cartelized state-dictated “integration” rather than the only kind of integration reconcilable with efficiency and freedom. Let governments remove the international trade barriers they have themselves set up. Permit producers to make and sell as much coal or steel as they can. Permit consumers to buy coal or steel or whatever they want wherever they can get the lowest price. Let the relative efficiency and profitability of individual enterprises, and the relative demands of consumers for products of every kind, determine how much capital is invested, where, and in what. It is the restoration of free markets and free trade that will do most to increase world production, raise living standards, and promote peace.

It is indeed encouraging that France, on its own initiative, has made a sweeping proposal for economic cooperation with Germany. But in the long run no step can be really constructive unless it moves in the direction of freedom.

**Salvation through Spending**  
June 12, 1950

The Truman Administration is beyond comparison the biggest peacetime spender in our history. At the height of an inflationary boom it still flounders in deficits. Yet until a few weeks ago we were told that the spending was temporary, made unavoidable by the cold war. The deficit was “inadvertent,” or the fault of the Republicans.

In a speech on May 15, however, Leon H. Keyserling, the new chairman of the President’s Council of Economic Advisers, came out frankly in favor of spending for its own sake. Spending itself is so necessary, it seems, that “when the costs of the cold war can safely be reduced we should use some of that saving to expand the programs of resource development and human security.” In other words, instead of economizing or trying to reduce the burden of taxes, we should then increase other spending.
“In 1929,” says Keyserling, “Federal expenditures represented only about 3 percent of the nation’s total production of goods and services. But this did not produce a healthy economy. During the most recent three years Federal spending has averaged about 15 percent.” And this spending has “lifted our total national product” and “restored faith in the American way of life.”

This is economic nonsense. It takes the credit away from the inventors, investors, managers, and workers responsible for our economic growth and assigns it all to the bureaucrats. By itself, in fact, government spending does not add a single dollar to purchasing power. It merely changes the directions in which money is spent. When the Federal government was spending 3 percent of the nation’s income, it took only 3 percent of it away from the nation’s taxpayers. When it spends 15 percent of the national income, it must in the long run take 15 percent away from the taxpayers. The taxpayers have as much less to spend for goods and services as the bureaucrats have more.

“The test,” continues Keyserling, in his speech of May 15, “of whether Federal spending is wise or unwise is this: Is it putting people and other resources to work for purposes which are more useful to our economy as a whole than the other purposes for which this same manpower and other resources would be used if the Federal spending did not occur?”

And Keyserling’s own implied answer is that he and Mr. Truman know how to spend money more usefully and wisely than the people who actually earned it. If you permit the citizen to spend his own money on the things he himself wants, he will run the economy into the ditch. The way to save him is to take the money out of his irresponsible hands. Let the bureaucrats spend it to expand their pet “social” programs. They know what the taxpayer needs better than he does himself.

Government can increase monetary purchasing power, not by spending per se, but only by deficit financing and by printing money and expanding credit. In short, by inflation. And the Federal government is now inflating by every direct or indirect means: by increasing its deficit, forcing down interest rates, supporting government bonds, increasing government loans for farm price supports, for housing, for small business, for big business, for artificial exports, and by political loans to every “democratic” foreign government from Tito’s Yugoslavia to Perón’s Argentina.

Inflation is always politically popular in the early stages. It raises prices, increases profit margins, promotes “full employment,” expands incomes, wages and profits in terms of dollars, and makes everyone feel richer. The present inflationary boom can doubtless be kept going for a long time yet. But the bigger and longer such a boom, the bigger and more certain, other things equal, the eventual bust.

One of the chief ironies of the present situation is that the very people who have been most derisive about a “boom-bust economy” are the ones now most zealous in whipping up the present inflationary boom to ever new and dizzier peaks.

**Drought Fighting in a Flood**

June 19, 1950

In his talk on June 6 President Truman made it clear that he is still fighting the 1932 depression. And he is fighting it by inflation. In the midst of the 1950 flood his main efforts are devoted to combating the 1932 drought. The rains are falling; the rivers overflow their banks; there is grave doubt that the flood can be controlled. But of all these dangers Mr. Truman is oblivious. “Remember that 1932 drought,” he says. And he orders his rainmakers to bring another monetary downpour.

Inflation works its apparent magic because it depreciates the value of the currency unit and hence raises prices. Rising prices usually mean higher profits. The prospect of these brings the feverish activity and “full employment” that are the boast of every inflating government.

Inflation can go on for a long time and to great lengths. We need not cite here the horrible modern examples of Germany, Greece, and China. But the French currency unit, for example, has depreciated to a hundredth of its 1914 value (which is as if the 1950 dollar had no more purchasing power than the 1914 cent), and the danger of further inflation in France is still not altogether past. In general, inflation will go as far as political forces push it. And inflation is still politically popular here.

Once a nation embarks upon a “full employment” policy through monetary inflation, it can only continue that course either by inflating at an accelerative rate, or by resorting, as Britain and nearly every country in Europe has resorted, to “repressed inflation” through government controls.

Today our government is resorting to monetary inflation to keep “full employment,” and is encouraging a the same time the chief counterforce to full employment—higher wage rates. Inflation brings its activity and employment by pushing prices ahead of costs. But if wage rates are forced up faster than prices, then marginal profits, and hence activity and full employment,
are threatened. No matter how high prices are forced, if labor costs are forced up relatively still higher, they must bring unemployment.

From this standpoint, the new General Motors five-year labor contract is a disturbing sign. Whatever General Motors may be able to take on (as one of the strongest corporations in the world), our economy could not stand the general adoption of this settlement as a precedent. The pension provisions are a formidable boost to present labor costs. And no economy can guarantee in advance to pay every year a “productivity” wage increase of 4 cents an hour, because no one can be sure there will in fact be that much real increase in productivity. As for the cost-of-living escalator clause, I need merely quote Bresciani-Turroni’s 1931 book on the German inflation: “The inflation proceeded with quickened pace especially . . . after the workers had obtained money wages which varied with the index number of the cost of living.”

We seem about to witness a new race between prices and labor costs. The amount of employment or unemployment will depend on which phase gets started first, and when.

Commenting on my article (Newsweek, June 5) on the Schuman plan for a European coal and steel pool, an American economist of European background writes from Paris:

“The whole press here seems to have lost its head. One reads only the crudest sentimental nonsense. . . . Such a pool would certainly create a common interest between German and French industrialists. It would yield them huge profits, because it would not charge competitive prices but prices based on the highest costs. In case of war every country would again manage its own plants anyway.

“The truth is that the greatest cartel in the world is being created. The funniest thing about it is that it is happening under the noses of hundreds of Americans busy fighting such comparatively minor trusts as the I.G. . . . It seems that a ‘bold’—and vague and sentimental—slogan works better in our world than logic.”

Who Are the Isolationists?
June 26, 1950

The most encouraging world economic development in recent weeks is the news that real stabilization of the franc and the removal of exchange controls is being discussed in official French circles. The most discouraging is the foreign-policy manifesto of the British Labour Party. Together these developments symbolize the present conflict between international liberalism and isolationist socialism.

Whether French officials have in mind going on a gold basis, or going merely on a dollar basis, has not yet been made clear. Either decision would involve the serious initial problem of choosing a tenable rate. A rate fixed in dollars rather than gold would make the French economy a tail to the American kite. And as long as our own political authorities display their present carelessness about maintaining the integrity of the dollar, the wisdom of such a French decision would be highly dubious.

But what is most encouraging is that French officials are discussing the abolition of exchange control. Even by itself this would be an enormous step forward. Only freely convertible currencies will make possible free multilateral trade. That is what economic internationalism means.

The British Labour Party pamphlet unintentionally reveals a truth that socialists have always ignored or denied—that socialism does not promote international integration, but disintegration. It is nationalistic, isolationist, autarchic—not by accident, but inherently. What is most important in the Labour Party pamphlet is not that it rejects the Schuman plan, but its reasons for doing so—the general philosophy it enunciates. The British Labourites could properly have rejected the plan on the ground that what it proposes is merely a gigantic cartel. They rejected the plan, in fact, not on the ground that it would set up a monopoly, but on the allegation that this monopoly would be private and not governmental. The real truth is that, pernicious as a private European coal and steel monopoly would be, an inter- or supra-governmental one—using not merely economic but political power to exclude outside competition—would be far more so.

The British Labour Party declares that it “fundamentally rejects” proposals for freeing European trade by the removal of “customs duties, exchange controls, and quotas. . . . The sudden dismantling of internal barriers to trade would in the short term cause serious dislocation, unemployment, and loss of production. . . . Whole branches of industry . . . would go bankrupt.”

This is a tacit admission that these branches of industry could not stand competition and freedom of trade. It is a tacit admission that production in Europe under exchange controls, quotas, bilateralism, and other “internal” trade barriers is grossly uneconomic and wasteful. It is a tacit admission that national socialism and national planning are not reconcilable with
international freedom of trade, including free exchange markets and full currency convertibility.

All this throws a brilliant light on the application of the Marshall plan. President Truman on June 10 once more denounced the “isolationists,” whom he identified as those who express any misgivings about our foreign giveaway programs. Yet it is the ERP program itself that has not only been tolerating, but sanctioning and subsidizing the isolationist policies of its British and other European beneficiaries—their exchange controls, bilateral treaties, quota systems, import prohibitions, their direct governmental discriminations against American goods. Our ECA officials have echoed and subscribed to all the isolationist European nonsense about a so-called “dollar shortage”—which is brought about purely by exchange control itself—and about a so-called “dollar gap”—which exists precisely because there is an ERP to fill it.

Our present foreign policy might be described, in short, as one that sanctions and subsidizes the economic isolationism of every country but our own. Yet freedom of trade has no meaning unless it is two-sided. ♠

Free Trade or Coercion?
July 3, 1950

Rather than reiterate my own reasons for questioning whether the Schuman coal and steel pool proposal is a real step toward free trade and economic integration (Newsweek, June 5), I quote from the excellent summing up of George Winder in The London City Press of June 9:

“What Mr. Schuman proposes is a substitute for free trade—an effort to obtain its advantages without conceding the freedom which is its essential condition. Free trade brings about the integration of trade by giving the individual freedom to buy and sell as he likes. Mr. Schuman is attempting to give us the advantages of free trade by denying freedom. He intends to impose integration by setting up an international body with power to dictate to national producers. . . .

“However disinterested are the aims of those who desire to bring about this unification, we can be sure that, if it is attained, it will be run for the benefit of iron, steel, and coal producers and their employees, and not for the benefit of the peoples of Europe as a whole. . . .

“The integration of the iron, steel, and coal industries would require that the less efficient units should close down, and the more efficient would expand their production. . . . Any politician, however, who imagines that the British iron and steel worker, and the British coal miner, or their French and German counterparts, would allow units of the industry which provides their livelihood to be closed down by the fiat of an international body, has lost all sense of reality. . . .

“But the economic unity of Europe, by means of free trade, is within the bounds of attainment. . . .”

The British Labour Party pamphlet rejects the Schuman plan, not because it would involve coercion, but because it would not involve enough. “Any industries concerned in European planning,” it insists, “should be subject to government direction in their own country.” Government “must be able to decide the investment policies of the basic industries. . . . Nothing less than public ownership can ensure this fully. . . . If there is any threat of a recession in world trade, it is then vital to maintain and perhaps increase investment in these industries. But this is just the time when private capitalists, fearing for their profits, restrict production.”

In other words, it is precisely when events have proved that steel is already being produced in excess of demand that socialism would increase steel capacity—not because anybody wants to buy more steel, but to maintain “full employment and stability”!

The National Executive Committee of the British Labour Party, which composed this pamphlet, does not know that it is precisely relative prices, profits, and losses that in a free-market economy decide the balance of production among thousands of different commodities. If this free-market yardstick is thrown away, nothing remains but naked government coercion. It is then the politicians and bureaucrats who decide arbitrarily how much of each thing is to be produced.

But at least the socialist authors of this pamphlet have a candor missing in our crypto-socialists at home. They do not pretend to be for socialism and the free market at the same time. “Our population,” they write, “would not tolerate the flagrant injustices of a free-market economy in which workers live in squalor yet see the shops bulging with goods beyond their reach.” No doubt the free-market squalor they have in mind is in the United States, where average factory wages are still only $57 a week, as compared with the magnificent average of $20 a week in Socialist Britain. I wish the authors had explained in more detail, however, how industry keeps going here and in other squalid free-market economies by turning out goods that nobody can buy.

Just why our own government thinks it must continue to force American taxpayers to underwrite all these economic errors, and support and subsidize these
Planning for a ‘War Economy’
July 10, 1950

Its dramatic collapse on the news of the Communist invasion of South Korea reflected the judgment of the stock market that a war today would have a drastically adverse effect on the prospect for profits. Though war means huge war contracts, it also means a huge increase in corporate taxation. But what caused the violent market break on June 26 was not merely fear of the inevitable consequences of war _per se_, but fear of the kind of economic policies which might be put into effect.

Modern war, aggressive or defensive, is necessarily a collective enterprise and must necessarily invoke compulsion. But the preservation of a certain irreducible minimum of the individual’s economic liberty, together with the kind of economic deterrents and incentives that normally guide him, is necessary not merely for its own sake, but for maximum and most efficient war production.

It is precisely this that is forgotten by most of those who come forward with plans for rigid economic controls to be imposed immediately upon the outbreak of war. The files of the National Security Resources Board are presumably stuffed with proposals for ready-made legislation and plans to be handed to Congress and Federal agencies on M Day. And most of these plans are known to be based on the assumption that what will be necessary in case of war is a more or less completely regimented economy.

One of the favorite proposals of these war planners, for example, is an overall freeze of prices and wages as of the day before the outbreak of the war. The idea behind this (apart from control for its own sake) is “to prevent war profiteering.” But it is hard to think of any economic measure that would more surely embarrass and slow down the transition to an effective war economy.

The relationship of prices to each other, and of prices to costs, is based on the constellation of supply and demand at any given moment. These are the prices and costs, wages and incomes, calculated to maximize and balance production in accordance with the relative demand for thousands of different commodities and services at that time. But relative war demand is radically different from relative peace demand. And there is no more certain way to slow up the transition to a war economy than to try to freeze for wartime the price relationships adapted to peacetime.

It is commonly thought that blanket price ceilings are necessary in war to prevent a _general_ rise in prices. But the way to prevent this is through money and credit policy. Speaking broadly, there cannot be a general rise in prices in wartime unless there is a corresponding increase in the volume of money and credit. If no increase in the volume of money or credit were encouraged or permitted, the tendency would be for rises in the prices of “war” goods to be compensated by declines in the prices of “peace” goods. The price “level” would remain virtually the same.

It is the shift in _relative_ prices that tends to produce the quickest transformation from a peace to a war economy. Producers are attracted by the higher prices and profits in the war goods to start producing them immediately, while they are driven out by losses from the production of “peace” goods. The higher prices of war goods, moreover, permit producers of them to offer higher wages to workers than those obtainable in peacetime production, and so facilitate the quickest shift of labor as well as management into war production.

If this sort of quick voluntary shift is prevented by blanket price and wage controls, then the government has to fall back upon an enormously complicated set of coercive orders. This compulsory bureaucratic system—which is almost certain to be influenced by political pressure-group considerations—can never be as effective as flexible free markets.

We should always do what we can to prevent wartime profiteering, but this must always be subordinated to the chief end, which is the most effective conduct of the war itself.

A Bad Tax Bill
July 17, 1950

For a period of either prosperity or depression, peace or war, the tax bill passed by a vote of 375 to 14 in the House and now before the Senate is on net balance a bad measure.

In the new fiscal year for which there is already an estimated deficit of $5,133,000,000 (without allowing for added costs in Korea) the bill would cut excise taxes by about $1,010,000,000. To compensate for this it would increase other taxes, chiefly on corporations, by about $1,000,000,000. This means that in a period of peak prosperity and inflation the House voted a deficit of more than $5,000,000,000.

Some of these excise taxes—notably those on railroad freight and passenger travel, and on telephone and telegraph messages—are without excuse in peace times.
But the way to make possible their removal was to cut Federal expenditures by a few billions, not to place still heavier burdens on other forms of production.

Some of the cuts in excise taxes are hard to understand, especially in view of the taxes substituted for them. There is a tax on radio sets and on movie admissions but not on television sets. There is a tax on croquet balls and mallets but not on fencing equipment. A tax is retained on all railroad freight including coal, but the tax on $65 watches was removed because these are “necessities.”

The House bill attempts to compensate for these excise cuts by soaking the corporations. The real purpose of the provision to speed up corporation tax payments is to make the current inexcusable Federal deficits look smaller; in the long run this device will not add a dollar to Federal revenues.

The House bill still treats corporations as if they were separate and additional individuals, instead of merely a way in which individuals organize for production. Corporate income taxation is double taxation. To tax corporate income 38 or 41 percent, and then tax dividends by individual income-tax rates, is to tax the same income twice. This puts a heavy penalty on corporate production and discourages investment in new corporate enterprises. It strikes directly at the job-creating organism. It retards increases in real wages.

It is estimated that an average of $8,000 in capital is invested in every job in American industry today; it is precisely this capital that makes these American jobs as productive and remunerative as they are. The Ways and Means Committee’s majority report argues that it increased corporate rates by only 2 or 3 percentage points. It refuses to face the ominous long-run implications for production of a 41 percent tax takeout of corporate earnings even before the investor is asked to pay individual income tax on the dividends he receives.

The committee majority, still treating corporations as if they were individuals, taxes corporate incomes at graduated rates and proudly points out that it has reduced taxes on “small” corporations earning less than $167,000 a year and increased them only on corporations earning more. This means that a rich stockholder in a small corporation has his tax reduced while a small stockholder in a big corporation has his tax increased.

The Republican minority report, one must admit, says some excellent things: “Taxes are eating at the foundation of our free-enterprise system.” The new bill shifts “the tax from some of the consumers to a more concealed tax on all of the consumers.” “As a natural corollary to reduction of excise taxes there should be a drastic reduction in Federal expenditures.”

How true! And if military expenditures must now be increased, then a slash in nonmilitary expenditures becomes more imperative than ever. But what of acts? When President Truman on June 23 courageously vetoed a discriminatory veterans’ bonus disguised as a postal pay increase, two out of three Democrats in the House, and four out of five Republicans, voted for the added expenditure over his veto. “Federal expenditures must be immediately reduced,” say the Republican committee members. Do you reduce by more political handouts?

**The Inflation in Housing**

July 24, 1950

The direct cause of inflation is an increase in the supply of money and credit. When more money competes for the same supply of goods, prices are forced up. Today we have three times as much money and credit in this country as in 1939.

A Federal budget deficit is directly inflationary only to the extent that it is financed by the creation of more money and credit. The other hand, government-agency loans to foreign countries or to private corporations and individuals at home are inflationary—even if they do not appear as part of the conventional book-keeping budget deficit—to the extent that the loans are not covered out of current taxation. These government-agency loans, in brief, are part of a concealed government deficit.

All government expenditures go in the first instance to specific people and industries. The total inflation today, therefore, may be said to be caused by four major specific inflations: the armament inflation, the farm inflation, the export inflation, and the housing inflation.

They all have one thing in common. Regardless of the original purpose for which any of these programs was started, they have all created a special vested economic interest in their own continuance on the present scale. Thus the foreign-aid program was started to “put Europe on its feet”; but it is now argued that it must be continued to keep our artificially inflated export trade boom from collapsing.

The outstanding case is housing. There would have been a huge private housing boom today even without “government aid.” But the government decided to give the boom continuous shots in the arm. The result has been to skyrocket costs out of all proportion to the increase achieved in production. As Marriner S. Eccles, governor of the Federal Reserve Board, pointed out on March 15, the government has turned to “the creation
of new money to finance construction at a time when activity is already fully utilizing available supplies of material and labor.”

In articles in The New York Times of July 9, 10, and 11, Paul P. Kennedy ably summarized the major inflationary devices to which the Federal government has resorted to keep the housing boom at a peak. These include everything from high mortgages at low interest rates to direct subsidies. Under the 1950 National Housing Act “the builder, on pure speculation, may receive a construction loan of 85 percent. This loan is insured up to 95 percent of his price when he finds a government-insured purchaser. Thus the extreme limit of his speculation becomes 5 percent on a product in which the gross profit can go several times higher.”

Once this kind of inflationary boom is established, the politicians don’t dare let go. They now express the fear that “any appreciable slowing up of building now would have a telling effect on the entire economy.”

The present government-financed housing boom, in short, is a perfect illustration of the political naïveté of all the “compensated budget” and “compensatory economy” theories. Well-meaning proponents of these theories now protest that what they proposed was government deficits, pump-priming, or housing programs only in bad times, not in booms. But they reckoned without the politicians, who must be entrusted with such programs. Office holders want to stay in office. They are enthusiastic for any proposal that gives them the credit for starting a boom, but never for one that makes them take the responsibility for stopping it. No matter how dangerous the inflation they have started becomes, they keep it whipped up for fear of the consequences of letting it sag. But this only increases the danger and havoc of a subsequent bust.

The “compensated economy” doctrine, because it rests on merely mechanical reasoning, has inherent economic weaknesses too. But because it overlooks the psychology and interest of the politicians, the irony is that the doctrine seems likely to end in practice either in increasing the violence of business fluctuations, or in driving us toward rigid government controls to prevent this.

Program for the Crisis
July 31, 1950

President Truman showed moral courage as well as good sense in ordering a slowdown in the Federal government’s own program of artificial stimulation to housing. He showed good sense also in not asking for price controls and consumer rationing now.

But it was doubtful wisdom to threaten the imposition of price controls and rationing “if a sharp rise in prices should make it necessary.” Such a threat could help to bring about the very price rise that he fears; because many consumers may take it as a hint to hoard before the rationing starts.

The proponents of price controls completely ignore the vital regulating function that prices play in a wartime no less than in a peacetime economy. Higher prices reward and stimulate the production of the key war commodities at the same time as they discourage and penalize wasteful consumption. As I pointed out in this column of July 10, it is precisely the shift in relative prices that tends to produce the quickest transformation from a peace to a war economy. Prevention of a general rise in prices is to be achieved, not through the imposition of price controls, but through money and credit policy.

The chief result of overall price ceilings is not to speed up a war effort but to entangle it in red tape. The economy then breaks out with all the diseases so familiar under OPA: lopsided and unsynchronized production, delays and shortages caused by dilatory or inept price-control decisions, needless deterioration in quality, discriminatory decisions as among different producers, and other abuses.

Here are some parts of an economic program for the present crisis:

1—No mere token contraction of the government’s own housing program, but the total suspension of this inflationary stimulus for the duration of the crisis.

2—Suspension of our arms aid to any country not interested enough to send even a token force to Korea.

3—Suspension of the whole ECA gift program as at present set up, and its conversion to an exclusively arms-aid program—and then only to European countries which are actually sending military aid to Korea and increasing their military expenditures correspondingly. There is no excuse for scattering money around the globe for the vaguely defined purpose of “halting Communism” as long as the crucial place to make sure that it is actually halted is on the Korean battlefront.

If it is really the “United Nations” that is now conducting a “police action” in Korea, it cannot do this by the mere fiction of having armies made up almost exclusively of American boys fighting and dying under a United Nations flag. The chief hope of preventing a third world war is to convince Stalin right now that if he or his puppets make an aggressive move anywhere, they will have to fight not merely us but the rest of the
world. But the other members of the United Nations are most likely to convince him, not by offering to mediate or even by applauding our efforts from the sidelines, but by their own participation in the struggle now.

4—The Point Four program, which even on the rosiest view looks toward a remote future, should be completely suspended until the Communist military adventure has been halted in South Korea. Until then it would be an indefensible dissipation of funds. If there is anybody to whom we need to show our “know-how” at the moment, it is to the North Korean Communists.

5—Put real credit control into effect. Limits to installment buying and curbs on commodity speculation are mere token controls. They divert attention from what is really needed. We must restrict high-powered credit before we worry about merely derivative credit. We must restrict commercial bank credit, and above all Federal Reserve credit. We must put an end, especially, to the highly inflationary government bond-pegging policy.

Until the Federal government is willing to accept these suspensions of its own inflationary measures, it is not consistently entitled to ask Congress for stringent priority and allocation powers over business.

War Measures—Or Hysteria?
August 7, 1950

From laxity and unconcern prior to June 25, Washington has swung over to hysteria. Technically we are still fighting only a “police action” in a tiny country. Yet Washington acts as if our only hope of national survival lay in immediately turning our whole economy inside out and frightening to death the very corporations responsible for our unparalleled production. The proposed measures into which Congress is being stampeded reflect not so much real war necessities as the familiar demands of a statist and controlist ideology.

Congress should, of course, appropriate without delay whatever additional amounts can be spent quickly without misdirection or gross waste. But even if all of the President’s additional appropriation request of $10,500,000,000 is really necessary, is it also necessary that the Federal government should add that net amount to the expenditures it had already planned? Most of the bureaucrats and congressmen who are so sternly calling on the consumers and taxpayers for more sacrifices are singularly silent about any cut in their own pet programs for handing out taxpayers’ money to pressure groups or diverting resources to inessential “welfare” or pork-barrel projects. Apparently, aside from mere token cuts, these are to go on as usual.

Yet Arthur Krock, writing in The New York Times, considers $7,000,000,000 a “moderate” estimate of what could be cut from the Fair Deal budget if some of its programs were suspended during the crisis.

Nor is the nonmilitary budget the only one that needs to be critically examined. The American public is entitled to a much more convincing explanation than has yet been offered of why the almost $50,000,000,000 spent on “defense” in the four fiscal years since July 1946 bought apparently so little of it. The sum is not negligible. We spent on defense in the last fiscal year alone as much as we spent in the whole sixteen fiscal years before Pearl Harbor.

The chairman of the House Armed Services Committee now wants to know “just what” there is on hand to show for the military expenditures of the last four years. This is a laudable, if belated, curiosity. One would have supposed that a committee properly carrying out its responsibilities to the American people would have been checking on this at least every quarter. The armed services committees urgently need a numerically adequate permanent full-time staff of military experts and investigators, responsible to Congress alone, to check on the requests from the services and to know at all times how much defense the people are getting for their money.

The ideological hysteria of the moment is reflected in the demands, even on the part of so-called conservatives and professed believers in a free enterprise system, for overall government economic controls, including a blanket “freeze” of prices and wages. Such demands stem from a complete misreading of the lessons of the last war. These controls and freezes would tie the economy in red tape. They would delay or prevent the very price and wage readjustments that are most necessary. It cannot be pointed out too often that the only way to control the general level of prices is through money and credit policy.

The Administration has still to show real awareness of how serious, compared with present practices and proposals, money and credit control would have to be to accomplish this purpose. It must begin with restraints on the Treasury and Federal Reserve System. We must severely limit the expansion of credit by the Federal Reserve Banks themselves. These banks must abandon the inflationary policy of cheap money rates and government bond-pegging. The government must shut down on all new loans from the RFC or the Export-Import Bank. Commercial bank credit must be restricted by allowing interest rates to rise, by
tightening reserve requirements, and by scrutinizing new loans. Demands for installment-credit and real-estate mortgage control only divert attention from these more serious credit controls. ❧

The Fraud of Price Control
August 14, 1950

Congress is being stampeded into granting—in fact, into forcing upon—the Administration all-out controls over the American economy. These would include not only powers to allocate and ration but to impose an overall freeze on prices and wages. The selling label for these powers is “total mobilization.”

The contention is that unless price controls are slapped on instantly there will be a runaway inflation. This fear rests on a lack of understanding of economic cause and effect. If the government refuses to print more money, or to permit an expansion of credit, then the average level of prices can rise very little or very briefly, even in wartime. For if civilian consumers and the government have between them no more money than before, then the more they pay for some commodities the less they can pay for others. Except within narrow limits, a general advance in prices is not possible unless the supply of money is increased correspondingly to finance it.

To seize on price control, therefore, in peace or war, as the way to “fight inflation,” is to adopt a fake remedy as disruptive as it is irrelevant. If the government adheres to noninflationary money and credit policies, general price control is not necessary. If, on the other hand, it resorts to money and credit inflation, any attempt to offset the effects by price control is worse than futile. Price control always restricts, unbalances, and disorganizes production. It brings artificial shortages. So far from “mobilizing” the economy, or speeding it up, price control puts it in a strait jacket.

General price control is at once an ineffective and a crippling device by which a government pretends to protect its citizens against the inescapable consequences of its own fiscal and monetary policies. But it has the merit for the bureaucrats of deflecting attention from their own irresponsible monetary policies onto private scapegoats known as “profiteers.”

It was assumed during the last war that the high prices were primarily the result of war scarcities. They were not. They were primarily the result of the overissue of money and credit. In the five years since the end of the second world war we have been producing goods in vastly greater volume than in the period from 1935 to 1939. This June, in fact, according to the Federal Reserve Board, industrial production was running at 199 percent of the 1935–39 rate. Yet retail consumer prices were 70 percent higher in June than in 1935–39.

Why did we have higher prices with more abundant goods? We don’t have to go far for the answer. There is present more than three times the volume of money and credit as in 1939. It is this increase in monetary purchasing power, brought about by government policy, and not a continuance of war shortages or so-called “profiteering,” that caused the high prices prior to June 25 of this year.

The Administration’s real duty now is not to start dictating prices and wages but to halt its own inflationary policies. It must ruthless slash needless nonmilitary expenditures. Senator Byrd, in an itemized statement, has estimated that the whole appropriation of $10,500,000,000 that the President requested could be taken out of the present nonmilitary budget. This is the Administration’s economic job No. 1.

The government must stop holding up prices of foodstuffs artificially; it must stop financing an inflationary housing boom; it must stop subsidizing an inflationary export boom. It must stop its inflationary government bond-pegging policy; it must stop its inflationary low-interest rates. Both the Federal Reserve System and the commercial banks must tighten down on new credit. Present hostilities and preparedness must be financed as far as possible out of taxation, or out of bonds paid for out of real savings. Congress should authorize the Administration to levy during this fiscal year excise taxes ranging as high as 50 percent on civilian nonessentials.

If such steps are taken we need not fear inflation, and we will get the all-out production that only free markets and a free economy can provide. ❧

Transform EGA
August 21, 1950

It obviously makes no sense today, as Senator Byrd has pointed out, to convert our own economy to a restricted wartime basis, and at the same time to continue to spend nearly $4,000,000,000 to build up Europe’s economy on a peacetime basis. Yet this is still substantially what we are planning to do.

As late as June 21, the Senate committees of Foreign Relations and the Armed Services, “after hearing the testimony of Administrator Hoffman concluded it would be unwise to divert” any EGA funds from
their original civilian-welfare purpose to the military aid program.

Tucked away in the table of this report are two columns of extremely significant figures whose significance the joint committee apparently did not consider great enough to call attention to in the text. I reproduce them here. The column TNI represents the percentage relationship of the military expenditures of each country to its total national income. The column TGE represents the percent of military expenditures of each country to its total government expenditures:

These Western European countries are in far greater and more immediate peril from Russian aggression than the United States. Yet they have been spending only an average of 5 percent of their national incomes on defense. Even more indicative of the dream world in which they have been living is the second comparison. While 36 percent of our own government expenditures were going into defense, even prior to the Korean war, these nine countries were devoting to military defense an average of only 18 percent of theirs.

In the face of their country's obvious peril, in other words, these governments have been devoting less than a fifth of their expenditures to defense and spending the other four-fifths largely on socialistic experiments—especially to cover the deficits of their nationalized industries.

It may be politically and diplomatically impossible to terminate EGA now. But at least it must be converted at once into an exclusively arms-aid program. And we must ask in return for far better assurances that so-called arms-aid funds will actually add to the might of European armaments.

For our arms-aid funds, of course, do not necessarily add to Europe's defense simply because they are specifically earmarked for defense. If an aided European government merely spends the same amount on defense that it would have spent out of its own funds anyway, this means that our arms aid has simply released that government's own resources for additional nondefense expenditures. To assure that we are not throwing our arms aid away on nations with no will to use it, a good rule might be to make only those governments eligible that agree to devote at least as great a proportion of their total expenditures to defense as we do. It is impossible for us to help defend Europe unless Europe is determined to defend itself.

If any European country is unready to give evidence, right now, that it is willing to fight Communist aggression, by sending at least token aid, including men, to Korea, or if it complains that it cannot afford to increase its armament expenditures just now because it must first improve its standard of living, we can simply suggest that it will have to do that without our help.

By importuning the European governments to rearm with our money, we are giving some of them the dangerously perverted impression that they are rearming not for their own survival, but as a favor to us. The governments of Western Europe, even more than our own, need to awaken to realities before it is too late.

Some Notes on War Taxes
August 28, 1950

Overall price and wage control would not only unbalance and disrupt production. It would divert public attention away from the only real remedy for inflation, which is to refrain from expanding money and credit.

We are not likely to do this unless we bring the budget to a balance or near-balance. There has been some recognition of this need in Washington, but the emphasis has been thrown in the wrong place. It has been all on imposing still more drastic taxes, with at best a perfunctory acknowledgment, unaccompanied by serious action, of the need for reducing non-military government spending.

Any congressman who still doesn't know where these non-military economies could be effected might consult the August letter of the National City Bank of New York. “With the widespread anxieties over possible shortages,” suggests the bank, “expenditures of $1,066,000,000 in public funds to hold up [farm] prices and remove agricultural products from the market seems more than ever indefensible.” It goes on to recommend cutbacks in the new “welfare” programs which the President proposed to launch this year, in
the record-breaking $961,000,000 “rivers and harbors” bill, and in civilian ECA.

If such economies were made, the problem of increased taxation would prove far less formidable than it appears at present.

Two forms of war taxation deserve careful study. The first is the so-called “excess-profits” tax. It would promote clarity of thought to call this, rather, a war-profits tax. Zealots hostile to free enterprise regard almost any profit as “excessive,” and seize on the phrase “excess-profits” tax to put forward punitive schemes which have nothing to do with war. A war-profits tax is simply an effort to skim off most of the windfall profits due to war itself.

How are we to identify such profits, however, and segregate them from those that would have been made anyway had peace continued? It has been usual to regard as specifically “war profits” all profits made in excess of those in the three or four years before the war. There is a plausible presumption in favor of this. But in no case can one be sure that the presumption is more than roughly correct, and in many cases it is unjustified. In all growing industries (e.g., television) at least part and perhaps all of the increase in earnings would have occurred anyway.

There is talk of applying the principle of a war-profits tax not merely to corporate but to individual incomes. This would no doubt be consistent. But it would clearly apply unjustly in many cases—to people with fluctuating incomes, say, and particularly to young workers who would have been promoted to higher-paying jobs even in peacetime. Should a lower absolute corporate or individual income be taxed more than a higher income, even in the event of war, simply because the recipient is not accustomed to it? We must remember, finally, that a drastic corporate “excess-profits” tax, as we learned during the last war, encourages higher costs and a wasteful use of men and materials.

Particularly appropriate to wartime, however, is an excise tax on civilian-consumption goods. This should be charged separately to the consumer, and labeled a war-purchase tax. Congress might fix a minimum uniform tax on all goods except foodstuffs (say 2 to 5 percent) and authorize the Administration to impose an added tax in its discretion, at any rate up to a maximum of 50 or even 100 percent, on any luxury or other product the civilian production or consumption of which it wished to discourage in wartime. This would be a far more flexible and less disruptive way of dealing with certain commodities, such as gasoline, sugar, and rubber, than the hit-or-miss rationing of the last war.

To prevent such a war-purchase tax from becoming a permanent part of the tax structure, Congress should grant such a power for not more than a year at a time, and should retain, in addition, the right to terminate it even before then by a vote of either House.

Sham Fight against Inflation
September 4, 1950

While the Administration is demanding and getting fake weapons and needless powers to “fight” inflation, it is driving ahead with the very policies that produce inflation.

Inflation is directly caused by an increase or expected increase in the supply of money and credit in relation to the supply of goods—and (apart from deterioration also in the quality of money) by nothing else. All other so-called causes or “pressures” are at most only indirect.

One of the most important of these indirect causes is a governmental cheap money policy. Artificially low interest rates increase the demand for loans—particularly from marginal productive or marginal speculative ventures. This means the creation of more bank deposits—i.e., of more money bidding for goods—of more inflation. The Treasury insists on continuing precisely such a policy.

In the last decade the Federal Reserve System has been used primarily as a huge engine of inflation. The Federal Reserve authorities have been subservient to the Treasury. They have carried out its shortsighted interest-rate policies and allowed the banking system to be used as a dumping ground for government securities. This is the chief way in which the nation’s volume of money and credit has been more than tripled between 1939 and the present. This is the primary cause of the inflation of the last ten years.

But on Aug. 18 the Federal Reserve Board increased the discount rate of the Federal Reserve Bank from 1½ percent (a fantastically low rate in the face of inflationary danger) to 1¾ percent. This was a very cautious move indeed—but it was in the right direction. Its chief importance was symbolic. Yet the Treasury on the same day moved in precisely the opposite direction. It announced that it would offer $13,570,000,000 of thirteen-month notes at only 1¼ percent interest. And Secretary Snyder publicly reproved the Board’s anti-inflationary gesture. “A stable and confident situation in the market for government securities is our first line of defense on the financial front.” He added that we must
fulfill our responsibility to the millions of Federal security holders throughout the nation.”

But this merely meant that Mr. Snyder was putting low borrowing rates for the Treasury ahead of every other consideration—including the certainty that this policy must produce still more inflation. To maintain artificially low interest rates not only encourages general inflationary borrowing; it compels the banking system to support and load itself up with U.S. government securities issued at such rates. The Federal Reserve Banks now hold $18,577,000,000 of these, and the country’s commercial banks more than $66,000,000,000. The money and deposits created against these securities are the chief reason why present wholesale commodity prices are more than double those of 1939. The Federal Reserve Banks at that time held only $2,484,000,000 in government securities and the commercial banks held only $16,000,000,000.

Mr. Snyder’s belief that his bond-pegging and low-interest policies protect Federal security holders is the exact opposite of the truth. It is mainly because of these very policies that every dollar invested in Federal securities in 1941 has a purchasing power of only 61 cents now. This is a real depreciation of 37 percent.

Nothing can now prevent a serious inflation except a termination of the Federal Reserve and Treasury policies of the last decade. Interest rates must be allowed to rise. Government bond-pegging at present rates must be abandoned. The Treasury must sell its bonds to nonbank investors. The reserve requirements of the Federal Reserve Banks must be restored at least to the old 35–40 percent level, and preferably put even higher. And when the government has made these self-denying reforms, the reserve requirements of the commercial banks must be tightened.

If these measures are taken we will not need price controls against inflation. If they are not taken, price controls, as in the past, will be worse than futile. They are false anti-inflation weapons. They merely impede, unbalance, and disorganize production.

Dilemmas of Price Control
September 11, 1950

Before passing the economic controls act, Congress got into a last-minute snarl over whether it should insist on “across-the-board” price- and wage-fixing, or permit “selective” price-fixing. The truth is simply that there are dilemmas in either course.

“An overall ceiling across the entire economy” is the Baruch proposal. Its purpose is to insure that “prices, wages, rents, fees, and so on” will be controlled in an impartial, non-discriminatory, nonpolitical manner. Baruch thinks he would insure this by recommending that all prices and wages be “rolled back” to and frozen as of June 25, the day hostilities broke out.

But the proposal has fatal defects. It ignores the whole function that free prices, free wages, and free markets play in our economy. That function is to direct production into the goods that are most needed and away from the goods that are least needed. Free prices provide a wonderfully flexible but inextricably interrelated system of incentives and deterrents, which constantly balance and synchronize production as among thousands of different commodities. The free price system provides a voluntary and “automatic” allocation of capital and labor.

The Baruch plan would try to freeze for wartime the price relationships that were adapted to a past situation in peacetime. It would prevent the very adjustments necessary to get the immediate, voluntary changes in the structure of production that war requires. It would force the government into compulsory rationing of materials and labor—into allocation problems of bewildering and unmanageable complexity. It would drive us straight back to the absurdities of the last war, when OPA was controlling the price of oyster shells and Cadillacs, mink coats and paper clips. The Baruch plan would strait-jacket production. It would dangerously retard, not advance, the prosecution of the war.

And it would not even, in the end, have the one merit of being politically nondiscriminatory. Labor would not tolerate the compulsions involved. Demands would come from every side for the correction of “hardships” and “inequities.” Many of these demands would have undeniable merit. But once the door was opened every powerful pressure group’s demands would be granted under the euphemism of “correcting inequities.”

It must be pointed out once more that if credit controls were tight enough, there would be no need for blanket price and wage control, because the general level of prices would not rise. The relationships of individual prices and wages to each other would change, of course, as they should. On the other hand, if money and credit are substantially expanded, blanket price controls are worse than futile. In the end they break down, but they constrict production in the meantime.

If we try to avoid the evils of blanket price control by “selective” price control we merely create other evils. Selective price control becomes political and discriminatory almost at once. It becomes an excuse for holding down prices while permitting or encouraging wages to rise. And in the long run the price of a finished
commodity can be held down only by controlling also the price of the raw materials and labor that go into it, the prices of substitute products, and so on. Selective price control, once inaugurated, tends to spread in everwidening circles toward blanket price control.

But suppose the price of a particular product starts to soar above the level thought necessary to insure the required production of that product? This is the most plausible case for selective price control. Even here a better solution would probably be a heavy excise tax on that product. Such taxes could be either a flat percentage of the whole price of the product, or, say, 75 percent of the amount by which the price exceeds that considered necessary to bring out sufficient production of that product. Congress, in wartime only, could delegate to the Administration discretion to levy such flexible taxes. These taxes would discourage wasteful consumption, reduce war profits, and increase revenues to the government.

Shadow-Boxing with Inflation
September 18, 1950

Neither Congress nor the Administration can take any legitimate pride in its economic or fiscal record since the outbreak of war in Korea.

Congress failed to provide for control of what most needs control. It provided controls that are not needed and can only create confusion or harm.

What is needed is the most stringent credit control. Without this, inflation is certain. With this alone inflation can be halted. Yet Congress provided only for the control of derivative credit, such as installment buying and real-estate mortgages. It did nothing to curb the expansion of the money supply or bank credit at the source.

When everyone in the Administration and in Congress professes to be “fighting inflation,” and when the average combined reserve ratio of the Federal Reserve Banks is still 54 percent, it is a scandal that the Federal Reserve authorities should be permitted to retain the “emergency” legal reserve ratio of only 25 percent adopted in 1945. The minimum ratio requirement should now be restored to at least the former levels of 35 percent against deposits and 40 percent against notes. And the Treasury must be prevented from continuing to float its securities by inflationary means. Until such measures of self-restraint are adopted by the government itself, all its other so-called “anti-inflation” measures or exhortations must be set down as hypocritical and futile.

At least lip service, it is true, has been paid in Congress and the Administration to a balanced Federal budget as a preventive against inflation. But apart from the protests of a small Congressional minority symbolized by Senator Byrd, virtually all the emphasis has been thrown on getting this balance by still more crushing taxation. When Congress directed the President to cut his proposed annual expenditures by about 1 percent, to be taken out of the nonmilitary budget, Mr. Truman called the requirement “arbitrary” and didn’t see how he could conform with it “without impairing essential government services”! It is only the taxpayer, apparently, who is to be told that he will just have to learn how to get along on less. The austerity is to be all his; political pork must not be touched.

The same government that is crying for more power to keep down prices is still using hundreds of millions of the taxpayers’ money to keep food and other farm prices high. And when every spare dollar and resource is needed for defense, we are still handing out billions to European bureaucrats to enable them to play with more civilian “welfare” schemes.

The Defense Production Act embodies the false economic theory that the way to combat monetary inflation is through blanket price control. Its idea of “total mobilization” is total government restraints. Price control at best is an effort to “combat” inflation by disregarding its causes and attacking merely its symptoms. The chief effect even of “impartial” price control is to cut production. But in addition the new measure is frankly discriminatory. Explicit protections are written in for farm prices and wages. If these are justified, why shouldn’t they apply equally to all prices? The President, for example, is explicitly directed not to fix any wage below that paid in the month prior to June 25. Why not the same restriction on his price-fixing powers for all prices?

In fixing prices or wages the President is authorized to “make such adjustment as he deems necessary to prevent or correct hardships or inequities.” This is the door through which every political pressure group will try to pound its way. Union leaders, of course, will argue that the whole wage level was “inequitable” as compared with the price level before June 25. Why not the same restriction on his price-fixing powers for all prices?

In fixing prices or wages the President is authorized to “make such adjustment as he deems necessary to prevent or correct hardships or inequities.” This is the door through which every political pressure group will try to pound its way. Union leaders, of course, will argue that the whole wage level was “inequitable” as compared with the price level before June 25.

In spite of the Lustron loan and other RFC scandals, the new act authorizes $2,000,000,000 more—$600,000,000 of it under virtually uncontrolled Presidential discretion—for loans to private firms
When Prices Go into Politics
September 25, 1950

In their ostentatious “fight against inflation,” Congress and the Administration have made nearly every wrong decision possible.

The direct cause of inflation is an increase in money and credit. Practically every other cause is indirect; it operates through this. Yet in its economic-controls law Congress did nothing to prevent expansion in the total volume of money and credit. Nor did the President in his radio talk on the law say a single direct word on the necessity of limiting the total quantity of money and credit. Congress legislated specifically only on such derivative forms of credit as consumer installment and housing loans. And the Treasury insists on financing the war by methods that must swell the volume of money and bank deposits.

Mr. Truman rightly insists that we should pay for defense “as we go.” But the budget balance he speaks of is entirely to be achieved, apparently, by an increase in the already ominous burden of taxes. Not once did he mention a cut in the government’s own unparalleled nondefense extravagance. The sacrifices are all to come from the taxpayers, and none from the bureaucrats or pressure groups that live at their expense.

“The supply of civilian goods will not keep pace,” Mr. Truman blandly predicts, “with the growth of civilian incomes. In short, people will have more money to spend, and there will be relatively fewer things for them to buy. This inevitably means higher prices. . . .” He neglects to say that this will happen only if the government itself continues to spend wastefully or fails to tax away from civilian incomes the amount needed to pay for defense. The way to prevent inflation is to prevent a gap from developing between civilian incomes and civilian goods—not by the hoax of price control.

Not only the Defense Production Act, but Mr. Truman’s radio speech and executive orders foreshadow political discrimination in price and wage control. Mr. Truman tells the businessman: “Hold your prices down.” But he tells the wage earner: “Do not ask for wage increases beyond what is needed to meet the rise in the cost of living.” This sets a double standard. What would have been thought had he reversed it, and said to the unions: “Hold your wages down,” and to the businessman: “Do not ask for price rises beyond what is needed to meet the rise in other prices”?

This double standard is not inadvertent. It appears in the text of the President’s executive orders. Sec. 401 (b4) provides that the Economic Stabilization Administrator shall “establish price ceilings and stabilize wages and salaries where necessary.” It does not say either that he shall establish wage “ceilings” or that he shall merely “stabilize” prices. Is different language applied to the two cases for any other purpose than to discriminate in favor of wages as against prices?

Moreover, the Administrator can “establish price ceilings” all by himself, but before “stabilizing” wages he must consult a Wage Stabilization Board of nine members, three to represent labor, three industry, and three “the public”—all appointed by Mr. Truman. For any businessman to raise his prices unless his costs have increased correspondingly is, Mr. Truman thinks, “just plain profiteering.” No such harsh label is applied to unions that raise wages more than living costs. On the contrary: “Existing inequities in wage rates, of course, can and should be corrected.” If experience in the last war is any guide, all “inequities” in wages will be straightened out by raising the lower wage, never by lowering the higher, and the government will allow wages as a whole to push up while it tries to hold down prices and squeeze profit margins.

Of course neither the honest advocates of “selective” price control nor the doctrinaires who want “an overall ceiling across the entire economy” approve of this kind of political discrimination. But what both of them overlook is, first, that price control, selective or overall, is a spurious remedy for inflation, and, secondly, that once we put in the hands of politicians the power to say what specific prices and wages shall be, that power will inevitably be used as a political weapon.

The Need for Credit Control
October 2, 1950

In understanding the real causes of inflation and recommending the means for combating it, one Federal agency has come nearer to realities than any other. This is the Federal Reserve System, which after ten years of
subserviency is at last rebelling against the Treasury’s reckless inflationary cheap-money policy.

The best discussion I have read by any Federal official of the true causes and preventives of inflation is a lecture by M.S. Szymczak, a governor of the Federal Reserve System. The lecture was delivered on Aug. 29 before the School of Banking of the University of Wisconsin. An extensive excerpt from it was published by The Wall Street Journal of Sept. 11.

“I do not believe,” he declared, “[direct] controls [including price and wage fixing and rationing] are the present answer to our immediate inflation problem. They deal only with effects and not with basic causes. The basic cause of our inflationary problem is continuing rapid credit and monetary expansion, abetted by current government deficits which threaten to grow larger and larger. . . . If the fuel of inflation is provided, all that direct controls can do is to drive the inflationary pressures underground and to postpone some of their effect. . . .

“The cornerstone of our anti-inflation program must be bold fiscal measures. . . . Financing the expanded military budget cannot be limited to the taxation of wealthy individuals and business enterprises if it is to be useful as an effective anti-inflationary measure. It must restrict spending, and most spending is done by the vast number of individuals and families with low- and middle-bracket incomes. In an emergency situation like the present, our tax changes must be designed primarily to meet the danger of inflation.”

Szymczak goes on to recommend debt-management policies designed to tap real savings by sales of government securities to non-bank investors, so as “to reduce the volume of government financing through banks, which is highly inflationary.” He endorses the restriction of consumer and real estate credit, and the action of the Federal Reserve System in August of raising the New York and other discount rates from 1½ to 1¾ percent. If the measures so far taken are not effective, he adds, “monetary policy will need to resort to even more restrictive use of one or more of the general instruments of credit control at its disposal, namely, open-market operations, changes in the discount rates, and changes in bank-reserve requirements.”

All this is excellent as far as it goes, and Szymczak and those for whom he speaks in the reserve system deserve great credit for their courage and clear-sightedness in going even this far. But Federal Reserve officials are still the prisoners of their own submissive record of the last ten years.

The official statement of the Board of Governors on Aug. 18, for example, declared that they were prepared to use all the means at their command to restrain further expansion of bank credit “consistent with the policy of maintaining orderly conditions in the government securities market.” Now this phrase is ambiguous. If we may judge by its interpretation in the past, it is little more than a euphemism for saying that it is the duty of the Federal Reserve System to continue to support government securities at substantially their present artificial inflationary low interest yields. And if this is Federal Reserve policy, it cancels bold words about fighting inflation with “all the means at our command.”

It is the duty of the Treasury itself to make the market for its securities “orderly” by paying rates of interest that will appeal to real investors and—if necessary to protect existing holders—by refunding its outstanding long-term securities at higher rates or even, perhaps, as an emergency measure, with securities bearing a variable coupon rate (see this column, Newsweek, Oct. 4, 1948).

The country cannot continue indefinitely to be the victim of the Treasury’s past as well as present inflationary cheap-money policy. That policy must be terminated now. ✗

Communism Imitates Capitalism

October 9, 1950

The latest Bulletin of the Soviet Union’s Academy of Science reveals, according to Harry Schwartz in The New York Times of Sept. 24, that Russian bureaucrats are trying to fix their socialist prices on capitalist principles. “Prices charged by Soviet enterprises must now be set high enough to cover costs and to permit profits to be made,” reports Schwartz. “In addition they must be based on demand and supply so that prices for scarce commodities will be sufficiently high to stimulate increased production and reduce consumption of such scarce items.

“But these prices are still determined by planning authorities rather than set in markets through the interplay of competitive forces. These principles were apparently used to help frame the major revision of the Soviet wholesale price structure [in 1949 and] this year. During and immediately after World War II Soviet economists boasted that wholesale prices of industrial commodities had remained stable. Only later did they reveal that this policy had been possible because of very large government subsidies to many plants.”

To those who have followed the discussions of the more enlightened socialist theoreticians over the last two decades, not to speak of those who have peered
behind some of the curtains of propaganda to the economic realities in Russia, none of this will come as a blasting revelation. Socialism and Communism began as a revolt against the alleged folly and iniquity of capitalism and the free market. The supreme irony is that, once the socialist and Communist theorists had finished their joyous work of destruction in the countries where they had seized power, and were called upon to buckle down to the task of producing the economic paradise which their rhetoric had so long and confidently promised, they found themselves forced, in the end, to try to imitate and revive the very price system they had so eagerly destroyed.

The whole problem is one of which the cocktail-party socialists are blissfully unaware. As long as there is only partial socialism, as in the Western democracies, the problem can be concealed. The city-owned New York subways, for example, are run at a deficit; but the city merely forces property owners, and the private industries within its boundaries that are run at a profit, to make up the deficit. The nationalized railroads of Britain and France are run at a deficit, but the British and French Governments can simply force the profit-making private industries in their countries to pay that deficit. (Of course today, with ERP, they in effect get their nationalized railroad deficits paid for out of the profits of private American business.)

There are many other ways in which partial socialism can camouflage its deficits. Nationalized enterprises don’t make the same kind of deductions for interest, depreciation, and taxes that private industry is forced to make. The Labor government can increase the apparent productivity of the British coal mines by mechanizing those mines at the expense of private projects in which the new capital could be used to more advantage. Or the government, because of its monopoly, can raise coal prices, and so force consumers to make up a hidden deficit by what is in effect a stiff excise tax on coal.

But none of these devices are open as a general practice in a country where socialism, as in Russia, is virtually complete. Partial socialism is parasitic on capitalism; but complete socialism is forced to be self-supporting. A deficit in one part of the socialist economy can only be made up at the expense of another part.

And so, in present-day Russia, the Communists find themselves compelled to imitate the very “profit system” they have spent their lives denouncing. But their imitation, unfortunately for them, can’t take the place of the real thing. Under their system, in which wages, prices, and interest rates are all arbitrarily set by bureaucrats, they can never know what their real costs are, or even what real consumer demand is. They must play capitalism, competition, price and profit system, the way children play house. Only their game is more like blind man’s bluff.

---

**Canada Takes the Lead**

October 16, 1950

The decision of Canada to permit a free market in its dollar may be the first real break in the ice jam of international exchange control.

Exchange control is a totalitarian device first systematically applied by Schacht in Nazi Germany, then endorsed by the late Lord Keynes of Britain and embodied, under his leadership, in the International Monetary Fund.

The Fund was Keynes’s proposed substitute for the gold standard. The gold standard was a triumph of international cooperation. It established in effect a single world currency. For when each country’s monetary unit was convertible on demand into a fixed weight of gold it was also necessarily convertible at a fixed rate into all other monetary units. And the monetary managers of each country could keep their currency on gold only by refraining from inflation or any other act that undermined confidence.

Keynes was opposed to all this, partly because he was at heart—as he confessed in an article in the *Yale Review* in 1933—an economic isolationist. He resented having England’s internal price level tied to the international price level. He dreamed of a system in which England’s monetary managers could manipulate their own internal price level—by inflation and devaluation—so as to keep constant “full employment” at home regardless of what was going on in the rest of the world. And he actually succeeded in selling to the world’s assembled monetary “experts” at Bretton Woods the idea that gold convertibility was not needed to sustain or stabilize a currency’s value—that the purchasing power of engraved scraps of paper could be made whatever the monetary managers of that country chose to say it was. But to peg them for a while he proposed the Fund, an institution pledged to use the relatively hard currencies (chiefly the U.S. dollar) to buy the soft currencies at whatever arbitrary valuations their governments put upon them.

This system had to be supported by exchange control—that is, by using each government’s police power to forbid anybody to buy or sell its currency at any other than the arbitrary official value put upon it. But the breakdown of the whole system is now becoming evident even to the “experts.”
Its first effect was to choke and unbalance foreign trade. It produced the so-called “world dollar shortage” which at least one British economist, Roy Harrod, had the courage to call “one of the most brazen pieces of collective effrontery that has ever been uttered.” Even Sir Stafford Cripps eventually profited by the expensive education of events, and slashed the arbitrary value of sterling from $4.03 to $2.80 in September 1949—a step which led to the reversal of the sterling area’s balance of payments.

It was a step imitated by some 30 countries, but it fell short of being the right step—which was to set the markets free. And this is what Canada has now had the courage to take.

Canada’s step has been criticized in some quarters because it would mean a “floating rate” that can move up and down every day in accordance with fluctuations of supply and demand and fluctuations in confidence. But the bureaucrats’ headache is the citizens’ salvation. It is precisely the great advantage of a free rate that it compels the monetary managers to act with prudence and foresight and maintain the integrity of the currency at all times. It is precisely because they know that any lapse in confidence will be reflected immediately in the market quotation that the managers of a free-exchange currency are compelled to act with more responsibility than the managers of a controlled one. Because of the public confidence in Canada’s policy, the quotation of the Canadian dollar on the first day of free markets actually rose from the former fixed “official” rate of 91 American cents to a level of 95 cents.

A floating rate for the Canadian dollar is probably intended to be temporary, but it is a necessary transitional step. We will never emerge from the present world monetary chaos until the leading countries return to a gold standard and adopt the measures to create confidence that the gold standard will be maintained.

**ERP Reverses Its Aims**

October 23, 1950

Santayana once defined a fanatic as a man who redoubles his efforts after he has forgotten his aims. The definition would apply equally well to the typical bureaucrat or government planner. The history of ERP is an outstanding example.

The Marshall plan began as a mistaken remedy based on a wrong diagnosis. The European bureaucrats contended that their trouble was a “dollar shortage,” and that the remedy was for the United States to give them dollars. Our own bureaucrats took this at face value and started giving away billions of taxpayers’ money.

But the “dollar shortage” merely got worse. It was being created, in fact, by the very measure ostensibly designed to prevent it—exchange control at absurdly high currency valuations. The European bureaucrats argued that they were losing gold and dollar reserves in spite of their exchange controls, not because of them. But when on Sept. 18, 1949, Sir Stafford Cripps reversed his position overnight and slashed the official value of the pound from $4.03 to $2.80, the effect was an almost immediate reversal in the sterling area’s net flow of international payments. Britain’s gold and dollar reserves are now more than double last year’s pre-devaluation level. And in August, for the first month in thirteen years, our own imports exceeded our exports.

Yet though the so-called world “dollar shortage” is curing itself, there is no suggestion from our own ECA that we can terminate or taper off our outward flow of gift dollars. On the contrary, our own officials are still warning us that we must continue to throw our money all around the world even after 1952; they are putting no pressure on Britain to free sterling from controls as the Canadian dollar has now been freed, and they resent hints that British socialism has done anything to offset our aid to Britain.

In 1949 the British nationalized railways lost $58,000,000. This deficit was paid in fact though not in form by American taxpayers. The funds that we turned over to the British Government to pay for things that it would otherwise have had to pay for itself released $58,000,000 of its own funds to pay the socialized railway deficit. The end result is the same as if we had paid for that deficit direct. And now the British Labour Party is going to nationalize the steel industry, and create new deficits.

The slightest suggestion that we should refuse to subsidize European socialism is rejected by our ECA bureaucrats as an intolerable interference in Europe’s domestic affairs. But let any European country attempt to move toward a free economy, or toward prudent finance, let it seriously try to protect the integrity of its currency unit, and our ECA bureaucrats will forget all about “noninterference” and berate that country in no uncertain terms.

A New York Times dispatch of Oct. 2 from Rome, for example, reports that our ECA officials there are appalled to find that the Italian Government has finally balanced its budget! It is to this, and not to the inevitable hangover from the previous inflationary spree, that
our ECA “experts” attribute present Italian unemployment. “It is absurd for the [Italian] Government to be showing a surplus” now, according to our ECA administrators. They are “particularly disheartened by the slow rate” at which Italy is spending our money! They are urging “larger expenditures” on the Italian Government and “a more liberal policy of investments”—which are Keynesian euphemisms for Government subsidies to private business and for the philosophy of spend and spend and spend.

Our ECA officials find it particularly hard to understand Italy’s “fear of inflation.” They might get some glimmering of light on the subject if they consulted official index numbers, which show, for example, that the cost of living in Italy was 50 times as high last year as in 1938 and is still 48 times as high.

Queer people, these Italians, definitely in need of a pep talk from someone like Leon Keyserling.

Credit Control at the Source
October 30, 1950

The Federal Reserve Banks have kept interest rates abnormally low. They have loaded themselves up with nearly $20,000,000,000 of government securities. In brief, they have failed to make proper use of the two best ways to prevent credit expansion—by raising interest rates and through open-market operations. So to compensate for this failure they are planning to increase the reserve requirements of member banks of the Federal Reserve System to the limit permitted by law.

Increasing reserve requirements is a clumsy method of credit control. But it is far better than permitting a further inflation of bank credit. It is ironic, however, that the Federal Reserve authorities who want to impose higher reserve requirements on the member banks have resisted every effort to restore the reserve requirements of the Federal Reserve Banks themselves. Prior to 1945, the Federal Reserve Banks were required by law to keep reserves in gold certificates of 40 percent against their notes in circulation and of 35 percent against their deposits. By act of Congress on June 12, 1945, these requirements were lowered to a uniform reserve ratio of 25 percent. This was done to permit the Federal Reserve System to inflate more in the war emergency—though Germany had already surrendered the month before, and the Japanese surrender, as it proved, was only two months off.

Though the reserve authorities never had to resort to the lower reserve ratio, they have not only failed since then to recommend a restoration of the former reserve requirements, but have opposed all outside suggestions that this be done. Yet the National City Bank, in its monthly letter this September, pointed out that the Federal Reserve Banks could still buy up about $50,000,000,000 additional government securities—a tremendous inflationary potential—before their note and deposit liabilities would reach the present legal limit of expansion permitted with present reserves.

This situation urgently demands action by Congress. The reserve requirements of the Federal Reserve Banks themselves should be restored at least to their pre-1945 levels. As the average reserve ratio of all the Federal Reserve Banks is now 52.5 percent (from 56.4 on June 21), this legal change can fortunately still be made without causing the slightest hardship.

It is true that this action would do nothing to reduce the already outstanding volume of money and bank credit. Its purpose would be to forestall a further inflationary expansion while there is still time. It would, however, have a tremendous immediate psychological importance. It would put not only the Federal Reserve System but the whole country on notice that Congress is determined to prevent inflation and knows the direction in which the danger really lies.

As long as we have legal reserve requirements, they must be adequate. A legal reserve ratio is a declaration of Congressional policy. The present reserve requirement of only 25 percent is equivalent to a Congressional sanctioning of further gross inflation. If the Federal Reserve Board has in fact no intention of inflating to this point, it should welcome a restoration of the former reserve requirements.

Of course even if the legal reserve ratios were restored to their former levels, it would still leave a tremendous inflationary potential. This is no reason for not taking this step; it is a reason for taking additional measures.

So let Congress restore the Federal Reserve Bank ratio requirements to their previous levels. Or better, let it raise the present flat “emergency” 25 percent reserve requirement against both deposits and notes to a flat 40 percent. Then let Congress in addition give the Federal Reserve Board discretionary authority to raise the reserve requirements of the Federal Reserve Banks even further—just as it already has discretionary authority to raise member bank reserve ratios. And let Congress provide still further that the board cannot hereafter raise the reserve requirements of the member banks without raising the reserve requirements of the Federal Reserve Banks correspondingly.
The Great American Giveaway
November 6, 1950

In Newsweek of Oct. 23 this column pointed out that though the so-called world “dollar shortage” had cured itself, there was still no suggestion from our own ECA that we now terminate or taper off our outward flow of gift dollars. In the same issue Newsweek carried an article and charts on the dramatic suddenness with which the “dollar gap” had been closed. Here are some further developments:

On Oct. 22 the joint Senate-House committee on Federal expenditures, under Senator Byrd, reported that $42,591,000,000 had been expended for foreign aid since V-J Day. This adds up to about $283 for every American man, woman, and child. It almost equals the cost of operating the Federal government for the whole six years preceding the second world war.

Senator Byrd said these figures were up to the minute and covered 28 programs of military and economic aid. However, they didn’t cover other programs that President Truman has in preparation. These are expected to include more foreign arms help, another round of Marshall-Plan assistance, reconstruction funds for Korea, and food for Tito’s Yugoslavia. Any reader curious about such matters will find half a dozen new proposals for giving away American money in almost any day’s newspaper. Giving away American money still seems to be, in fact, the Administration’s main solution for every foreign problem.

Lately, however, the American people have begun to wonder what they are getting for all this money. When they see the dollar weakening on world markets, when they see Britain’s “forward” sterling selling at a premium, when they see our (paid-for) imports exceeding our (partly-given-away) exports for the first month in thirteen years, when they see us losing gold at a rate of about $2,000,000,000 a year, they are beginning to ask just why our officials continue to give away dollars to bridge a gap that has already been closed.

Some of them are beginning to wonder what we are getting in return even for our military-aid programs. Three days before the publication of the joint Senate-House committee report just cited, former President Hoover warned that we “cannot long endure the present drain on our economy.” He bluntly raised the question whether, in view of the actions and statements of their leaders, the nations of Western Europe, outside of Britain, “have the will to fight, or even the will to preparedness.” And he proposed, for one thing, that “we should say, and at once, that we shall provide no more money until a definitely unified and sufficient European army is in sight.”

Still another recent development has emphasized the fact that the more zealous apostles of the Great American Giveaway in the last few years have not known what they were about. It is only a few months ago that the European Payments Union was started with great fanfare to solve all the problems of intra-European trade. It was on this argument that Congress was persuaded to throw $600,000,000 of American money into the scheme. And now it is found that West Germany has used up in three and a half months all the credits allotted to it for an entire year’s operation of EPU. The union is “faced with a major crisis.” And the suggested solution is that America throw in more dollars.

The real trouble, of course, is that the European Payments Union is a needless and amateurish piece of bureaucratic gadgetry set up on an unsound basis. (See the analyses in this column of March 27 and April 10.) The real solution of the problem with which the EPU was supposed to deal was not still more bureaucratic machinery but the simple abolition of exchange control. This would have brought at once the full and free convertibility of currencies and the expansion and balance of foreign trade that the EPU has failed to achieve.

The final irony of most of our government giveaway programs is that their effect, on net balance, has been to set back, not to advance, world economic recovery and production.

‘Bankruptcy’ Is Here
November 13, 1950

How big a national debt can we stand? What will happen if it ever exceeds that figure?

One of the strangest things about these questions is that they are still being put in the future tense, as if nothing important had happened up till now. A typical letter I frequently get reads something like this: “Years ago economists told us that the nation couldn’t stand a debt of more than $50,000,000,000. But now the debt is $257,000,000,000, and we seem to be doing OK. What about it?”

Congress, it is true, has frequently set a so-called legal debt limit (which could have served a real function as a danger signal), but has as frequently raised the limit as soon as it was approached. Thus in the Second Liberty Bond Act of 1917 it set a legal debt limit of $45,000,000,000. It increased this to $49,000,000,000
in 1940, to $65,000,000,000 in 1941—and it is now set at $275,000,000,000.

The sad truth is that our government has already exceeded the safe debt limits of the past. It has already in practical effect done what a bankrupt—government or individual—always does, which is to make only a partial repayment—to pay its debts off at only so many cents on the dollar.

In form, of course, our government has paid off its debts 100 cents on the dollar, and will doubtless continue to do so. It has reduced its repayment in substance, however, by depreciating the dollar itself, the unit in which the debt is measured. According to official index numbers, the purchasing power of the dollar in terms of consumers' prices is today only 57.5 percent of its purchasing power in 1935 to 1939. In other words, a citizen who bought a government bond at par in 1935–39 gets back today in real purchasing power less than 58 cents for every dollar he invested. In still other words, he has taken a real capital loss of more than 42 percent.

We have been following, in fact, precisely the course governments have followed from time immemorial in melting down their internal debts. In The Wealth of Nations, Adam Smith, of laissez-faire fame, wrote in 1776:

“When national debts have once been accumulated to a certain degree, there is scarce, I believe, a single instance of their having been fairly and completely paid. The liberation of the public revenue, if it has ever been brought about at all, has always been brought about by a bankruptcy; sometimes by an avowed one, but always by a real one, though frequently by a pretended payment.

“The raising of the denomination of the coin has been the most usual expedient by which a real public bankruptcy has been disguised under the appearance of a pretended payment. . . . [In 1776 most governments had not yet learned the easier trick of printing paper money instead of coining hard metals.] A pretended payment of this kind, instead of alleviating, aggravates in most cases the loss of the creditors of the public. . . . It occasions a general and most pernicious subversion of the fortunes of private people; enriching in most cases the idle and profuse debtor at the expense of the industrious and frugal creditor, and transporting a great part of the national capital from the hands which were likely to increase and improve it, to those which are likely to dissipate and destroy it.

“When it becomes necessary for a state to declare itself bankrupt, in the same manner as when it becomes necessary for an individual to do so, a fair, open, and avowed bankruptcy is always the measure which is both least dishonorable to the debtor, and least hurtful to the creditor. The honor of a state is surely very poorly provided for, when, in order to cover the disgrace of a real bankruptcy, it has recourse to a juggling trick of this kind, so easily seen through, and at the same time so extremely pernicious.”

Smith then proceeds to recite examples of such “juggling tricks” of currency depreciation from Roman times on. He describes in effect what is happening to our own Federal debt today. It is too late to forestall “bankruptcy” of the United States. Our problem is to prevent such bankruptcy from going any further than it has.

---

**On Taxing ‘Excess’ Profits**

November 20, 1950

Though Congress has pledged itself to enact an excess-profits tax, it is fortunate that an interlude for sober thought—and a sobering election—has occurred between pledge and passage.

The term “excess” profits is ambiguous. It may refer either to the excess of wartime over peacetime profits or to the excess of profits over a so-called “fair” return. We must distinguish at the beginning, therefore, between what Senator George (Democrat, Georgia) has called a “true war-profits tax” and “establishing a precedent for a permanent [peacetime] excess-profits tax.”

To penalize high profits as such is basically hostile to private enterprise. Any standard of “fair” profits must be purely arbitrary and is based on complete ignorance of how the private-enterprise system works. For it is precisely the differences between profit margins that bring about a dynamic balance of production among thousands of different items, that reward efficiency and foresight and penalize inefficiency and poor judgment. To destroy profit differentials, to punish high profits per se, is to destroy the productivity foundation of the free-enterprise system.

But even the attempt to take away only the so-called “windfall” profits that accrue as a result of war, desirable as this goal may seem from a moral standpoint, faces formidable practical difficulties. Unfortunately there is no certain way of identifying specifically “war” profits and segregating them from “normal” profits.

The usual method has been to regard the average profits of the three to five years before the war as “normal peacetime profits” and to apply the war-profits tax to any excess above this. What we are really trying to tax in wartime is not the excess of wartime profits over past peacetime profits but the excess over what present
profits would have been if there had been no war. This must at best be guesswork.

It is easy to see how unfair such a standard could be in many cases if applied to the individual income tax. Paul, let’s say, had a salary in 1949 of $5,000. Today he has a better job and a salary of $7,500. The increase may or may not be the result of the fact that the country is at war. Peter had a salary of $8,000 in 1949 and has the same salary today. Are we to take Paul’s increase of $2,500 away from him as “war profiteering” or tax it at such a rate that Paul would be paying a higher total tax on his $7,500 than Peter pays on his $8,000? Are we to penalize Paul for his $7,500, simply because he is not used to getting that much?

Yet this is the principle that an excess-profits tax applies to corporate earnings—which are merely pooled individual earnings. The presumption that the excess of any particular corporation’s earnings today (or in 1951) over those of 1946 to 1949 can be wholly attributed to war or rearmament is no more reliable than in the case of an individual’s earnings. The earnings of a new industry, such as television, would in any case have shown a spectacular growth. Even a company now working on direct wartime orders might conceivably have had bigger peacetime orders instead.

An excess-profits tax, in short, rests on a hit-or-miss presumption. And there is a more serious objection to it, especially when the rate is excessive. In the second world war “excess profits” were subject to a tax of 95 percent (with a refund of 10 percent of the tax after the war). This meant that the government took 85 to 95 cents out of every dollar that a company saved by economies, leaving only 15 cents to a nickel of it for the company itself. This all but destroyed the normal incentives for economy and efficiency. It led to inflated expense accounts and caused companies to hoard labor and materials without worrying about costs. In short, it reduced total civilian and war production at the very time when it was most essential to maximize such production.

Under a high excess-profits tax the government loses more on the side of expenditures than it gains on the side of revenues. If we must have an excess-profits tax, let the rate be moderate; and let us get by other means the further revenues we may need.

‘Full Employment’ as Inflation
November 27, 1950

One of the great ironies which future historians will observe about our time is that the American free-enterprise system, which out of its unprecedented productivity was subsidizing the controlled economies of Europe, was not only being criticized by the recipients of its charity as being ridiculously out of date, but was itself shamefacedly trying to make amends by starting to imitate the very socialistic systems it was having to support.

One is reminded of this situation by an article by Prof. Wilhelm Röpke of Geneva in a new quarterly published in Frankfurt, Zeitschrift für das Gesamte Kreditwesen, available in an English translation under the title The Journal of Finance and Credits. Dr. Röpke’s article exposes the delusions behind a policy of so-called “full employment.” His description of this policy as it exists in Europe applies with uncanny accuracy to the American imitation of it:

“The measures envisaged include a continuous reduction of the interest rate; deficit spending; in case of need, large-scale public works financed by the creation of credit; the heaviest of taxation on the classes with higher incomes and great wealth, with the object of restricting savings, which are so much feared; encouragement of demands by the trade unions for increased wages, and so forth.”

This policy, which has been pursued by Britain and by nearly every Western European country (with the exception of Belgium, Italy, and Switzerland), puts continuous “full employment” before every other consideration. And its apostles use that phrase to imply that there is no other way to reach their goal except by the inflationary policies just outlined.

“Full employment” is desirable, of course, in the sense that no one wants involuntary unemployment with its consequent loss of income. But “full employment” is not the sole end of human activity. It is not even the primary end. The primary end of economic action is to maximize production. “Full employment” is only a means to the end of maximum production for the satisfaction of human desires. It is one of the central errors of the zealots for “full employment” that they subordinate ends to means.

This initial error is only the first of a chain, and of a series of self-contradictions. It is the “full employment” philosophers who complain most of “chronic private underinvestment.” But it is precisely the same group who most vigorously applaud government policies that paralyze the desire to invest. These policies include stiff taxation of successful investment, ruthless exploitation of the monopolistic position of labor unions, special subsidies at the general expense, threats of ever more socialization, currency manipulation of various kinds, a contempt for private property, arbitrariness and an abandonment of all firm economic principles by
governments. Though investment is always directed to an uncertain future, and requires the highest degree of optimism and confidence, all these “full employment” policies make investment more and more of a risk, more and more of a game in which one can lose much but can gain only a little.

The full-employment champions, in short, have no faith in a process of continuous adjustments in conditions of liberty and free competition. The policy they advocate finally results in a continuous competition between a wage policy which seeks to push wages upward, and a credit policy which, to counteract the wage policy, seeks to increase employment.

The upshot of all this, as Dr. Röpke points out, is that the final remedy of the full-employmentists for every trouble is to increase the volume of money and credit. Hence “full employment” tends to result in full inflation. This has to be disguised by repressive measures. And so we get the result of “pent-up” inflation.

Dr. Röpke adds a note. “Full employment” policies, in combination with exchange control, result in Europe in the well-known deficit in the balance of payments. “This policy obviously depends on a foreign benefactor being found.”

Gray Is for Giveaway
December 4, 1950

When Gordon Gray was asked by the President last March to study our “foreign economic policies and programs,” there was little doubt concerning what his conclusions would be. He was hardly expected to conclude that the Truman Administration’s giveaway program had been a mistake.

The report contains a few sound recommendations such as the reduction of trade barriers and of farm price supports. It even pays brief lip-service to the idea that future civilian loans and grants “should be substantially less than we have been spending.” But it winds up by urging on net balance bigger and broader foreign giveaway programs than ever. And it endorses every fallacy and misconception behind our existing giveaway programs. Gray is no serious reexaminist.

There is not space to analyze or even mention all these errors here, but I should like to touch on a few central ones.

1—Like all previous Administration documents of the sort, it ignores the central fact that every dollar we send abroad to increase the productivity of foreign countries must reduce by at least an equal amount the increase in our own productivity. We can push forward the capital development of foreign countries only by postponing our own. If we donate X dollars for a hydroelectric plant in France we can’t use the same dollars to build a new hydroelectric plant in the United States. Yet the Gray report never once reminds the reader that we cannot give away our cake and have it too.

The notion that America has such a “mature economy” that it cannot profitably absorb any more of its own capital is monstrous nonsense. We could use almost limitless new capital in adding to the quantity and quality of our housing alone.

2—The emphasis of the Gray report is persistently in the wrong place. It doesn’t once recognize and state clearly that the chief obstacle to the capital development of most foreign countries—particularly the much-discussed “underdeveloped areas”—has been their own governmental policies. These policies are hostile to foreign capital—and almost equally hostile to their own domestic capital.

None of the Point Four zealots seem to have stopped to ask themselves the question: If the natural resources are there to be developed, and foreign capital hasn’t yet come in to develop them, why hasn’t it? Private capital goes where it is offered the highest returns or the lowest risks. It goes to the borrowers who most efficiently fill consumers’ needs and have a record of honesty and repayment. That is why private capital tends to provide the most rapid and best balanced world development. Government handout capital, “invested” for political purposes, in the main diverts, distorts, and retards economic development.

3—The Gray report shows no understanding of all this. It even recommends enactment of the bill for “government guarantees of private investment against the risks of non-convertibility and expropriation.” This bill proposes that private foreign investors be allowed to make whatever profit comes from their investment, but that the taxpayers be compelled to pay the losses. Such a proposition has only to be stated plainly to be recognized as preposterous.

Such guarantees, moreover, in effect condone and encourage the very practices they are supposed to insure against. If such government guarantees do not exist, private capital will flow, as it should, only to those countries that have proved by their actions and record—and not merely by offering smooth assurances or signing “investment treaties”—that they will not interfere with currency conversion and will not expropriate property. For contrary to the tacit assumption of the Gray report, no honest or liberal government is compelled to seize foreign investors’ property or to prohibit foreign investors from converting whatever currency they earn into
their own currency—or into any other currency—at the best rates they can get.

There is no room left to analyze the dubious assumptions the Gray report makes about financial military aid to foreign governments. But that can be done at a later time.

This Is the Peace We Bought
December 11, 1950

Over the past five years, the American public has been repeatedly told by the bureaucrats who were throwing its money all over the globe that they were “buying peace.” Every question was dismissed with the breezy answer: “You can’t expect to buy peace cheaply! What we’re getting for the $43,000,000,000 we’ve spent on foreign aid since V-J Day is the biggest bargain this country ever bought!” Passing over the question whether peace can in fact ever be bought with dollars, the American people now see, in Korea, just how much peace they got for their foreign-aid money.

I devoted last week’s article to some of the central fallacies behind our foreign civilian giveaway program. Now let’s look at “arms aid.”

We have already given to Western Europe—as we should have done—a guarantee of our military intervention in case it is attacked. This is in itself a tremendous commitment, unprecedented in our history. We also lightly and casually made similar promises in a dozen remote places of the globe. The one to Korea, for example, was considered of such negligible importance that most Americans never heard of or remembered it until June 25. We have already paid a tremendous price for that unweighed promise and still do not know the total price it will cost us to carry it out. Should we start adding still further commitments when we are not sure we can fulfill those already made?

Unless we attach strict conditions, we may only be deceiving ourselves when we transfer foreign aid from civilian to military projects. The mere fact that our funds are “earmarked” for this or that specific purpose is meaningless. If we pay for part of the military programs of Europe, and these programs are no larger than they would have been without our aid, then our dollars or equipment have merely released that much of the European governments’ own funds for other purposes—say for “welfare” programs or to pay the deficit on nationalized industries. Our contribution has not really gone for defense unless these governments spend the whole of it on defense above the amount they would have spent on defense anyway. And there is of course no certain way of determining what this latter figure would have been.

The contention that we must make heavy gifts of money or equipment to Europe for defense is not primarily military but economic. It rests on the assumption that Europe cannot afford to arm itself. (The Gray report, in fact, warns that we mustn’t push Britain to arm too fast, even with our aid, lest it put too much strain on the pound sterling.) The assumption that European nations cannot afford to arm themselves is untenable. What they are arming against, in fact, are nations with incomparably lower living standards than their own. If Communist aggressors divert enough resources to threaten, Europe must divert enough resources to survive.

If we continue to extend foreign arms aid, we must safeguard it with far stricter conditions than in the past. At least three suggest themselves:

1—The nations of Western Europe are in far greater peril from Russian aggression than the United States. Yet they have been spending an average of only 5 percent of their national incomes on defense and an average of only 18 percent of their governmental budgets (as compared with 36 percent in the U.S.). We should insist that most of the countries receiving arms aid devote a far larger percentage of their incomes and governmental budgets to their own defense.

2—As former President Hoover has insisted, we should “say, and at once, that we shall provide no more money until a definitely unified and sufficient European army is in sight.”

3—We should not give any more military (or civilian) funds to any country that fails to send at least token aid in the Korea conflict. The emergency we have been paying to guard against is already here. If these countries are not willing to fight on our side now, we are not justified in giving them more money in the thin hope that they may be fighting on our side in the sweet by-and-by.

More Inflation Ahead?
December 18, 1950

The first response to the Korean debacle in Washington, in terms of domestic economic policies, was far from encouraging. It was the hasty passage in the House, by an overwhelming vote, of essentially the Administration’s form of the so-called “excess-profits tax.” The only merit of this tax (especially in the form in which it was passed) is that it carries a specious political label that few have courage to stand up against.
The tax itself will hurt, not help, war production. It will breed wastes and extravagances to offset the revenues it ostensibly raises. It will be inflationary compared with any of its alternatives. It will penalize new firms and industries compared with established ones. It will not impose taxes in accordance with present relative incomes but only in accordance with the relationship of these to past incomes. The principle is so bad that practically no one has seriously suggested that it be applied to personal incomes. Yet the income of corporations is merely the pooled income of individuals.

But there has been a note in the recent economic news from Washington that is even more ominous than this. It is the open abandonment of the Administration’s previously proclaimed (though never followed) pay-as-you-go tax policy for financing rearmament. Congressmen and Administration officials are now blandly saying that of course it will be impossible to finance war production on the scale now needed except by monetary inflation.

This argument rests ostensibly on the size of the sums now contemplated. The new military appropriation of $18,000,000,000 for which President Truman has asked would raise total military appropriations to $49,000,000,000 in the current fiscal year. There is talk of a total budget in the neighborhood of $75,000,000,000 in the 1952 fiscal year, and Secretary Snyder is already predicting a deficit in that year of $10,000,000,000 to $15,000,000,000.

The politicians who think that monetary inflation is now either “unavoidable” or preferable to its alternatives simply do not know what inflation is or what it does. Inflation is not a way of avoiding taxation; it is itself a form of taxation. It is tantamount to a huge sales tax on all commodities, with the rate as high on bread and milk as on jewelry and furs. It is equivalent to a flat unprogressive income tax, without exemptions, on rich and poor alike. It is a flat unprogressive capital levy on all savings accounts, life insurance, government bonds.

And yet those who are blandly proposing this are the very people who still fight tooth and nail against the merest suggestion of a more broadly based income tax, or of excise, sales or expenditure taxes, and who pretend that they want to tax only “the rich” or “the war profiteers.” They favor inflation because it disguises the realities (perhaps as much for them as for its other victims) under endless illusions.

Given a certain maximum production, the civilian population, the consumers, must be deprived of whatever production or consumption is diverted to the war effort. When this is done through honest and outright taxation, taxes take away the same amount of money from the consumer that they turn over to the government. When it is done through monetary inflation, the consumers’ real deprivation is not lessened in the slightest degree. Its incidence is merely far more haphazard and unfair. The average citizen’s nominally higher income is far more than offset by higher living costs. The government too is deceiving itself, for it must spend far more money for the same war preparedness.

In the long run, inflation only increases the real deprivation of the taxpayer. It draws attention away from the government’s failure to slash needless expenditures—which Senator Byrd has estimated at $10,000,000,000. It leads to a demand for price and wage controls, which cannot offset the inflation but merely abridge economic liberties while they reduce, distort, and disrupt production.

There is no magic in inflation except the magic of self-deception. It leads in the end to chaos and collapse.

Total Muddleization

December 25, 1950

The President’s proclamation of a “national emergency,” however well intended, is a rhetorical gesture that creates more problems than it solves. It will not of itself produce a single additional gun, tank, or plane. It serves no other purpose than to give more powers to an Administration that has not known how to use the huge powers it already had. It was not needed to “arouse” a country already more aroused than Washington.

The phrase “total mobilization” is also a rhetorical solution based on a false analogy. “Mobilization” has hitherto meant the actual assembly of armies for war. It is now being used metaphorically to mean the imposition of rationing, price fixing, and wage fixing. Such controls do not “mobilize” anything. They reduce, unbalance, and disrupt production, and tie the economy up in bureaucratic red tape.

We have once more stumbled into price control by a chain of blunders and bad thinking. On Dec. 7, Alan Valentine, Administrator of the Economic Stabilization Agency, asked Ford and General Motors to rescind the price increases on their 1951 passenger automobiles until his agency could examine and determine “the entire question of price.” Both refused. Henry Ford II pointed out that the proposal was discriminatory. General Motors pointed out that its new prices were less than 5 percent over its pre-Korean-war prices, though
the increase in its wages and raw-material prices had ranged from 7 to 300 percent, and “no stabilizing action has been taken regarding the prices of these materials.”

These replies were good as far as they went. But they did not point out that the chief cause of inflation was the government’s own spending, deficit, and monetary policies. Nor did they emphasize the absurdity of “fighting inflation” by beginning with automobile prices. Here was a government which was not only failing to hold down food prices, but was still deliberately boosting food prices, not only through monetary inflation but by creating artificial shortages and “supporting” the prices of eggs and potatoes. And its first concern was not to reverse these food policies but to protect the poor from paying too much for Lincolns and Cadillacs!

Government price control is inevitably political, and such absurdities are not accidental but systematic. Politicians are afraid to hold down wages for fear of losing the labor vote. They are afraid to hold down food prices for fear of losing the farm vote. They will hold down rents, in war or peace, because the tenant vote is bigger than the landlord vote. And “the big automobile companies” are of course easy political targets. It is naïve to put the power to fix prices in the hands of politicians and expect that power not to be used as a discriminatory political weapon.

But even if the Bernard Baruch dream of completely “nonpolitical” price control could be realized, it would still be harmful economically. The “selective” price control that Mr. Truman wishes to begin with must lead inevitably into overall price control. And overall price ceilings must unbalance and disrupt production.

Price control never offsets inflation; it increases it. It directly discourages production, encourages consumption, and intensifies shortages. It helps to lull the public until too late into believing that “inflation” is being “controlled.” It draws public attention away from the real cause of inflation, which is the government’s own creation of more money and credit. If the public can be led to believe that the culprits are private “profiteers,” then it will not demand the reduction of wasteful public spending, the termination of bond-pegging, the increase in interest rates, and the overall control of credit which are the only real cures for inflation.

Politically, President Truman’s radio address was conciliatory in tone and in parts courageous. He was sincerely trying to act in the national interest. But his proposed economic program can only lead on net balance into muddle and disorganization. ✩
The Price-Control Straitjacket
January 1, 1951

The proclamation of a “national emergency,” followed by the immediate imposition of price control, was a double misfortune and a double diversion. It diverted public attention away from our military defeat in Korea, and even from our foreign policy in general, to internal controls. And it diverted public attention away from the sole cause of inflation—the government’s own money and credit policies—to a false and irrelevant remedy built on a false diagnosis.

Price fixing is not even a partial or a supplementary remedy for inflation. It is not a remedy at all. If the volume of money and credit is kept from expanding, there is no need for price control. If the volume of money and credit is recklessly encouraged to expand, price control is worse than futile. It must merely unbalance and disrupt production.

But these basic facts are still not understood in Washington—not in the White House, not in the Treasury, not by most members of Congress. And so our economy is being snarled in the red tape of price control.

There cannot be such a thing as intelligent price control. Price control is unsound in principle. Yet the theory today seems to be that the reason the OPA made a mess of things is that the Hendersons and Bowleses and Porters did not know what they were doing. It is true that they did not know what they were doing, but it is also true that they were being asked to do something that not even geniuses or archangels could do well.

Our present price controllers have begun, not by trying to hold down the price of foodstuffs (of, say, bread or milk) but by rolling back the price of—automobiles! They have announced cloudy, confused, and obviously unworkable overall “voluntary” and “honor system” standards for price ceilings. These are certain to break down. This will then “oblige” the controllers to impose their threatened mandatory price ceilings.

The controllers did not dare to announce parallel wage standards. The union bosses, who had at first demanded price control without wage control, suddenly switched tactics and demanded “wage stabilization” standards which were in fact wage-boosting.

But government price control is inevitably political, and perhaps even present discriminations are no more flagrant than in the past. “At the moment of writing this [I wrote in Newsweek of Oct. 28, 1946] our whole price-control system is a mass of fantastic contradictions. The price of whisky is controlled, but the price of milk is not. Lamb prices go where the market sends them; but automobiles are held down by government edict so that he poor can buy their share of Lincolns and Cadillacs.”

Present discriminations do not prove, however, that Bernard Baruch’s dream of “an overall ceiling across the entire economy,” made nondiscriminatory by a rollback or freeze of all prices and wages as of June 25, would have been any better economically even if it had been politically possible. For the advocates of both selective and overall price ceilings overlook the function of free prices, which is to maximize and balance production continuously in accordance with today’s, not yesterday’s, supply and demand. Only free markets can balance and synchronize the relative production of thousands of different commodities, and bring the quickest conversion to production of war goods.

The worst feature of price control is that it concentrates public attention on a false remedy which can only put the economy in a straitjacket, and divert attention from the remedies that really need to be applied. It is the very government that pretends to be “protecting” us against “inflation” by price controls that is causing the inflation by its monetary and credit policies—by unbalanced budgets, bad taxation, wasteful spending, and by holding down interest rates and monetizing the public debt.

And because these elementary things are still not understood, we are returning, on an even greater and more dangerous scale, to all the errors of the past.

How to Stop Inflation
January 8, 1951

Overnight, without any serious consideration of past experience, present facts, theory, or consequences, the economy has been put into the straitjacket of price control. This has happened because most people still do not understand that price control creates far more problems than it “solves.” It has happened because, in spite of the Niagara of books, pamphlets and editorials in the last ten years, most people still do not understand what inflation really is, what causes it, and what can cure it.

Fortunately, the problem of inflation is in at least some respects much simpler than it is commonly thought to be. There are not a hundred different causes. There is only one: an increase in the volume of money and credit in relation to the volume of goods. When people have more dollars to bid for the same supply of goods, they will bid prices up. Putting the matter another way: just as each individual bushel of wheat will exchange for less, other things being equal, when the
supply of wheat is increased, so each individual dollar will exchange for less, other things being equal, when the supply of dollars is increased.

At the end of 1939 the combined total of demand deposits and currency outside banks was $36,194,000,000. At the end of May of 1950 it was $109,700,000,000. In other words, the supply of money in the pockets and bank accounts of consumers and other buyers had more than tripled.

It was said and commonly believed in the second world war that prices were high because of the “shortage of goods.” This was not true then, and it was certainly not true after the war, when prices went higher still. The cost of living right at the end of the second world war, in August 1945, was 29.3 percent above the 1935–39 level; the cost of living in May 1950 was 68.6 percent above that level. The wholesale price index rose from 105.7 in August 1945 to 155.9 in May of 1950. This was certainly not because goods were scarcer in May of 1950 than during the war or in the prewar period. On the contrary, the official index of industrial production in May of 1950 was 95 percent higher than in the prewar period 1935–39.

Why were prices so much higher in spite of the fact that goods were so much more abundant? The answer lies in the volume of currency and demand deposits, which was not only three times as high in May of 1950 as in the 1935–39 period, but $12,000,000,000 higher than at the end of July of 1945.

A similar explanation must be given for the rise in prices since the outbreak of war in Korea. It is not due to a greater “shortage of goods.” The index of industrial production, in fact, has risen from 195 in May to 214 in November. But in that period there has also been an increase of some $5,000,000,000 in demand deposits. The secret of the rise in prices, in other words, is that more money has come into existence to buy even the increased supply of goods.

Even sophisticated bankers and economists get confused about this subject because the causation often seems to be the other way round. It is not always the increase in the money and credit supply that comes before the rise in prices. Often (and this happened after the outbreak of the Korean war) it is the price rise that comes first. But what most people overlook is that unless an increase in money and credit followed immediately, the price rise could not be sustained.

A typical chain of causation is this. War breaks out. Manufacturers and speculators think that the demand for certain goods is going to increase, making them higher in price. Therefore they begin to buy and hold them immediately. But to buy and hold them at a higher price they need more credit. This is usually forthcoming from the banks as a matter of course. If the banks refused this credit, however, or were not allowed to expand their total volume of advances, or if interest rates were raised to a point that discouraged this further expansion, no substantial general rise in prices could be sustained. The rise in the price of war goods would be offset by declines in other commodities.

Inflation is a monetary and credit phenomenon—and nothing else.

**Inflation Has One Cure**

January 15, 1951

On Dec. 28 the Federal Reserve Board announced increases in the legal reserve requirements for the 6,900 member banks of the Federal Reserve System as a measure to curb credit. The increases, to be spaced out over the period from Jan. 11 to Feb. 1, took the form of a rise of 2 percentage points in demand deposits and 1 percentage point in time deposits. The board explained that the effect of this measure would be to raise required reserves by member banks by about $2,000,000,000, and that this would make unavailable about $12,000,000,000 in potential bank credit.

It must be said in favor of this measure that it seeks to curb inflation in the only field in which it really can be curbed—that of monetary and credit policy. But it must be added in all candor that this step is wholly inadequate in itself, that it is little more than a token measure, and that even its small effects will be and are being offset by inflationary countermeasures on the part of the Federal Reserve authorities themselves.

As the National City Bank of New York points out in its January monthly bank letter: “As the reserve requirement increase was announced, there was evidence in the market that the Federal Reserve Banks had again put pegs under the government security market to maintain their price levels…. For most of the banks, doubtless, the adjustment will be accomplished with the greatest mechanical facility. Government securities will be sold with the Federal Reserve the buyer. In effect, banks will ship a part of their government securities to the Federal Reserve where they will get a credit of idle, unusable cash. By and large, the whole of the operation—increasing cash reserve requirements with one hand and supplying the cash with the other—is self-defeating. …

“Pegs, rigidly maintained, invite any and all holders of marketable government securities to turn their holdings into cash, for spending or lending, any time they
Mr. Truman's Wrong Remedies

January 22, 1951

President Truman’s tremendous economic demands on this country, in his State of the Union message to Congress, are so closely related to his foreign policy that it is difficult to discuss them purely on their own merits.

Mr. Truman chooses to ignore the fact (pointed out by Mr. Hoover) that this country is already bearing an altogether disproportionate share of the burden of the collective defense of the 53 “democracies.” What the President now proposes, in effect, is that we assume an even more disproportionate share of that burden.

Even today, for example, Mr. Truman blandly recommends that we continue the Point Four program. Our government is to “help people who are striving to advance from misery, poverty and hunger”—all over the world. And it is to do this by forcing the American taxpayers to drop still more money into “underdeveloped” countries so that their governments will not have to make the reforms necessary to attract private capital, either domestic or foreign. The Point Four program not only puts an added strain on our own economy; it retards world production. It bypasses the pros and incentives of free enterprise to substitute the principle of the free lunch.

Mr. Truman lists ten subjects “on which legislation will be needed.” These include still bigger appropriations and still higher taxes—but not government economy. As an afterthought, however, he declares that the government “must practice rigid economy in its non-defense activities.”

Unfortunately, too much weight cannot be attached to this single sentence of lip-service. Mr. Truman has been making similar declarations over a long time now, yet on net balance the very opposite continues to happen. It is to be observed, further, that in this message Mr. Truman did not specify just what nondefense expenditures were to be cut. He did specify, on the other hand, many non-defense expenditures that were not to be cut. He even spoke of “rounding out,” “improving,” and adding—in other words, of making bigger—social insurance, old-age pensions, unemployment benefits, government health insurance and socialized medicine.

Mr. Truman asked for “improvement of our labor laws” to increase production in the emergency. If taken seriously, this proposal would mean the suspension of the present legal penalty rate on all weekly working hours above 40. He asked for “improvement of our agricultural laws, to help obtain the kinds of farm products we need for the defense effort.” By far the best way to do that would be to repeal all our “parity,” control, and subsidy laws and let the supply and kinds of farm products be determined by demand through free prices.

Mr. Truman asked for “revision and extension of the authority to expand production and to stabilize prices, wages, and rents.” Congress should not extend this authority but contract it. If Congress could force the Administration to abandon its policies of monetary
inflation, none of these price-fixing powers would be needed.

To quote from a statement by the Committee for Economic Development on “Paying for Defense”:

“Experience in the United States and in other countries has demonstrated that this [a system of general price and wage controls and rationing] is not an effective solution to the inflation problem, especially if the problem lasts for a long time. Even while the controls are nominally in effect, price increases break through in black markets, in deterioration of quality, and in the disappearance of low-priced goods from the market. Price ceilings and wage rates come to be determined in a political bargaining process which pushes up the prices and incomes of the groups most powerful politically at the expense of those less powerful. And when the controls finally come to an end, either by formal decision or by erosion in fact, the dammed-up inflationary pressure breaks out in open inflation. [Meanwhile] prices are prevented from performing their economic function of directing production . . . and economizing the use of scarce resources.”

An Irresponsible Budget
January 29, 1951

Senator Byrd was using the language of restraint when he declared that President Truman’s budget of $71,000,000,000 for the next fiscal year was “the very height of fiscal irresponsibility.” Mr. Truman no longer seems to attach any meaning to figures, or even to pledges. He has repeatedly promised “rigid economy in nondefense activities.” And he solemnly continues his lip-service to “strict economy” in the very budget in which, as Senator Byrd points out, proposed nondefense spending is increased “to the highest level in the history of the nation.”

Mr. Truman threw in practically the whole Fair Deal spending program—compulsory health insurance, bigger unemployment benefits, Federal subsidies to education, including nursery schools, more public power projects, including the St. Lawrence Seaway, more government housing, more handouts to foreign countries for “economic recovery,” and on top of all this, the Brannan farm plan, the year-to-year cost of which is indeterminable.

It may be doubted whether Mr. Truman seriously intended this as a budget or meant it only as a campaign document—so that, in 1952, he can tell the pressure groups that he asked for everything, and only a niggardly Congress denied it.

The response of Congress to this budget was much milder than it should have been. Senator Byrd’s estimate that it could be sliced by $7,000,000,000 was very moderate. Representative Taber’s contention that it could be cut by $4,000,000,000 was even more so. I hazard the guess that with proper Federal policies and proper administration of spending, the whole $16,000,000,000 difference between the proposed $71,000,000,000 of spending and the $55,000,000,000 of prospective tax yields could be cut, making it possible to balance the budget without increasing taxes any further. And the result could be both more production and better defense.

Mr. Truman still talks of government expenditures as if they came out of some fourth dimension, and bought more things than were bought before. All they do is to change the direction of spending. What the government pays out to Paul it must take from Peter. What it spends on government project X it must take away from unborn or unexpanded private projects Y and Z. For every speech Mr. Truman makes on how many “new needs” he is meeting by his $71,000,000,000 of expenditures, millions of mute inglorious taxpayers could make a speech on how many old and new needs they will be unable to meet because these billions will be taken away from them.

It is not enough for government to prove (though it seldom attempts even this) that every dollar it spends meets some vague “need” or other; it must show that every dollar it spends meets a greater need than it would have met if the man who earned it had been allowed to spend it on his own family or for his own projects.

Nor should we allow the magic word “defense” to save a proposed expenditure from serious scrutiny. Once Congress permits the Administration to set up a sacred and untouchable category of expenditures, it will find the Administration shoving every proposed expenditure possible under that category. Today “defense” covers a multitude of fiscal sins.

If there is any fiscal responsibility in Congress itself, it will return Mr. Truman’s 1952 budget to him without approval, and request him to submit a responsible, balanced budget with a certain specified number of billions sliced off the expenditure side. It will bind itself, in return, not to increase by its own appropriations either the total or any individual item of this revised budget. But it will not bind itself not to make any further reductions in individual items when the individual appropriation bills come before it. And its separate committees—including the Armed Services and Military Affairs Committees—will increase their technical and
research staffs and make a far less perfunctory scrutiny of expenditure requests than they have in the past.

**Fighting Fire with Gasoline**

February 5, 1951

How preposterous can the situation get? The Administration starts the inflationary fire, fights it by pouring on more gasoline, and then talks as if it were completely mysterious in origin. Or it hints that the fire was started by business, by the “speculators,” the “hoarders,” the “profiteers,” or by the buying public. And it acts on this assumption when it insists on the completely false remedy of price control, which puts the economy in a straitjacket of prohibitions, allocations, rationing, licenses, and subsidies, unbalances and disrupts production, creating artificial shortages. All this is called total mobilization.

Take the Secretary of the Treasury, John W. Snyder. He is personally a mild-mannered, quiet, unassuming, amiable, loyal, and honorable man who thinks of himself as a conservative. He would be shocked beyond measure to learn that he is more responsible than any other single man for the existing inflation in this country and the almost universal fear of further inflation. And he has earned this No. 1 position not only by his past record but by his extraordinary announcement on Jan. 18 that the long-term rate for marketable Federal securities must be held to 2½ percent. He might just as well have announced outright that he is determined to have more inflation.

Mr. Snyder’s attitude stems, of course, not from any desire for inflation, but from a tragic lack of understanding of economic cause and effect. Inflation, always and everywhere, has one basic cause—an increase in the supply of money and bank credit. At the end of 1939, demand deposits and currency outside of banks totaled $36,000,000,000. At the end of May of 1950 this total had reached $109,000,000,000. At the end of December of 1950 it had reached $117,000,000,000. This is not merely the cause of inflation; this is the inflation. The increase in commodity prices is merely a consequence.

And the principal cause in turn of this increase in money and bank credit has been the artificially low interest rates maintained by the Treasury.

This cheap money policy has not merely swollen the volume of private borrowing; it could be maintained—in connection with the policy of pegging government bonds above par—only by encouraging the member banks to load up with government bonds and by forcing the Federal Reserve Banks to buy as many of those bonds as is necessary to maintain the predetermined rate. They bought these bonds by creating deposits or printing money.

All this is now an old story among monetary economists and bankers. But Mr. Snyder has never understood it. He can see the problem only from the immediate short-run interest of the Treasury—to pay as low an interest rate as possible. “Any increase in the 2½ percent rate,” he says “would seriously upset the existing security markets.”

Any increase in prevailing interest rates would of course mean a lower price for present outstanding bonds. But Mr. Snyder refuses to see that the only alternative to accepting this comparatively mild consequence is an uncontrollable inflation. In the face of overwhelming economic opinion and evidence to the contrary, Mr. Snyder persists in declaring that a cheap money policy and inflation have nothing to do with each other.

If Mr. Snyder stood alone in this appalling blindness the situation would not be so grave. But he is supported in Administration circles by a conspiracy of silence. Within the Federal Reserve System there is some real understanding of the situation; but—with a few honorable exceptions like Allan Sproul, president of the Federal Reserve Bank of New York—there is precious little courage. Mr. Snyder’s statement clearly implies that Chairman McCabe of the Federal Reserve Board acquiesces in the policy of maintaining the inflationary 2½ percent interest rate. In lieu of any genuinely effective overall action, the board on Jan. 16 announced the token gesture of increasing required stock margins from 50 to 75 percent. Meanwhile, an ominously growing bureau prepares to “cure” inflation with the colossal hoax of price control.

**Price Control Means Politics**

February 12, 1951

The confusion at Washington has reached such a point that even the price controllers admit that they don’t know what they’re doing. They announced the so-called overall price-and-wage freeze on Jan. 26. The very next day an executive of the Office of Price Stabilization said that his agency was working intensely to “cure the absurdities and inequities inherent in such a sweeping order.” How many times this order will be changed or amended no one can predict. But what can be predicted with complete confidence is that no matter how many times the order is changed or amended it will still be riddled with “absurdities and inequities.”
Those who, like Bernard Baruch, honestly believe in what they call “an overall ceiling across the entire economy,” assume that the nondiscriminatory and nonpolitical way in which this could be done would be to freeze all prices, wages, rents, fees, and so on as of a particular date. Mr. Baruch originally recommended June 25, the day hostilities broke out in Korea.

This proposal—or a proposal to take the prices of any other date or period as the basis for an overall freeze—has fatal defects. It treats the prices or price relationships of that date as peculiarly “normal,” “fair,” or “right.” But the general price level of that date reflects the money supply of that date; and the specific prices and price relationships reflect the individual state of supply and demand for each commodity on that date. Even if we disregard changes in the supply of money and credit, the commodity supply-and-demand relationships of yesterday are never those of today.

The function of free prices, free wages, and free markets is to direct production into the goods that are most needed and away from the goods that are least needed; to balance and synchronize production as among thousands of different commodities; to bring about a voluntary allocation of land, capital, and labor to their most efficient and productive uses.

Even an honest overall price-and-wage ceiling, therefore, would deprive us of the invaluable guidance that free prices give. It would misdirect and waste capital, labor, and other productive resources. It would cause both hardships and wastes in consumption. It would disrupt productive relationships and bring on artificial bottlenecks and shortages. But what we are getting is a dishonest “overall” price-and-wage ceiling, which is much worse. It is riddled with special exemptions and discriminations. It exempts farm prices under “parity.” It tries to free the farmer while controlling the processor and distributor. It treats wages quite differently from industrial prices. It holds some prices at the peak and “rolls back” some others. It is going to straighten out “inequities”—which means, as experience shows, that it is going to hand out political favors and penalties. Our price control, in brief, is saturated with politics.

Nor is the politics going to be taken out. Political favoritism is inevitable in government price control. The appointed price controllers are not solely to blame. They have to deal, for example, with discriminations already built into the law. Our farm-price-parity laws and labor laws are full of built-in inflationary pressures.

Price fixing does not merely put huge economic power, always abused, into the hands of politicians, but it serves to divert public attention away from the fact that it is the government itself that creates the inflation from which it then “protects” the citizens. At the very moment when the government resorts to the fraudulent remedy of a general price freeze, President Truman openly supports Secretary Snyder’s announcement that the rate on long-term government bonds must be kept pegged at 2½ percent. As Governor Eccles of the Federal Reserve Board has pointed out, this can only be continued “by the creation of tremendous sums of money, at the cost of progressive decline in the value of the dollar.”

No serious effort to stop inflation is possible until the government halts this government bond-pegging policy. 

Inflation Plus Usurpation

February 19, 1951

On Jan. 31, at a meeting that should never have been called, President Truman presumed to lecture the Open Market Committee of the Federal Reserve System on what its policies ought to be in the present crisis. The next day the White House Press Secretary announced: “The Federal Reserve Board has pledged its support to President Truman to maintain the stability of government securities as long as the emergency lasts.” Then Mr. Truman made public a “Dear Tom” letter to Chairman McCabe of the Federal Reserve Board in which he thanked him for “your assurance that the market on government securities will be stabilized and maintained at present levels.”

Governor Eccles of the Federal Reserve Board was “astonished” by the President’s version, denied flatly that the agency had given any such pledge, and made public the board’s own memorandum covering what took place. The memorandum failed to support Mr. Truman’s version.

We need not be diverted by any attempt to appraise the comparative accuracy of these conflicting versions. If we keep our eye on the legal and economic issues involved, it is clear that Mr. Truman is wrong on both.

The President has no more legal right to tell the Federal Reserve Board what to decide than he has to tell the Supreme Court what to decide. To minimize Presidential influence, Congress deliberately made the board an independent body, with fourteen-year terms for each of the seven members, overlapping so that no President should have the appointment of more than one member in any two-year period. The late Senator Glass long ago quoted President Wilson as saying: “The very moment that I should attempt to establish
close relations with the [Federal Reserve] board, that moment I would be accused of trying to bring political pressure to bear." The pressure that Mr. Truman is now bringing to bear on the board is a clear usurpation of power.

President Truman and Secretary Snyder are patriotic and sincere. They simply do not understand the economic consequences of what they are proposing. They wish to force the Federal Reserve Banks to keep buying as many government bonds as necessary to hold them above par, and so keep down the long-term yield to the arbitrary maximum of 2½ percent. Now when the Reserve banks buy such government bonds they pay for them simply by creating deposit credits or printing money in exchange. These in turn become the reserve bases for member banks to create still more money and bank deposits. This creation of more money and bank credit without more goods is not merely the cause of inflation; it is the inflation. Mr. Truman and Secretary Snyder might just as well tell the Federal Reserve Board point blank: "We demand more inflation!"

None of the reasons that either Mr. Truman or Mr. Snyder gives for wanting Federal bonds pegged at par or over will stand examination. Mr. Truman recalled before the Open Market Committee "his wartime experience when he bought Liberty bonds out of his soldier's pay. When he returned from France and had to sell his bonds to buy clothes and other civilian things, he got only $80 or a little more for his hundred dollar bonds. . . . He did not want the people who hold our bonds now to have done to them what was done to him."

Now none of the Liberty bonds ever fell quite as low as 80. Some issues did fall within a few points of that price, but only for a few months in 1920. And the decline affected only those people who were forced to sell in those months. The maximum loss even of these people was only about 18 percent. Today, on the other hand, mainly as a result of the very bond-pegging and low-interest policies on which Mr. Truman has insisted, a government bond bought in 1942 has a purchasing power in terms of consumer prices of only 70 percent of what it had then. This is a real depreciation of 30 percent. Which policy—that of the first or the second world war—was worse for the bondholders? ✽

Abolish the RFC

February 26, 1951

In the Feb. 19 Newsweek Raymond Moley dealt with the scandals that have developed in the Reconstruction Finance Corp.; but in the light of subsequent developments and of the wider issues involved, some further comment seems warranted here.

On Feb. 2 an investigating panel of the Senate Banking Committee, after months of inquiry, brought in a report charging improper use of the RFC's lending authority, political and personal favoritism, and mismanagement. It was the practice of one director, the report found, "to give special attention to matters in which the [Democratic National] Committee was interested." Other details, including the remarkable rise of an E. Merl Young, husband of a secretary to one of President Truman's secretaries, from a $1,080-a-year messenger job, to a vice presidency of the Lustron Corp. (an RFC borrower) at $18,000 a year, and finally to an income of $60,000 in 1950, were recorded by Raymond Moley last week.

Though these factual findings were unanimously approved by the subcommittee, consisting of two Republican and four Democratic senators, Mr. Truman at a press conference dismissed the report as asinine. He followed this up by defiantly sending to the Senate the nominations of all five directors of the RFC—even though the last session of Congress had declined to take action on these nominations, and though three of the nominees were named by the Senate subcommittee report as having been unduly influenced in the grant of loans by individuals close to the President.

The subcommittee, however, apparently thinks that it would remove the political element from the RFC’s loans if the five-man board of directors were replaced by a single governor with complete responsibility. The blunt truth is that there is no cure short of the abolition of the RFC itself.

The RFC was set up in 1932 to perform a specific emergency function—to make loans to banks then under pressure, against sound assets which were not legal for rediscount at the Federal Reserve Banks. Once this emergency function was performed the RFC should have been liquidated.

On the contrary, it was not only retained but expanded, and was soon used for making direct loans to business. Such loans were bound to be economically unsound. A solvent and promising business, willing to pay the going rate for money, can obtain it from private lending institutions. Therefore, the firms that turn to the RFC for money must be either those who are unwilling to pay the going rate (already kept unsoundly low by the government’s cheap money policy) or those firms whose credit and prospects are not good enough to satisfy private lending institutions. The RFC, in fact, exists on the self-contradictory assumption that there are loans sound enough to risk the American taxpayer's
money in, though they are not sound enough for any private individual or institution to be willing to risk its own money in.

The $37,500,000 loan made by the RFC to the Lustron Corp, is typical of what happens under such an assumption. According to some estimates, the RFC will be lucky to get back 5 cents on the dollar from that "investment."

It is argued that the RFC cannot be abolished now because it is needed to make “defense” loans to private business. This argument is without substance. Any solvent, well-managed corporation with a government contract in its hands should have no trouble in borrowing from private banks all the money it needs to fulfill that contract. But if we create a system under which private persons can get the funds from one government agency to set up facilities to solicit contracts from another government agency, we have created still further opportunities for political pressure and corruption. Even as matters already stood, as the Hoover Commission warned in a report on March 31, 1949: “Direct lending by the government to persons or enterprises opens up dangerous possibilities of waste and favoritism to individuals or enterprises.” The RFC should be abolished.

How to Cause a Famine
March 5, 1951

“This program,” said President Truman, in asking Congress to give the Indian Government 75,000,000 bushels of grain, “does not constitute a precedent for continuing to provide food to India on a grant basis or for providing similar aid for other countries.” But it does, of course, constitute precisely such a precedent. We cannot do less in future for India or any other country without being accused of less generosity or plain discrimination.

Famine and starvation should, of course, always be prevented or relieved when humanly possible. But we must also ask what caused it, whose duty it is to relieve it, and what steps are essential to prevent its recurrence.

It has gradually, precedent by precedent, become the assumption of most foreigners and most American Fair Dealers that when any real or imagined deficiency of anything whatever exists anywhere on earth, it must be made good primarily, if not solely, at the expense of the American taxpayer. Yet even the Indian Government did not ask us for more than a long-term loan to enable it to buy this grain. Given reasonable prudence, it could easily have repaid such a loan. Why did Mr. Truman recommend a gift?

The process will be this. “America” will give the grain. But the average Indian (nearly 85 percent of the Indian people are illiterate) will probably never know this. For the gift will be to the Nehru government, and the Nehru government will sell the grain to India’s hungry. Moreover, the Nehru government will be allowed to keep for statist schemes even the “counterpart funds” it gets for selling what we give.

Just as Mr. Truman ascribed the Yugoslavian food shortage solely to “the drought,” so he now ascribes the Indian famine solely to “natural disasters—earthquakes, floods, droughts, and plagues of locusts.” Yet the famine has at least been intensified, if not principally caused, by the economic policies of the Nehru government:

1—The Nehru government is a “planning” government, a socialist government. Like all such governments it has embarked on a grandiose “industrialization” program. This means that it has diverted land, labor, and capital from agricultural to industrial production. This has directly reduced India’s production of food. Mr. Truman apparently approves of this compulsory diversion. For he wants to compel American taxpayers to subsidize it. It is explicitly because he wishes the Nehru government to have the funds to continue this “long-range economic development program” that he thinks American and not Indian taxpayers should be asked to pay for the present Indian food deficiency.

2—Specifically, the Nehru government intensified India’s food shortage by its isolationist efforts to become independent of Pakistan (or anywhere else) for cotton and jute. It ordered a reduction in grain-growing acreage to increase cotton and jute acreage.

3—The Nehru government has not permitted free markets in agriculture. It has put price ceilings on grain. These have, as always, discouraged and reduced the production and sale of grain. The government has resorted to forced government procurement of grain from peasant growers. Our government is asking American taxpayers to suffer from these policies and is not suggesting any change in them. Therefore the food shortage is likely to recur.

4—The argument that India cannot pay $190,000,000 for grain because it has only “limited foreign exchange reserves” and an “unfavorable balance of payments” is economic nonsense. These conditions are the result of the Nehru government’s own exchange control measures. It has made dollars scarce in the same way as it has made foodstuffs scarce—by putting artificial price ceilings on them.
In this grain discussion the whole emphasis has been on distribution. But in the long run nothing can save India or the world from poverty and famine but greater production. And there is willful blindness to the fact that government "planning," price-fixing, and socialism inevitably discourage, reduce, and disrupt production. ♣

Inflation Is Government-Made
March 12, 1951

The Treasury's announcement that it will offer "non-marketable" bonds bearing 2¼ percent in exchange for issues of its outstanding 2½ percent bonds maturing in 1967–72 must be warmly welcomed as at least a step in the right direction and the first crack in the 2½ percent fetish.

The sole cause of inflation is an increase in volume of money and credit in relation to volume of goods. This has gone steadily forward. At the end of 1939, both demand deposits and currency outside of banks totaled $36,000,000,000. Wholesale prices in 1939 stood at an index number of 77. At the end of May 1950, money-and-credit volume had increased to $109,000,000,000. Wholesale prices in May 1950, had risen to an average of 156. In December 1950, money-and-credit volume had reached a total of $118,000,000,000. Wholesale prices had soared to an average of 175.

This general rise of prices cannot be attributed to any general "shortage of goods." On the contrary, the index of industrial production, which stood at 109 in 1939, had risen by May of 1950 to 195 and by December to 216. This rise in production was the chief reason, in fact, why wholesale prices between 1939 and the end of 1950 did not rise more than 127 percent, though the volume of money and bank credit increased by 228 percent.

The chief cause for the increase in the volume of money and credit all through this period was the government's own cheap-money policy, maintained mainly through the device of pegging outstanding government bonds above par. The Federal Reserve Banks were forced to buy the bonds, which were then made the basis for the creation of more money and credit. At the end of 1939 Federal Reserve Banks held $2,484,000,000 of U.S. Government obligations and the commercial banks $16,316,000,000 worth. At the end of 1950 Federal Reserve Banks held $20,800,000,000 worth and the commercial banks $62,390,000,000 worth. Thus a total of $64,390,000,000 out of the whole increase of $82,000,000,000 in money and bank credit since the end of 1939 in effect represents the "monetization" of government securities acquired by the nation's banking system.

Mr. Truman's memorandum of Feb. 26 on government debt and general credit policies wrongly identified "stability" of government securities with "full confidence in the public credit," and this in turn with an artificial parity. Yet obviously the government cannot create real confidence in its own credit by forcing its left hand to buy the bonds that it "sells" with its right. It has managed to keep up the nominal quotation of the bonds only by a process that has led since 1939 to a depreciation in their real purchasing power of 44 percent. In a self-defeating effort to prevent further inflation, while still preserving the fetish of a 2½ percent long-term interest rate for government securities, the President's memorandum in effect proposed still further direct government control of the entire economy.

The March 3 Treasury announcement is the first clear recognition that its efforts to hold yields on its long-term securities down to 2½ percent have been inflationary. But the new measure does not on its face seem adequate to solve the problem. The banking system could have been much better protected against a halt in the bond-pegging policy, for example, by allowing holders of outstanding long-term government bonds to convert them into bonds bearing a variable-coupon rate (see Business Tides, Newsweek, Oct. 4, 1948).

This general rise of prices cannot be attributed to any general "shortage of goods." On the contrary, the index of industrial production, which stood at 109 in 1939, had risen by May of 1950 to 195 and by December to 216. This rise in production was the chief reason, in fact, why wholesale prices between 1939 and the end of 1950 did not rise more than 127 percent, though the volume of money and bank credit increased by 228 percent.

The chief cause for the increase in the volume of money and credit all through this period was the government’s own cheap-money policy, maintained mainly through the device of pegging outstanding government bonds above par. The Federal Reserve Banks were forced to buy the bonds, which were then made the basis for the creation of more money and credit. At the end of 1939 Federal Reserve Banks held $2,484,000,000 of U.S. Government obligations and the commercial banks $16,316,000,000 worth. At the end of 1950 Federal Reserve Banks held $20,800,000,000 worth and the commercial banks $62,390,000,000 worth. Thus a total of $64,390,000,000 out of the whole increase of $82,000,000,000 in money and bank credit since the end of 1939 in effect represents the “monetization” of

The CED on Price Controls
March 19, 1951

We take as our text this week a statement of the program committee of the Committee for Economic Development entitled “Conditions Necessary for Effective Price-Wage Controls.” This statement typifies the views of a large group of business leaders and economists. We choose it for discussion partly to point out what is wrong with it, but also to underline much that is right with it.

The committee specifies four conditions it regards as necessary to make "price and wage controls work as
these “conditions necessary for effective price-wage controls” were achieved, the price-wage controls would not be necessary! For given such conditions, the general level of prices simply could not go up substantially or permanently.

It is true that the prices of certain war goods in exceptional demand might go up sharply. But this would leave less money to buy other goods, the price of which would consequently decline. And this change in relative prices is exactly what is necessary. To try to retain the same relative prices, wages, costs, profits (and losses) as those of June 24, 1950, say, is to discourage, retard, or prevent the very changes in the structure of production that we need.

Price control, in short, is not only an unnecessary weapon against inflation, but a positive evil in itself.

Point Four Is Growing Up

March 26, 1951

The global giveaway mania seems to grow by feeding on itself. The latest illustration is the report to the President by the International Development Advisory Board headed by Nelson Rockefeller. It proposes nothing less than a new $4,500,000,000 foreign lending-and-giving program to the so-called underdeveloped areas of the world.

The Administration made Point Four look very modest and innocent at the beginning, you will remember, by asking for only $45,000,000 for the first year. Now this sum was ridiculously small when compared with the grandiose objective of a new world flowing with milk and honey that Point Four was to bring about. It did not take much shrewdness to calculate that if there were 1,075,000,000 people in the “underdeveloped areas,” then the $35,000,000 actually appropriated meant only about 3 cents per ward per year—hardly enough to assure the economic millennium.

Some of us were so cynical as to ask whether the requested appropriation had not purposely been made ridiculously small compared with the tremendous pretensions of the program in order to lure Congress into accepting the principle that the American taxpayer somehow owed all the rest of the world a living. Even Democratic Chairman Connally of the Senate Foreign Relations Committee publicly expressed his apprehensions: “As time goes on I can feel the pressure coming in the window for big projects.”
His prophetic soul did not have to wait long. Here, only one year later, is a program involving altogether 100 times as much as that modest little entry fee of $45,000,000. And as I need hardly point out, we are not going to raise foreign living standards very much by lending or giving out only $2 to $5 per beneficiary per year. Will we be offered next year, perhaps, a really “adequate” program, bearing the same 100-to-1 ratio to this year’s, say, as this year’s does to last?

The stated purpose of this new proposal is to “unify” and “centralize” “all major United States foreign economic operations.” The board finds 23 American agencies already engaging in such operations in addition to 33 different foreign agencies. Its report admits, with masterly understatement, that “in some cases there is duplication.” But it does not specifically recommend the abolition of any one of these overlapping and duplicating agencies. It simply proposes to absorb them in a supercolossal U.S. Overseas Economic Administration.

Moreover, the report not only leaves some foreign hand-out agencies outside even this proposed consolidation; it suggests the creation of several new ones. One of them would be a new affiliate of the International Bank. With the ominous political record of the Reconstruction Finance Corp. before it, the board nonetheless proposes the creation of an “International Finance Corp. . . . to make loans . . . to private enterprise without the requirements of government guarantees.” And finally, though the new overall agency is of course put forward as “a vital part of our own defense mobilization,” it is nevertheless to be a “permanent governmental agency.”

As one who, in vain, wrote a 48 page pamphlet called Illusions of Point Four, it seems to me a rather futile exercise to call attention once more to all the false assumptions of theory and fact that underlie these Point Four proposals. Americans should be indebted, however, to Sir Ramaswami Mudaliar, the Indian representative to the United Nations Economic and Social Council (who demands that the U.S. provide bigger and better giveaway programs), for admitting so frankly that Point Four “may have to be at the expense of developed countries.” “The choice,” he says, “may be between a comfortable motorcar for an average American family or a motor truck for carrying passengers or goods in remote parts of the East.” At least Sir Ramaswami recognizes clearly that we in America must do with less if we give part of our goods away, whereas most of our own Point Four champions seem to argue that the more we give away the richer we will get.

---

International Statism Rampant

April 2, 1951

On March 19 the delegates of France, Western Germany, Italy, Belgium, the Netherlands, and Luxembourg initiated at Paris a draft treaty running for 50 years to give legal effect to the Schuman plan. It was another major step in the onward march of international bureaucratism, international controlism, and international statism.

The Schuman plan does have two merits. It represents a political rapprochement between France and Germany. And it recognizes, at least in the sphere of coal and steel, the evils of economic nationalism and fragmentation. But it resorts to a dangerously false method of meeting the problem. When we consider what it will mean from the standpoint of peace, freedom, and real internationalism in the long run, it is a grave step backward.

The truly liberal way for the six governments concerned to solve their coal and steel problem would be simply to lower or remove the legal barriers to international trade that they themselves have erected. This would mean the removal of tariffs, quotas, import and export prohibitions, license systems, and exchange controls.

Instead, the Schuman plan imposes new controls for old ones. It frowns, it is true, on private bigness, integration, or cartelization. But it will sanction and enforce all these things under intergovernmental direction. Under the plan the supranational control authority will have power to fix maximum, minimum, and “just” prices for coal and steel; to fix wages, production quotas, and consumption priorities; to subsidize submarginal companies; to guarantee private loans and to direct investment, financing expansion here and prohibiting it there. And to do all this the plan sets up elaborate bureaucratic machinery with consultative committees, and its own Assembly, Council, and Court of Justice.

In brief, in the name of freedom of competition the plan will prevent the very adjustments that it has been the immemorial function of competition to bring about—to allow and encourage the free expansion of efficient producers, to weed out the inefficient, to economize resources, lower prices, and promote maximum output.

Hardly was the ink dry on signatures to the Schuman plan than the French Government announced new plans to set up new supranational agencies with power to fix prices and allocate markets for Europe’s wheat, sugar, dairy products, wine, and whatnot. And the U.N. Economic and Social Council, meeting in
Chile, voted 13 to 0 that governments of the world combine “to regulate at equitable levels and relationships the prices of essential goods moving in international trade, including capital goods, essential consumer goods and raw materials”—in other words, to fix prices on practically everything.

All this is to be piled on top of what is already the greatest aggregation of overlapping intergovernmental agencies and collectivist controls that the world has ever known—from the International Fund to the European Payments Union, and from exchange controls to the wheat pact.

The fact that existing agencies and controls are either breaking down or promoting further economic chaos, instead of leading to any demand for their abolition, leads merely to demands for still more agencies, still more bureaucrats, still more controls. It is never the controls that are blamed for the resulting chaos, but the few remaining elements of freedom.

When the brief attempt to make pounds convertible into dollars broke down in 1947, the British Government blamed free convertibility, and not its absurd officially pegged price of $4.03 for the pound. When Erhard finds it almost impossible in Germany today to maintain a few tiny islands of economic freedom in a sea of controls, it is the partial freedom, not the control, that is ridiculed.

The situation would not be quite so ironic if the bureaucrats of the world were frankly repudiating a free market economy. But world economic freedom is being strangled to the accompaniment of suave assurances that it is in the clutches of its friends.

Is Price Control Necessary?
April 9, 1951

The present price law expires on June 30, and the Administration is of course attempting to get even greater and more arbitrary control powers out of Congress. But if any economic sense prevails in Congress it will reduce and not increase the government’s control powers. Above all it ought to reduce if not eliminate the Administration’s power to fix prices.

I have argued so often on this page against price control that it will perhaps be more effective, and certainly more varied, if I cite the opinions and arguments of others. So I begin with a quotation from Frank H. Knight of Chicago, retiring president of the American Economic Association, from the American Economic Review for March:

“Of late, I have a new and depressing example of popular economic thinking, in the policy of arbitrary price fixing. Can there be any use in explaining if it is needful that fixing a price below the free-market level will create a shortage and one above it a surplus? But the public oh’s and ah’s and yips and yaps at the shortage of residential housing and surpluses of eggs and potatoes as if these things presented problems—any more than getting one’s footgear soiled by deliberately walking in the mud.”

I turn next to an article, in the same issue of the same learned quarterly, called “Is Price Control Really Necessary?” It is by Prof. Wytze Gorter and G.H. Hildebrand of the University of California at Los Angeles. “The duty of professional economists,” they declare, “is clear: to demonstrate once again the superiority of the price system over direct controls, even in the management of a preparedness economy.” And they proceed to advocate a pay-as-we-go system (which they call a “cash and carry fiscal-monetary policy”) with free prices and free markets, as “an alternative to the interminable queues, stamps, boards, and bureaucrats” of price control.

Exhibit C is a little 24-page pamphlet on Inflation, by F.A. Harper, just published by the Foundation for Economic Education. (Irvington-on-Hudson, N.Y. No charge for single copy.) I commend this for the simplicity and clarity with which it states the case against price control. Professor Harper begins by pointing out: “Inflation means too much money. The way to prevent inflation, is to close down the money factory. It is just that simple.” If it closes down the money factory, the government must live within its income. Inflation is a form of tax. When the government starts to appoint “inflation fighters” it is in effect illogically setting up a branch for the purpose of fighting the payment of the inflation-tax that it has assessed through another branch.

Price-ceiling laws, as Harper goes on to point out, were imposed at least as far back as 3,800 years ago in ancient Babylonia. They have always created shortages. Our memories are so short, however, that we have even forgotten the “meat famine” that price ceilings created in this country in 1946. Harper proceeds to give an elementary lesson on the way in which the free market price equalizes supply and demand and maximizes production and consumption, whereas arbitrarily fixed prices cause disequilibriums—distortions, surpluses, and shortages. “When the free market is allowed to operate and to set the price at a point where supply and demand will equate, each person will have purchase
tickets in the market which correspond to the supply of something he puts into the market.”

In spite of the conclusiveness of the case against price control, the general ideological and political confusion is such that there is little practical hope that Congress will allow price control to terminate. But we can hope that it will at least put a light trigger on any renewal of its economic control legislation, that it will extend any control law for no more than a year, and retain the power to terminate even that at any time upon the vote of a simple majority of either House. Congress should not continue to be helpless against bureaucrats who issue nonsensical orders in the name of carrying out the will of Congress itself.

**Controls Create Inflation**
April 16, 1951

Congress can do most to curb inflation by granting the Administration and its agencies fewer control powers, not more.

Price control is not a remedy for inflation. It actually tends to increase and prolong inflation. It distorts and prevents production, and so brings about needless shortages. It diverts the attention of the general public from the real cause of inflation—the increase in money and credit.

It does not follow that the best way to combat inflation is to grant the Federal Reserve authorities more power over money and credit. On the contrary, a more effective step would be to deprive the Federal Reserve authorities of some of the powers they have been abusing for so many years.

Suppose, for example, that Congress deprived the Federal Reserve Banks of the power to buy more government securities. The Treasury would then be obliged to pay high enough interest rates to make its securities attractive to investors on their own merits. It could no longer force the Reserve Banks to peg the price of its bonds. In effect, the government would have to stop selling its bonds to itself. The Reserve system could no longer hold down interest rates artificially by monetizing government bonds.

If government agencies were no longer permitted to increase the supply of money and credit through this device, interest rates would rise. And permitting interest rates to rise—i.e., making credit more expensive—has been the traditional way of bringing inflation to a halt.

Simply permitting interest rates to rise might be enough to halt the present inflation. There are still the possibilities, however, (1) that member banks might increase their holdings of government securities and (2) that, in spite of higher interest rates, private credit might continue to expand. There are several ways in which such developments could be checked.

Further limitations might be put on the power of the member banks to increase their holdings of government securities. The Federal Reserve authorities might be empowered to raise member bank reserve requirements still further. But they should certainly not get this additional power unless it is accompanied by the obligation to increase the reserve requirements of the Federal Reserve Banks themselves. Their reserve requirement against combined liabilities, now only 25 percent, should be restored to the 35 to 40 percent level that existed before 1945. Such an action on the part of Congress would not only restrict further potential credit inflation but would create an immediate increase of confidence in the dollar. Congress should restore the old legal requirements before still further inflation has occurred. The combined reserve ratio of the Federal Reserve Banks is already down to 46.6 percent compared with 56.5 percent a year ago.

Raising legal reserve requirements is a relatively clumsy way of controlling credit. This supplementary device is necessary chiefly because the Federal Reserve authorities have not shown the courage to make full use of the powers they have always had—to increase the discount rate to a noninflationary level and, if necessary, to sell part of their holdings of government securities back to the market. Combined action of this sort could halt inflation overnight.

Just as Congress could do more to curb inflation by placing restrictions on the Federal Reserve authorities than by granting them further control powers, so it could do more by taking some powers from the Federal bureaucracy in general than by adding new ones. Above all, in a time of inflation Congress should discontinue subsidies to farmers, and the “parity” price nonsense, and reconsider all other legislation which arbitrarily forces up production costs.

The Federal Reserve authorities are always asking for more powers for the ostensible purpose of “combating inflation.” But they have in fact used the powers they have in order to create inflation. The way to halt inflation is not through controls by government but through controls on government.
Priorities vs. Price Control
April 23, 1951

On April 6, 7, and 8 I attended a conference on “the economics of mobilization” at White Sulphur Springs under the sponsorship of the University of Chicago Law School. There were some 70-odd participants, consisting of university professors of economics and law, representatives of labor, banking, and business, editors, members of Congress, government officials, former price control directors and the present Director of Price Stabilization, Michael V. DiSalle.

In view of the diversity of views expressed, DiSalle could hardly be blamed for remarking that “the experts are much more effective talking to nonexperts than they are talking to each other.” But the chief reason why this was so was that many of the professional economists present abandoned their function as economists in order to become amateur politicians. They did not talk of the economic consequences of price control but of its political popularity. They made no real answer to the argument of those who held that the only way to prevent further inflation is through proper monetary and fiscal policy, and that price-wage control not only fails to strike at the root causes of inflation but impairs the general efficiency of the economy and even of the armament effort.

This contention, shared by most of those who came to the conference from the University of Chicago itself, will not be unfamiliar to the readers of this column. As pointed out at the conference, the country’s bank loans rose from May 31 to the end of 1950 by nearly 20 percent, while demand deposits increased more than 9 percent. It is this increase in money and bank credit that financed the rise of 11 percent in wholesale prices and of 6 percent in living costs.

What was most remarkable about the conference was not the political defense of existing price and wage controls but the number of those who condemned the whole policy not merely in details but in principle.

There was instructive discussion of some technical questions. Herbert Stein, for example, of the Committee for Economic Development, pointed out that even where such direct controls as priorities and allocations might be necessary, price controls would still be both unnecessary and undesirable.

As examples, Stein cited such industries as machine tools and steel. These are already working at capacity; they cannot make some deliveries for many months; and they customarily fill first the orders longest on the books. In place of such a “private rationing system,” Stein advocated government priorities and allocations to permit the quickest military deliveries.

Few persons, I believe, would venture to deny the need for this particular kind of priority in wartime or in a defense emergency. But there are several implications of this kind of control which are usually overlooked by those who are most insistent on it. It is not needed where prices have risen too much, but, as Stein points out, where prices haven’t risen “fast enough and far enough to . . . eliminate an excess of demand.” Price ceilings, so far from reducing the need for such priorities, simply make their need “more widespread and more persistent.” Such priorities are “a means of supplementing the allocating function of price where prices do not rise enough to do the whole job.”

This is the opposite of the doctrine usually voiced. It is recognized by most economists (though not yet, apparently, by our present price fixers) that price ceilings do not make sense without priorities, allocations, and rationing. But the converse is not true. Though price ceilings make allocations necessary, allocations do not make price ceilings necessary. On the contrary, they tend by themselves to hold down prices, by reducing demand. They work much easier without price ceilings than with them. For administrators are not then confronted with the impossible task of trying to solve all three determinants in the supply-demand-price equation simultaneously. In brief, though price ceilings cannot work long without rationing, rationing works better without price ceilings. Rationing helps price ceilings, but price ceilings thwart rationing.

Gold Standard vs. Inflation
April 30, 1951

Congressman Howard Buffett of Nebraska, one of the ablest members of the House Banking and Currency Committee, sent out a questionnaire on inflation and the gold standard to the nation’s bank presidents and bank chairmen. He sent out 16,748 letters in all, and got back 666 replies. These replies came from banks representing more than 20 percent of the nation’s bank deposits and showed a remarkable consensus.

There were four questions in all. No. 1 was: “Do you believe that price and wage fixing will effectively prevent inflation?” Only 7 percent of those answering the question said Yes; 93 percent said No.

Question No. 2 was: “Have you been able to find satisfactory evidence that Congress can resist spending pressures without the historical restraint of a currency redeemable in gold on demand?” Only 7 percent said Yes; 93 percent said No.
Question No. 3 was: “Do you believe expansion of the money supply can be effectively restrained when long-term government bonds are rigged at the 2½ percent level?” Only 9 percent said Yes; 91 percent said No.

Question No. 4 was: “Would you support the Reed bill, HR 324, to promptly reestablish redemption in gold of our currency at $35 an ounce? I was the introducer of this bill in the 80th Congress. (Copy attached.)” Seventy-three percent of those replying said Yes; 9 percent said in effect Yes but not now; 7 percent were undecided, and 10 percent said No.

Individual replies to the Buffett questionnaire were interesting for their comment. But the most interesting and encouraging, to my mind, came from outside the banking field—from Allan B. Kline, president of the American Farm Bureau Federation. He wrote in part:

“Nothing but disaster can result if we allow the delusion that price and wage ceilings can stop inflation to prevent the adoption of policies which actually will control inflation by bringing about (1) strict economy in government expenditures, (2) a pay-as-we-go tax program, (3) effective credit controls, and (4) a sound management of the public debt. . . .

“Fixing prices and wages would unquestionably reduce production. . . .

“In the present situation . . . we must cut non-defense program expenditures throughout the Federal budget. As an indication of our willingness to do this in agriculture, we are recommending that the authorization for a 1952 agricultural conservation program be reduced from the budget recommendation of $285 million to $150 million. . . .

“We aggressively oppose the extension of price and wage controls beyond the present expiration date of June 30, 1951, since these controls are diverting attention from the things which must be done if we are to have an effective program for the control of inflation.”

My own answers to the Buffett questionnaire would include a clear-cut No to questions No. 1 and No. 3. To question No. 2 I would reply that a currency redeemable in gold on demand is a necessary restraint on Congressional spending pressures but not in itself a sufficient one. To question No. 4, I would agree in principle with the purpose of the Reed bill, which is to return to a gold standard, but I would have reservations about the “promptly” and about the rate of $35 an ounce. The gold standard cannot be considered in isolation. We can restore and maintain it only as an integral part of an entire system of economic freedom, unhampered markets, solvency, prudence, and good faith. Finally, the conversion level at which we return to a full gold standard must take account of the tremendous American and foreign inflation and the rise in world prices since 1934.

But what is centrally important is to recognize that a return to reasonable monetary stability, an end to inflation, a resumption of freedom of world trade, an escape from bureaucratic arbitrariness and caprice, will be possible in the long run only with a return to a full gold standard. And it is heartening to find that there are still men in Congress with the vision to see this and the courage to fight for it.

We Have Asked for Inflation
May 7, 1951

The main reason we have inflation in this country today is that, by and large, we have asked for inflation.

It is amusing to hear politicians talk of inflation as if it were a visitation from without, in spite of our will, like a flood, a hurricane, an army of locusts, or the bubonic plague. The truth is that we could stop inflation, if we wanted to, overnight.

Not by price control, of course, which is an irrelevant and completely fraudulent remedy for inflation, favored by some groups precisely because it can never really be successful. The government can halt inflation by the simple process of ceasing to create inflation. All it has to do is to keep the budget balanced (as it is in the current fiscal year) and stop monetizing its existing debt by buying its own bonds through the Federal Reserve Banks. If it did this, interest rates would go up for the simple reason that they were no longer artificially held down. And higher interest rates would discourage the expansion of private credit.

These steps alone might prove to be enough. If they weren’t, then the Federal Reserve authorities could take the initiative in selling government securities, raising discount rates and raising legal reserve ratios. That’s all. The Federal Reserve authorities already have practically all the powers they need; what has been lacking is the will to use them.

Inflation is caused by an increase in the volume of money and bank credit in relation to the volume of goods. Halt this increase, and the fear of any future increase, and you halt inflation.

We hear predictions that if the Federal Reserve authorities used their existing powers to halt inflation all sorts of terrible things would happen. It is true that outstanding government securities, lacking an automatic buyer at an artificial price, would fall. But this problem could easily be taken care of by allowing long-term bonds to be converted into new bonds at a higher
rate of interest. We also hear predictions that commodity prices would stop rising, and might even fall. But the people who complain of this are admitting that they prefer the certainty of more inflation to the risk of even a little deflation.

And this brings us to the heart of the problem. Ever since 1932 the world has been haunted by the specter of deflation. Rather than face up to even a touch of it, people have asked for greater and greater doses of inflation. Since the end of the second world war, whenever there has been even a slight sinking spell in prices, there has been a resumption or speeding up of inflation as the cure.

The farmers have demanded subsidies, support buying, “parity” prices. Industrialists have granted huge wage increases and then demanded inflation in order to pay them. Labor-union officials seem secretly to welcome continuous price advances because then they can demand, and get, a continuous series of wage increases—thus proving to the rank and file how necessary the union officials’ services are. Most of us still retain the delusion that under inflation we can gain more in our role as sellers and producers than we must lose in our role as buyers and consumers.

The pressure on the politicians to continue a policy of inflation is enormous. For the fetish of today is “full employment.” This can be achieved, for a time, by “repressed inflation” because this is the policy we have the President’s message to Congress asking for extension and “strengthening” of the Defense Production Act is a very curious document, replete with passages that cannot be reconciled with each other.

At one point he even declared plainly: “Price and wage controls do not cure the basic cause of inflation—the inflationary gap between the supply of goods and the volume of buying power. The cure can come about only by closing the gap.” In other words, price and wage controls are not only irrelevant, but distract attention from the real cure for inflation.

Yet Mr. Truman nevertheless went on to insist on “stronger” price and wage controls. He even announced that government policy planned to permit or encourage the very “inflationary gap” that causes inflation. In the next two or three years, he said, there will be “more money available for people to spend” at the same time as there will be “much less civilian goods for people to buy.” This can only mean that while Mr. Truman talks bravely about taxing away surplus income, “paying for government expenditures as we go,” and tight credit restrictions, he does not seriously expect to adopt these programs.

There are other inconsistencies no less serious. In one breath he urges “holding the line on food prices.” In the next he praises the “parity principle,” which forces up food prices, as “the basis for our agricultural laws” and “the best guide we now have available to judge what is a fair return to farmers.” And then he seeks to conceal this contradiction by advocating food subsidies—apparently on the theory that if the American people are forced to pay part of the higher food prices as additions to their tax bill instead of to their grocer and butcher bills they will never notice it. The fiasco of England’s food subsidy program seems to hold no lessons for Mr. Truman except a yearning to imitate it.

Again, Mr. Truman continues to apply a double standard to price control and wage control. He asks for “ceilings” on prices and rents; but wages and salaries he merely wants to “stabilize.” He urges everybody to invest again in U.S. savings bonds. “After the war,” he says, “those savings helped many a family.” He neglects to add that as a result of his own and his predecessor’s “inflationary gap” policies, which he proposes in the main to continue, those bonds have a much lower purchasing power than when they were bought. He is trying to get savings through exhortation while ignoring incentives.

If Congress is well advised, it will not give Mr. Truman the kind of Defense Production Act for which he now asks. It will allow the present wage-and price-fixing powers to lapse entirely, on the following grounds: (1) As even the President now concedes, they do not cure the basic cause of inflation. (2) They divert public attention away from the real cure. (3) The price regulations put into effect in January, as the President

Why Price Control Should Expire
May 14, 1951

The President’s message to Congress asking for extension and “strengthening” of the Defense Production Act is a very curious document, replete with passages that cannot be reconciled with each other.
End Price Ceilings—and ‘Parity’
May 21, 1951

At this moment Congress has a rare opportunity. The economic situation and political sentiment at last combine to make it possible to return to free markets—to get rid of both price ceilings and “parity” price supports at a single stroke.

The price-control program is heading into obvious absurdities and inconsistencies. The government is asking for subsidies and “parity” to put farm income and food prices up, and price ceilings to hold them down. It wants to put its foot on the gas and the brake at the same time. The result of that kind of driving, as it ought to have learned, is not to maintain an even rate of speed, but to stall the motor.

The public is becoming disillusioned with price control. So are special groups. Neither workers nor employees can understand wage ceilings that are riddled with exceptions, or escalator clauses for some and not for others. Meat producers and congressmen from cattle-raising states are appalled by the ineptitude of the beef-price “rollback” and predict that it will bring the same sort of beef shortage as in the fall of 1946.

The influential American Farm Bureau Federation is now opposing the continuance of price control in general, and not merely for farm products. This is something different from the tactics of those groups which have put themselves in the untenable position of demanding tight price control for what they have to buy, while vehemently opposing it or demanding loose standards, for what they have to sell.

Of course the OPS warns that without price control living costs may skyrocket. But Congress can prevent this by insisting on a balanced budget and an end to the credit expansion policies of the Treasury and the Federal Reserve System. This is the real remedy for inflation; price control is a fraudulent one.

Labor officials are right in fearing wage control. Farm groups are right in opposing price control. Price ceilings on farm products—whenever those ceilings are below free-market rates—chronically bring black markets or food shortages. In Yugoslavia and India today price ceilings have even brought famines, which are then blamed on “droughts” or “floods” or anything but government policy.

As a condition for granting relief from wage control and price control, Congress and the consumers have a right to demand a quid pro quo. They should remove not only the ceilings but the floors. Congress should not only allow wage control to lapse, but should repeal the Walsh-Healey Act. In addition, it might fix the minimum legal hourly overtime rate at $1.12½ (50 percent above the minimum straight-time rate of 75 cents) and leave higher overtime rates to be determined by collective bargaining.

As applied to agriculture, Congress should end the whole “parity” price formula. That formula constantly raises the food prices paid by city workers. It is a built-in “inflationary pressure.” It tries to freeze forever the price relationships that happened to prevail in a carefully selected five-year period nearly 40 years ago. If that formula is really sound it ought to be applied universally—to steel, aluminum, freight rates, rents, neckties, haircuts—in fact, to the price relationship of every commodity in 1910–14 to every other.

I cannot recall that any member of the farm bloc ever suggested this. In February of this year farm prices averaged 13 percent above even the parity level. This is another way of saying that industrial and other prices averaged 11 percent below the parity level. The farm bloc did not recommend correcting this inequity. “Parity” is a one-way street.

Of course the whole principle of freezing past price relationships is wrong, whether they happen to be the prices of 1910–14 or of June 24, 1950. We freeze the price structure merely at the cost of distorting the structure of production. The very function of free prices and free wages is to balance and synchronize production as among thousands of different commodities and services. Optimum employment and production need two-way
freedom for wages and prices. Controls are no substitute for the graded incentives of the market. ✽

More Powers—or More Curbs?
May 28, 1951

The Administration has asked not merely for a two-year extension of the present Defense Production Act, but for a large increase of control powers. And no doubt many congressmen fear that if they do not grant these additional powers, they will be blamed for any further inflation on the ground that they failed to provide the “weapons” to “combat” it.

Yet if it wishes to frame a really effective law against inflation, Congress cannot permit itself to be intimidated. It should allow the present powers of price and wage control to expire entirely. Price and wage control is a fraudulent weapon against inflation. It merely distorts and reduces production.

Nor should Congress grant most of the additional powers for which the Administration now asks. If there were no price ceilings on food, then obviously there would be no excuse for the food subsidies that the Administration wants. Those subsidies would in any case serve no purpose except to conceal the real rise of food prices in an increased tax bill. Again, if other prices are not held down by government edict, there is less excuse for the differential subsidies, the “power to give special financial aid to high-cost producers,” for which the President has asked. Differential subsidies easily lend themselves to favoritism and abuse. With the example of the RFC before it, Congress should be slow to create more opportunities for influence and free mink coats.

Congress should also hesitate to grant a sweeping renewal of rent control. If it insists on imposing more rent control, it should be in the form of permitting no more than a 10 or 15 percent increase each year until rents have caught up with the average rise in other prices and costs since 1935–39.

Jess Larson, who was head of the War Assets Administration after the second world war, has told Congress to act “very hesitatingly” in granting the government the sweeping powers it asks for to build its own new defense plants. Disposing of government plants after the second world war, he points out, cost nearly $1,000,000,000 “just for overhead,” not counting the loss to the taxpayer on the sales themselves. It would not be too much to require the Administration to get specific Congressional approval for each plant it wanted to build.

All this does not mean that the whole Defense Production Act should simply be allowed to expire. Extension of some powers is needed. Even more, some explicit curbs are needed on existing government powers.

Congress should not merely remove ceilings on prices and wages; it should at the same time remove present legal floors on agricultural prices and discriminatory floors on wages (as represented, say, by the Walsh-Healey Act and the penalty overtime provisions in their present form). Congress should continue to authorize material allocations and priorities. These are more effective, in fact, when not accompanied by price and wage ceilings (see Business Tides, April 23).

Most important of all, Congress in the new law must strike at the real cause of inflation. It should:
1) Declare that the root cause of inflation has been the increase in the supply of money and credit, and that the government-bond-support policy of recent years has been inflationary because it has produced this increase in money and credit. 2) Declare that the Federal Reserve Board is not subordinate to the Treasury, and should not be forced to support government obligations issued by the Treasury at inadequate interest rates. 3) Restore the required legal reserve ratio of the Federal Reserve Banks against deposits and notes to at least 35 percent, and authorize the board to increase this reserve ratio even further. And if it permits the board to increase further the reserve ratios of member banks it should do so only on condition that the board orders at the same time a corresponding increase in the required reserve ratios of the Federal Reserve Banks themselves.

Congress can act to combat inflation only by forcing the Treasury and the Federal Reserve System to live up to the responsibilities they have shirked for the last ten years. ✽

The Future of ‘Fair Trade’
June 4, 1951

The Supreme Court has ruled that retailers are free to ignore “fair trade” agreements, designed to prevent price cutting, if they do not sign them. It is too early to say exactly what the practical result of this decision will be. Some lawyers contend that it in effect nullifies all the “fair trade” laws in 45 states. Others argue that it nullifies only the “non-signer” clause of state fair-trade laws, and even this only as it applies to interstate, not intrastate, commerce. But while manufacturers are
It is often argued that price-maintenance laws, by protecting the small retailer, promote rather than prevent competition. This would no doubt apply to carefully drawn laws designed to curb clearly unfair practices—for example, against selling below actual cost with the deliberate intent of putting small competitors out of business in order to raise prices again later on. But that such practices are really frequent may be seriously doubted. In any case, preserving competition should not be identified merely with preserving inefficient competitors. Retailers exist for consumers, not consumers for retailers.

When we look at the problem from the standpoint of the interest of the consumer, we recognize that there is no merit in any law which tries to hold up prices arbitrarily merely to "help the small retailer." Higher prices reduce consumption. Less consumption means less production, less employment, and lower living standards. ✹

Foreign Giveaway Grows
June 11, 1951

The Administration's foreign giveaway program has grown by feeding on itself. The State Department wants to meet new foreign problems chiefly by handing out money because it has met past foreign problems chiefly by handing out money. It keeps changing the reasons for handouts but never the practice.

It now wants to spend $8,500,000,000 in the next fiscal year for foreign aid. Of this sum, $6,250,000,000 would be for "military" and $2,250,000,000 for "economic" assistance. Just why we must give away additional billions for "economic" aid is not clear. Even Mr. Truman admits: "The original goals of the Marshall Plan have been largely achieved." Why, then, start setting up new goals? Italy's index of industrial production is running about 30 percent above the prewar figure; the United Kingdom's, 50 percent above; France's, 40 percent above. Even if we grant the debatable proposition that it was the American taxpayer's duty to restore Europe's production to the prewar level, on what theory is it his duty to continue pouring in gift money now that European industrial production is well above the prewar level?

Similar questions may be raised about "military" aid. The North Atlantic Treaty, however desirable or even essential, was in itself an unprecedented and tremendous commitment. It is far from clear why we must take on the additional task of paying for part of the armament of practically all our Allies. This is an apparently still free to refuse to sell their products to a retailer who will not sign a fair-trade contract, many of them doubt the practicability of attempting to get a contract from every dealer.

The non-signer clause, in existing state fair-trade laws, provides that when a manufacturer has obtained the signature of even one retailer to a minimum-price agreement, all other retailers in the state are bound by it. According to the new Supreme Court decision, the Federal Tydings-Miller Act, which was previously thought to uphold the state fair-trade laws in full, simply permits an individual retailer and a distributor to fix a minimum retail price that would otherwise be illegal. "When they seek, however," continues the six-man majority of the court, "to impose price fixing on persons who have not contracted or agreed to the scheme, the situation is vastly different. That is not price fixing by contract or agreement; that is price fixing by compulsion. . . . Contracts or agreements [the phrase used in the law] convey the idea of a cooperative arrangement, not a program whereby recalcitrants are dragged in by the heels and compelled to submit to price fixing."

Whether or not this is a correct interpretation of the words of the Tydings-Miller Act or of Congressional intent, it is sound legal and economic principle. The chief valid argument in favor of price-maintenance laws is that government should permit freedom of contract and uphold voluntary agreements. But this argument cannot be applied in cases where no real contract or voluntary agreement exists.

Most of the other arguments in favor of price-maintenance laws are dubious. No doubt they make some things easier for the salesman for the manufacturer. The small retailer's markup on the product is practically guaranteed; his larger or more efficient retail competitors, he is assured, cannot cut prices on him. But this also works the other way. The larger retailer may place a smaller order than otherwise because he cannot offer his customers any special price advantage. And the retailer who is overstocked or needs cash can't cut his price to whatever level he thinks will move the goods.

The manufacturer's real protection for his brand name lies in maintaining the quality of his product rather than in maintaining a uniform retail price for it. He is more likely to gain and keep consumer good will by trying to prevent retailers from selling his product at more than a "fair" markup than at less than one. And if the average price of his product is lowered by individual price cutters, he is likely to sell more of it rather than less.
economic, not a military decision. It is for the military experts to say that a given Western European country needs so many tanks or planes. But it does not follow that we should turn all of them over as gifts. If a country buys them, it sends us other goods, military or civilian, in exchange—and so gives reality to the “mutual” part of “mutual aid.”

To give arms to Europe is to assume that Europe cannot afford to pay for these arms out of its own resources. This, to repeat, is a purely economic, not a military assumption; and there is no evidence to show that it is justified. Western Europe in 1951 is planning to spend only about 8 percent of its gross national product for armament compared with an American expenditure of about 15 percent. There is nothing to show that the sums we are giving to Europe for armament are not purely arbitrary in amount—or even that they are necessary at all.

The division, moreover, between “military” aid and “economic” aid is also in practice purely artificial. To give European governments $1,650,000,000 in “economic” aid is to relieve them of that burden. They can then spend that much more money on increased armaments without adding to the total they would otherwise have had to lay out. If, on the other hand, we give them $5,240,000,000 for “military” aid, then, unless their total rearmament budget is at least $5,240,000,000 more than it would otherwise have been, we have simply released all or part of their own funds for other kinds of expenditures. The only way we can be sure of protecting our gift funds against such a diversion is to dictate every item in the European budgets—which no one would seriously recommend.

What our foreign aid does, in effect (whether it is labeled “military” or “economic”) is to put heavier burdens on American taxpayers in order to relieve European taxpayers. And as every American is not richer than every European, “foreign aid” puts heavier burdens on many poorer U.S. taxpayers so that lighter burdens may be put on richer European taxpayers.

The politics of our foreign-aid program are as mystifying as the economics. Mr. Truman begins by telling us that the purpose of our handouts is to help “the free nations.” Now we find that these include the Communist dictatorship in Yugoslavia and the Fascist dictatorship in the Argentine. Most fantastic of all, Mr. Truman proposes to reward the Persians for seizing vital oil from the Atlantic Treaty nations by giving Iran still more money. If the present situation in Iran is not enough to puncture the iridescent bubble of the Point Four dream, is anything at all capable of waking the White House to realities?

Price Controllers in a Panic
June 18, 1951

As the June 30 deadline approaches, when the present price-and-wage control law is due to expire, the statements of the price controllers take on a note of desperation. Mr. Truman professes to fear “an unmanageable torrent of inflation”—which could, in fact, only be caused by his own fiscal and monetary policies. Eric Johnston, Economic Stabilization Administrator, declares that those who oppose the continuance of price and wage controls are led by special interests whose whole attitude is “damn the consumer, and full pockets ahead.” They are “grinding their own ax without thought for the welfare of anyone or anything else . . . at a time when men are dying in battle in Korea for a free way of life.”

It is sad to find Eric Johnston impugning the intelligence, motives, and patriotism of those who disagree with him. Nor does it seem wise for the advocates of price control, in their own interest, to put the argument on an ad hominem basis. Their own sincerity and disinterestedness are not altogether above question.

How seriously, for example, can we take Bill Green, president of the AFL, when he pleads for wage controls instead of free collective bargaining? “If price controls were scuttled,” he says, “wage stabilization would have to go and there would be no limit to the amount of wage increases unions could obtain from employers.” It is surely suspicious to find Bill Green worrying about how high wages might soar unless the government held them down with a firm hand. Some of us suspect that “wage inflation” would not be a very serious problem if the government itself refrained from inflating money and credit and stopped creating boards and “stabilization” formulas that force wage increases on employers.

It is not for nothing that the Wage Stabilization Board is beginning to be called the Wage Stimulation Board. It began by issuing a so-called “catchup” formula under which wages were “allowed” to go 10 percent over the Jan. 15, 1950, level. But what a government board once “allows”, it is taken to approve, sanction, and practically to direct. Then on April 25 Economic Stabilization Director Johnston approved a 6-cent-an-hour cost-of-living increase for nonoperating railway workers. This was 3½ cents above the 10 percent limit. On May 18 the WSB itself allowed a 9-cent-an-hour increase for packinghouse workers, which punched such a gaping hole in the ceiling that even the Board said: “We are fully aware that this decision looks in the direction of a new policy.”
Meanwhile the Board approved cost-of-living escalator contracts signed before Jan. 26, 1951. It has now unanimously approved automatic so-called “productivity increase” pay boosts in contracts signed before the same date. What sort of ceiling is it that is full of holes at the beginning and moves upward with every new major decision? And how long does the Board seriously think that it can use an arbitrary date to approve increases for some workers and withhold them from others? Already Eric Johnston wants to give wage increases to everybody to compensate for the rise in living costs since Jan. 15, 1950. Many labor leaders are willing to “accept” this fake wage control for their own groups in the hope of imposing real price control on others.

As for farm groups, they hardly know where they stand at the moment. A government that has already lost $276,000,000 (through the Commodity Credit Corp.) so far in this fiscal year, in its efforts to hold some farm prices up, is trying to roll meat prices down. It seems on the verge of duplicating the consequences of meat price control in 1946. On June 6, as a typical example, one of the “Big Four” packers slaughtered only one-tenth of its normal quantity of cattle at its Chicago plant because the cattle raisers and feeders would not offer any more at the government ceiling prices.

Even if price and wage control were put in the hands of economic geniuses and political saints it could not be made to work. It creates and intensifies shortages. But when it is cynically used as a political football, it becomes altogether intolerable.

An Anti-Inflation Program
June 25, 1951

Regardless of what Congress actually does before June 30, it is instructive to consider what a sensible anti-inflationary legislative program would be like if we could get it.

1.—What is primarily needed is not more controls by the government but more controls on the government. It is government policy, and government policy alone, that creates hyperinflation. Inflation means an increase in the volume of money compared with the volume of goods. It is government policy that either permits, encourages, or directly produces such an increase.

2.—The enormous increase in the volume of money and credit since 1939 has been directly caused by the policy of cheap money and government bond support followed by the Federal Reserve System. That policy should be definitely stopped by Congressional direction. And whether or not powers are given to the Federal Reserve to increase still further the required reserves of member banks, Congress should restore, at least to their pre-1945 level, the required reserves of the Federal Reserve Banks themselves. It is absurd to control the low-powered credit of installment buying and the medium-powered credit of member bank loans, while failing to put even normal restraints on the high-powered credit created by the Federal Reserve Banks.

3.—Congress should insist that the Administration keep the Federal budget balanced. Budget deficits cause inflation by forcing an increase in the volume of money and credit. The budget should be kept balanced mainly, of course, by drastic slashes in unjustified expenditures rather than by still more burdensome taxation.

4.—Price control should be dropped. It is a fake remedy for inflation. It creates and intensifies shortages. It prolongs inflation by diverting public attention from the real cure, which is simply for the government to stop printing more money. It leads to ever-widening government controls, which tend to stay long after the “emergency” which was the original excuse for them has passed. The controlled economies of Europe, and the permanence of rent control almost everywhere, are typical examples. The price controllers neither understand nor trust the workings of a free market.

5.—The Administration’s priority and allocation powers, though they have so far been handled rather ineptly, should be continued. The controllers usually try to tie in price control with allocation powers. But while price control creates a need for rationing and allocation, the causation does not work the other way. Allocations work best without price control.

6.—No good case has been made out for any of the additional powers asked for by the Administration. The proposed food subsidies, for example, would be merely a way of concealing real inflationary increases in costs by adding them to your tax bill instead of to your butcher or grocer bill. The only way the British Labour Government could keep the cost of meat subsidies from going up was to forbid British consumers to eat more than two mouthfuls meat per week. Where there is no price control, there is no excuse for a food subsidy.

7.—There is no convincing case, either, for giving the government the blanket discretionary powers it has asked for to build its own “defense” plants. It has not proved that it cannot get private industry to build and operate such plants, and at a far lower cost than the government could. If there should turn out to be a real need for a few plants that private industry would not in fact build, the Administration could go to Congress for specific authorization to build each of those plants. If any project were alleged to be top secret, it could appear
in a Congressional bill as project X4Y, but at least a few key members of the Military Affairs Committees should know what it is.

8—In the light of sad experience, any extension of controls should carry a double termination trigger. In no case should extension run for more than a year. In addition, the new law should be terminable at any time by a majority vote of either House of Congress. Congress should never make itself impotent to repeal emergency powers that are being abused or that have ceased to be needed.

‘They Told Us Then . . .’
July 2, 1951

Mr. Truman’s radio appeal of June 14 exposed more than ever the logical and factual weaknesses of the Administration’s case for price control.

“These people who say we should throw out price controls and rent controls,” the President said, “are all wrong. They are just as wrong now as they were back in 1946. They told us then that if we would just put an end to price controls, everything would be rosy and prices would stay right in line.”

Though prominent labor leaders and farm groups have been opposing the continuance of price-and-wage controls, Mr. Truman picked the National Association of Manufacturers to symbolize the whole opposition. “The NAM,” he said, “put full-page advertisements in the papers all over the country [in 1946] saying if we would just take off price controls, there would be plenty of things to buy at reasonable prices.”

The NAM did make the mistake of implying that if price controls were removed, the competition and increased production resulting would in themselves bring down prices. But what Mr. Truman has forgotten is that this mistake was not confined to the NAM. It was President Truman himself who, on Feb. 14, 1946, declared: “Production is our salvation. . . . Production will do away with the necessity for government controls.” And Chester Bowles, his price administrator, said four days later: “Production is the only answer to inflation.”

I recall these statements because I quoted and took issue with them in an article in The New York Times of Feb. 25, 1946. I pointed out then that such statements represented “at most only a half-truth. . . . For prices are determined not only from the side of supply, but from the side of demand. Demand is now far greater than it was before the war because money incomes are far greater. And money incomes are greater principally because the supply of money and bank credit has been almost tripled since the outbreak of the war. . . . The solution to the problem of high prices, in brief, is not production alone. It is the production of more goods combined with the cessation of production of more money and bank credit.”

Returning to the subject in The Times of May 6, 1946, I wrote: “Unless there is a radical change in our monetary and credit policy, the upward pressure on prices today seems likely to continue for at least several years. . . . The cure for the present inflation is a change in Federal fiscal and money policy, not constant renewals of price control.”

Prices in fact continued to go up, not because price control was taken off, but because the Administration continued to increase the supply of money and credit. At the end of April of this year, the total of demand and time bank deposits and currency outside of banks was $15,000,000,000 more than at the end of June 1946.

Mr. Truman, in his recent radio address, of course utterly ignored the fact that the upward pressure on prices today comes from his own Administration’s monetary and fiscal policies. And he went on to imply that those who, like himself, favored the price control, were inspired only by the loftiest patriotism, while those who opposed price control were merely “lobbyists,” who “placed private interests above the national interest.”

“After the representatives of the Administration testified in favor of a good, strong law,” he explained, “the Congressional committees heard from 124 witnesses, representing all sorts of private organizations. And do you know how many of them came out for the bill? Twenty, just twenty.” Instead of concluding that this might indicate some possible weaknesses in the bill, or some real dangers to producers and production, Mr. Truman implied that the 104 opposing witnesses were all placing their “private interests above the national interest.”

Mr. Truman’s strange idea is that the only way to be a real friend of the consumer is to make things tough for the producer. But it is a little hard to see just how the consumer gains by measures that discourage production.

The Cause of Currency Chaos
July 9, 1951

The International Monetary Fund was born in July 1944. One of its declared purposes was “to assist in the establishment of a multilateral system of payments
in respect of current transactions between members and in the elimination of foreign-exchange restrictions.” A few weeks ago it issued its second annual report on exchange restrictions. The report concluded that “despite the existing uncertainties and difficulties . . . many countries are in a position to undertake substantial removal of discrimination and relaxation of nondiscriminatory restrictions and to make significant progress toward convertibility.”

On the surface this conclusion sounds promising. Yet the full text of the report leaves one with no good reason to believe that progress toward monetary stability and removal of restrictions will be any greater in the next seven years than it has been in the last seven.

For the report is riddled with qualifications, loopholes, and exceptions. For example: “It is the view of the Fund that, if countries have favorable balance of payments conditions and are experiencing increases in their reserves providing a reasonable basis of exchange stability it is in their interest, and in that of the international community, to relax or remove restrictions unless such action would produce conditions justifying the intensification or reintroduction of those restrictions.”

More examples: “In certain cases, strategic considerations may well require the retention of control machinery, even if it is not required for financial reasons.” “The Fund recognizes that there are a number of countries still experiencing basic or structural balance of payments difficulties limiting their ability at this time to make progress toward the removal of restrictions.” “It must be recognized, however, that some countries pursuing substantial development plans may not be in a sufficiently strong balance of payments position to permit them to dispense with the selective application of controls.”

The sad truth is that the schizophrenia of the Fund—which makes it simultaneously both for and against exchange restrictions—was built into its very conception. In accordance with the theories of the late Lord Keynes, the Fund was established on the assumption that governments can print paper money and fix the value of their monetary unit by simple fiat; and that this rate both can and should be maintained by police coercion. Section 3 of the Articles of Agreement even provides that a member government must not permit exchange transactions to take place within its territory at rates which are different from the parity level.

Other Keynesian theories embodied in the Fund Agreement are that the maintenance of a nation’s monetary unit at parity by convertibility into gold on demand is an outworn, needless, or at best a permissible window-dressing requirement; and that the bureaucrats have the right to alter the exchange value of their nation’s monetary unit overnight—thus cheating both domestic and foreign holders of its currency at any time this seems to serve their government’s advantage.

Is it any wonder that the end product of these ideas has been increasing currency chaos, an endless series of inflations, a bewildering network of exchange controls which put domestic economies in a straitjacket and disrupt or strangle international trade? The managers of the Fund urge constantly and rightly that all currencies be made freely convertible. But they also want to retain exchange control. Now exchange control and free convertibility are irreconcilable. The way to get free convertibility of currencies is simply to stop prohibiting it—to stop price-fixing in currencies, to stop policing the rates, to stop seizing, licensing, and rationing exchange. But the Fund grants the central principle of exchange control and then deplores all the corollaries.

If we want not merely convertible but stable exchange rates—. Well, some day, somewhere, somebody, even in an official position, may triumphantly rediscover the gold standard. ✪

Price Fixing as Red Herring
July 16, 1951

The present outlook is for continued inflation and a bad “control” law, but not for the reasons assumed by Administration propaganda. The new law threatens to be bad not because it will give the Administration too few “weapons” to “fight inflation,” but because it will give it political weapons it ought not to have at all. And the Administration will still be free to follow inflationary policies.

Says Michael V. DiSalle, head of the Office of Price Stabilization, in fighting the ban against rollbacks: “If all you can do is grant increases, then necessarily your price level will be continuously higher.” If this is not a non sequitur, it must be because it implies: (1) that the Administration will continue to print more money to force prices up further; (2) that the OPS must grant requested increases; and (3) that the intention of the OPS was to grant wage and price increases to favored groups and then hold the index numbers level by forcing price reductions on unfavored groups.

Never before has price control been treated quite so openly and shamelessly in this country as a device for handing out political favors to some groups and penalizing others. A year ago Bernard Baruch recommended
“an overall ceiling across the entire economy,” which would roll back all prices and wages to their level of June 25, 1950. This was economically unsound, but sincere and politically impartial. Among its implications were that everyone should be locked at precisely the income he was already receiving, and that relative profit incentives and deterrents should have been kept just where they were for “peace” production on the day before Korean hostilities broke out.

Hardly anyone seriously advocates this today. Now everyone talks of “correcting inequities.” But how do you determine precisely what constitutes an economic inequity? And how precisely do you measure the extent of the inequity? No one is seriously and openly proposing to legislate an absolute equality of incomes. No one, in fact, has even suggested consistent and coherent economic standards for measuring “inequities.” The standards applied in practice are not economic but political. Where the votes are, there the favors go.

Thus the so-called Wage Stabilization Board raises wages with practically every major decision. Eric Johnston, the Economic Stabilization Administrator, insists that “good reasons” have been shown for every exception that has been made in the so-called wage ceiling. The most favored class next to the wage earners are the farmers, but their political strength is spotty. Congressmen from the city districts want to hold down farm and food prices by edict; congressmen from the rural districts want to boost farm and food prices by “parity” formulas, support prices, and other edicts. Those who are least likely to get price-increase awards in Washington are the landlords and the manufacturing corporations.

What chiefly stands in the way of any serious effort to prevent further inflation is sheer economic illiteracy. It is this that has made it possible for the politicians to blame inflation on “the selfish private interests,” the “greedy sellers,” the “profiteers”—in short, on the producers of the country. The naive faith in price fixing rests on a complete lack of understanding of the function of free markets and the function of relative prices, costs, profits and losses in directing, balancing, synchronizing, and maximizing production. Punitive price fixing pretends to benefit consumers by killing the incentives to production. It pretends to benefit workers by undermining the sources of their employment.

Meanwhile, in the whole hullabaloo about an “anti-inflation” law, no attention whatever is being paid either by the price fixers or by Congress to the real cause of inflation, which is the government-created increase in the quantity of money and credit. Instead of putting curbs on the money factory—i.e., on the Federal Reserve System—Congress is having its attention diverted to a fraudulent cure for inflation, price fixing.

Government: Plan Thyself
July 23, 1951

In its budget estimates for the fiscal year 1951 the Administration made a series of bad guesses. The President originally figured that the government would spend $42,400,000,000, take in $37,300,000,000, and end up with a deficit of $5,100,000,000.

This estimate was made in January 1950. Had Mr. Truman foreseen the outbreak of war in Korea that June, his deficit guess would probably have been even larger. Last January, after six months of actual fighting and mobilization, he turned in a revised estimate reducing the expected Federal deficit to $2,700,000,000. Less than three months later this was changed to an expected surplus of $2,900,000,000. When the fiscal year had actually closed on June 30 last, actual government expenditures had come to $44,700,000,000, receipts to $48,000,000,000, and the surplus to $3,300,000,000. So in spite of an unexpected year of war, an estimated deficit of $5,100,000,000 became an actual surplus of $3,300,000,000. This was an error of $8,400,000,000—an amount greater than the total average annual expenditures for all purposes in the Roosevelt Administrations prior to the second world war. This huge error merely comes on top of a record of chronic bad guesses. The table below compares, for each year since 1934, the President’s estimates (in millions of dollars) of expenditures, receipts, and deficits for the following fiscal year with the realities of that year.

Even if we disregard the five war years, 1942 to 1946 inclusive, and the wartime year 1951, we find that in the remaining eleven peacetime years there was an average error of 20 percent in estimating expenditures, an average error of 13 percent in estimating revenues, and appalling errors and reversals in estimating surpluses and deficits. In short, a government that presumes to plan and forecast for everybody, cannot even estimate with reasonable accuracy what its own expenditures, revenues, and surplus or deficit are going to be. It cannot predict even its own action, and makes errors of a dimension that would bankrupt a private business in no time.
### Iran vs. Point Four

**July 30, 1951**

In 1901, the Iranian Government granted, on terms and for a consideration that must have been satisfactory at the time, a concession to what is now the Anglo-Iranian Oil Co. In 1933, Iran granted the company another 60-year concession under which the government got a greatly increased share of profits. A few months ago the Iranian Government repudiated its contract and seized the properties of the company, including its huge installations. The company’s value is estimated at $600,000,000 to $1,000,000,000.

In the wicked nineteenth century the British Government would probably have sent warships and troops immediately to Iran to protect the lives and property of British citizens. Such action is now universally condemned as “imperialism.” So the British, after delays and vacillation, submitted the dispute to the International Court of Justice at The Hague. When the British got a verdict substantially in their favor, however, the Iranians denounced the court and rejected its decision.
What happens now? How does the International Court enforce a decision when a country spurns it? Through the United Nations? Is it likely that the U.N. would order international troops to protect British property? Would any nation besides Britain actually send troops for that purpose? And would not the fatal delays involved in the whole process in fact decide the issue against Britain?

So far as we can see at the moment, the actual result of present procedure is that Britain and the Atlantic Pact nations have lost a vital source of war—strategic oil. Worse, the probabilities seem high that, in one way or another, Iran's oil will now fall under the control of the Kremlin before a year has passed. Stalin will have won another great bloodless victory—bloodless, at least, for the Russians.

The course of our own government in this affair has been peculiar. After the irresponsible Mossadegh had rejected the Hague Court's decision, President Truman sent him an astonishing message. In it he wrote: "You know of our sympathetic interest in this country in Iran's desire to control its natural resources. From this point of view we were happy to see the British Government has on its part accepted the principle of nationalization."

This seems to support the Iranian contention that a government is entitled to sell a concession, invite foreign capital in, then repudiate its contract and seize the capital. It clearly supports the "principle of nationalization"—i.e., the principle of government seizure, ownership, and management, the principle of socialism. And through the Export-Import Bank Mr. Truman has offered the Iranian Government $25,000,000 to reward its expropriation and to finance its socialistic planning.

In the old days before the Export-Import Bank, ECA, and Point Four, the governments of economically "underdeveloped" countries, like Iran, before joyfully seizing the foreign investments already made there, would have had to reckon with the consequence of an immediate halt to any further significant investment from abroad. But today they can get American Government funds by a simple form of political blackmail. They need merely threaten to seize Western investments, or to bring about a famine by bad policies, or to go Communist, or not to like us.

As long as they have such easy ways of getting money, such governments need not and will not bother to set their economic house in order. They need not fear the usual consequences of breach of faith. Point Four is based on the assumption that what the "backward areas" chiefly need is technical advice. What they really need is internal political stability, order, and good faith, and the adoption of policies calculated to attract the confidence rather than distrust of domestic as well as foreign private capital. That is why our government foreign give-away and lend-loose programs do not in fact tend to increase world production. On net balance they retard world production and the rise of living standards.

**The Dangers of Profit Control**

*August 6, 1951*

Nothing in recent years has more clearly signaled the imminent danger to our whole system of private competitive enterprise than a few passages in the President's Midyear Economic Report to Congress.

Mr. Truman assumed the tone of a high authority on economics lecturing to a Congress that would be irresponsible and unpatriotic if it did not adopt without criticism, change, or delay all of the "sound and strong" legislation that he himself is recommending. Yet on Nov. 9, 1946, it was Mr. Truman (as the Mansfield, Ohio, News-Journal reminds us) who said: "The law of supply and demand, operating in the market place will, from now on, serve the people better than would continued regulation of prices by the government. . . . Accordingly I have directed immediate abandonment of all controls over wages, salaries, and prices."

Whereas on June 14 of this year he declared: "These people who say we should throw out price controls and rent controls are wrong. They are just as wrong now as they were back in 1946."

What is most serious in Mr. Truman's economic report, however, is his proposal for government control of all business profits through discretionary price control. "As a general rule," he declared, "price increases should not be approved, even where some costs have risen, if the industry is earning a fair and equitable level of profits." He added: "Some rollbacks will be needed in selected cases, for example, where prices or profits are excessively high."

What is most serious in Mr. Truman's economic report, however, is his proposal for government control of all business profits through discretionary price control. "As a general rule," he declared, "price increases should not be approved, even where some costs have risen, if the industry is earning a fair and equitable level of profits." He added: "Some rollbacks will be needed in selected cases, for example, where prices or profits are excessively high."

Though he himself once failed to make a success of a haberdashery business, Mr. Truman now seems to have taken over the naive assumption of many labor leaders and bureaucrats that profits are something that occur automatically, and that the chief task of government is to prevent them from becoming "excessive." This ignores the whole way in which a free market and a competitive system work. Profits are never automatic,
never guaranteed, and never uniform. The rate of profit is different for every firm, even within the same industry. In 1947, the latest year for which statistics are available, 169,000 active corporations reported a loss compared with 382,000 that showed a profit.

And the margin of profit does not depend merely on luck. It depends on whether an enterpriser is making a product that consumers really want, and on whether he is making a better or worse product, or making it more efficiently or less, than his competitors. Present and prospective relative profits (and losses) are, in fact, the great guides to production. They determine what commodities and services are produced, exactly how much of each of these thousands of different commodities and services is produced, and how it is produced. The differences between profit margins are both the measure of, and the constant spur to, economy and efficiency. To impose on all firms some bureaucrat’s idea of a uniform “fair” profit would be to destroy the whole complex and delicate mechanism of incentives and deterrents which determines the ever-changing balance of production in a private competition system. It would force the substitution of a totalitarian system as crude and clumsy as it would be intolerable.

The President still does not realize that the real cause of inflation is the increase in money and credit brought about by his own policies. He even rebukes the Federal Reserve System for its timid efforts to halt this increase. “General credit measures,” he says, “do not discriminate between activities which should be supported, and those which need to be restrained.”

The implication of this is that Mr. Truman’s political appointees, and not the consumers of the country, should have the right to say what production is good and what is bad, what should be subsidized at the taxpayer’s expense, and what should be forbidden. This would be still another way, even more direct than profit control, to give the government life-or-death powers over every firm and business. It would be a long step down the road to economic serfdom.

Why the New Controls Act Is Bad
August 13, 1951

After his outburst at Detroit, denouncing all criticisms of his policies as “smears,” “slander,” and “lies” from “doubters and defeatists,” neither the tone nor content of Mr. Truman’s statement on signing the new economic controls legislation came as any surprise. It was a purely political document designed to throw the entire blame for any further inflation onto the Republicans in Congress. Take, for example, his comment on the Capehart amendment. “This complicated amendment will force price ceilings up on thousands of commodities, clear across the board. It is like a bulldozer, crashing aimlessly through existing pricing formulas, leaving havoc in its wake.” This violent simile was apparently considered a complete substitute for bothering to tell the American people what the Capehart amendment actually provides. It is simply intended to prevent the OPS from fixing price ceilings that would deprive retailers and wholesalers of at least their “customary percentage margin of profit” in the month before the Korean war.

If we accept the premises of price control, it might be argued that this amendment is “inflationary” in the sense that it permits a customary percentage mark-up rather than merely a customary dollars-and-cents mark-up. But this argument is not consistently open to those who, like the President, have supported the cost-of-living escalator clauses in wage contracts.

The new Defense Production Act is really a very bad law, as Mr. Truman insists. But it is bad, in the main, for precisely the opposite reasons from the ones he gives. It is bad not because it has failed to impose price and wage controls that are sufficiently “strong” or “tough,” but because it continues the flagrant fraud of price and wage control. It cannot be repeated too often that price control is not a cure for inflation. It regimes the economy and ties it in red tape. It inevitably has consequences which provoke demands for more and more controls and lead toward economic totalitarianism. It actually prolongs and intensifies inflation because it unbalances production and causes shortages—and above all because it diverts public attention away from the only real cause of inflation, which is the increase of money and credit.

In the whole course of the debate on the new law the only genuine anti-inflation amendment that got a vote was that offered by Rep. Jesse P. Walcott of Michigan. This declared: It is the further intention of the Congress that none of the powers contained in this act . . . with respect to the stabilization of prices and wages, shall be used unless other indirect means of effectuating such controls and stabilization presently provided in other acts for use by the Secretary of Treasury and the Federal Reserve Board have been utilized . . .” This merely expressed the intention of Congress that in addition to using the fraudulent “anti-inflation” measure of price control, government agencies should also use the genuine anti-inflation measures involved in raising
The board showed not the slightest awareness of the disastrous consequences of parallel decisions in Austria and Germany in the ’20s. “Those who have forgotten the past,” as Santayana has reminded us, “are condemned to repeat it.”

Anyone interested in the facts can find them in a book by the Italian economist Costantino Bresciani-Turroni, published in Italy in 1931 and in an English edition, under the title *The Economics of Inflation*, in 1937 (London: Allen and Unwin). “It was observed in Austria as well as in Germany,” writes Bresciani-Turroni, “that the inflation proceeded with quickened pace especially after the workers had obtained money wages which varied with the index number of the cost of living.” This is an understatement. The system of fixing wages on a cost-of-living index became general in the summer of 1923. The cost-of-living index number in Germany rose from 3,816 in May of 1923 to 7,650 in June, 37,651 in July, 586,045 in August, 15,000,000 in September. . .

This consequence was not merely coincidental. As I wrote (*Newsweek*, June 7, 1948) when the General Motors wage settlement was first announced which established the “cost-of-living adjustment” as a precedent here: “We must remember that the consumers’ price index represents an average of many different prices. If companies whose products have risen in price much less than the average were nonetheless compelled to pay wage increases equal to the average, they would either be forced out of business or forced to raise prices. If the price index were thus forced up, this would of course in turn require still further upward cost-of-living wage adjustments.”

George W. Taylor, chairman of the Wage Stabilization Board, has tried to defend the new decision by saying: “If prices are stabilized there will be very little movement in wage rates under our cost-of-living resolution.” This has surface plausibility, but it is not true. If each particular wage is allowed to catch up with the existing average percentage rise in wages or in prices generally, then the average wage itself must go up.

This points to the fallacy in all the so-called “catch-up” wage formulas. They force an increase in production costs of goods that have hitherto not had the average price rise; hence they lead to demands for price relief. They force firms to borrow more money at the banks to meet increased payrolls. This increases the money-and-credit supply. Increased money in the hands of workers bids for a reduced volume of civilian goods. The increases thus forced in the price of goods become in turn the cause under the escalator provision for still further increases in wages—and so *ad infinitum*.

The attempt is already being made to argue that this universalized escalator clause was made necessary in wages to compensate for the action of Congress in allowing price increases to meet increased costs under the Capehart amendment. This defense puts Capehart before the horse. Congress passed the amendment because it was convinced that wages were not going to be stabilized anyway. It felt that increased wage costs must therefore be permitted to come through in prices. Continuance of existing wage escalator clauses had already been sanctioned by Eric Johnston months before the Defense Production Act came up for renewal. Every realist recognized that this discrimination as between different labor groups could not and would not be long maintained.

But Congress made the wrong response. Instead of insisting on catch-up price-fixing to match catch-up wage-boosting, Congress should have allowed price- and wage-fixing powers to expire altogether, and concentrated on the only real cure of inflation, which was discount rates, tightening bank reserves, and in ceasing to monetize the government debt.
to pass laws designed to halt the further increase in money and credit. ✳

**Congress’s Monetary Duty**

August 27, 1951

The renewed Defense Production Act, with its emphasis on price control, is a fraudulent remedy for inflation. The only genuine anti-inflation proposal that even got to a vote in connection with it was the amendment offered by Rep. Jesse P. Wolcott. This amendment—which would have put pressure on the Treasury and Federal Reserve Board to start using the real anti-inflationary powers that they have long possessed—was defeated by virtually a straight party vote. In the Senate the matter was never even brought up. As a result we now have on the books a so-called anti-inflation measure unmarrered by a single clause calculated to halt inflation.

There is only one way to stop inflation. That is to stop the further increase in the supply of money and credit. Congress has not only the right to regulate money and credit, but the clear constitutional duty to do so. One of the enumerated powers of Congress (not of the President) is “to coin money” and “regulate the value thereof.”

Now the value of our present money is not stable—precisely because Congress has neglected its clear duty. It has delegated excessive discretionary powers to the executive and to his appointed officials, and it has done this at the request of these officials.

The original Federal Reserve Act provided that the Federal Reserve Banks must hold a reserve in gold and lawful money of 35 percent against deposits and 40 percent against notes. On June 12, 1945, under the plea of the Federal Reserve authorities that further inflation might be necessary, Congress reduced the required legal reserves of the Federal Reserve Banks to only 25 percent against deposit and note liabilities combined. Germany had already surrendered a month before. Hostilities against Japan ended less than three months later. Yet the Federal Reserve authorities have never requested that the former Federal Reserve ratios be restored, and Congress has never restored them. The duty of Congress is plain. It must restore the required legal reserves of the Federal Reserve Banks to their former level. It must do this whether or not the Federal Reserve authorities request it or even if they actively combat it; for there is almost no case on record in which a Federal agency has asked for limitations on its own powers or discretion. In fact, because of the Administration’s present irresponsible course, it is desirable that Congress:

1—Restore the minimum legal reserve ratio of the Federal Reserve Banks from the present 25 percent to at least 35 percent against combined deposit and note liabilities.

2—Authorize the Federal Reserve Board to raise the legal reserve requirement to 40 percent—and even (as an emergency measure) as high as the actual reserve ratio existing at the time of the Board order. Such a power would make the Federal Reserve Board itself clearly responsible for any further failure to halt inflation. And it would provide a conclusive answer to those who have been opposing a restoration of the former Federal Reserve Bank legal reserve requirements on the incredibly confused ground that even this restoration would still allow further inflation. Of course it would; but it would allow far less further inflation than the present legal requirement. And if Congress in addition empowered the Board to raise the legal reserve ratio of the Federal Reserve Banks as high as their actual reserve ratio at the time of the order, then the responsibility for further inflation would be clearly upon the Board.

3—Authorize the Reserve authorities to raise the legal reserve requirements of member banks as high as their already existing reserve ratios. But only if (a) reserve requirements of the Federal Reserve Banks have already been raised to at least 40 percent and (b) if Reserve Bank required ratios have also been frozen where they are. In short, the Federal Reserve authorities should no longer be permitted to exempt their own goose while they tie up the other fellow’s gander. Especially as new Federal Reserve credit is the reserve basis for new member-bank credit, and hence many times as inflationary. ✳

**Inflation for Beginners—I**

September 3, 1951

No subject is so much discussed today—or so little understood—as inflation. The politicians in Washington talk of it as if it were some horrible visitation from without, over which they had no control—like a flood, a foreign invasion, or a plague. It is something they are always promising to “fight”—if Congress or the people will only give them the “weapons” or “a strong law” to do the job.

Yet the plain truth is that our political leaders have brought on inflation by their own money and fiscal
policies. They are promising to fight with their right hand the conditions they have brought on with their left.

Inflation, always and everywhere, is primarily caused by an increase in the supply of money and credit. In fact, inflation is the increase in the supply of money and credit. If you turn to the recent American College Dictionary, for example, you will find the first definition of inflation given as follows: “Undue expansion or increase of the currency of a country, esp. by the issuing of paper money not redeemable in specie.”

In recent years, however, the term has come to be used in a radically different sense. This is recognized in the second definition given by the American College Dictionary: “A substantial rise of prices caused by an undue expansion in paper money or bank credit.” Now obviously a rise of prices caused by an expansion of the money supply is not the same thing as the expansion of the money supply itself. A cause or condition is clearly not identical with one of its consequences. The use of the word “inflation” with these two quite different meanings leads to endless confusion.

The word “inflation” originally applied solely to the quantity of money. It meant that the volume of money was inflated, blown up, overextended. It is not mere pedantry to insist that the word should be used only in its original meaning. To use it to mean “a rise in prices” is to deflect attention away from the real cause of inflation and the real cure for it.

Let us see what happens under inflation, and why it happens. When the supply of money is increased, people have more money to offer for goods. If the supply of goods does not increase—or does not increase as much as the supply of money—then the prices of goods will go up. Each individual dollar becomes less valuable because there are more dollars. Therefore more of them will be offered against, say, a pair of shoes or a hundred bushels of wheat than before. A “price” is an exchange ratio between a dollar and a unit of goods. When people have more dollars, they value each dollar less. Goods then rise in price, not because goods are scarcer than before, but because dollars are more abundant.

In the old days, governments inflated by clipping and debasing the coinage. Then they found they could inflate cheaper and faster simply by grinding out paper money on a printing press. This is what happened with the French assignats in 1789, and with our own currency during the Revolutionary War. Today the method is a little more indirect. Our government sells its bonds or other IOU’s to the banks. In payment, the banks create “deposits” on their books against which the government can draw. A bank in turn may sell its government IOU’s to the Federal Reserve Bank, which pays for them either by creating a deposit credit or having more Federal Reserve notes printed and paying them out. This is how money is manufactured.

The greater part of the “money supply” of this country is represented not by hand-to-hand currency but by bank deposits which are drawn against by checks. Hence when most economists measure our money supply they add demand deposits (and now usually, also, time deposits) to currency outside of banks to get the total. The total of money and credit so measured was $64,099,000,000 at the end of December 1939, and $174,200,000,000 at the end of June this year. This increase of 171 percent in the supply of money is overwhelmingly the main reason why wholesale prices rose 135 percent from 1939 to June of this year.

Inflation for Beginners—II
September 10, 1951

It is often argued that to attribute inflation solely to an increase in the volume of money is “oversimplification.” This is true. Many qualifications have to be kept in mind.

For example, the “money supply” must be thought of as including not only the supply of hand-to-hand currency, but the supply of bank credit—especially in the U.S., where most payments are made by check. And it is an oversimplification to say that the value of an individual dollar depends simply on the present supply of dollars outstanding. It depends also on the expected future supply of dollars. If most people fear, for example, that the supply of dollars is going to be even greater a year from now than at present, then the present value of the dollar (as measured by its purchasing power) will be lower than the present quantity of dollars would otherwise warrant.

Again, the value of any monetary unit such as the dollar, depends not merely on the quantity of dollars but on their quality. When a country goes off the gold standard, for example, it means in effect that gold, or the right to get gold, has suddenly turned into mere paper. The value of the monetary unit therefore usually falls immediately, even if there has not yet been any increase in the quantity of money. This is because the people have more faith in gold than they have in the promises or judgment of the government’s monetary managers. There is hardly a case on record, in fact, in
Inflation for Beginners—III
September 17, 1951

One of the most stubborn fallacies about inflation is the assumption that it is caused, not by an increase in the quantity of money, but by a “shortage of goods.”

It is true that a rise in prices (which, as we have seen, should not be identified with inflation) can be caused either by an increase in the quantity of money or by a shortage of goods—or partly by both. Wheat, for example, may rise in price either because there is an increase in the supply of money or a failure of the wheat crop. But we seldom find, even in conditions of total war, a general rise in prices caused by a general shortage of goods. Yet so stubborn is the fallacy that inflation is caused by a “shortage of goods,” that even in the Germany of 1923, after prices had soared hundreds of billions of times, high officials and millions of Germans were blaming the whole thing on a general “shortage of goods”—at the very moment when foreigners were coming in and buying German goods with gold or their own currencies at prices lower than those of equivalent goods at home.

The rise of prices in the United States since 1939, or since the outbreak of war in Korea, is constantly being attributed to a “shortage of goods.” Yet official statistics show that our rate of industrial production in June of this year, for example, was two and a quarter times as much as from 1935 to 1939, and 12 percent higher than in June of 1950. Nor is it any better explanation to say that the rise in prices is caused by a shortage in civilian goods. Even to the extent that civilian goods were really short, the shortage would not cause a rise in prices if taxes took away as large a percentage of civilian income as rearmament took of civilian goods.

This brings us to another source of confusion. People frequently talk as if a budget deficit were in itself both a necessary and a sufficient cause of inflation. A budget deficit, however, if fully financed by the sale of government bonds paid for out of real savings, need not cause inflation. And even a budget surplus, on the other hand, is not an assurance against inflation. This was shown in the fiscal year ended June 30, when there was substantial inflation in spite of a budget surplus of $3,500,000,000. A budget deficit, in short, is inflationary only to the extent that it causes an increase in the money supply. And inflation can occur even with a budget surplus if there is an increase in the money supply notwithstanding.

The same chain of causation applies to all the so-called “inflationary pressures”—particularly the so-called “wage-price spiral.” If it were not preceded,
accompanied, or quickly followed by an increase in the supply of money, an increase in wages above the “equilibrium level” would not cause inflation; it would merely cause unemployment. And an increase in prices without an increase of cash in people’s pockets would merely cause a falling off in sales. Wage and price rises, in brief, are usually a consequence of inflation. They can cause it only to the extent that they force an increase in the money supply.

The accompanying chart compares the percentage increase in the money supply (currency plus bank deposits) since 1939 with the rise in wholesale prices and in the cost of living during the same period. The correlation is obvious—though the factors involved are too complex to expect it to be exact. The chief reason why prices have not increased as much as the money supply is that the production rate of goods has also greatly increased since 1939.

A warning must also be given concerning the accuracy of the two price indexes themselves. They show apparent stability from the end of 1942 to the middle of 1946, and a sharp rise then when price control was taken off. But this is chiefly because official price and cost-of-living indexes tend to become fictional under price control. They do not measure the realities of black market prices, shortages, rationing, queues, favoritism, deterioration of quality and non-existent goods. When price control is taken off, the government’s increase of the money supply has its full effect on the official price indexes.

---

Inflation for Beginners—IV
September 24, 1951

As long as we are plagued by false theories of what causes inflation, we will be plagued by false remedies. Those who ascribe inflation primarily to a “shortage of goods,” for example, are fond of saying that “the answer to inflation is production.” But this is at best a half-truth. It is impossible to bring prices down by increasing production if the money supply is being increased even faster.

The worst of all false remedies for inflation is price fixing and wage fixing. For if more money is put into circulation, while prices are held down, most people will be left with unused cash balances seeking goods. The final result, barring a like increase in production, must be higher prices.

There are broadly two kinds of price fixing—“selective” and “overall.” With selective price fixing the government tries to hold the prices merely of a few strategic war materials or a few necessaries of life. But then the profit margin in producing these things becomes lower than the profit margin in producing other things, including luxuries. So “selective” price fixing quickly brings about a shortage of the very things whose production the government is most eager to encourage. Then bureaucrats turn to the specious idea of an overall freeze. They talk of holding or returning to the prices and wages that existed on the day before war broke out in Korea. But the price level and infinitely complex price and wage interrelationships of that day were the result of the state of supply and demand on that day. And supply and demand seldom remain the same, even for the same commodity, for two days running, even without major changes in the money supply.

It has been moderately estimated that there are some 9,000,000 different prices in the United States. On this basis we begin with more than 40 trillion interrelationships of these prices. And a change in one price always has repercussions on a whole network of other prices. The prices and price relationships of June 24, 1950, were presumably those roughly calculated to encourage a maximum balanced production of peace time goods. They are obviously the wrong prices and price relationships to encourage the maximum production of war goods. Moreover, the price pattern of a given day always embodies many misjudgments and “inequities.” No single mind, and no bureaucracy, has wisdom and knowledge enough to correct these. Every time a bureaucrat tries to correct one price or wage maladjustment or “inequity” he creates a score of new ones. And there is no precise standard for measuring the economic “inequities” of a particular case that any two people seem able to agree on. Coercive price fixing would be an insoluble problem, in short, even if those in charge of it were the best-informed economists, statisticians, and businessmen in the country, and even if they acted with the most conscientious impartiality. But they are subjected in fact to tremendous pressure by the organized pressure groups. Those in power soon find that price and wage control is a tremendous weapon with which to curry political favor or to punish opposition. That is why “parity” formulas are applied to farm prices and escalator clauses to wage rates, while industrial prices and rents are penalized.

Another evil of price control is that, though it is always put into effect in the name of an alleged “emergency,” it creates powerful vested interests and habits of mind which prolong it or tend to make it permanent. Outstanding examples of this are rent control and exchange control. Price control is the major step toward a fully regimented or “planned” economy. It
As long as Federal Reserve Banks buy the government’s 2.5 percent bonds, say, at par, they hold down the basic long-term interest rate to 2.5 percent. And they pay for these bonds, in effect, by printing more money. This is what is known as “monetizing” the public debt. Inflation will go on as long as this goes on.

The Federal Reserve System, if it were determined to halt inflation and to live up to its responsibilities, would not only halt this process of holding down interest rates and monetizing the public debt, but it would take the leadership in raising interest rates. It should never have departed, in fact, from the tradition that the discount rate of the central bank should normally (and above all in an inflationary period) be a “penalty” rate—that is, a rate higher than the member banks themselves get on their loans.

Congress should immediately restore the required legal reserve ratio of the Federal Reserve Banks to the previous level of 35 and 40 percent, instead of the present “emergency” level of 25 percent put into effect as a war-inflation measure in June, 1945. Congress should in addition authorize the Federal Reserve Board to increase this reserve ratio even further. Legal minimum reserve ratios are admittedly an awkward method of limiting the potential supply of money and credit. But they are an added safeguard when other methods are not properly used. As long as the Federal Reserve authorities, moreover, insist on the power to control the reserve ratios of member banks, they should also be obliged to control their own. An increase in reserve bank credit can cause far more inflation than an equal increase in member bank credit.

As a last resort the monetary authorities could actually freeze the credit supply, allowing no net increase in loans at all. But this will never be necessary if other measures have been wisely taken.

It can be said, finally, that the world will never work itself out of the present inflationary era until it returns to the gold standard. The gold standard provided a practically automatic check on internal credit expansion. That is why the bureaucrats abandoned it. In addition to its being a safeguard against inflation, it is the only system that has ever provided the world with the equivalent of an international currency.

The first question to be asked today is not how can we stop inflation, but do we really want to? For one of the effects of inflation is to bring about a redistribution of wealth and income. In its early stages (until it reaches the point where it grossly distorts and undermines production itself) it benefits some groups at the expense of others. The first groups acquire a vested interest in maintaining inflation. Too many of us continue under the delusion that we can beat the game—that we can increase our own incomes faster than our living costs. So there is a great deal of hypocrisy in
the outcry against inflation. Many of us are shouting in effect: “Hold down everybody’s price and income except my own.”

Governments are the worst offenders in this hypocrisy. At the same time as they profess to be “fighting inflation” they are following a “full employment” policy. And as one writer recently admitted frankly in the London Economist: “Inflation is nine-tenths of any full-employment policy.”

What he forgot to add is that inflation must always end in a crisis and a slump, and that worse than the slump itself may be the public delusion that the slump has been caused, not by the previous inflation, but by the inherent defects of “capitalism.”

Inflation, to sum up, is the increase in the volume of money and bank credit in relation to the volume of goods. It is harmful because it depreciates the value of the monetary unit, raises everybody’s cost of living, imposes what is in effect a tax on the poorest at as high a rate as the tax on the richest, wipes out the value of past savings, discourages future savings, redistributes wealth and income wantonly, encourages and rewards speculation and gambling at the expense of thrift and work, undermines confidence in the justice of a free enterprise system and corrupts public and private morals.

But it is never “inevitable.” We can always stop it overnight, if we have the sincere will to do so. ✿

The Real Problems of France
October 8, 1951

PARIS—To a visitor who, like myself, has not been in France since 1947, the improvement in the physical appearance of the country, and in the better neighborhoods of the cities, is in some respects striking. Much of this physical improvement must no doubt be attributed directly or indirectly to American economic aid. Yet the EGA program, as at present conceived and administered, seems largely irrelevant to the real problems that confront France today. These problems might be grouped under three main headings: (1) lack of confidence in the government, (2) lack of confidence in the currency, and (3) lack of incentives for new enterprises and for expanding production.

1—When a Frenchman talks about necessary fiscal or economic reforms, he is apt to add resignedly that they would only be possible under a government with a majority dependable enough to give it reasonable security of tenure and courage. But the French vote for a multiplicity of warring political parties and become collectively disgusted with the overall situation they have collectively created.

Much has been written about the great effect of Marshall aid in turning the tide against Communism in Europe. In France, the statistical proof is not impressive. In November 1946, the Communist vote came from 28.6 percent of the French electorate. In the elections this June the percentage was still 26.5. How much credit Marshall aid can claim even for this reduction of only 2 percentage points is doubtful. For in the light of all that has happened in the intervening four years, no French voter has any excuse for still believing the old myth that Soviet Russia is a great peace-loving nation or that the French Communist Party has the interests of France primarily at heart.

2—The Frenchman’s lack of confidence in his currency is hardly surprising. He has seen the franc decline to one-twentieth of its purchasing power in 1938. He has seen it decline since 1914 to one-seventieth of its former value in terms of the dollar and to less than one-hundredth of its former value in terms of gold. No one should be astonished to learn that the former French habits of saving have largely disappeared and that the kind of saving that does take place is more likely to go into gold-hoarding than into government bonds.

Today the franc is under new pressure of several different kinds. One is the rise in world raw material prices, owing to American rearmament. Another is the increased strain on the budget for increased French armament. A third is the continuing deficit in French socialized industries (of more than 90,000,000,000 francs, for one example, in the nationalized railways in the 1951 fiscal year). A fourth is the political pressure for adopting “l’échelle mobile”—“the moving ladder,” or sliding scale, whereby the legal minimum wage will automatically follow prices upward. A fifth is the persistence of a low-interest-rate policy under which the volume of money and bank credit have continued to expand by 554,000,000,000 francs, for example, from June 1950 to May of this year.

3—Finally, as a result of the whole network of exchange controls, import quotas, tariffs, price controls, allocations, social-security deductions and payments on a huge scale, and the cartelization of business, there has been a great distortion of productive incentives, a growing lack of correspondence between effort and reward, and heavy obstacles to the appearance or success of new enterprises.

I have space to cite only one example. Price-fixing in wheat is unfortunately one of the chief reasons why France’s wheat production since the war has been persistently lower than the average production in 1934–38.
The major problems of France today, in short, barring the menace of Russia, are problems of internal policy. They can be lightened, of course, by continuance of American military and economic aid. But they can be solved only by a courageous recognition on the part of the French that a halt to the present inflation, and the restoration of economic freedom and production, will come primarily only through their own efforts.

To a Mitigated Socialism  
October 15, 1951

LONDON—Even if, in accordance with most forecasts, the Conservatives win this month’s elections, the outlook at the moment is not very promising for a return in England to a free-enterprise system as Americans still use the term. What seems much more likely is a mitigated socialism, administered by the very people who declare that they do not believe in socialism.

There are many bold and excellent phrases in the Conservative manifesto: “The attempt to impose a doctrinaire Socialism upon an island which has grown great and famous by free enterprise has inflicted serious injury upon our strength and prosperity. . . . Freedom and abundance—these must be our aims. . . . Confidence and currency are interdependent. . . . The Conservative aim is to increase our national output.” And so on. But when it comes to details, the manifesto promises merely not to carry socialism any further. The Conservatives, in effect, promise to operate existing socialism much better than those who introduced it.

The Conservative manifesto does promise definitely to “stop all further nationalization.” This means repeal of the law to nationalize steel. But the manifesto also promises that “coal will remain nationalized”—though the Conservatives have been repeatedly asserting that coal nationalization has been an utter failure. Quite as important as what the manifesto says is what it does not say. It says nothing about denationalizing the railroads, nothing about denationalizing gas and electricity, nothing about denationalizing telephone and telegraph service, nothing about denationalizing the Bank of England, and nothing about abandoning the National Health Scheme or exchange control. It merely promises to run a few of these schemes more efficiently, to “simplify” and “decentralize” administration, and to “prune waste and extravagance.”

In some respects the Conservatives even try to outbid the Labour Party in socialism, statism, protectionism, and restrictionism. “Housing,” they declare, “is the first of the social services.” And they offer a “target” of 300,000 (mainly government-built) houses a year, compared with Labour’s 200,000. They promise to maintain “guaranteed agricultural prices and markets and protect British horticulture from foreign dumpers.” They warn that: “Food subsidies cannot be radically changed in present circumstances.” And they call for an excess-profits tax—which is hardly calculated to encourage new firms, efficiency, or increased output.

On their side the Labourites contrast the “mass unemployment, mass fear, and mass misery” under the Conservatives in the inter-war years with the miracle of “full employment” that they have brought about. They support this with statistics that are very impressive if taken at face value.

Why, then, are most British voters nonetheless expected to vote Conservative on Oct. 25? One reason, of course, is that they will not be voting on economic issues alone: Many are disgusted by what they regard as the humiliating conduct of the government in the Iranian crisis, for example. Another reason is that, though the Conservatives do not promise them release from socialism, they at least promise not to believe in it, while the Labourites threaten to make it even worse. They threaten to “take over concerns which fail the nation and start new public enterprises wherever this will serve the national interest”; to “limit dividends by law”; to put still more punitive taxation “on the small minority who own great fortunes,” and to “stop all excess profits”—whatever that may mean. (Incidentally, the Labour manifesto’s boast of economic achievements gives not a single line of credit to American aid.)

But one of the chief reasons why many will vote Conservative does not reflect a flattering estimate of the party’s candor. These voters suspect that the Conservatives, particularly if they get a substantial majority in the new Parliament, will proceed to liquidate socialism to a larger extent than they now dare to promise. But whether the Conservatives are in fact prepared ideologically to do this is still an open question.

Britain’s ‘Third Crisis’  
October 22, 1951

LONDON—On Oct. 3 the British public received the jolting news that the gold and dollar reserves of the sterling area had fallen in July, August, and September by $598,000,000. This loss of gold was greater than that in the entire six months before the 1949 devaluation. As T.W. Kent wrote in Lloyds Bank Review, “the change is almost the most startling of all the dramatic turns in Britain’s postwar economic experience.”
One of the most illuminating analyses of the causes of these recurring British crises is that made recently in The Manchester Guardian by the well-known statistician Colin Clark (Newsweek, Oct. 1), “Not merely the British Government,” he declares, “but virtually the whole British people . . . has allowed itself to cherish three economic illusions”—the illusions of Cheap Food, of Limitless Taxable Capacity, and of Rapidly Increasing Productivity.

The illusion of cheap food, according to Clark, consists in the belief that the recent adverse movement of the “terms of trade” is temporary and that Britain will soon be able again to buy its imports cheaper and to sell its exports dearer. Clark shows convincingly that this belief rests on nothing better than wishful thinking.

His next point concerns taxable capacity. In each postwar year British national and local taxation has been levied at a rate of more than 40 percent of the national income. “In no other country has a rate like this ever been approached.” As early as 1945 Clark contended that the safe limit of taxation was 25 percent of the national income. “This result was based not upon theoretical considerations, but upon a study of the actual experience of attempts which had been made at various times and places, to exceed this limit. In every case the effects were so discouraging to real production, and encouraging to the circulation of money, that within two or three years an inflation supervened sufficient to raise prices (and thus the money value of national income) to a point where the 25 percent ratio again prevailed.” Clark concludes that unless drastic and immediate steps are taken to slash British Government expenditures the present “temporary barriers” to inflation “will shortly all be swept away.”

This conclusion is of course not “scientific.” But it is based on impressive experience. A number of economists in England, in fact, have come independently to the conclusion that taxation is already so high that more of it will not combat inflation because it will so seriously reduce the incentives to hard work, risk taking, and enterprise. This conclusion has a direct bearing on our inflation problem at home. Only drastic slashes in governmental spending can help.

The third economic illusion in Britain, according to Clark, is the belief that British productivity has been increasing at an unprecedented rate. He questions the official claims that real product (not money product) has been increasing at the rate of 5 percent per annum. His own conclusion is that real product per man-hour is rising very slowly and is only about 5 percent higher than that of 1938. About half of this increase, moreover, has been swallowed up in shorter working hours. This conclusion is supported by the London and Cambridge Economic Service, which argues that the rate of increase in real product may now be very small. It is supported also by what is known in special fields. The Girdwood committee estimated in 1950, for example, that to build a given type of house in England the man-hours needed in 1949 were 26 percent above the level of 1938–39—a 20 percent drop in productivity.

Colin Clark, in short, has correctly put his finger on three of the economic illusions that have led to persistent financial crises in Great Britain. But there are many others. He has not put his finger on the central illusion, from which most of the rest are derived. This is that England can be saved by a series of governmental controls. The truth is that these very controls—and above all exchange control—create the evils they are ostensibly designed to combat.

**This Is Where We Came In**

October 29, 1951

When I was in Paris a few weeks ago the press was headlining what it called “l’opération bifteck”—the government’s order rolling back meat prices by 10 percent. The result, of course, was a meat shortage.

To an American it was all very familiar. When President Truman restored meat ceilings in September 1946, the Federally inspected production of beef, which had been 594,000,000 pounds in August, fell to 186,000,000 in September (only 28 percent of production in the preceding September). Mr. Truman belatedly removed ceilings on Oct. 14, and in November beef production was back to 605,000,000 pounds.

Yet our price controllers seem incapable of learning even from our own experience. They seem determined to repeat and magnify every past error. They have raided hundreds of slaughtering plants and succeeded in bringing about another beef “shortage.” The American Meat Institute reports that in the four-month period of June through September, the 95 leading beef-producing plants were able to buy only 65 percent of the number of cattle they bought in the corresponding period of 1950. At the ceiling prices they were legally allowed to bid, they weren’t being offered any more. Yet in the same four months the receipts of cattle at the twelve leading livestock markets were down only 12 percent compared with the corresponding 1950 period.
What became of the cattle that were not bought by the 95 leading beef-producing plants? It’s a fair assumption that they went through gray-or black-market processors. If these processors are not paying much attention to official ceiling prices, will they pay much attention to the slaughtering quotas that Michael DiSalle has been demanding? Suppose DiSalle got his slaughtering quotas. And suppose even that he was able to enforce them. The first consequence would be sharply reduced competition among packers. (There are more than 3,000 plants.) The efficient packer could not expand, because the quota assignment would not permit him to. New entrants would be presumably barred. The inefficient packer could not be eliminated, because he would be assured of his quota. Incentives to better service and competitive cost-cutting—which help both cattle raisers and consumers—would languish or disappear.

To the extent that the OPS really did prevent black-market operations, it would repeat the 1946 shortage of meat. For by holding meat below the market price, it would both encourage increased meat consumption and discourage meat production. If DiSalle sincerely believes that he can hold meat prices substantially below free-market levels for any length of time without resorting to consumer rationing and eventually to subsidies, then he does not understand the tremendous task he is undertaking.

In Newsweek of Nov. 29, 1948, reporting on a visit to the stockyards of Fort Worth, I tried to explain why any effort to fix meat prices was bound to derange production: “It is the present relative prices of meat in the butcher shops to meat on the hoof, of hogs to corn, of corn to hay and wheat, of hay and corn to steers, of steers to calves, hogs, and sheep ... it is this incredibly intricate maze of relationships which determines how much corn and wheat will be planted, how many hogs will be raised, how many steers will be slaughtered now, how many held for further feeding, whether on ranges or in pens, for just how long, to just what weights, and so on. . . . The intimate connexity of prices runs through the whole economy. It is the relation of the prices of thousands of different commodities to each other that determines the relative amounts produced of each of these commodities. It is not surprising, in view of these intricate interrelationships, that government price-fixing always upsets the balance of production.”

The worst of all excuses for price-fixing, we may add now, is “fighting inflation.” Price-fixing is a futile but harmful effort on the part of the government to protect the public against the high prices caused by its own overissue of money and credit. ✹

---

**Chaotic Spending and Taxing**
November 5, 1951

The history and contents of the new tax law are one more illustration of what is wrong with our whole budgetary system.

It was irresponsible and hypocritical for the House to vote for colossal appropriations and then try to reject the taxes to meet the appropriations. It was irresponsible for Congress to make these appropriations and then pass a tax law calculated to leave a deficit of more than $6,000,000,000 in the current fiscal year, and an estimated $18,000,000,000 to $24,000,000,000 in the next fiscal year. In combination these fiscal actions were recklessly inflationary.

So far the critics of Congress are right. But when they go on, as most of them do, to support Mr. Truman’s lip-demand for $5,000,000,000 to $10,000,000,000 of still further taxes, they are closing their eyes to the facts. These further sums simply cannot be raised (at present price levels) without irreparable harm to the American economy.

Taxes are now scraping the bottom of the barrel. In the highest brackets of the personal income tax the rates long ago passed the point of maximum productivity. Today they reflect mainly an attempt to punish success. It has already been pointed out in Newsweek that a 100 percent tax on all taxable incomes above $25,000—that is, complete confiscation—would yield only $700,000,000 a year more in revenue, while a similar tax on all taxable incomes above $10,000 would yield only about $3,500,000,000. But even these represent the maximum possible yields, on the assumption that people would be foolish enough to go on earning what they could not keep.

Corporation tax rates now reach 52 percent on corporate incomes, plus 82 percent on so-called excess profits, with a maximum overall rate of 70 percent. Just look at that as an incentive to start new corporate enterprises, to put more capital into old ones, and to expand the capital equipment upon which the growth of all production, the creation of new employment and the increase of all real wages depends. The government takes up to 70 percent of a corporate investor’s earnings on his investment before he even gets them, and then taxes the remainder, when, as, and if he gets it, at personal income-tax rates up to 91.8 percent. This is what we do to encourage new production.

In my Newsweek article of Oct. 22 I referred, in connection with Britain, to the conclusion of Colin Clark, the Australian statistician, that the safe limit of total taxation in any country was 25 percent of the
national income, and that any attempt to take more than this is so discouraging to hard work, risk-taking and production that it must lead to inflation. Let us apply this to the United States.

It is expected that the national income for the current fiscal year ending June 30, 1952, will reach $289,000,000,000. Federal tax receipts are now estimated at about $63,700,000,000, and state and local taxes at about $19,000,000,000. This would represent a total tax burden of about 30 percent of the national income. And it would still leave an inflationary deficit estimated at more than $6,000,000,000. If we tried to cover projected fiscal 1953 expenditures of $85,000,000,000 to $90,000,000,000 completely by taxation, we would reach a total tax burden of 40 percent of the national income, which would parallel the plight of Great Britain.

There is only one real fiscal solution. It is a drastic slash in government expenditures. This solution is usually dismissed by Administration spokesmen as “economizing with a meat ax.” But as long as the Administration continues to spend with a steam shovel it is hopeless for Congress to try to economize with a teaspoon. It is wrong, of course, to economize blindly. But it will be disastrous to continue to spend blindly.

The political problem is how to restore Congress and the Administration to a sense of their fiscal responsibilities. While the solution lies mainly in a change in present ideology, it is unlikely to be achieved without reform of our entire budgetary procedure.

How to Denationalize
November 12, 1951

Now that British socialism has been repudiated at the polls, the world waits to see how far the Conservatives will dare to go in denationalizing and desocializing. They are pledged to “stop all further nationalization,” and specifically to denationalize steel. But apart from this, the outlook is not clear. They have been silent on some nationalized industries and worse than silent on coal. They have given explicit assurance that “coal will remain nationalized.”

A few weeks before the election, at the Reform Club in London, I raised this problem with a group of outstanding economists and financial journalists. Though everyone in the group was anti-socialist, and expected the Conservatives to win, most of them treated denationalization as if it were difficult and all but impossible. Yet from a purely technical standpoint it is infinitely easier to denationalize than to nationalize. The economic problems involved are minor; it is the ideological and political problems that are appalling.

This becomes clear as soon as we candidly examine the obstacles to denationalization. Let’s begin with the cliché that once you scramble eggs you can’t unscramble them. This might be true if you were trying to get each yolk back into its original shell—in other words, if you were trying to reestablish all the original private companies in their original form. But such an exact restoration is pointless and unnecessary. In coal, for example, the more than 1,400 collieries that the British Government took over are now divided into only nine administrative regions. These nine regions could be simply transformed into nine separate private companies. Or, if so few companies were thought to endanger competition, the National Coal Board could subdivide the present regions into whatever number or whatever size of private companies promised to combine optimum competition with optimum efficiency. Then the individual units could be put up for sale.

Such a sale would present no more inherent difficulties than are presented every day by private sales. The government could consult investment bankers as to the best financial setup and the best realizable price for each company, share or bond. Or, without attempting to set a price in advance, the government could open the various stock and bond issues to competitive bidding by investment firms or individuals. States and municipalities constantly offer their own obligations in this way. Nor would the government necessarily have to sell all securities of a desocialized industry at once; it could do so over an extended period. And it could of course retain existing governmental managers until the new owners had had time to reelect or replace them.

A well-advised government would, in offering shares, give priority to the workers in a denationalized industry, allowing them not only to purchase on installment but at a price somewhat below the market.

Some of the misgivings of the Conservatives regarding denationalization have a real enough basis. One is that if any attempt were made to denationalize coal, for example, the mine unions would immediately go on strike. Another is that nobody would buy the British railways today, which are losing money under government management, unless they had assurance that they could alter present costs and rate-and-fare levels. A third is that private investors would not buy back into these industries as long as they had reason to fear (as they now have) that the Laborites, once back in power, would reexpropriate the steel mills, coal mines, or whatnot without any compensation at all.
But none of these fears shows that denationalization is undesirable or inherently difficult. What they do show is how formidable the obstacles to it can be as long as a powerful minority, which could become a majority again, retains the socialist ideology. It is not some mystically inevitable socialist wave of the future that we have to fear, but men’s ideas and intentions in the present. It is the winds of doctrine that blow today that determine the waves of tomorrow.

Who Is Mislabeling What?
November 19, 1951

In her column in The World-Telegram of Nov. 1, under the heading “Mislabeled Facts,” Eleanor Roosevelt quoted from a pamphlet published by the Foundation for Economic Education (of which the present writer happens to be a trustee). The quotation was: “The welfare state is a name that has been substituted as a more acceptable one for Communism-Socialism wherever, as in the United States, these names are in general disrepute.”

“It seems to me that much that appears in this pamphlet,” says Mrs. Roosevelt, “is dishonest in its thinking. In the first place, the mere tying together of Communism and Socialism is dishonest. They are two quite different things. . . . We can have opinions as to whether all the things that have been done . . . under the name of ‘welfare state’ are wise. . . . However, that does not make us Communist or Socialist.”

Mrs. Roosevelt frequently affects to deplore the “smear” technique. Yet she begins her criticism of a statement with which she disagrees by calling it dishonest. This is an argumentum ad hominem—an attack, not on the merits of an idea, but on the character and motives of those who advance it. Such an attack not only lowers the level of debate, but is irrelevant to the real question, which is whether or not the idea is true.

If there is any charge of dishonesty or deliberate mislabeling to be brought, indeed, it might much more justifiably be lodged against those who deny any connection between the welfare state and Socialism, or between Socialism and Communism. But I prefer to believe that this denial stems in most cases from mere lack of knowledge and confusion of thought.

The Wohlfahrtstaat concept had its origin in Germany, shortly after Bismarck, in 1881, introduced his first social-security bill for “the welfare of all.” If we leap to Feb. 19, 1949, we find Supreme Court Justice William O. Douglas, in a speech at Occidental College, lumping “laissez-faire economics” with “Communism and Fascism” and hailing “the human welfare state” as “the great political invention of the twentieth century.”

Then on March 20, 1949, in The New York Times Sunday Magazine, Barbara Ward developed the thesis that “In the last four years, the most important single feature on the British scene has been the creation not of the Socialist state but of the welfare state.” “So far,” she argued, “nationalization has touched only a tiny fragment of the economy.” Tiny, indeed. All that had been nationalized was coal, the railroads, civil aviation, telephone, telegraph, gas and electricity service, the Bank of England, and new housing! To contend that nationalization is unimportant in England because it exists only in the key industries is like arguing that Stalin is unimportant in Russia because he constitutes so small a percentage of the total population.

The “welfare state,” in short, has come to mean in practice the Socialist state plus the handout state plus the controllist state.

How to Depoliticize Money
November 26, 1951

Two years ago a Congressional subcommittee headed by Sen. Paul H. Douglas made a careful study of monetary policy. It emerged with the conclusion that “the freedom of the Federal Reserve to restrict credit and raise interest rates for general stabilization purposes should be restored.” But tucked away in a footnote was a dissent from Congressman Wright Patman: “Steps
should be taken,” he said, “to increase the responsibility [i.e., the subservience] of the Federal Reserve System to the executive department.”

Now, by one of those political miracles that happen so often in the Administration’s favor, a new subcommittee has been appointed, headed by none other than Patman himself, to investigate the same subject all over again.

There is the usual affectation of open-mindedness; but no one can be in any real doubt concerning the conclusions at which Congressman Patman is determined to arrive. He has already sent out heavily loaded questionnaires.

Patman, in fact, as the November monthly letter of the National City Bank of New York reminds us, has a long record in support of the crudest and most flagrant inflation. It was “a shame and a disgrace,” he said on the floor of the House on June 27, that the Federal Reserve had allowed government bonds to decline below par. He wanted Congress to compel the Federal Reserve Banks to buy at par or better any government security issued at par. In 1932–35 we find him advocating Treasury issues of paper money to pay off “adjusted service certificates” held by first-world-war veterans. In 1941 he proposed in a radio speech that the government buy the stock of the Federal Reserve Banks: “Then it will not be necessary for the government to issue and sell interest-bearing bonds. Then as money is needed, non-interest-bearing bonds can be delivered to these twelve banks, credit given for them on the books of the banks, and checks drawn by the Treasury to pay any debt that is owed by the government.” In other words, the government can just print all the money it needs as it goes along.

The Patman proposals are a threat of hyperinflation. What is desperately necessary today is the exact opposite of the course he proposes. The Federal Reserve System must be taken out of politics. It must be freed from domination by the President. It is still under that domination. Between June 21, 1950, a few days before the outbreak of war in Korea, and Nov. 14 of this year, the Federal Reserve Banks on net balance had bought nearly $6,000,000,000 of additional government securities, putting out more money and feeding inflation.

The hard fact is that the central bank in practically every nation today has been or is being used as an enormous inflation factory to serve the incumbent government’s political purposes. In view of this hard fact, I should like to advance a counterproposal of my own. Let the Federal Reserve Board retain every power it already has to prevent or to halt inflation. Give it, if necessary, added powers of disinflation. But remove entirely from the board any power to inflate or “reflate.”

This would mean that neither the Federal Reserve Board nor the Federal Open Market Committee would any longer be permitted to lower reserve requirements on its own initiative, to compel open-market purchases of government securities, or to lower rediscount rates. (And that would prevent any repetition, for example, of the disgrace of 1927, when the Federal Reserve Board not only ordered the individual Federal Reserve Banks to lower their rediscount rates, but openly overrode the Chicago bank when it refused.)

Under this proposal, on the other hand, full responsibility would still rest on the board for any further inflation. For it would still have full powers to increase reserve ratios, to recommend sales of securities, and to order a higher discount rate by Federal Reserve Banks when it thought such actions necessary. Any “reflationary” initiative could come solely from the individual reserve banks.

Day of Disillusion
December 3, 1951

For the last two or three years we have been repeatedly told about the “miracle of recovery” brought by the Marshall Plan in Europe. And suddenly another European crisis is upon us; suddenly the British can’t solve their balance-of-payments problem; suddenly the French economy is in another tailspin; suddenly everybody complains about a “dollar shortage” again. And suddenly, once more, it is all our fault.

It seems that, as Europe reminds us, we just can’t do anything right. Not only do we give them too little money, but we give it for all the wrong things. We give it for armament, whereas the real need is for Europeans to live more comfortably. Thus The London Economist says bluntly that “rearmament is a serious threat to the internal stability of Europe” and: “It may prove healthier for Europe to receive more dollars to keep its civilian economies steady and fewer to defend its frontiers.”

The French are sure of it. In a dispatch from Paris to The New York Times of Nov. 10, Harold Callender wrote: “High officials here contend that while the aggregate of United States aid may be sufficient, too much has been earmarked for military use and not enough for civilian economies. ‘Europe is not ready for all the military equipment that is provided, but desperately needs dollars to buy raw materials to keep its industries going,’
said one expert. Moreover,” Callender continued, “the French are annoyed by the slow receipt of [U.S.] aid.”

The situation has reached a point where even American taxpayers are beginning to ask questions. Here is an excerpt from a letter I have just received from one of them in Switzerland: “As I travel through Europe my admiration for the patience of the American taxpayer grows in the same measure as my disgust at the inefficiency and nonchalance of the Europeans. As I look around me all over Western Europe at the business-and-pleasure-as-usual attitude, the crammed theaters and movies, football matches, horse racing, automobile racing, and stores full of everything to buy, I know that nobody ever gives credit to the long-suffering American taxpayer, who has made all this possible through the billions given to foreign countries.”

Why has postwar recovery in Europe proved so transitory and insecure, so vulnerable to recurrent crises? Clearly because it has never rested on a sound basis.

The rate of recovery in Europe after 1947 was no more than what might have been expected in any case, if we judge by the standard of previous postwar recoveries. And the Marshall Plan got far more credit even for this result than it earned. Macaulay in his History of England, reminded his readers that “No ordinary misfortune, no ordinary misgovernment, will do so much to make a nation wretched as the constant progress of physical knowledge and the constant effort of every man to better himself will do to make a nation prosperous.” EGA got credit that belonged to what Macaulay called “the exertions of private citizens.”

In fact, it is an open question, when we consider the present French and British crises, whether Europe would not be better off today if we had never given it a dollar of Marshall aid. For then it might have been forced to take the hard course that alone would have brought a durable recovery.

Contrary to the outcries from European officials, the present crises in Europe are not the result of our failure to provide enough dollars, or the result of their own tremendous armament effort. They are the results of their own spending, inflationist, controllist, and socialist policies. In my 1947 book, Will Dollars Save the World, I pointed out that “The report of the sixteen [European] nations shows that they have no intention of abandoning the major policies which have brought them to their present crisis. They will continue as before to impose price control and exchange control, food subsidies, cheap money, ambitious capital investment programs, government-dictated production, nationalization, and socialism.” Well, they are still at it.

‘Arms’ or ‘Economic’ Aid
December 10, 1951

The central fact about our so-called “arms aid” to Europe is that it is only another name for general economic aid.

When the United States Government gives $5,000,000,000 for defense to European governments, either in the form of cash or military end items, then—unless Europe’s total armament budget shows a net increase of at least $5,000,000,000 over what it would have been if we had made no contribution—we have simply released Europe’s own funds for other governmental expenditures (such as social security, food subsidies, deficits on nationalized industries), or we have allowed European governments to reduce taxes by that much.

The only way we could make sure that none of our funds intended for European rearmament were being in effect diverted to other purposes would be to insist on a minimum defense expenditure by each government and a ceiling on all its other expenditure. Even this would not be enough; we should have to assume detailed supervision. The New York Times reported on Nov. 28, for example, that our officials are finding “an immense amount of waste in European defense expenditures—installations designed to prevent a German invasion of France that make no sense in terms of present-day problems, unneeded Navy outlays, expenditures on obsolete arms and services,” etc.

But no responsible person would dream of recommending that our officials should dictate European budgets. We still face the dilemma to which I devoted an article in Newsweek of Nov. 3, 1947; If we give aid without imposing conditions, it will be dissipated without bringing the results we seek; if we try to impose the necessary conditions, the attempt must bring immediate resentment and ill will.

The argument is frequently put forward that the reason we need to give military aid to Europe is that Europe cannot make the items it requires. This argument is empty. Europe could simply buy the goods from us, as we buy the rubber, tin, and wool we do not ourselves produce. The argument for our military-aid program is basically economic—that Europe just can’t afford to pay for its own rearmament. Let’s see. As no figures are available of our proposed military aid to individual countries, we are compelled to deal with overall figures. The overall “gross national product” of Belgium, Luxembourg, Denmark, France, Iceland, Italy, the Netherlands, Norway, Greece, Turkey, and the United Kingdom is estimated at $128,000,000,000.
Total governmental expenditures of these countries this fiscal year will come to about $30,000,000,000. Of this, $8,600,000,000 will be for defense. In other words, these countries are spending on defense less than 30 percent of their total governmental expenditures and only about 7 percent of their national incomes.

On what assumption, then, are we contributing $5,200,000,000 in arms aid? On the assumption that these countries can neither (1) increase their expenditures on defense to 11 percent of their gross national product; nor (2) reduce their nondefense governmental expenditures from $21,400,000,000 to $16,200,000,000 and use the saving for defense; nor (3) increase their national product by 4 percent.

The American public has never been given the factual basis, if any, that supports this remarkable conclusion. The Congress that voted the money wasn’t even curious enough to ask for the factual basis. The Senate Appropriations Committee, before voting for the $7,300,000,000 overall foreign aid program, held hearings for just one day! Who cares for $7,300,000,000? After all, it is only equal to our total Federal expenditures for all purposes in the fiscal year 1938 and to the estimated 1952 deficit.

For purposes of comparison with the European rearmament effort, the United States is spending this year (not even counting the military aid to foreign countries) $47,000,000,000 on defense, which is 14 percent of our gross national product and 68 percent of our total government expenditures. ✽

**Guns, Butter, and Disruption**

**December 17, 1951**

“We didn’t have the courage to put guns ahead of butter; to put security ahead of selfishness; to put the cause of liberty ahead of luxury.” This was the verdict reached by the Senate Preparedness subcommittee headed by Lyndon Johnson.

The evidence does not support this sweeping indictment of the American people. It is true that our defense program has gravely lagged. But the basic cause has not been public apathy. Some of the real causes were cited by the Johnson committee report itself, summarized by *Newsweek* in the Dec. 3 issue. Others can be found in the *Newsweek* report of Dec. 10 on the lag specifically in warplane production. If these detailed reasons could be reduced to a single reason it would come down to this: that while Russia since the second world war has continued without intermission to produce for another war, the U.S., in spite of the very heavy governmental expenditures for “defense” even prior to June 25, 1950, suspended major production of weapons and scrapped, converted or mothballed its war facilities.

Since the outbreak of the Korean war the Defense Department has been faced with this problem: Should it resume mass production of weapons now obsolete? Should it order mass production of present guns, tanks, and planes known to be inferior to corresponding Russian matériel? Or should it keep working indefinitely at blueprints and pilot models? Clearly some working compromise must be adopted. It is not uncommon to hear of the Defense Department submitting more than a thousand changes in design or specifications on a single item over the course of the last year. Most of these changes may be unimportant, but some may involve costly delays. Deliveries of definite quantities of an item on definite dates are possible only when a design has been frozen and a clear go-ahead signal given. There is little evidence that the defense production program has been set back in any substantial way because civilian production has been needlessly big. It is easy enough for any official with a taste for coercion and histrionics to order a cut in the allocation of steel or copper or even an entire death sentence for whole industries. But it does not follow that this will speed up defense production; it may do the exact opposite.

And the real need is Production, not Austerity or Sacrifice for its own sake. There are always those, of course, who love to wear loud-colored hair shirts in public. When President Roosevelt declared in May 1940 that there was no reason for the country to become “discomboomerated” by the defense program, the remark met a storm of criticism. But he would have been quite justified if he had said merely that no one should be needlessly discomboomerated. Needless discomboomeration means needless disruption. Yet the hair-shirt wavers demand this purely ritualistic sacrifice. Their main emphasis is not on more guns but on less butter.

The real danger is that our defense program will be snarled up not by too little government interference but by too much. The insistence on price controls is a case in point. Price controls combined with allocations have so greatly distorted the supply-and-demand picture that no one can be sure whether or not we are heading for actual overproduction of steel. Eugene G. Grace, chairman of the Bethlehem Steel Corp., says we are. Government controllers are inclined to scoff at this. But the demand for steel today is not determined by free prices in free markets. As *The Wall Street Journal* illustrates it, a man who wants 10,000 tons of steel may get ration “tickets” for only 1,000, while a man who can
use only 1,000 may manage to get “tickets” for 1,500, and may take that much as insurance.

Manufacturers with whom I have talked think we would be much farther ahead if firms with war contracts got priority tickets for the metals they needed and all other “allocations” were left to the traditional method of a free economy—the play of supply and demand and free prices.

**A Budget Out of Control**

December 24, 1951

In a few weeks President Truman will present Congress with the budget for the next fiscal year. If either precedents or predictions are any guide, the spending he will recommend will be staggering—somewhere around $85,000,000,000, or more than even Franklin Roosevelt succeeded in spending in the whole nine years from 1933 through 1941. But Mr. Truman will blandly announce that his budget has been cut to the bone—that any attempt to reduce it will bring on a third world war or military defeat. He will defy critics of his budget to make a single reduction. His Congressional opponents will, of course, eloquently denounce his “reckless spending,” A corporal’s guard, under the leadership of Senator Byrd, will unsuccessfully propose cuts. The appropriations will end up by being substantially what the President asks for. In fact, it will be unprecedented if Congress doesn’t make a few appropriations and handouts over even Mr. Truman’s veto.

This is the outlook we face. It is a budget out of control.

And none of the proposals that are being seriously considered to give us a responsible budget goes nearly far enough to achieve one.

We will not have a responsible budget in this country, in fact, until Congress has been deprived of the power to make any appropriation not recommended by the President. This is the wholesome rule that has long prevailed in Britain. No expenditure can be proposed in Parliament except by “the government.”

It is still not generally understood that the legislature’s only justified “power of the purse” is the power to withhold the people’s purse from the executive—not the power to put its own hands in that purse. If the watchmen of the Treasury are allowed to put their own hands in the Treasury, they cease to perform their function as watchmen. A congressman cannot be depended on to serve the taxpayers if he must also serve the pressure groups. Congress should have the power to reduce proposed Federal expenditures, but never the power to initiate or increase them.

Such a change in the powers of Congress would raise the whole level and tone of our political life. As Henry Jones Ford pointed out in his *Representative Government* in 1924, to disable members from introducing measures proposing any added appropriations or salaried offices would “of itself shut out most of the bills congesting American legislative calendars.”

It would do far more. It would eliminate the type of congressman who holds office mainly by promising or giving handouts of the nation’s money to pressure groups in his own district. We will never have a responsible budget as long as the President, the House, and the Senate are all encouraged or even permitted to compete with and outbid each other in spending schemes.

Other procedural reforms are needed and, fortunately, could more easily become realities. For several years there has been a lively debate between those who favor a single overall annual appropriation by Congress or, as now, a series of separate appropriation bills for special purposes. To achieve economy the best solution would be to have both. Each fiscal year Congress should authorize a total maximum overall expenditure not to be exceeded. But it should continue to require the President to get a separate authorization for each special purpose. The President should not be allowed to spend the whole of these separate authorizations if they exceed the total overall maximum that Congress has previously fixed. He would have to make his own specific cuts (but be permitted no specific increases) to bring the sum of the special authorizations within the authorized overall total. In other words, the President could spend only whichever sum was lower.

A third reform would be more full-time research assistants for the major Congressional committees to try to keep the Army, for example, from again ordering enough front-axle-housing gaskets to last for 104 years.

**Canada Breaks the Ice Jam**

December 31, 1951

From Sept. 19, 1949, to Sept. 30, 1950, the Canadian dollar, under exchange control, was pegged at 90 American cents. Then the peg was pulled and the rate was left to the mercies of supply and demand. Instead of falling, it went up. It remained around 95 cents, with small fluctuations on either side, until a few weeks ago, when it rose above 97 cents.
On Dec. 14 Canada abolished exchange control entirely. This means that, for the first time in twelve years, Canadians will be able to spend their money for whatever they please, wherever they please. They will again be able, for instance, to buy American securities on the New York Stock Exchange or deal in wheat futures in Chicago. And Americans with investments “frozen” in Canada can now, if they wish, get them out.

Canada thereby becomes the first major country to abolish exchange control. The United States and Switzerland were the only countries that never directly imposed it. Peru, in 1949, set its own currency rate free, but its example attracted little attention. Canada’s step, however, may prove the first real break in the world ice jam of exchange controls. Even Britain seems to have been influenced by it, and has permitted the resumption, within very narrow price limits, of private exchange transactions.

Both the theory and practice of exchange control, in other words, are beginning to fall apart. In Newsweek of Sept. 8, 1947, I wrote: “Nearly every currency in the world . . . is overvalued in terms of the [American] dollar. It is precisely this overvaluation which brings about the so-called dollar scarcity.” But this glaring fact was ignored or denied not only by European but by American bureaucrats, who poured billions of our dollars into Europe to finance its self-created trade deficits.

Then on Sept. 18, 1949, Sir Stafford Cripps completely reversed all his previous pledges and arguments and slashed the pegged rate of the pound from $4.03 to $2.80. Two dozen other nations took similar action within a week. This temporarily improved the balance of world trade; but it was still not the right step. “What was called for,” as I pointed out in Newsweek (Oct. 3 and 31, 1949, and Jan. 9, 1950), “was not continued exchange control with lower fiat rates, but the restoration of free exchanges.”

This is the step that Canada has at last taken. It is the most hopeful international development in many months. The chief remaining obstacle to a world restoration of freedom and sound money is the International Monetary Fund, an unnecessary institution set up, under the influence of the late Lord Keynes and Harry Dexter White, on a completely unsound basis. The minimum reform on which the managers of the Fund should now insist is to strike out Sections 3 and 4 of Article IV of the Articles of Agreement, which prohibit exchange transactions within any country that vary by more than 1 percent from the official parity. This in effect forces the continued imposition of exchange control.

The adherents of exchange control have devised derogatory names for freedom. They call free-market rates “floating” rates, “drifting” rates. What they overlook is that exchange control under fixed police rates merely conceals instability without curing it. It is precisely because free rates do honestly reflect and reveal instability that they force officials to take the steps necessary to restore confidence. And it is precisely this that Finance Minister Abbott of Canada has discovered: “The conclusion I have come to is that we would be better advised not to rely on exchange restrictions but rather on the general handling of our domestic economic situation to keep us in reasonable balance with the outside world.” And the Canadian dollar is strong because he has acted in accordance with this conclusion. For the first seven months of the fiscal year which began April 1, for example, Canada had a budget surplus of $604,700,000. There has been a steadily increasing flow of foreign investment into the country. ⚡
The Limits of Taxation
January 7, 1952

How much taxation can our economy stand? This question will become more insistent than ever when Mr. Truman presents his new budget.

One of the latest efforts to answer it appears in a pamphlet published by the United States Chamber of Commerce under the title: "How Much Can Our Economy Stand?" The pamphlet calls attention to some startling facts.

For the three fiscal years, 1952 through 1954, government expenditures will take on the average approximately one-third of each dollar of the income of every person in the country.

Though Mr. Truman, in his budget message last year, stated that the government “must practice rigid economy in its nondefense activities,” he went on to advocate nondefense expenditures higher than in any previous year in our history and nearly double those of the fiscal year 1948.

To analyze a $57,000,000,000 military appropriation, the Senate Appropriations Committee had the assistance of only one technical staff member.

Personal income taxes now range from 22.4 percent on the lowest bracket to 92 percent on the highest. According to Secretary Snyder’s estimates, there is $68,000,000,000 of personal income available for additional taxation; but more than 73 percent of this amount falls in the income tax bracket of less than $2,000.

If the government seized all personal income above $6,000 it could not get more than $6,500,000,000 additional revenue. This would fall nearly $1,000,000,000 short of this year’s foreign-aid program alone.

The corporation income-tax rate, which never exceeded 40 percent during the second world war, was raised by the 1951 Tax Act to 52 percent. In addition, an excess-profits tax takes 82 percent of corporation earnings in excess of 83 percent of the average of the best three years from 1946 through 1949. Federal taxes can run as high as 70 percent of a corporation’s total earnings.

The Canadian Minister of Finance, D.C. Abbott, said in April 1951: “I am not happy about corporation tax rates when they go over 50 percent. . . . It would be only too easy to take a superficially popular line and increase these taxes to a point which while yielding larger immediate revenues would do great damage in the longer run to the economy as a whole.”

Heavy progressive taxation in the United States is retarding capital formation and the growth of production. Until the past decade our productivity per man-hour increased about 2.5 percent per year. Since 1940, however, the rise in productivity has been below the long-term trend.

The Chamber’s pamphlet concludes that our present tax programs penalize saving and risk-taking and destroy the incentives to work. This conclusion carries additional force if taken in connection with a study made by the Australian economist Colin Clark in the (London) Economic Journal of December 1945. There, as the result of a survey of a large number of countries which he summarized in impressive tables, Clark concluded that “the critical limit of taxation is about 25 percent of the national income, or possibly rather less.” That conclusion was based, as he has since written, “not upon theoretical considerations but upon a study of the actual experience of attempts which had been made, at various times and places, to exceed this limit.”

A 25 percent limit is, of course, purely empiric, not “scientific.” The factors involved are so complex, indeed, that the precise limit to taxation under all conditions is probably indeterminable. Yet Clark’s statistics do, as he declares, “appear to give very considerable support to the hypothesis that once taxation has exceeded 25 percent of the national income (20 percent or less in certain countries), influential sections of the community become willing to support a depreciation of the value of money,” the political forces making for inflation become irresistible, and production is seriously undermined.

We urgently need further statistical studies of the limits of taxation.

More about Arms Aid
January 14, 1952

As I have pointed out in this column before, the distinction between “economic” aid and “arms” aid to Europe is in practice very questionable. Any money or material we give to a European government for any purpose, however specifically earmarked, can simply release that much of its own funds for other purposes. The only way we could make sure that no such diversion of resources was taking place would be to dictate and supervise every item of that government’s budget—which no one dares to propose.

Here are this fiscal year’s armament expenditures of our aid beneficiaries stated as a percentage of (1) their gross national product, and (2) their total governmental expenditures. Our own record is compared.
countries are spending an average of only 25 percent of their total budgets on defense, which means that they are spending 75 percent on nondefense items. They are robbing their own national defense at the cost of comparative luxuries. It is their nondefense expenditures that are responsible for three-fourths of their economic strains and inflation.

Why must American taxpayers pay $5,200,000,000 for Europe’s defense? Why cannot the Europe’s arms-beneficiary governments reduce their nondefense expenditures from $21,400,000,000 to $16,200,000,000, and themselves add the difference to the modest $8,600,000,000 they are spending for defense? Why, because European politicians prefer to spend money on deficits for nationalized industries, food subsidies, socialized medicine, pensions, and other handouts calculated to snare votes at home, should the American taxpayer be called upon to dig in his pocket for what these politicians refuse to pay for their own nations’ defense?

A Ceiling on Spending
January 21, 1952

The most promising approach in a long time to the Federal budget problem is the resolution introduced by Rep. Frederic R. Coudert, Jr., Republican of New York, to limit total expenditures in the coming fiscal year to revenues from present taxes.

If this resolution were passed and adhered to, it would end deficit spending and the inflation that flows from it. It would put a maximum ceiling on overall expenditure for the 1953 fiscal year of, say, the $70,000,000,000 now estimated as the probable tax receipts under existing tax laws; and if the President asked for a total of $85,000,000,000, Congress would send his budget back and require him to submit a new one with $15,000,000,000 slashed from it.

The United States, in short, is spending on armament not only more than five times as much absolutely as these other nine nations combined ($47,000,000,000 against a total of $8,600,000,000); but it is spending for more relatively—14 percent of its gross national product compared with an average of less than 7 percent for the nine beneficiaries.

Now many Europeans contend that this is just as it should be. They would impose a sort of international progressive income tax. Prof. James Meade of the London School of Economics advocated this explicitly in the October 1951 issue of Lloyd’s Bank Review: “The United States, with its higher real income per head, should contribute a higher proportion of its national income to the common defense. Indeed, it is inevitable that the progressive principle should be adopted.

Baldly stated, this is the view that the man or country that works more, saves more, and produces more somehow owes part, if not half, of the difference to the man or country that works less, saves less, and produces less. The London Times has carried the “progressive principle” to even greater lengths. “If it is true, as, seems likely,” it wrote on Dec. 19, “that Britain’s [armament] effort is the maximum that is possible economically, and the United States effort is the maximum that is possible politically—for there can hardly be any economic limits to her capabilities . . . ” In other words, no burden can possibly be too big to lay on our taxpayers.

But the second percentage column of the foregoing table is even more significant than the first. The United States is devoting 68 percent of its total Federal expenditures to armament. (Or 75 percent, if our foreign arms-aid program is included.) This means that only 25 to 32 percent of our total government outlay goes for nondefense items. But the arms-beneficiary

separate authorization for each special purpose. And the President should not be allowed to spend the whole of these separate authorizations if their total exceeded the overall maximum Congress had previously fixed. He would have to make his own specific cuts (but be permitted no specific increases) to bring the sum of the special authorizations within the authorized overall total. In other words, he could spend only whichever sum was lower.

This double limit would permit Congress to say in effect: “If we are to avert further inflation our government, like everyone else, must live within its income, X billions of dollars is the largest tax burden that can safely be laid on the American economy at this time without destroying incentives and disrupting production. Our government must keep its total expenditures within that sum. We in Congress are seldom in a position to know precisely what specific sum is necessary for each specific purpose or what precise amount can safely be cut from each specific request. We are therefore often compelled to give the President the benefit of the doubt on specific authorizations. But we do know that the American economy cannot stand more than the overall ceiling we have fixed. It is up to the President to make his own detailed cuts; but he must cut his suits to fit his available cloth.”

Congress could not use this plan to evade its own clear budget responsibilities. If it first fixed an overall expenditure ceiling of, say, $70,000,000,000, and then went on to authorize a series of special appropriations totaling $80,000,000,000, including pet projects of its own not asked for by the President, it could not reasonably complain if the revised budget presented by the President cut out all the projects or increases added by Congress or (what might be even more serious) included all the authorized pork-barrel or inessential expenditures but applied the whole required cut to some essential activity with the straight-faced argument that the overall total permitted by Congress did not allow enough funds for it.

The double-limit plan, in short, though it would put more specific responsibility on the President, would fail if Congress tried to use it to evade its own legitimate responsibilities.

But what is immediately essential, regardless of the procedure used, is that total expenditures for the new fiscal year be kept at least within the revenues that would be raised by existing taxes. The only alternative is a further wave of inflation whose fateful consequences cannot be foretold. By every calculation of possible yields from still higher income-tax rates, by every test of a tolerable burden, the tax ceiling has already been reached.

One Message Too Many

January 28, 1952

At this time of year the conscientious congressman or editor, or for that matter any conscientious citizen anxious to “keep abreast of things,” has an enormous amount of homework to do. The President dumps in his lap three messages—on the State of the Union, on the Budget, and on the Economic Report. The first anyone can usually assimilate; it is comparatively short, and read by the President in person. The budget message is a necessary evil. But at least we could be spared the economic report. Its information is secondhand. Its chief recommendations are and ought to be found in the other two messages. And the rest consists mainly of giving “scientific” and “economic” reasons for what the President has done or wants to do for political reasons.

The economic report, in brief, is Administration propaganda paid for by the taxpayers, and it promulgates more fallacies than the rest of us have time to answer. The latest opens with the declaration that; “The past year has been marked by great gains in our basic economic strength.” The unwary reader might be led to suppose from this that the ideal way to increase our economic welfare is to have an immense diversion of men and resources to war and armament.

On the next page we learn that “Our total [1947] output, measured in 1951 prices, was more than $90,000,000,000 higher than in 1939.” Our curiosity piqued by this, we turn to tables in the rear, and find that our 1939 total output, measured in 1939 prices, was $91,000,000,000. But measured in 1951 prices it was $179,000,000,000. So we have increased the total output even of 1939 by $88,000,000,000, simply by changing the measuring rod! We can get our national income up to any figure merely by depreciating the dollar.

We are not surprised to learn a little later that “true economy” is something vastly different from economy. True economy means “the making of necessary outlays,” and all of Mr. Truman’s proposed $85,000,000,000 of outlays are of course necessary. And anyway, it is better “to run a deficit of limited size and duration in the Federal budget” than “to run a deficit in our national security effort.” And much more semantics of the same kind.

The truth is that all three messages are profoundly disheartening. They contain no acknowledgment anywhere that inflation is caused by the government’s own...
policies of reckless spending, deficit financing, low interest rates, using the Federal Reserve Banks as a dumping ground for government securities—in short, of increasing the supply of money and credit. Instead, on top of unparalleled armament and civilian spending, Mr. Truman can think only of still more spending—subsidized housing, socialized medicine, Federal aid to education, bigger social-security payments, bigger “public assistance,” bigger veterans benefits, the St. Lawrence Seaway and power project, bigger farm price supports, bigger handouts to Europe, bigger handouts to the “underdeveloped” countries.

And after asking for all these expenditures that increase inflation, he promises to “control” and “contain” inflation by the fraudulent, dangerous, and disruptive device of price control. He asks, in addition, for still more strait-jacket controls over the economy. Not once does he promise to balance inflation—by simply ceasing to create more money and credit.

Not only does Mr. Truman show no understanding of inflation. He shows no understanding of how and why wealth is created. His cure for the bottomless poverty of Asia, like his cure for everything else, is more handouts from the U.S. Treasury. This, he tells us, will avert “stomach Communism,” The phrase is revealing. It implies that Communism is a cure for empty stomachs rather than a cause of them. The real cure for empty stomachs is capitalism. It is economic freedom that brings maximum production of food and clothing and housing. And not until the “underdeveloped” nations understand and adopt a free market economy will they emerge from their misery.

‘Where Would You Cut?’
February 4, 1952

For the last eighteen years, whenever a congressman or a mere taxpayer has ventured to express concern about the ever-mounting total of Federal spending, he has been promptly squelched by some Administration spokesman with the rhetorical question: “Where would you cut?”

The question is seldom asked as a sincere quest for information. It is a taunt, uttered in the assurance that there are certain politically sacrosanct causes, and that none will dare question the amount of any expenditure made in the name of such causes. The sacred word in Washington today is “defense.” In our cities it is “education.” In England it is “full employment.” Any private business that tried to run its budget on this incantation basis would soon be on the rocks. And so, eventually, will a government.

The basic fallacy involved in the question “Where would you cut?” is that it assumes the burden of proof to be on those who wish to make economies. But the real burden of proof obviously belongs on the executive who proposes the spending. It is his job to make a positive case for every dollar of that proposed spending. And in the whole fantastic new budget of $85,400,000,000 there are very few places where this positive case has been seriously made. Mr. Truman’s defenders seem to think it is enough to say of any questioned item: “Secretary Brannan has asked for it,” or: “The Army has asked for it.” But no private firm could afford to assume that a mere unsupported request was a sufficient reason for increasing the spending budget of one of its departments.

Mr. Truman asks, for example, the tremendous sum of $10,500,000,000 for “military, economic, and technical assistance” to foreign governments in the next fiscal year. He demands this huge sum on familiar rhetorical grounds: “We cannot . . . isolate ourselves from threats to other free men,” etc. But he never tells us why the amount should be $10,500,000,000, nor why the NATO governments of Europe cannot pay more than $8,600,000,000 this year for their own armament, though they manage to find $21,400,000,000 for non-defense expenditures, largely socialistic. (See this column Dec. 10, 1951, and Jan. 14.)

Those who assert it is the responsibility of Congress rather than the President to bring spending down to a bearable level by cutting the budget item by item have simply never stopped to consider what this would mean. The $85,400,000,000 for which Mr. Truman asks is the aggregate amount to be spent by 1,252 different organizational units. How can Congress determine to exactly how much, if anything, each of these 1,252 spending or getting units is entitled? Particularly when the individual budget of each one of these agencies or categories is in turn usually made up of hundreds of items?

Not only does Mr. Truman show no understanding of inflation. He shows no understanding of how and why wealth is created. His cure for the bottomless poverty of Asia, like his cure for everything else, is more handouts from the U.S. Treasury. This, he tells us, will avert “stomach Communism,” The phrase is revealing. It implies that Communism is a cure for empty stomachs rather than a cause of them. The real cure for empty stomachs is capitalism. It is economic freedom that brings maximum production of food and clothing and housing. And not until the “underdeveloped” nations understand and adopt a free market economy will they emerge from their misery.
The individual taxpayer, in brief, is seldom in a position to say precisely where the budget should be cut, but he can say how it should be cut. We will not have an orderly and responsible budget until we reform our entire budgetary procedure. (See this column Dec. 24, 1951.)

But the first and indispensable step is for Congress to adopt the Coudert resolution. It should send Mr. Truman's unbalanced and irresponsible budget back to him with the request that he submit a revised budget cutting his proposed $85,400,000,000, of spending down at least to the $71,000,000,000 of revenues expected under present tax laws. If the President declines this opportunity to use his own scalpel, he can hardly complain if Congress applies a meat ax.

Delusions of ‘Productivity’
February 11, 1952

One of the grounds of the steel-workers’ union demand for higher wages before the War Stabilization Board is “increased productivity.” The new wage pattern set by the WSB decision will ostensibly apply only in steel, but precedent may impose it on all industry. The principle of “annual improvement” increases in wages therefore deserves far closer scrutiny than it has hitherto received.

1—Most of the clauses in wage contracts providing for “productivity” increases are fraudulent, because the specified annual wage increase must be granted unconditionally, whether or not the anticipated increase in productivity actually occurs.

2—Virtually all labor operates with tools or machines of some sort. There is no such thing as pure “labor productivity”; there is only combined labor-land-capital productivity. The production ascribable to labor cannot be physically separated from the production ascribable to machines.

3—An increase in the productivity of a particular machine, plant, company or even industry does not necessarily imply a general increase in productivity. Or vice versa. The Bureau of Labor Statistics has estimated that from 1939 to 1950 productivity per man-hour (which in longhand means man-machine-method-management hour) went up 23 percent in the bituminous coal industry but down nearly 13 per cent in anthracite. Would John L. Lewis favor, say, raising wages 23 percent in the bituminous mines and cutting them 13 percent in the anthracite mines?

4—The overall increase in man-hour productivity is very difficult to measure. An estimate hitherto widely accepted among statisticians is that in the long-run past, productivity has risen about 2½ percent a year. But there is little evidence that this rate has held in recent years. Estimates recently released by the Manufacturing Census of 1947 show that the physical output of manufacturing was 84 percent higher in 1947 than in 1939—using 1939 “weights”—and 69 percent higher using 1947 weights. But man-hours in manufacturing increased in that same period by 68 percent. Therefore, using 1939 weights, productivity per man-hour increased only 9½ percent in those eight years, or at an annual rate of barely more than 1 percent. And if we use 1947 weights we find no increase in productivity per man-hour at all! Yet vast sums of capital were invested in that period in new tools.

5—Between 1939 and 1947 straight-time hourly earnings increased 89 percent, and gross hourly earnings 95 percent. In the same period wholesale prices of manufactured products rose 82 percent. In the absence of a real increase in physical productivity, higher hourly wages can only be paid, in the long run, out of higher prices.

6—Throughout our history, competition and the free market economy have been solving, infinitely better than any bureaucrat could, the problem of how the gains of increased productivity should be distributed. To the extent that added productivity has been brought about by an increase in the individual worker’s own effort or skill, the gain has gone directly to the worker. To the extent that the gain has been brought about by more capital investment (more or better factories and machines) enough of the gain has gone to the investor to pay an adequate return. But any increase of profits to the pioneers and risk-takers has been transitory. In the long run the gains from higher productivity have been diffused through the whole nation in the form of lower prices than otherwise to consumers. In other words, we have increased the ratio of wages to prices.

7—The proposition that the whole increase in productivity brought about by a new or better machine should go to the particular worker who operates the machine is absurd on its face. It completely contradicts the principle of equal pay for equal work. Its application would give no incentive to any investor or employer to buy or build a machine, no incentive for progress, no gain for consumers. It would not merely be inflationary, but reactionary and disruptive. And no one would be worse hurt by it than labor itself.
Calling the Market Black
February 18, 1952

In the spring of 1947 I was a dinner guest in the home of a Cabinet minister of a European country that shall remain nameless. Generous portions of butter were served. “From the black market,” volunteered my host. “Everybody in this country has to go to the black market for butter; nobody could get along on the official ration.” And he seemed quite forgetful that he was a member of the government that had imposed a price and a ration that he himself felt forced to violate.

He was merely part of what has become an established world hypocrisy. Today bureaucrats try at nearly every point to stop the market process from functioning. Fortunately for production and trade, they are never completely successful. So they denounce the markets that they have illegalized, but cannot prevent, as “black.”

But they have more respect for the black markets than they pretend. This was unconsciously revealed by Sir Stafford Cripps when he slashed the official value of the pound in 1949 from $4.03 to $2.80—and gave as his reason for choosing the latter figure the fact that this was the value the black markets of the world had been placing on the pound!

When free markets are forbidden, black markets become the best and often the only available guide to real values. If they did not exist, moreover, in many parts of the world the most essential commodities would either not be raised, made, bought, and sold at all, or only in far smaller quantities. Millions of people in the world today literally owe their very lives over the last dozen years to the black market, which is the only resort when price fixing has become too absurd, disruptive or intolerable.

It is high time the black market received the recognition it deserves. It gets it with the publication of The 1951 Black Market Yearbook by Franz Pick. Born in Czechoslovakia, educated at the Universities of Leipzig and Hamburg, Dr. Pick in 1945 started in New York a monthly report on world black money markets. His book lists the official and black-market fluctuations in the prices of dollars in the currencies of 54 countries, gold in 33 international trading centers, and of silver, platinum, and diamonds.

The book is dedicated “to the more than 2,000,000,000 victims of inflation, who, for obeying the law, have been punished by the law.” It is full of fascinating tables, graphs, and other information. You can find here that at the end of 1951 the black-market value of the British pound was $2.40 (compared with its official parity of $2.80); that the black-market value of the West German mark was 5.13 to the dollar (close to the official par of 4.20); that the German Eastern zone mark sold at 21 to the dollar; that black markets in American dollars flourish even in draconian Moscow, where the Russian ruble trades at 25 to the dollar (officially it is 4 to the dollar); that the Nationalist Chinese yuan had reached 425,000,000 to the dollar in September 1949; that the Chinese Communist dollar was 38,500 to the American dollar at the end of 1951, but the National Taiwan dollar in Formosa was less than 27 to the American dollar; and that in Cairo, gold sovereigns that bear the effigies of Kings, and not of Queens, are preferred by Mohammedan hoarders.

To these facts and tables Dr. Pick adds his own comments and predictions. His definitions are unconventional: Hoarders are “individuals who have no confidence in the skill of their country’s monetary management, and who prefer illegal ownership of gold or hard currency to the legal expropriation by patriotic possession of paper money.” Devaluation is “the unpunished crime of state bankruptcy.”

Dr. Pick believes that the future of the dollar “is not as rosy as the hoarder in Buenos Aires or Shanghai sees it to be.” He concludes that world inflation is likely to continue, and that “black markets are here to stay,” because “more and more people will disregard existing regulations in order to preserve the remaining value of whatever possessions they may have.”

Price-Control Follies of 1952
February 25, 1952

No one seriously expects that Congress will obediently extend price control for two more years, repeal the Capehart and Herlong amendments, and “strengthen” the Defense Production Act by giving the President the still more sweeping discretionary powers he now demands. What seems most likely to happen is an extension of substantially the present or a “weaker” price-control law for another year. But unless this is accompanied by stringent Congressional curbs (which are improbable) on further monetary inflation by Federal Reserve policy, Mr. Truman will have achieved the real purpose of his message, which is both to continue price control and to throw the blame on Congress for any further inflation.

The basic cause of inflation is the increase in the supply of money and credit. This increases most people’s monetary purchasing power, cheapens the dollar, and forces up prices. Not once, however, does Mr. Truman’s
message acknowledge this overwhelmingly dominant cause. True, after devoting seven-eighths of his message to the need for “strong price control” as the remedy for inflation, he does get around in the end to “other” (and presumably subordinate) “anti-inflation powers needed to do a completely effective job.” Even here, however, he throws his whole stress on the alleged need for curbing the kind of credit which is least inflationary—consumer installment credit. He says not a word about curbing the overall growth of bank credit, particularly the most inflationary kind, Federal Reserve credit.

What, then, is Mr. Truman’s own theory of the chief cause of inflation? It is almost impossible to tell from his message. He implies reasons that are clearly wrong, and then contradicts even some of these. He talks at times as if inflation were caused by “scarce supplies” of goods. This, however, is contradicted by the Federal Reserve Board, which shows industrial production at an index rate of 218 in January 1952, compared with 199 in June of 1950 and 109 in 1939. Moreover, he himself goes on to point out that “the wholesale price index rose 17 percent in the seven months from June 1950 through January 1951, and the consumers’ price index rose 8 percent”—when, as he adds, “there were no shortages of any kind.”

Then what caused the price rise? According to the President, “consumers” and “businessmen” went on a “buying spree.” But he never asks where they got the extra money for the buying spree. Had those who drafted his message looked up the figures, they would have found that in this same period when wholesale prices increased 17 percent, the country’s bank loans increased 17 percent; and in this same period when the consumers’ price index rose 8 percent, demand bank deposits increased 8 percent! It was this increased bank credit that financed the price rise.

In calling for “stronger” price control, Mr. Truman is particularly outraged by the Capehart amendment, under which price ceilings must allow for cost increases incurred between the Korean war outbreak and July 26, 1951. But his own examples prove how necessary this amendment is, in common fairness, if we retain the folly of price control. One product, he says, had to be granted a 5 percent price increase under the amendment, though the OPS had previously scheduled a 4 percent reduction. But this simply means that without the amendment the OPS would have blindly or ruthlessly imposed a further squeeze in the profit margin of a firm whose profit margin had already been reduced by rising costs!

His whole attack on the Capehart amendment reveals that Mr. Truman wants to use price control to effect a political redistribution of income by cutting profits even below the pre-inflation level to make possible still higher wage awards by the WSB—the “Wage Stimulation Board.”

Price control is a fraudulent “protection” against the money inflation that the government itself permits or creates. Congress should force a halt to any further increase in the money supply, and let price control expire.

---

**Footnote on ‘Statism’**

March 3, 1952

In this excellent new book, *How to Keep Our Liberty* (see Books), my colleague Raymond Moley has a prefatory “Note on Terminology.” Like all of us who try to write sense on economic and political questions today, he is troubled by the strange perversions and reversals that have taken place in recent years in the meaning of words: A ‘liberal’, as he points out, “was once a person who opposed the intervention of the state in the life and affairs of the individual. Now the word is used as self-description by those who favor such intervention.”

So Moley defines his own chief terms in advance. “Interventionism” accurately describes the trend toward a socialist state, but he thinks a shorter and better word is “statism.” He defines it as “a policy or philosophy that advocates a progressive trend of intervention by government in economic, social, and personal life.”

The term with this meaning fills a long-felt need. Moley’s own book, in fact, is largely devoted to countering the danger of statism, and we have to identify and label a trend or a philosophy before we can effectively combat it. But as Moley points out: “Recent use of the term [statism], mainly by opponents of the trend, has anticipated the lexicographers.”

I should like to supplement my colleague’s remarks on the word with a few notes of my own, as I happened to play a part in its adoption. I first became acquainted with the term “état” in the writings of the Austrian economist Ludwig von Mises, whose great book *Socialism* I reviewed in *The New York Times* in 1937. He used the term to mean “the doctrine of the omnipotence of the state, and, as a policy, the attempt to regulate all mundane affairs by authoritative commandment and prohibition.”

Though Mises probably did more than any other writer to establish the term and the meaning, neither was original with him, as I have since learned, but goes back some half a century. It was originally used by French critics of interventionism (*état* is the French...
In early December, had fallen by Feb. 27 of this year to 186.48. On the stock market, industrial shares have declined sharply since the middle of January.

The break in wholesale commodity prices has been pretty general. It has been particularly severe in grains, and in the metals and raw materials—copper, lead, zinc, wool, rubber—that went up most following the outburst of the Korean war. The severe shortages of steel, aluminum, lead, and copper that appeared to exist a couple of months ago have been easing or disappearing. Spots of unemployment have developed. And in a few lines—cotton textiles, for example—there is a definite depression.

This decline has been the consequence of several main causes:

1—The expectation in recent weeks that a truce would be arrived at in Korea.

2—The deferment of government schedules on many war items.

3—Recognition that previous fears of shortages had been exaggerated. This has brought a halt to "inventory hoarding." In addition, the need of corporations for cash to pay income-tax installments, or for other purposes, has been causing them to reduce inventories or to sell part of them.

4—Profit margins are now being squeezed by price ceilings on one side and by higher taxes and higher wage demands on the other.

5—In recent months, the Federal Reserve authorities have ceased to follow inflationary policies.

It is the last factor that needs particularly to be emphasized. The banking system has not for a long time been buying long-term 2½ percent government bonds at par or better. On Feb. 20 the Federal Reserve Banks held $22,400,000,000 of government securities, a reduction of $1,250,000,000 from Jan. 2, and the lowest holdings since May of last year. Interest rates have been allowed to creep higher. The rate on short-term bank loans to commercial borrowers, for example, rose from an average of 2.68 in June 1950 to 3.27 in December 1951. The rate on long-term U.S. government bonds was allowed to rise from an average of 2.33 in June of 1950 to an average of 2.70 in December 1951. Total loans of reporting member banks of the Federal Reserve System were $34,633,000,000 on Feb. 20, a decline of $870,000,000 from Dec. 26, compared with an increase of $278,000,000 in the corresponding period a year ago.

To sum up, what has been taking place is a lull in the inflation. The business and price readjustments that have been occurring are unavoidable whenever an inflation is allowed to come to a halt. If the government

The Lull in Inflation
March 10, 1952

Evidence has been rapidly accumulating in recent weeks that inflation has come to a temporary halt. The government’s old index of wholesale prices, which rose from 157.3 at the outbreak of the Korean war in June 1950 to a peak of 184 in March a year ago, had fallen in the week ended Feb. 19 to 174.8. The Dow-Jones daily spot commodity price index, which reached as high as 224.61 in February of last year, and as high as 197.85
is now content simply to let things alone; if it does not start pumping new money into the system; if Mr. Truman keeps Federal expenditures in the next fiscal year to the $71,000,000,000 that he expects to raise from present taxes, and does not embark on a course involving a stupendous deficit of $14,000,000,000; and if the War Stabilization Board does not precipitate a new round of wage increases by its steel decision, the inflation will halt in its tracks.

So the present situation is a test of the sincerity of the Administration, of Congress, of farmers and union members, and of businessmen. If they are really opposed to inflation they will not start taking or demanding desperate measures to keep it spiraling upward. The Administration will not ask for a continuation of price control, for there will be no longer any excuse for it. All that Congress will need to do is to remove the temptation from Federal agencies to start inflating again merely by removing their present powers to do so. (For details, see this column, Nov. 26, 1951.)

Case against Price Control
March 17, 1952

A year or so ago a leading Mexican banker wrote me that agitation for price control was rising in his country, and that those who favored it were citing the United States as the great example of how successful such controls had been in the second world war. Could I send him a list of the outstanding studies, pro and con? More recently, I received letters from students assigned to the negative of the topic chosen for national intercollegiate debate: “Resolved, that the Federal Government should adopt a permanent [sic] program of price and wage controls.” These students had been referred to some of my Newsweek articles or to my Economics in One Lesson. Could I refer them to further literature against price controls?

The answer was not easy. In favor of government price control there were tons of official propaganda in all languages, and plenty of theoretical fireworks by academic statists and New Dealers. But analyses and documentation critical of price control, except those buried in legislative hearings, were appallingly scarce.

At last, however, a good critical literature on price fixing is beginning to emerge. I should like to speak here of three outstanding recent pamphlets: Price Fixing for Foodstuffs, by Earl L. Butz, head of the Department of Agricultural Economics at Purdue University (American Enterprise Association, 4 East 41st St., New York City, 17); American Agricultural Policy during Rearmament, by Karl Brandt (Food Research Institute: Stanford University, Stanford, Calif.); and The Price of Price Controls, by the Committee on Economic Policy (Chamber of Commerce of the United States, Washington, 6, D.C.).

Every one of these pamphlets is opposed to price control, and each is excellent in the field it covers. They combine a sound theoretical analysis with telling illustrations and facts. They recognize that inflation is caused primarily by increase in the supply of money and credit, and that the way to halt inflation is to halt this increase. They all point out that free-market prices perform a vital function. “Price is the device that determines how we use our resources and how we distribute our national product. Prices tell producers what to produce and tell consumers what and how much to consume” (Butz). And they explain how price control destroys this guide. They show how price ceilings curtail and distort production, encourage wasteful consumption, create shortages, and necessitate priorities, rationing, and subsidies to make them work at all over any long period. They point out that price control inevitably means profit control and gives a government bureaucrat power of life or death over an industry.

They cite liberally from the absurdities of price control in the second world war. “A lumber producer testified,” says the Chamber of Commerce pamphlet, “that his customers desperately needed one-inch boards, but due to OPA ceilings he could not sell these and break even, but he could sell three-inch boards and make a small profit. His customers were required to recut lumber to their specifications at increased cost.” “Early in 1942 [writes Butz] some farmers were being fined 42 cents per bushel for wheat grown in excess of their quota, at the very same time their neighbors were purchasing ‘feed’ wheat from the government [imported from Canada] which was subsidized approximately 49 cents per bushel.” Butz also points out that retail food prices have risen no more than factory wages since before the second world war.

FOOTNOTE ON ‘STATISM’
Since the appearance of my column of March 3 on “Statism,” a correspondent has pointed out to me that the word “Stateism” was used in a speech in Omaha as early as February 1940 by Herbert Hoover. The former President there contrasted the concept of “Stateism with its political bureaucracy, directing, dictating, and competing with farmers, labor, and business,” and controlling “price, wages, farms, . . . industrial output, and investment,” with the concept of “a free enterprise regulated to prevent abuses.”
Are These Handouts Necessary?
March 24, 1952

The whole foreign giveaway program—whether it is labeled “direct military aid,” or “defense support” (the latest euphemism for economic handouts), or Point Four—needs to be completely reexamined. In this task neither Mr. Truman’s message to Congress nor his radio and television appeal to the nation will be found of help. Both appeals were chiefly rhetorical and openly partisan.

Mr. Truman accused anyone who wants to cut his $7,900,000,000 request by even a small amount as “demagoguing in favor of economy.” He resorted to inventing straw men as the only alternatives to his quixotic giveaway schemes. Straw Man No. 1 was to make “premeditated and deliberate war” on Soviet Russia. As no influential group in this country is proposing such a thing, it was recklessly irresponsible for Mr. Truman to feed Communist propaganda by talking as if there were one. Straw Man No. 2 was to “abandon our allies and hole up on this continent.” No influential group is suggesting this either, and it was equally irresponsible for Mr. Truman to give our European allies the false impression that there is such a group and such a proposal.

Neither Senator Taft nor former President Hoover has proposed that we repudiate the Atlantic treaty. And neither of them, nor any other serious person, has proposed that we actually cut off trade and stop buying necessary goods from the European continent. But a responsible body of opinion here has doubted that it is wise or necessary to pour heavy American land forces into Europe in peacetime and to give away as many billions to as many countries as Mr. Truman and his aides recommend. (We have giveaway—i.e., “economic”—missions today in 40 countries.)

Mr. Truman’s message and radio appeal were distinguished by self-righteous rhetoric, gross caricature of opposing views, and a contemptuous absence of facts. He assured the public that his figure of $7,900,000,000 was “not just taken out of the air” but was “the result of many months of careful study.” But in his whole message to Congress he gave not the slightest hint of how the figure was arrived at. How much did the other NATO nations spend, individually and collectively, on defense and other items of their government budgets in the twelve months ending June 30, 1950? In the twelve months ending June 30, 1951? In the current twelve-month period? How much of their own money are they planning to spend for these purposes in the next fiscal year? What is the ratio of these sums to their respective national incomes? And the ratio of their defense to other government expenditures?

Nowhere in a message of 7,000 words devoted solely to the subject did Mr. Truman find room to mention any of these figures. How did our bureaucrats decide how much European arms and goods it is up to us to supply? And above all, how did they decide that American taxpayers had to give these arms and goods to European taxpayers—that the latter just cannot afford to pay for any of these themselves?

When Mr. Truman’s message does venture into the realm of fact, we get a howler: “Europe has moved faster toward integration in the last five years than it did in the previous 500.” This is blandly said at a time when inter-European trade is sunk in currency chaos and tied up in the most vicious network of exchange and import controls in centuries!

Mr. Truman’s message is obscure even on the most basic facts. He is asking for “only” $7,900,000,000, but his budget two months ago set down a total of $10,500,000,000 for foreign aid. Presumably this is still the amount he actually plans to spend on foreign aid in the 1953 fiscal year. Why is there no mention of this fact in his message or radio talk? Again about $7,000,000,000 is already available for foreign aid. If Congress does vote all the new funds requested by the President, then apparently some $15,000,000,000 will be available all together for such aid. Why wasn’t this even mentioned by the President? Surely the subject needs clarification.

Inflation and High ‘Costs’
March 31, 1952

From Sept. 3 to Oct. 1 last year there appeared in this space a series of articles called “Inflation for Beginners” which have since been made available to Newsweek readers in the form of a pamphlet. These articles sought to explain how and why: “Inflation, always and everywhere, is primarily caused by an increase in the supply of money and credit.”

There was nothing peculiar or particularly original about my explanation. It corresponded closely, in fact, with “orthodox” doctrine. It is supported overwhelmingly by theory, experience, and statistics. It may be pointed out once again, for example, that the doubling of retail prices since 1939 has been primarily caused by the increase in the supply of money and credit (currency plus bank deposits) from less than $65,000,000,000 at the end of 1939 to $188,000,000,000 today.
But this simple explanation still meets with considerable resistance. The Truman Administration denies or ignores it, because it places responsibility for inflation squarely on its own doorstep. Few of the academic economists are helpful. Most of them are attributing present inflation to a complicated and disparate assortment of factors and “pressures.” Labor leaders vaguely attribute inflation to the “greed” or “exorbitant profits” of manufacturers. And most businessmen have been similarly eager to pass the buck. The retailer throws the blame for higher prices on the exactions of the wholesaler, the wholesaler on the manufacturer, and the manufacturer on the raw-material supplier and on labor costs.

This last view is still widespread. Few manufacturers are students of money and banking; the total supply of currency and bank deposits is something that seems highly abstract to most of them and remote from their immediate experience. As one of them writes to me: “The thing that increases prices is costs.”

What he does not seem to realize is that a “cost” is simply another name for price. One of the consequences of the division of labor is that everybody’s price is somebody else’s cost, and vice versa. The price of pig iron is the steelmaker’s cost. The steelmaker’s price is the automobile manufacturer’s cost. The automobile manufacturer’s price is the doctor’s or the taxicab-operating company’s cost. And so on. Nearly all costs, it is true, ultimately resolve themselves into salaries or wages. But weekly salaries or hourly wages are the “price” that most of us get for our services.

Now inflation, which is an increase in the supply of money, lowers the value of the monetary unit. This is another way of saying that it raises both prices and “costs.” And “costs” do not necessarily go up sooner than prices do. Ham may go up before hogs, and hogs before corn. It is a mistake to conclude, with the old Ricardian economists, that prices are determined by costs of production. It would be just as true to say that costs of production are determined by prices. What hog raisers can afford to bid for corn, for example, depends on the price they are getting for hogs.

In the short run, both prices and costs are determined by the relationships of supply and demand—including, of course, the supply of money as well as goods. It is true that in the long run there is a constant tendency for prices to equal marginal costs of production. This is because, though what a thing has cost cannot determine its price, what it now costs or is expected to cost will determine how much of it, if any, will be made.

If these relationships were better understood, fewer editorial writers would attribute inflation to the so-called “wage-price spiral.” In itself, a wage boost (above the “equilibrium” level) does not lead to inflation but to unemployment. The wage boost can, of course (and under present political pressures usually does), lead to more inflation indirectly by leading to an increase in the money supply to make the wage boost payable. But it is the increase in the money supply that causes the inflation. Not until we clearly recognize this will we know how to bring inflation to a halt.

The ‘Stabilization’ Hoax
April 7, 1952

Nothing has more clearly revealed the complete hypocracy of the Administration’s so-called stabilization program than the Wage “Stabilization” Board’s decision in the steel case. The board granted the steelworkers’ unions practically every major demand of whatever nature. It awarded straight general wage increases of 17½ cents an hour, plus higher premium pay for workers on second and third shifts, plus reduction of geographical differentials, plus holiday pay and longer vacations. On top of all this, it recommended the union shop. Altogether, it is estimated that these changes would raise the steel industry’s direct labor costs by 25 to 30 cents an employee hour.

The industry itself estimates that these increases would cost the companies about $1,000,000,000 a year, which would require an increase of about $12 a ton in steel prices (now about $110 a ton) to offset it. It is not believed likely that price officials will grant increases of more than $5 or $6 a ton at most. But no one denies that some increase in the price of steel will be unavoidable.

Yet Nathan P. Feinsinger, the Wage Board chairman, blandly assures us that its recommendations, if adopted, “would not start another round of wage increases or set a new pattern.” This statement is flagrantly contrary to fact and experience. Philip Murray has already revealed that he will now extend his demands to steel fabricating plants. We shall soon hear from other labor leaders. As three of the Wage Board’s industry members declared: “Rather than resolving disputes, it is creating more disputes; rather than combating inflation, it is creating more inflation.” In the Wright Aeronautical case, as they point out, the board’s recommendation even exceeded the original union demand.

Technically the Wage Board’s “recommendation” is not binding. But in plain fact the pressure on industry is such that the board’s decision amounts to one-sided
compulsory arbitration. The board solemnly tells the parties to the dispute to go ahead and arrive at its foreordained result by “collective bargaining”! This turns collective bargaining into a sham and a mockery. What is left to “bargain” on when the board has announced in advance that its decision is “in all respects fair and equitable”?

It is especially ironic and absurd, as the industry members of the board point out, that “the largest [wage] increases in history” should be recommended by a board “which purports to be engaged in stabilizing wages.” Worse, the board threw “the weight of the government in support of the proposition that employees should be required to join a union as a condition of holding their jobs.”

The board’s recommendations constitute compulsory arbitration for the companies but not, of course, for Philip Murray. He can simply threaten to strike if he does not get precisely the settlement he wants. And apparently no one in Washington questions the right of union leaders to bring the production of steel or anything else to a halt, even in wartime, unless their demands are met. As long as we grant legalized monopolies to industrywide unions, the only way we can prevent strikes is to give the union leaders just what they ask for.

Even if a sincere attempt were made to impose wage and price ceilings by a uniform rule, the economy would not be free and the controls would not work. But the existing situation is infinitely worse. Completely different standards and formulas are applied, and different agencies set up, to fix prices on the one hand, and to “stabilize” wages on the other. This process is a disguised and dangerous way of trying to effect a political redistribution of income. The insincerity of the whole “fight” against inflation is further emphasized by the objections of the Treasury and of Leon Keyserling to discontinuance of the inflationary bond-support policy by the Federal Reserve Board.

But Congress has one way out, before too much further damage is done. It can let the whole mess of price fixing and wage “stabilization” powers expire on June 30 next.

Price Fixing without Tears?
April 14, 1952

If the government does not increase the money supply, price ceilings are unnecessary. If the government substantially increases the money supply, price ceilings are futile. They represent a hypocritical effort by the government to “protect” the consumers against the consequences of its own inflationary policies.

But price ceilings, though in the long run futile, are never harmless. They curtail and distort production, encourage wasteful consumption, and intensify shortages. They give a set of government bureaucrats life-or-death powers over industry. They are used as a political weapon to try to distribute economic favors and penalties. And when wage controllers and price controllers (usually two different sets of officials loath to recognize each others’ existence) try to push up wages and hold down prices, they put dangerous strains on the economy.

What Congress ought to do now, of course, is simple. It ought to allow the whole network of price fixing and wage “stabilization” to expire on June 30. The Controlled Materials Plan in its present form should expire with it. War contractors could be granted enough “tickets” to get priorities for the strategic metals or other raw materials they need for themselves or their subcontractors. The remaining supply of such materials would then be “allocated” by supply and demand working with free prices in free markets. Today the rationing and allocation problem is created by price controls. Arbitrary ceilings hold these materials below the prices to which free markets would bring them. This creates shortages both by reducing production and by encouraging wasteful consumption.

But confused economic ideas and the present political atmosphere combine to make it highly improbable that Congress will do anything so simple and sensible as to allow price-and-wage control to expire. Too many congressmen honestly believe that under present conditions price fixing is really necessary. Others will vote for its continuance for purely political motives. They are afraid of being accused of favoring the “profiteers,” and of refusing to give the President the “weapons” to “fight” inflation. They are afraid of being blamed if prices actually do continue to go up.

If price fixing is destined to be prolonged, therefore, at least two main safeguards are necessary to minimize all the harm which it would do.

The first is to extend the price-control powers only for a short term (not more than a year at most), and in addition to put several emergency triggers on their termination. Congress should provide that the price- and wage-fixing powers can be terminated at any time by a vote of either House of Congress or by Presidential proclamation. With Congress always in a position to terminate the powers, the control officials would have to pay constant regard to sentiment in Congress and refrain from arbitrary rulings in defiance of that sentiment. Mr. Truman, on the other hand, could not argue...
that he was being forced to continue price fixing by Congressional edict, and his successor would be free to terminate the powers as soon as he wished.

But even more important would be an amendment to deprive the Federal government of its present power to inflate. This could best be done by depriving the central Federal Reserve authorities of their power to lower the rediscount rates or to order the purchase of government securities in the open market by the Federal Reserve Banks. (See this column of Nov. 26.)

If the Federal government no longer had the power to inflate, it would have no excuse for using its price-fixing powers to “combat” inflation. Prices would not rise (or at most very moderately), and therefore Congress would not be blamed for a price rise. Price-fixing powers would lose their popularity with the Administration, because they would be accompanied by deprivation of the power to inflate. In fact, in order to get back its power to inflate, the Administration might itself order termination of the price control law. But this action would educate the country in the real economics and politics of inflation.

It Is Happening Here
April 21, 1952

Mr. Truman's attempt to justify his illegal act in seizing the steel industry was demagogic, intemperate, and full of distortions. Under his Wage Stabilization Board's "fair and impartial" recommendations, he contended, "the steel workers would simply be catching up with what workers in other major industries are already receiving." Well, according to government statistics, the workers in all manufacturing industries are earning an average of $1.64 an hour and the steel workers an average of $1.88 an hour. The workers in all manufacturing industries are earning an average of $67 a week and the steelworkers an average of $78 a week. How much more do the steelworkers have to get above the average in order to "catch up"?

Mr. Truman can’t be referring to living costs, because the earnings of the steelworkers have already gone up 13½ percent since the outbreak of war in Korea, whereas living costs have gone up only 11 percent. What is Mr. Truman's catch-up formula? How does he let everybody catch up with everybody else and still pretend to hold wages down?

The moment Mr. Truman turns to prices and profits; he considers all talk of catch-up formula outrageous. He never tires of denouncing the Capehart amendment, which is only a limited catch-up formula for price ceilings.

The President’s discussion of steel industry profits is a statistical nightmare. “The steel companies,” he says indignantly, “are now making a profit of about $19.50 on every ton of steel they produce.” This is double nonsense. After taxes and other costs, as Clarence B. Randall, the president of the Inland Steel Co., has estimated, the steel companies in 1951 made less than one-third of this amount. And neither Mr. Truman’s $19.50 nor the steel industry’s estimate of about $6.50 was made on every ton of steel. Either figure is an average. Marginal companies have been making considerably less, and they would have to halt production if their narrower margins were wiped out.

The most glaring omission from Mr. Truman’s speech was of course his complete failure to mention the fact that his board's order would establish compulsory unionism throughout the steel industry, compelling every worker in it to knuckle down to Philip Murray to hold his job.

Let us glance back over the last twenty years and reexamine the economic ideology that has dominated the government, and the policies to which it has led. The New Deal began with the assumption that the unions— all unions—were so weak that they needed the paternalistic help of the government. It also assumed that unions could do no wrong. It compelled an employer, however small, to “recognize” and “bargain” with the union, however large, that once succeeded in getting the votes of more than 50 percent of his workers. No matter how unreasonable the demands made by a union leader, the employer was forced by law to “bargain” with him and him alone. This union leader was in effect granted a Federal certificate of monopoly.

But this is not all. The employer had to bargain “in good faith.” How does one bargain in good faith? Obviously, by making concessions. Even this is not enough. The employer must concede all the union’s final demands, whatever they are. For if he does not, the union will strike. And then, of course, it is not the union but the employer who, in Mr. Truman’s phrase, is guilty of being “willing to stop production.”

This is the baneful logic that has led Mr. Truman to his present course. Industrywide unions are Frankenstein monsters created by Federal law. They have the power to bring the whole industry of the country to a halt unless their demands are met. For there is no longer any way to combat a strike. The government has legally deprived the employer of whatever effective way he formerly had of combating a strike. He is not allowed to break off negotiations with the union—or
threaten to discharge strikers and hire other permanent workers in their place. The strike must succeed. If the employer will not himself yield to the union demands, the next step is for the government to appoint an “impartial” wage board to recommend that this is the only “fair and reasonable” thing for him to do.

Of course, if you are a New Deal President, you do not stop there. You know that if the companies are permitted to charge higher prices to pay the higher wages, the public will blame you for the higher prices. So your next step is to forbid the companies to ask higher prices while compelling them to pay higher wages. If the companies say no, then you seize and denounce the companies and blandly argue that no other course was ever possible. You contemptuously ignore the legal procedure prescribed by Congress. You seize private property without a shadow of legal authority on the contention that this is the only way to prevent a strike.

You pretend that this course is bold, though it is really pusillanimous. You take it because you have legally deprived yourself of all power to combat a strike, because you don’t know how to stop it except by buying it off, by forcing employers to pay the ransom demanded and because, for political reasons, you have made the government completely subservient to union policy. Of course by buying off one strike threat, you reward it and buy yourself a hundred others. You leave yourself no way to solve these in turn except by seizing each industry successively until you have brought on some form of fascist-socialism.

The minimum legal lessons for Congress are plain. It must allow the President’s price-and-wage-fixing powers to expire on June 30. No government can be trusted to use such powers wisely or impartially, and least of all the present one. Congress should also repeal altogether the Wagner-Taft-Hartley Act; but if it lacks the clarity and courage to do that, then it must at the very least withdraw the present legal compulsion on employers to recognize and bargain with industrywide unions.

There is only one alternative: Either we make it legally possible once more for a strike to be broken, or we yield completely to constantly mounting union demands. There is no other alternative and no longer any excuse for believing that there is one. 

Toward Equality of Incomes?
April 28, 1952

We often hear of the “equalization of incomes” in England. We seem less aware that a similar transformation has been going on right at home. But in measuring either the growth or “redistribution” of incomes there are many traps for the unwary.

On March 5, for example, The New York Times carried a long article by Will Lissner announcing a “social revolution” since the 30s. “The poor,” he wrote, “have become better off. Where three out of four families had incomes of less than $2,000 a year in 1939, only one out of three fell into that class ten years later. The well-to-do... have become more numerous. In the late ’30s, one family in about 50 was in the $5,000 and over income class. ... In the late ’40s, one family out of six. ... Over the decade [that of 1939 to 1949] median family incomes rose from $1,231 to $2,949.” And much more to the same effect.

As they stand, such comparisons, if not meaningless, are grossly misleading. They are in terms of “current dollars” (though this fact is not explicitly pointed out by Lissner), and the cost of living rose substantially in the decade selected (more than 70 percent, in fact), so that an income would have to go up at least that much in dollars in order to remain the same in terms of what it would buy. Not only is this readjustment not made in the foregoing figures; the reader is not warned of its need or given the basis for making it for himself. Yet without such an adjustment all sorts of statistical miracles are possible in any inflation. Today a Frenchman with the equivalent of $3,000 is a millionaire in terms of his own francs.

There has, however, been a striking “redistribution” of incomes in the United States, as the recent studies of Simon Kuznets and others show. The full Kuznets findings are still [on] press, but summaries have already been made public by two of his colleagues in the National Bureau of Economic Research, Arthur F. Burns and Geoffrey H. Moore. I have room to cite only a few comparisons. The upper 1 percent of income recipients in the U.S. received 16 percent of the countrywide total income in 1913. 17 percent in 1929, and 9 percent in 1948. How substantial the shift has been between 1929 and 1948 can be shown by one comparison. To achieve perfect equality of incomes, the share going to the upper 1 percent could have declined only 16 points (from 17 percent to 1 percent). But it actually declined by 8 percentage points, or half the mathematically attainable maximum.

How did this shift occur? Analysis can give at least part of the answer. Most wealthy people receive a relatively large portion of their income from property rather than from salaries. In 1929, for example, the upper 1 percent received 32 percent of their aggregate income from dividends, interest, and rent. Now on a per capita
basis, employee compensation increased 134 percent between 1929 and 1948, “entrepreneurial” income 145 percent, rental income only 26 percent, and dividends only 6 percent: while interest payments per capita actually declined 21 percent.

Higher money income per capita is of course always desirable to the extent that it means a real increase in purchasing power. But whether greater equality of income is desirable or not may depend largely on how it is brought about. To the extent that it depends on maintaining artificially low interest rates, it is dangerous because such interest rates create and continue inflation. To the extent that it depends on holding down rents to uneconomic levels it means that in the long run not enough housing will be built or kept in repair. To the extent that it is brought about by excessive corporation taxes and excessive personal income taxes on the higher brackets it will undermine and eventually destroy incentives to the investment and production on which we all depend. But to the extent that it is brought about by a real increase in productivity on the part of the lower income groups it is not only wholly desirable, but tends to be solid and permanent.

**Perónism and Trumanism**

May 5, 1952

Strangely little attention has been given to the striking parallel between the economic and political policies of President Truman, culminating in his seizure of the steel industry, and the economic and political policies of the Argentine dictator Perón, culminating in his seizure of the newspaper *La Prensa*. Yet the parallel has been underlined by Mr. Truman himself. Asked whether he could also seize newspapers under his “inherent powers” doctrine, he replied that a President has the power to do anything that (presumably in his own judgment) is for the best interest of the country. A week later, while denying any intention to seize the press, Mr. Truman reaffirmed his power to do so in an “emergency.”

The parallel is even more striking because both seizures were made on practically the same excuse. Mr. Truman contends that his seizure of the steel industry was the only way to prevent a strike; Perón contended that his seizure of *La Prensa* was the only way to settle a strike. Mr. Truman’s way of preventing a strike was to order the employers to pay a thumping wage increase, Perón turned *La Prensa* directly over to the unions. Yet Perón took pains to act with more color of legality than Mr. Truman. He did not seize *La Prensa* by his personal ukase. He asked for, and got, a Congressional law authorizing the seizure.

The parallel may be extended. Neither Perón nor Mr. Truman has any faith in free enterprise or free markets. Both want to fix prices; both want to dictate wages. Each gives as his excuse for this that he is “fighting inflation”—the very inflation that his own monetary and fiscal policies have created. (Since Mr. Truman became President in April 1945, the money supply of this country—adjusted deposits plus currency—has been increased from $138,000,000,000 to $183,000,000,000. Since Perón became President in 1946 the currency of Argentina has been increased from 2,581,000,000 pesos to 17,704,000,000 pesos.) Each poses as the champion of the “underprivileged,” the *desamisados*, the “shirtless.” Each courts and subserves the unions.

What has caused this parallel to be overlooked is the persistence of the spurious interpretation that Communist propaganda long ago imposed on Western intellectuals. This is that Fascism is essentially a movement of the conservatives of the Right—“the last desperate effort of capitalism to save itself.” This interpretation has from the beginning ignored the open facts. Fascism, Nazism, Perónism, have all been bitterly hostile to “plutocracy” and to “laissez faire capitalism.” None of them tolerates free prices, free wages, free markets. They demand government control of wages, prices, profits, dividends, interest rates, investments. “Nazism” is, we should not forget, merely a contraction of the official title, National *Socialism*—or, more completely, the “National Socialist German Workers’ party.

It is a groundless myth that German labor was from the beginning opposed to Hitler. As Ludwig von Mises wrote in *Omnipotent Government* in 1944: “Although the closed-shop system was not carried to the extreme in Weimar Germany . . . it had gone far enough . . . [The worker] had to join one of the unions. . . . German labor was not greatly disturbed when the Nazis finally forcibly incorporated all trade-union members into their Labor Front.” It was too late when German labor at last became disillusioned—when it found that by gleefully conniving at Hitler’s crackdown on employers, it had put its own neck in the noose.

We need not labor the moral. American workers and American intellectuals have been off guard for the last twenty years, because they have been looking for the danger of fascism from the wrong direction. If they acquiesce in lawless action now, because it is taken in the name of unionism, of jacking up wages and slashing “outrageous” profits, they’ll deserve precisely what’s
coming to them once they have allowed the doctrine of executive omnipotence, above the law, to establish itself. ✥

We Took a Wrong Turn
May 12, 1952

In the course of his opinion holding that the seizure of the steel industry was illegal, Judge David A. Pine pointed to some of the presuppositions behind the Administration’s argument:

“Assuming the disastrous effects on the defense effort envisioned by the defendant, that can come about only in case of a strike, and that presupposes that the United Steelworkers will strike notwithstanding the damage it will cause our defense effort. It also presupposes that the Labor Management Relations Act, 1947, is inadequate when it has not yet been tried, and is the statute provided by Congress to meet just such an emergency. And it further presupposes, as defendant apparently does, that, this statute being inadequate, Congress will fail in its duties, under the Constitution, to legislate immediately and appropriately to protect the nation from this threatened disaster. I am unwilling to indulge in that assumption. . . .”

Judge Pine might have mentioned still another unstated presupposition in the Administration’s argument. This is that when the head of an industrywide union threatens to bring a whole industry to a halt unless his demands are met, there is no way to counter his threat; we must simply hasten to grant his demands. The Administration has come to regard it as unthinkable that a strike should be allowed to fail, or that employers should have once more the freedom that they had prior to the passage of the Wagner Act to discharge strikers and peacefully hire other workers in their place.

And Congress has made itself impotent by its own legislation. It has put in the hands of irresponsible private individuals the power to bring the whole industry of the country to a halt. And instead of acting to take such power out of these hands, Congress treats the strike orders of a Philip Murray or a John L. Lewis like some inescapable “national emergency.”

The truth is that twenty years ago the whole labor policy of the country took a wrong turning. Congress was sold the one-sided idea that there was only one cause of labor disputes—unfairness to labor. On that assumption it concluded that there was one all-sufficient cure for labor disputes, which was to make every union stronger, to strengthen its bargaining position further, to help it to win strikes or prevent it from losing them.

It put more legal weapons into the hands of union leaders at the same time as it illegalized counterweapons by the employers. In 1932 it passed the Norris-LaGuardia Act (reputedly drafted by Felix Frankfurter) which put paralyzing restrictions on the right of the Federal courts to grant injunctions against strikes and strike practices.

The next major step of Congress (after the temporary Section 7a of 1933) was the Wagner Act of 1935. Under this the government itself was in effect set up as a union organizing agency. It provided the election machinery. It named the “appropriate bargaining unit.” It threw any “company-dominated” union off the ballot—which seemed to mean, in practice, any union that could be shown to be on friendly terms with the employer or that was not affiliated with the AFL or the CIO.

Under this government tutelage union membership was built up from about 4,000,000 just prior to the Wagner Act to some 15,000,000 today. Industrywide unions have been legally granted the right to cripple the nation, even in time of war.

What is urgently needed now is not ex-post-facto authorization by Congress for further industry seizures by the President, but fundamental revision of our whole labor policy of the last twenty years. No private organization can be allowed to retain the power to coerce the public by paralyzing industry. Congress should clarify the antitrust laws as applied to labor unions. It should drastically revise the Norris-LaGuardia Act. And it should restore the provisions in the Taft-Hartley Act as originally passed by the House (they failed to carry by only a single vote in the Senate) which removed the compulsion on employers to bargain with industrywide unions. ✥

The Philosophy of Seizure
May 19, 1952

Where did Washington ever pick up this preposterous notion that the way to prevent or settle industrywide strikes is to seize the property of the victims of the strikes? The idea was not born in the last few weeks. The late “Clear-it-with-Sidney” Hillman told a special committee of the Senate in April 1941, when strikes were crippling our defense plants, that he opposed any legislation that would interfere with unions but would favor government seizure and operation of defense plants closed by strikes. Even prior to this, under Section 9 of the Selective Service Act of 1940, Congress had given the President statutory authority to seize war facilities. Franklin D. Roosevelt began seizing the plants and
properties of employers whenever an important strike occurred in them.

In June of 1943, John L. Lewis called a coal strike against a decision of the War Labor Board and offered to call it off only if the government would seize the mines and operate them itself. Then on June 25, 1943, Congress passed the Smith-Connally “antistrike” act, over the President's veto, which again authorized government seizure of war facilities, but with the restriction that any plant so seized “shall be operated under the terms and conditions of employment which were in effect at the time possession was taken.” One sequel to this was the seizure of Montgomery Ward in April 1944, when President Avery was carried bodily out of the plant.

According to one private score card, President Roosevelt ordered the seizure of four aircraft-manufacturing companies, three shipyards, all the railroads, all the coal mines, several utility companies, dozens of motor-transport companies and more than 150 industrial plants and shops. Of the 48 seizure orders he issued, 41 were to enforce labor demands. The Truman seizures have covered anthracite and bituminous coal mines, oil refineries, pipelines, packinghouses, railroads, and traction systems. And he ordered all of them ostensibly to stop or to prevent strikes. On this excuse the government has been “in possession” of the railroads of the country for 21 months (since Aug. 27, 1950).

What gives the idea of seizure its strange appeal? The legal logic behind it is too confused to follow. Why should it be perfectly all right to bring the steel output of the country to a halt if private investors own the plants, and wrong only if the government “owns” them? Production is just as crippled, and the national safety as much imperiled, in the first case as in the second. The theory seems to assume that government does not exist to protect the property and interests of citizens, but only to protect its own property and interests. You can strike against the public safety but “you can’t strike against the government,” yet even on this rear-end-first theory, seizure rests on a legal technicality, even on a legal fiction. For the government “owns” the property only for the purpose of settling a strike. And the strike is settled, not because workers fear to strike “against the government,” but because the government manager offers the strikers, out of other people’s money, substantially the increase they asked for.

This is the real motive behind the seizure policy. It is the product of a statist and socialist philosophy, it assumes that private employers can’t be depended on to pay “fair” wages, so the government must seize their property and force them to do so—knowing, of course, exactly what “fair” wages are. In the railway strike crisis of 1946, Mr. Truman even went before Congress to propose a measure under which: (1) When a strike occurred in an essential industry the essential industry was to be seized by the government; (2) under such seizure the President was to “establish fair and just wages”; but (3) the property owners were to be denied any profits!

Government seizure abridges property rights, rewards strikers, and penalizes the struck-against. Its real purpose is to impose a government-dictated wage increase. The threat of it is used not to restrain the demands of union leaders but to force employers to grant them. It destroys free collective bargaining. And it creates the very crisis it professes to solve.

Inflationary Double-Talk
May 26, 1952

At his press conference on May 8, Mr. Truman, asked whether the chief danger was inflation or deflation, replied that the country had to guard against both: and that was why it was necessary to have control powers—to prevent either one.

There is nothing new in this Scylla and Charybdis analogy. It runs like a refrain through the speeches of Leon Keyserling and the reports of the Council of Economic Advisers since that body was created. What is significant is Mr. Truman’s own espousal of the doctrine at this time. On top of the hasty removal of restrictions on the use of “strategic” metals, on state and local bond issues, on housing, on real-estate credit, and especially on general installment buying, on top of the violent denunciations by Administration spokesmen of every effort of Congress to economize at any point, this statement makes it unmistakably clear that what the Administration really fears and fights now is any lull in the inflation, any sag in the boom prior to election. In brief, it is prepared to throw all its “anti-inflation” policies into reverse.

It would of course serve Mr. Truman’s political purposes ideally if he could get Congress to swallow this fighting-both-devils-at-once doctrine. He could then continue both to inflate and to “fight” his own inflation. He could step on the accelerator of credit expansion with his right foot while he stepped on the resulting price increases with his left—always saving the country in the nick of time. The politicians of Europe have made a very good thing of this. The result is known there as repressed inflation.
The principal methods by which governments inflate are: (1) huge governmental spending, particularly deficit spending; (2) monetizing the public debt; (3) pegging or forcing down interest rates; (4) ordering wage boosts; and (5) encouraging private credit expansion. The Truman caliphate has resorted to all these methods. The principal methods by which governments pretend to “fight” inflation are by price fixing and wage fixing, usually accompanied by allocations, rationing, and subsidies.

These two sets of powers give a government unanswerable weapons for punishing political opponents (by crushing taxation, price rollbacks, profit cuts, inadequate allocations, seizures) and for rewarding political supporters (by favorable allocations, price or profit increases, wage increases, and subsidies). Through its life-and-death powers over everyone’s economic prospects, it has the power to keep everybody in line.

Politically attractive as such powers are to a ruling clique, they make no sense economically. They imply that a free economy cannot balance itself, but that the DiSalles and Arnalls and Feinsingers know just how to do it. They imply that inflation is some disaster that falls upon a country from the outside, like a flood or a plague of locusts. Inflation is in fact always and everywhere the creation of governmental policy. It is caused by the increase in the supply of money and credit. The way to halt it here is not to give the President “emergency” powers to halt it, but to deprive him of his present power to inflate. That the Administration knows how effective this deprivation would be is evident from its vehement objections whenever any proposal arises in Congress to free the Federal Reserve System from Treasury dominance.

As for price control, it cannot be repeated too often that as a cure for inflation it is completely fraudulent. It not only diverts attention from the real cause and cure of inflation. It adds further evils of its own. It abridges human liberty, encourages waste, and disrupts production.

The course before Congress is clear. It should allow price-control and wage-control powers to lapse completely. It should deprive the Administration of its present power to inflate. And it should repeal the provisions in its labor laws which compel employers to bargain with industrywide labor monopolies and which give those monopolies the power to bring the nation’s production to a halt.
I predicted here on Sept. 11, 1950, “becomes an excuse for holding down prices while permitting or encouraging wages to rise.”

And it is as a political device that Mr. Truman has used his price- and wage-control powers from the beginning. He and his agencies have demanded catch-up formulas for wages while denouncing even partial catch-up formulas for prices. Though hourly steel wages had already gone up since Korea more than the cost of living, though they were already 14 percent higher than the average of all manufacturing wages, Mr. Truman discovered that steel wages needed still another rise of 14 percent on top of this to “catch up.” But he becomes outraged whenever he speaks of the Capehart amendment, which allows sellers to pass on in prices any additional expenses up to July 26, 1951.

If Congress were now to insist that the same standard be applied to both price and wage control, then either each price would be allowed to go up as much as the cost of living goes up (which would increase the cost of living still further), or wages would not be allowed to go up any more than the cost of living had gone up prior to July 26, 1951—no matter how much further it goes up hereafter. But if Congress continues the President’s existing power to boost wages and to squeeze prices and profits, and adds authority to seize industries, the end result must be to disrupt production and to destroy free enterprise. *

---

**How Europe Curbs Inflation**

*June 9, 1952*

I have been meaning for weeks to discuss here a remarkable address, now available in pamphlet form, delivered in New York on Jan. 23 by Per Jacobsson, the economic adviser of the Bank for International Settlements at Basle (“Credit Policy: Recent European Experience”; National Industrial Conference Board; 247 Park Avenue; New York 17; 50 cents). This speech describes a gradual return toward monetary sanity in Europe that few Americans seem to be aware of.

At the end of the first world war most countries were eager to return quickly to stable currencies and to the gold standard. But after the second world war, under the influence of Lord Keynes, they preferred cheap money and deficit spending. This, they supposed, was the secret of perpetual “full employment.”

Keynes’s influence, however, was never as great on the continent of Europe as in England and America. “The continental peoples,” Per Jacobsson explains, “have been faced more immediately with the evils of inflation. They have learned to dislike controls. The imposition of controls has been very closely connected with the Nazi and Fascist regimes.” And contrary to the belief so widely held in 1945 and 1946, that between a capitalist United States and a Communist Russia there would stand a socialistic Europe, Europe has in some respects shown itself to be more “liberal in the sense in which Europeans still use this word—indicating adherence to and belief in a free economy—than either of the two principal Anglo-Saxon countries.”

Jacobsson then goes on to describe the monetary and fiscal policies followed in each of the leading European countries. Switzerland led the departure from cheap money, and the free-market quotation of the Swiss franc was for several years above the corresponding quotation of the dollar. Belgium followed sound policy and soon achieved monetary stability. It was criticized, particularly in England, for permitting unemployment; but Belgian workers supported the policy as holding down prices and helping them to achieve higher real wages.

In Italy, by 1947, prices had risen to 55 times the prewar level. But then—Einaudi, as Governor of the Banca d’Italia and Minister of the Budget, raised interest rates, imposed severe credit restrictions, and cut off all food subsidies. These seemed harsh measures—but they stopped the price rise.

“In the following year Einaudi was almost unanimously elected President of the Italian Republic.”

Following a crisis in Germany in October 1950, the discount rate of the Bank Deutscher Länder was increased from 4 percent to 6 percent. Ordinary bank accommodation could be obtained only at rates between 8 and 12 percent. “It was soon found that the program . . . adopted in Germany was working wonders. . . . The success of the German rehabilitation scheme has had a tremendous effect upon European thinking: It has shown us that a country as burdened with difficulties as Western Germany can, through a resolute credit policy, suddenly reverse its position.”

Jacobsson discusses similar changes in Holland and Austria. Since he spoke in January, policies in the same direction have been adopted in France and Britain. On March 11, for example, the Bank of England increased its discount rate from 2½ to 4 percent.

From this international postwar experience Jacobsson draws some of the principal monetary morals. One is the importance, in curbing inflation, of “a restrictive credit policy including the application of higher interest rates. . . . Of particular importance has been the withdrawal of support for the quotations of government bonds. “The first duty of the [U.S.]
Such a policy has exactly the opposite result of what the President contends. It “prevents” or “settles” a present strike only at the cost of buying a hundred future strikes. For it amounts to a capitulation by employers, government, and public to every major union demand. It rewards extravagant demands; it rewards strikes and strike threats. Under it the unions obviously get more by striking or threatening to strike than by not doing so. Mr. Truman’s policy, in brief, creates the very evil it purports to avert.

A sound solution lies in precisely the opposite direction. It is to stop governmental encouragement of strikes and governmental rewards for striking. It is to take away from union leaders the special immunities and sweeping monopoly powers that have been deliberately conferred on them by Congress. A thoroughgoing reform would involve the repeal or drastic revision of the Norris-LaGuardia Act of 1932, which makes the granting of a private plea for a strike injunction practically impossible, even where union intimidation and coercion are involved, and the repeal or drastic revision of the Wagner-Taft-Hartley Act, which in effect turns the government into a union-organizing agency. The minimum change would be to restore the provision in the Taft-Hartley Act, as originally passed by the House, which removed the compulsion on employers to bargain with industrywide unions.

Mr. Truman’s high-handed seizure of the steel industry raised a larger and deeper issue, which even an adverse six-to-three decision of the Supreme Court did not remove. This is the danger to our free-enterprise system of the hostility to it shown by the President, not only in his steel seizure, but in his incredible onslaught of May 26 against the public utilities, in which he threatened to invoke the Corrupt Practices Act against them for having the audacity to defend themselves against his attacks. Such governmental hostility, if long continued, must inevitably undermine confidence and discourage and choke off new investment. If that happens, the free enterprise system will have been effectively destroyed. It is up to Congress to erect safeguards against the execution of such demagogic threats.

Seizure Is No Solution
June 16, 1952

The decision of the Supreme Court that the President’s seizure of the steel industry was illegal and Mr. Truman’s prompt return of the companies to their owners averted a grave constitutional crisis. But as I write this we are back not only to the immediate problem of how to settle the renewed steel strike, but to a larger problem: What can we do about the present ability of nationwide unions to slow down or halt all industry unless their demands are met?

As a solution to this problem, most of the proposals now before Congress are not reassuring. For they propose to give the President the very seizure powers he usurped. They propose to tell him, in effect, that he was right in the first place—that what was wrong was not his policies, but existing law. They would simply give him the power to do legally what he had done illegally. They would give him the power to repeat with every industry the course he followed with steel.

That course may be summarized as follows: (1) When an industrywide union makes a set of demands, no matter how extravagant, they are turned over to a governmental board, packed with “public” members favorable to the unions, for decision. (2) The board then decides that the industry should grant the union demands practically in full—even though this makes a joke of all the previous “stabilization” standards of the board itself. (3) The union leaders and the President then treat this decision as unilateral compulsory arbitration, completely binding—on the employer. (4) If the employer fails to grant the board’s awards in full, his plant is seized by the President, who then imposes the wage increases, compulsory unionism, or other awards of the board.

The tacit assumption behind Mr. Truman’s whole policy, in short, is that there is only one way to prevent or settle a nationwide strike, and that is to grant practically all union demands.

Seizure Creates Strikes
June 23, 1952

Never has a rebuff to a President been so unmistakable, so prompt, and so richly deserved as that dealt by the Senate to Mr. Truman after he had asked Congress to let him continue to flout the Taft-Hartley Act and to give him industry seizure powers instead. And nothing
has so clearly revealed why Mr. Truman can not be trusted with such powers as his argument in favor of them.

Congress, he says, should “encourage the parties to settle their differences through collective bargaining.” But it is precisely his own plan that destroys collective bargaining. When both parties know in advance that their dispute will eventually be turned over to “special [governmental] boards to work out specific proposals” for settlement, then neither party will offer more or accept less than it thinks the special boards will demand of it or award to it.

But Mr. Truman blandly talks as if he can have free collective bargaining and compulsory arbitration at the same time—or even as if they were the same thing! The law he asks for is “to provide for fair and just compensation to the owners for the use of their property during a seizure, and fair and just compensation for the work of the employees.” And this government profit-fixing and government wage-fixing is the way to “increase the incentives for the parties to settle their differences through bargaining”!

Mr. Truman professes to want “sound price and wage stabilization policies” at the same time as he endorses the huge increases awarded to the steelworkers by the Wage Stabilization Board. But before their strike the steelworkers were already receiving an average of $1.88 an hour, compared with an average of $1.64 an hour in all manufacturing industries; steel wages had already increased 20 cents an hour since the Korean war outbreak, compared with an average increase in all manufacturing industries of 19 cents an hour; and steel wages had already gone up in the same period by 12 percent, compared with an 11-percent increase in the cost of living. Even the wage increases and other terms that have already been offered by the steel companies—and rejected by Philip Murray—would rip through the so-called stabilization ceilings and let loose a flood of demands for increases in other industries.

In spite of the constitutional provision that the President “shall take care that the laws be faithfully executed,” Mr. Truman still seems to think that his duty is limited to enforcing only those laws that he happens to like. He tells Congress that for him to apply the Taft-Hartley procedures at this time would be not only “unwise,” but “grossly unfair,” “harmful and futile”; that a court might not grant an injunction anyway, and that even if it did “there is no assurance that it would get the steel mills back in operation.” As Senator Taft has pointed out, these words are “practically an invitation” for the workers to violate the law.

And if the unions would strike even after a Taft-Hartley injunction, why wouldn’t they also strike even after government seizure? The President’s implied but unspoken answer is—because he expects to grant them, at the companies’ expense, the wages and other terms they demand.

Mr. Truman’s seizure solution would, in sum, create the very strikes and strike threats that it professes to cure. It would mean the imposition on industry of the strikers’ terms; and unions would threaten to strike to bring about this very result. It would make a mockery of wage “stabilization.” It would turn price-and-wage control into a political weapon. It would entrench industry-wide unions. It would impose compulsory union membership on every worker. It would undermine free enterprise and eventually injure workers most of all.

The real solution, to repeat, lies in the opposite direction. It lies in allowing price-and-wage control to lapse. It lies in having Congress reverse the course it has pursued for the last twenty years—by removing the sweeping grants of monopoly power it has conferred on union leaders.

Why Not Try Capitalism?
June 30, 1952

The other night I saw the new British film, *The Man in the White Suit.* It is a comedy with rare merits. (See the review in *Newsweek*, April 14.) But it is based on the implicit acceptance of an immemorial economic fallacy—the belief that new inventions destroy jobs and disrupt the economy.

A brilliant but erratic chemist, according to the story, develops a synthetic fabric that will neither stain nor wear out. But as soon as government officials, textile industry leaders, and the textile workers get wind of the discovery, they combine in their determination to suppress it. They argue eloquently (and no one in the film attempts a real answer) that once suits and dresses of the new material are put on the market, nobody will have to buy more than one, and that thereafter the whole textile industry will practically cease to exist, with a consequent permanent loss of capital and employment.

Let’s overlook its convenient forgetfulness of such sources of demand as style changes, personal size changes, and the desire for a varied wardrobe, and grant the picture’s central assumption that the invention of a stainless and wear-out-less fabric would permanently reduce the demand for clothing to, say, one-tenth of its present level. Then consumers would spend on clothing
Economic and technical progress does not destroy jobs, and capitalism (contrary to the implication of The Man in the White Suit) does not oppose or retard economic and technical progress. On the contrary, capitalism—the system of free, competitive enterprise—is the indispensable condition of maximum economic and technical progress.

[*The title of the film was corrected in the following week's column to The Myth in the White Suit.—Ed.]*

The Fallacy of Point Four

July 7, 1952

Two items in The New York Times, published nearly a month apart, combine to throw a brilliant light on our foreign handout program.

June 16: “The United States will have given away or lent an estimated $40,000,000,000 or more in postwar foreign aid by the end of this month. . . . More than 90 nations and colonies have received military equipment, economic aid . . . and a thousand other items. . . . Even Communist Russia, Czechoslovakia, and Poland were cut in for $1,000,000,000 before the ‘cold war’ developed . . . The end is not yet in sight.”

May 19: “Western leaders . . . are worried about the lack of any clear signs of improvement in production . . . and in the necessaries of life in the non-Communist underdeveloped areas. . . . The only characteristic [of the West] that the Asians have shown they really want to copy is its technical knowledge and its application of mechanical power to the production of goods and services. . . . These leaders also believe that . . . the West . . . must devote very much more of its . . . wealth . . . to the instigation of economic progress in the vast poverty-stricken regions of the non-Communist world.”

The American advocate of Point Four aid shares this in common with the Asiatic politician who receives it—that neither understands what makes capitalism so enormously productive. It is not “technical knowledge” or the “application of mechanical power.” These are among the results of capitalism, not its causes. It is capitalism that produce[s] the machines that produce consumers’ goods. The cure for the poverty of Asia, in brief, is not handouts from the capitalist United States; it is the adoption of the philosophy of capitalism by Asia.

Capitalism is a set of economic and political principles and institutions. It consists of the marriage of liberty and security. It means freedom to produce and consume, freedom to buy and sell. It means free prices and free markets. With these freedoms it combines the

Tire quality, safety and durability are still being improved. Yet where only 2,300,000 tires were sold in 1910, 30,000,000 were sold in 1920, 59,000,000 in 1940, and 100,000,000 in 1950. More tires were sold, it is true, because there were more automobiles. But better and cheaper tires helped to make better and cheaper—and therefore more—automobiles.
institution of private property; under which a man is entitled to keep the fruits of his labor. It is these freedoms and protections that give so tremendous an incentive to production.

The underdeveloped areas have not yet learned these principles. That is the chief reason why they have remained underdeveloped. The vice of Point Four is that it continues to protect the underdeveloped areas from this knowledge. If they had to go to foreign private investors to borrow the capital they need, these investors would not lend until they were assured of certain minimum reforms (1) guarantees to private property against nationalization, confiscation, or excessive taxes; (2) freedom to withdraw earnings or principal (which would mean the dismantling of exchange control); (3) freedom from vexatious controls generally, such as price fixing, wage fixing, and arbitrary profit limitation. Under such conditions, foreign capital would flow into such areas and speed their development as British capital once speeded the development of the United States.

The reforms that would give most incentive to the investment of foreign capital are happily the same reforms that would give most incentive to the investment of domestic capital. But as long as India or Brazil, for example, can get handouts from the American government without making the economic reforms or giving the economic assurances that private capital would require, then the politicians of these countries need not bother to make these reforms. And so confidence and productivity are not increased. Point Four, in sum, far from speeding up the economic productivity of the world, in fact retards it.

FOOTNOTE ON CONFUSION
My article in the issues of June 30, entitled “Why Not Try Capitalism”, should have been and was entitled in my original copy The Myth in the White Suit. The substitution was due to one of those last-minute composing room misunderstandings that it would take too long to explain but may not be too late to mention with regret. ✴

Our Laws Create Strikes
July 14, 1952

Settlements have a way of suddenly being made even when they seem least likely; and it is possible that, when these lines appear, the steel strike will be over. But it has not been possible, since the extraordinary decision of the Wage Stabilization Board, to settle the strike without destroying the last pretence of a wage “line” or “ceiling.” The strike can now be settled only by bringing a threat of further inflation. For the terms of settlement, even if they prove no more favorable to the strikers than those offered by the steel companies several weeks ago, will not only greatly raise the cost of producing steel; they will let loose a flood of new wage demands and new strike threats from other unions that will insist on catching up with the steelworkers. And, of course, no consistent reason will be left for refusing these demands.

The steel strike is primarily Mr. Truman’s strike. If he and his board had not interfered, it probably would have been either averted or settled long ago, and on far more reasonable terms than it is possible to settle it now. But the Wage Stabilization Board not only recommended wage increases that destroyed even all its own stretchable standards of “stabilization,” but it assumed authority to recommend a union shop. Then, to make it still more difficult to get a settlement, Mr. Truman’s price controllers announced that they were not prepared to allow the companies to pass on in prices the increased government-awarded wage costs. This was an attempt to use price-and-wage control powers, not to stabilize, but to boost wages and to squeeze profits.

Even if Mr. Truman were belatedly to apply the injunction provisions of the Taft-Hartley Act, as Congress has explicitly requested, it is doubtful that this would settle the strike. For he has publicly declared that the Taft-Hartley procedures at this time would be “grossly unfair” and “futile”; he has denounced the companies for “conspiracy against the public interest,” and he has virtually invited the unions to flout the law. Yet though Mr. Truman’s course has encouraged and prolonged the steel strike, Congress cannot escape its share of responsibility. It helped to create this paralyzing nationwide strike by its own legislation over the last twenty years. It still lacks the courage to repeal or amend that legislation. It has granted the unions special immunities from the antimonopoly laws. Through the Norris-La Guardia Act it has made private injunctions against strikes all but impossible. Through the Wagner-Taft-Hartley Act, it has made it perilous or impossible for an employer to discharge strikers and hire other workers in their place. It has made the government, in effect, a union-organizing agency. And it has forced employers to recognize and bargain with industrywide unions.

In the July issue of its monthly Survey, the Guaranty Trust Co. of New York argues ably and temperately that: “The only solution to the problem that is in harmony with the basic American principles of free labor and free enterprise is to limit the size of
The purpose of the typical party platform is to attract as many and to alienate as few votes as possible. It must try to reconcile or compromise conflicting views within the party. It seeks to find verbal formulas that can mean all things to all men. For these reasons nearly all platforms are full of glittering but vague generalities, and often embody outright contradictions. This year’s Republican platform contains its share.

The platform favors “reduction of expenditures.” But it also asks for more aid for veterans, “amendment of the Old Age and Survivors’ Insurance System to provide coverage for those justly entitled to it but who are now excluded,” and aid to farmers apparently as lavish as any being provided by the Democrats.

The platform deprecates the encroachments of Federal jurisdiction. But it believes in “enacting Federal legislation to further just and equitable treatment in the area of discriminatory employment practices.”

The platform favors “the expansion of mutually advantageous world trade.” It promises to “press for the elimination of discriminatory practices against our exports.” It supports our reciprocal-trade agreements “on a basis of true reciprocity.” But then it promises to “safeguard our domestic enterprises and the payrolls of our workers against unfair import competition.” It does not tell us what kind of import competition is “unfair.” One gathers, however, that we may not extend the same cordial welcome to imports from other countries as we expect them to extend toward ours.

Contradictory virtues, too, are claimed for the Taft-Hartley Act. We are told that it guarantees “the right to a job without first joining a union.” But we are also told that it guarantees “the right to establish ‘union-shop’ contracts by agreement with management.” Now, obviously, wherever the majority of a union or a group of union leaders establishes a union-shop contract, the individual loses his right to hold a job without joining a union.

The platform is ambiguous on important points. It promises, for example, to “remove . . . injurious price and wage controls.” Each reader must decide for himself whether this means that the Republican Party will remove all price and wage controls because such controls are necessarily injurious, or whether it will remove only those particular price and wage controls that in its opinion happen to be injurious.

The platform is eloquent in defense of economy and free enterprise. Yet it favors “a farm program aimed at full parity prices for all farm products . . . commodity loans on all nonperishable products . . . expanded soil conservation . . . [and] further development of rural electrification.” Only the Brannan plan could top this for expensiveness.

Yet when all this has been said, the Republican platform, for those who believe in economy and free enterprise, will probably prove incomparably preferable to the Democratic platform; just as the Republican record will probably prove incomparably preferable in this respect either to the past or the prospective Democratic record. On every economic ground this is a far better Republican platform than that of 1948. The monetary policies are courageous and in themselves sound, and would more than justify a change of Administrations:

“1—A Federal Reserve System exercising its functions in the money and credit system without pressure for political purposes from the Treasury or the White House.

“2—To restore a domestic economy, and to use our influence for a world economy, of such stability as will permit the realization of our aim of a dollar on a fully convertible gold basis.”

I am sorry that space does not permit me to point out more fully how much courage, understanding, and good sense are embodied in each of those two declarations. Faithful adherence to them could bring an immediate end to the threat of further inflation.
Price Control by Default
July 28, 1952

Price control today makes no economic sense; and yet it has been renewed. It is not a cure for inflation; and yet it has been retained. It is not a minor nuisance. It distorts and curtails production. It is a dangerous political weapon in the hands of the regime in power—a weapon by which it seeks to reward its friends and punish its enemies. Its prolonged retention imperils the free-enterprise system.

There was no irresistible majority demand behind the continuance of price control. The House, in fact (as shown by the vote on the Talle amendment), wanted to discontinue most of it. Both the House and the Senate passed provisions that rejected the dangerously harmful controls imposed by the International Materials Conference. Yet the Truman-dominated conference committee succeeded in throwing out all these provisions. The House, after less than an hour’s debate, meekly accepted the committee’s reversal. So we still have a price-control law nearly as bad as the one that expired.

The renewal of the law has already done great harm. It has been responsible, for example, for further prolonging the steel strike. Many of the steel companies were willing from the start to accept even the record wage increase awarded by the Wage Stabilization Board if they were permitted to pass on the increased labor costs by a corresponding increase in prices. But up to a late hour Price Administrator Arnall was still standing in the way of a settlement by refusing to grant such an increase.

Yet if price control makes no sense economically, and if even the political demand for it is so doubtful on net balance that Congress did not want to renew it, how did Mr. Truman succeed in getting it renewed? The answer is that while there has been some public awakening to the futility and folly of price control, this awakening has not yet gone far enough. Congress renewed price control because it was afraid that the Administration would otherwise try to pin the blame on it for any further price rise. And yet Congress failed to put into the law the only provisions that would have prevented such a price rise. The real cause of inflation is the increase in money and bank credit. Congress could have prevented the Administration from inflating further simply by making the Federal Reserve Board independent of Treasury or Presidential dictation; by restoring at least the previous 35 and 40 percent required reserve ratios of the Federal Reserve Banks, and by depriving the Federal Reserve authorities themselves of the power to inflate further.

The statement issued by Mr. Truman when he signed the new controls law betrayed the contradictions in his case. “At a time,” he wrote, “when our defense production is still expanding and necessarily contributing to inflationary pressures, the Congress has weakened price controls.” But defense production does not necessarily contribute to inflation at all. It does so only to the extent that it is not financed either out of increased taxation, or out of reductions in previous nondefense expenditures. It does so, in short, only to the extent that it is financed by deficits, themselves financed by increasing the money supply.

Congress, the President complained, “has virtually canceled selective credit controls.” But selective credit controls are the last refuge of the inflationist and the controlist. They encourage bureaucratic favoritism and discrimination between different firms, industries, and group interests. The only honest, workable, and free-enterprise way to stop inflation is through overall credit controls. In fact, it is merely necessary for the Federal authorities themselves to stop inflating—to stop monetizing government bonds, to stop holding down interest rates to inflation-stimulating levels.

But the Administration wishes to continue to inflate, by increasing the money supply, while pretending to “fight” inflation with price control. And Congress, by its new law, has enabled it to do precisely this. What Mr. Truman was really struggling for was not a cure for inflation but a campaign issue. And Congress, because of its own confusion, gave it to him.

‘You Never Had It So Good’
August 4, 1952

A couple of weeks ago I risked here the prediction that for those who believe in economy and free enterprise, the Republican platform would probably prove incomparably preferable to the Democratic platform. The prophecy proved to be quite safe.

The Democratic platform opens with the same theme song it has sung for twenty years. It is still fighting the campaign of 1932, still blaming the world depression on Herbert Hoover, still claiming credit for every advance in position or production that anybody
has made in the last twenty years through his own efforts.

In its offers to hand out the taxpayer’s money to every imaginable pressure group, the Democratic platform reaches new heights of vicarious generosity. It demands bigger unemployment benefits, bigger public-assistance programs, bigger old-age benefits, more Federal spending for medical care, school lunches, housing of every kind, including that for “middle-income families,” and more handouts to veterans. In fact, America, out of the fullness of your, the taxpayer’s, bottomless income, is going to pour out money to “lift the living standards” of practically everybody on earth, including specifically the Arabs and “the people of the Middle East.” Presumably a Democratic Administration will give Iran still more money as a suitable reward for seizing oil wells and refineries vital to the security of the Atlantic Pact nations and for stirring up anti-Americanism.

The farm handout program deserves special mention. The platform specifically “applauds” Congress’s recent action “in setting aside the ‘sliding scale’ for price support through 1954” and endorses a “mandatory price support program at not less than 90 percent of parity.” Even leading farm organizations have shrunk from such Federal lavishness, fearing its ultimate consequences. But in the Democratic platform this is only a beginning. Undeterred by the potato fiasco, the platform demands the extension of price supports “to the producers of perishable commodities, which account for three-fourths of all farm income.” Everybody is going to subsidize everybody else.

In flagrant contradiction to all this, the platform “solemnly” pledges “the preservation of the financial strength of the government.” It believes “in keeping government expenditures to the lowest practicable level.” Doubtless the money for all these spending schemes is to come out of some invisible fourth dimension. We cannot expect any serious discussion of the inflation problem in such a platform, and we get none. There is no recognition of the fact that inflation is caused primarily and overwhelmingly by the increase in money and bank credit, and there is no proposal to check this increase. Even the endorsement of price control blandly cancels itself out: “We pledge continuance of workable controls so long as the emergency requires them . . . and their removal as quickly as economic conditions allow.”

The platform’s attack on the Taft-Hartley Act, however, is outstanding for its lack of candor and disregard of facts. It calls for the “repeal” of the Taft-Hartley Act. Nothing, however, would be more calculated to appall the New Deal Democrats and the labor leaders who direct them than the simple repeal of the Taft-Hartley Act. What they want (though they do not admit it) is the restoration of the completely one-sided Wagner Act. In their absurd charges, the drafters of the Democratic platform seem to have forgotten that the Taft-Hartley law was passed in 1947 not merely by a majority of Republicans but by a majority of Democrats in both houses of Congress.

For the platform to say that the Taft-Hartley Act “has been proved to be inadequate, unworkable, and unfair” is a piece of brazen impudence. In the crippling 54-day steel strike the President did not even try to apply or to work the injunction provisions of the law. Instead he allowed the strike to run until he and Phil Murray had in effect succeeded in forcing the union terms on industry.

In the Wake of the Strike
August 11, 1952

The steel strike was ostensibly directed against the steel companies. But the loss of profit by the companies, and the even greater loss of tax revenues by the government, are now among the less important considerations. What comes foremost is the loss that the strike caused to the country. This has been estimated at some $4,000,000,000. In material terms, it came to 17,000,000 to 20,000,000 tons of steel-equivalent, as Henry H. Fowler, Defense Production Administrator, has pointed out, to “more than the total capacity of Great Britain . . . in a full year’s operation.”

The most telling summary of the loss was made by Defense Secretary Robert A. Lovett: “No enemy nation could have so crippled our production as has this work stoppage. No form of bombing could have taken out of production in one day 380 steel plants and kept them out nearly two months. The weird and tragic thing is that we’ve done this to ourselves.”

Who gained by the strike? The steelworkers? They lost collectively more than $350,000,000 in wages—an average of about $625 each. Even with their new increase, they will have to work a year to a year and a half before they have made up the loss that their self-elected idleness caused them.

Was the strike justified? Necessary? Before it started, the steelworkers were getting $1.88 an hour. This was already 24 cents more than the average wages being paid in all manufacturing industries. As compared with June 1950, at the outbreak of the Korean
war, steel wages had risen 12⁵/₄ percent compared with
an increase of 11 percent in the cost-of-living index. On any plausible “stabilization” formula, therefore, or on any concept of “equity” as compared with other wages, there was no ground for any increase in steel wages. Yet the companies were forced to submit the case to Mr. Truman’s Wage Stabilization Board, which recommended an increase of some 26.5 cents an hour, including “fringe” benefits, and called for compulsory unionism in addition.

Immediately all the pressure and propaganda of the Federal government were thrown into forcing the companies to make this settlement. And the companies, in the end, had to grant an increase equivalent to 21.4 cents an hour, as well as compulsory unionism (with a few escape clauses of negligible practical importance).

What may prove to be even greater than the cost of the strike is the cost of the settlement. It destroyed every pretense that the Administration is trying to hold down wages. It proved once again that there is no wage ceiling that a determined union leader cannot tear through at will. There will now be a flood of demands from other union leaders to catch up with or surpass the steelworkers. Once more the government has bought off one set of wage demands at the cost of provoking a hundred others.

From the first the government was not an impartial arbiter but a party to the dispute. Mr. Truman went on the air to take the side of the unions. He refused to carry out the legal provisions enacted by Congress for precisely such an emergency. He seized the companies in defiance of the Constitution. He prolonged the strike by trying to force a wage increase while refusing a corresponding price increase. When his lieutenants at last granted the price increase, they bitterly threw the full blame for the strike on to the companies struck against. Roger L. Putnam, Economic Stabilization Administrator, accused them of holding “a loaded gun” to the government’s head. He neglected to mention the really loaded guns that Philip Murray and Mr. Truman had held to the companies’ heads.

The leading moral of all this is to get the government out of wage arbitration, and to deprive it of wage-fixing and price-fixing powers. The result of government intervention has been to try to boost wages while squeezing profits; to build up industrywide unions; to encourage and prolong strikes and make their impact more deadly. The ultimate result of such a policy must be disastrous to a free economy. ✴

*Isolating’ Steel Prices*

**August 18, 1952**

Mr. Truman’s Wage “Stabilization” Board recommended a thumping increase in steel wages that tore through every “ceiling” that the board itself had set. Before this increase was awarded, hourly steel wages, since the outbreak of war in Korea, had already gone up more than the cost of living. They were already 14½ percent higher than the average hourly wage paid in all manufacturing industry. Mr. Truman nevertheless did everything possible, including resort to unconstitutional seizure of the steel industry, to force the WSB wage increase on the companies. He tried to do this without granting a compensating price increase. Finally he found that in order to get Philip Murray an additional 11 percent increase in steel wages he had to allow a 5 percent increase in steel prices.

The next step was for Mr. Truman’s price controllers to start bitterly denouncing the steel companies for the 5 percent steel-price increase. They studiously avoided any mention of the 11-percent wage increase, forced on the companies, that had made the price increase necessary.

And then the next step was for the price controllers to announce that they were going to “isolate” the steel-price increase from any inflationary effect by forcing steel fabricators and distributors to “absorb” the whole of it.

Now this sort of talk is as dangerous as it is foolish. It begins by ignoring the fact that the steel-price increase was forced by the steel-wage increase. And even a price controller must know that it is politically impossible to grant a thumping wage increase to one group, already being paid above the average, while denying a similar wage increase to other groups. By its decision on steel wages the Administration has left itself no consistent or plausible ground for denying similar wage increases around the circle.

It is politically possible, of course, at least for a short time, to “isolate” a price increase by forcing special groups of fabricators to absorb it. But we cannot escape the long-run economic effects of such a policy. These groups of fabricators will have their costs raised without having their prices raised. Their profit margins will be forced down as compared with profit margins of producers in other lines. This means that production by these steel fabricators—and especially any expansion of their productive capacity, and new capital investment in their industries—will be discouraged and reduced. Yet the steel fabricators represent the very kinds of production—of guns, shells, tanks, engines, ships—that the
government professes to be most eager to increase. It need hardly be pointed out that this cost-absorption policy is contrary to any principle of equity. It is an attempt to force a special set of producers to assume the entire burden of a cost increase created by a government decision. As profit margin and income are to be cut in order to relieve B. This sets up political discrimination as a policy. Nor would matters be helped by an attempt to penalize all producers in order to help consumers. In the long run, it should be obvious, it can never help consumers to hurt producers. To hurt producers is to hurt production, and to leave less of everything for everybody.

The bureaucrats’ belief that they can “isolate” a particular price rise once more reflects their utter lack of understanding of our marvelous productive system. All prices, wages, and costs are interrelated. The change in a single important price sends repercussions through the whole price network and alters the whole balance of production among different commodities.

It remains to be pointed out once more, finally, that price-fixing is a fraudulent remedy for inflation, and that the Administration’s “fight” against inflation is a sham battle. The cause of inflation is the increase in money and bank credit. The Administration is still busy trying to increase money and bank credit. Its new strategy is what its price fixers are calling “controlled escalation.” As even the friendly London Economist has put it, Mr. Truman “is taking every precaution to insure that the inflation continues through the election period.”

Is Inflation a Blessing?
August 25, 1952

Sumner H. Slichter is professor of economics at Harvard and enjoys in some circles a reputation as a first-rate economist and even as an eminent “conservative.” He has done some instructive work; but when he writes on the subject of money and inflation, as he has taken to doing frequently of late, the result is deplorable. His article in the August issue of Harper’s, “How Bad Is Inflation?” is an epitome of all the shopworn fallacies that have been put forward as apologies for inflation in the last two centuries.

He begins by dismissing the conclusions on inflation by the American Assembly, a group of distinguished economists, as “uncritical and almost hysterical.” The assembly concluded that “inflation is a continuous and serious threat to the stability of the American economy and to the security of the entire Western world.” This judgment was not hysterical, but restrained.

It is Slichter who is appallingly uncritical. He not only thinks that it is easy for a government to plan and control “a slow rise in prices”; he actually believes that an “extreme” inflation “is not easily started.” It would be interesting to learn what his definition is of an “extreme” inflation, and what his concept is of difficulty. Germany inflated until its mark fell to one-trillionth of its previous value. Nationalist China recently inflated until the yuan reached 425,000,000 to the dollar. In Great Britain prices are three times as high as they were before the second world war; in the Argentine (with no “war” excuse) prices are five to eight times as high; in France, more than 25 times as high; in Italy, more than 50 times as high. None of these countries found it at all difficult to get its inflation going, but most of them are finding it politically impossible to stop.

Slichter’s argument throughout is based on assumptions that are neither proved nor warranted. One of these is that a rising price level is necessary for prosperity. This is refuted by a wealth of historical experience. The great American boom from 1925 to 1929, for example, occurred in spite of a falling price level. And Slichter does not seem to know that depressions are caused chiefly by the collapse of previous inflations.

Nor does Slichter seem to understand how inflation temporarily works its magic. It does so only as long as prices run ahead of costs (mainly wages). Then the prospective restoration or increase of profit margins may lead to an increase in production and employment. But the jig is up once labor gets on to the game, and wages and other costs begin to rise faster than prices. The apostles of permanent inflation (“continuous slow inflation) are those who believe that labor can be permanently fooled.

Slichter does not explain in his article by exactly what process a “slow” permanent rise in prices—say 2 or 3 percent a year—could be produced. He does not understand why no nation has yet succeeded in keeping an inflation, once started, under control. He forgets that you can’t afford to tell people in advance that you are planning to cheat them. A government can’t plan a “gradual” increase in prices, because if people know that prices will be 3 percent higher, say, next year, they will bid prices up that much right away. If creditors know that the purchasing power of the money they are asked to lend today is going to depreciate 3 percent within a year, they will add 3 percent to whatever interest rate they would otherwise demand; so that instead of lending at 5 percent, say, they will ask 8.
Most fantastic of all, Slichter advocates a continuous inflation to combat Communism. I refer him to the late Lord Keynes, who wrote a generation ago: “Lenin is said to have declared that the best way to destroy the capitalist system was to debauch the currency. Lenin was certainly right. The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose.”

Amen. And Slichter, alas, is not that one man.

‘Planning’ for 1975
September 1, 1952

Several excellent comments—by The Wall Street Journal, by Lawrence Fertig in The World-Telegram & Sun, and by the Guaranty Trust Co. of New York in its August Survey—have already appeared on the massive five-volume report put out by the President’s Materials Policy Commission. But a good deal more than this will need to be done both by individuals and groups if we are to have any adequate analysis of what Fortune lyrically hails as “one of the greatest, most readable government documents of the century,” and if we are to have any chance of heading off a new network of government controls.

The technique of this report is familiar. It begins by fearing an alleged “crisis”; it ends by concluding that only more government power, more government controls, more government bureaucrats, can save us from it.

The crisis this time is a “deficit” of raw materials. It seems that in 1900 this country produced 15 percent more than it consumed of raw materials other than foods and gold; that by 1950 this surplus had been supplanted by a 9 percent “deficit,” and that without more government intervention this “deficit” may reach 20 percent by 1975.

Now even if this guess were right it wouldn’t necessarily be alarming. England built itself up to the greatest industrial nation in the world in the nineteenth century by importing raw materials to export finished goods. In a peaceful world of free trade we could play a similar role.

But there is no good reason for supposing the commission’s guesses to be right. They are based on dubious deductions from a set of arbitrary assumptions. Why should we take seriously, for example, the guess that by 1975 we will need only 18 percent more tin a year but 1,845 percent more magnesium? Anyone would be lucky today to make a good guess concerning the 1975 consumption of any one item. It is sheer presumption to try to guess with an air of authority the relative consumption by 1975 of thousands of different items. Who can foresee today the vast changes that may be brought about by new discoveries, conversions, and inventions? Yet a government that has persistently failed to guess even its own fiscal deficit a year ahead has no qualms about guessing every raw-material deficit twenty-three years ahead.

The report undertakes to rescue us by more of the same kind of government interventions that have already become depressingly familiar. It proposes to manipulate prices, production, and exports; to establish quotas, floor and ceiling prices on the model of the International Wheat Agreement; and to create “buffer stocks” to be bought and sold by international authority to offset free fluctuations in supply and demand.

Do government commissions ever learn anything from anything? Have they learned nothing whatever from a hundred dismal and disastrous failures of the past—from the British rubber restrictions scheme, the British African peanuts scheme, the Brazilian coffee “valorization,” our own potato controls, pig controls, cotton restriction, and “ever-normal granary” schemes? Must the world plunge into ever more grandiose international cartels, from the wheat pact to the Schuman plan to this latest proposal?

All these control schemes are the direct result of lack of faith in, and lack of understanding of, the free market. All this recent nonsense about each country’s getting its “just” share of raw materials can only result in endless international bickering. Price controls, combined with “allocations” of raw materials to each country, can only unbalance and distort world supply, increase consumptive wastes, result in allocations to individual firms within countries, and so undermine competition and the growth or shrinkage of individual firms in relation to their relative efficiency. All these schemes can only end by further “politicalizing” every economic transaction—by socializing, regimenting, and eventually totalitarianizing our economy at home and throughout the so-called “free” world.

The Case for Free Markets
September 8, 1952

The economic problems of the British and ourselves are more alike than is usually supposed. Both of us are suffering from the monetary inflation created by our respective governments’ own policies; and both of us are suffering even more from the government controls imposed ostensibly to protect us from the consequences
of this inflation. The difference between our respective problems is chiefly one of degree, not of kind.

This becomes clearer when we read an admirable article like that of Lord Balfour of Burleigh in the July issue of Lloyds Bank Review of London. His arguments are directed against the controls in Britain, but they apply with equal force against the controls here.

Lord Balfour begins by explaining the “immense superiority” of a free price system. “The price mechanism . . . and direct or physical controls . . . are the two fundamentally different methods of adjusting the demand for any good to the available supply. Under the price mechanism, supply and demand are brought into harmony by the movement of prices; the allocation of the available resources is determined by the operation of market forces. . . . [This] is the kind of situation we took for granted before the war, a situation in which every single consumer in the country could walk into any shop anywhere and buy (up to the limit of his money income, naturally) whatever he wanted . . . In those days there were no such things as ‘shortages,’ not because physical supplies were necessarily any greater but because prices were uncontrolled and so brought demand and supply into balance. Nowadays, of course, the very expression ‘uncontrolled’ prices suggests exorbitant prices. In reality, as we all know, the free, uncontrolled prices of prewar days were both low and stable by comparison with anything that has happened since. The situation, now so familiar, in which any price that is free to move tends to shoot upwards, is a product of inflation.”

When rationing and allocation take the place of free prices, the decisions are taken, not by the consumers themselves, but by bureaucrats who say in effect: “We know best what you want.” Consistently applied, as Balfour points out, the allocation system leads to direction of labor—a gross violation of freedom. “What do we value most in our way of life? Surely our liberty. Of all freedoms, with perhaps the single exception of freedom to choose our job, none contributes more to our real liberty than the freedom to spend our money as we will and to give free rein to our individual choices and desires.”

Balfour goes on to show that “there cannot really be any dispute about the superior efficiency of a properly working price system. . . . Rationing and controls are merely methods of organizing scarcity; the price system automatically works towards overcoming scarcity. If a commodity is in short supply, a rise in its price does not merely reduce demand but will also tend to stimulate an increase in its supply. In this, the price system stands in direct contrast with rationing and controls, which tend to make it less profitable, or less attractive in other ways, to engage in essential production than to produce the inessentials which are left uncontrolled.”

Balfour’s final step is to show how artificially low interest rates create inflation, and how effective and even “selective” a weapon is an increase in the Bank of England rate. It can not only halt inflation, but it can help to balance trade and to direct production into the desired channels.

It is a pity that so much clear-sightedness on the part of the chairman of Lloyds Bank should be marred by a blind spot. He cites exchange control, for example (one of the most vicious controls of all), as an exception, arguing that it “cannot be abandoned until the balance of payments is put right.” But if he had followed the logic of the rest of his article he would have recognized that the unbalance in Britain’s payments is caused by exchange control. Only foreign-exchange rates freed from price control will bring “supply and demand into balance.”

Adlai in Wonderland

September 15, 1952

Mr. Truman has never been one to let a mere fact get in the way of his campaign oratory. “It was the Republicans,” he said on Labor Day, who “put across the Taft-Hartley Act in 1947.” This is unjust to his Democratic colleagues. The Taft-Hartley Act was passed by a majority of Democrats in both houses of Congress and even passed over Mr. Truman’s veto by a majority of Democrats in the House. The President has been insisting that Taft-Hartley is a slave-labor act and a union-busting act; and yet, after five years of that act, he inconsistently boasted on Labor Day that union membership had grown from less than 3,000,000 in 1933 to a record 16,000,000 now.

Candidate Stevenson was more subtle—but considerably more confusing. He began his Labor Day speech by telling the union leaders that he is no captive of theirs, that “I intend to do exactly what I think right”—but then it turned out, by miraculous coincidence, that what he thought right did not quite coincide, however, with what he thought right just before his nomination. Then he wanted only “modification” of Taft-Hartley; now he calls for outright repeal.

He wants the act repealed, as far as I can make out, so that it can be passed all over again under a different name. Most of his “five general principles” and other ideas are already embodied in the existing Taft-Hartley
Act; wherever they are not, it is Stevenson who is wrong. He piously declares that “we cannot tolerate shutdowns which threaten our national safety.” But then he wants to deprive even the government of the right to request an injunction—the only weapon that the Taft-Hartley law provides for at least postponing a nationwide strike that threatens our safety. Even Mr. Truman, in vetoing the Case bill on June 11, 1946, told Congress: “Injunctions requested by the government itself and designed to restrain strikes against the government in . . . a condition of national emergency are, to my mind, an essential element of government authority.”

Though he is supposed to be a lawyer, Stevenson thinks that Congress passed the Norris-La Guardia Act in 1932 “to prohibit the labor injunction.” This is untrue. The Norris-La Guardia Act, although it narrowly restricts the conditions, sanctions injunctions against union “fraud or violence.”

What remedy, then, does Stevenson propose in place of the injunction? He won’t say. “I have no miracle-drug solution for this problem.” In short, he has no solution at all. But what he actually proposes is that the President be given in advance his “choice” of practically unlimited powers against employers. Among these he specifies all the powers that failed so disastrously in the steel strike when Mr. Truman used them legally or by usurpation—government “recommendation of settlement terms”; “arbitration” (presumably compulsory), and “seizure” of companies that don’t accept a union-dominated government’s “settlement terms.” And then Stevenson blandly describes this law—which would allow the President to seize the employer’s property and impose settlement terms—as a law that would “keep these cases out of the White House” and “leave the obligation to settle these disputes where it belongs—and that’s with the parties!” This makes the arguments in Alice in Wonderland sound comparatively sane.

The real defects and contradictions in our present labor laws the Democratic candidate did not even discuss. The employer is prohibited from firing a man for joining a union, but he is permitted, encouraged, and even forced to fire a man for not joining a union. This one-sided denial of individual rights to workers Stevenson passes over in complete silence. And he passes over in complete silence, also, the notorious fact that the reason industrywide unions have the power “to stop the national economy” unless their terms are met is precisely because the Wagner-Taft-Hartley Act legally compels the employer to recognize and bargain with such unions.

The Bribe to the Farmer
September 22, 1952

Once a government undertakes to subsidize or guaranty a favored group of producers against the competition and vicissitudes of a free market, it creates a permanent vested interest in the continuance and constant enlargement of its subsidy or guaranty.

The world upheavals and bad government policies following the first world war led to great distress among American farmers. There was much talk about restoring “fair” prices for the farmer’s products. A strange idea was born. This was that the particular relationship between agricultural prices and other prices which prevailed from 1909 to 1914 represented some sort of mystical “parity,” and that the aim of government policy should be to restore it. Actually those five years were one of the most favorable periods to agriculture, so far as relative prices were concerned, in our entire history.

But even if this had not been so, the idea that there was some mystical “parity” ratio between agricultural and industrial prices, which ought to be permanently maintained, was economic claptrap. If there had been any disinterested logic behind the idea, it would have been applied all around the circle. An attempt would have been made to preserve indefinitely the particular price relationship that existed from 1909 to 1914 between every commodity and every other—no matter what profound changes occurred daily or over the years in supply and demand, in costs or methods of production, or in consumers’ wants.

Fortunately, no such preposterous proposal was ever made. Yet “parity” prices for farm products are still demanded by politicians, and the notion of “parity” prices is still treated with solemn respect.

And the government handouts keep growing. Today, when the farmers are enjoying what would have been regarded in 1934 as unbelievable incomes and prosperity, they are getting not smaller, but far bigger handouts than they were then. Strict comparisons are difficult because of the caprices of government accounting. But in 1934, when farm income totaled $6,117,000,000, government payments to farmers amounted to $250,000,000. In the fiscal year 1952, when farm income had soared to $33,573,000,000, government payments for farm programs had gone up to $1,042,000,000. For the fiscal year to end next June 30 they are planned at $1,804,000,000.

In its September letter the National City Bank of New York presents an instructive history of farm price support. “What started out as an emergency program to
cushion the collapse of farm prices during the depression,” it points out, “has been gradually transformed into a permanent program of price supports with a constant upward bias.” Even farm organizations have been unsuccessfully urging Congress to show restraint.

But the two major parties are now competing recklessly with each other in bidding for the farmer’s vote with the taxpayer’s money. The Democratic platform wants “a mandatory price support program at not less than 90 percent of parity.” The Republican platform calls for “a farm program aimed at full parity prices for all farm products in the market place.” Governor Stevenson first piously quotes Jefferson’s fine motto: “Equal rights for all; special privileges for none,” then insists in special handouts to the farmer, and even argues that boosting the prices that the farmer gets doesn’t boost the food prices that the housewife pays. General Eisenhower, not to be outdone, not only stands behind the present price supports at 90 percent of parity, but adds: “And a fair share is not merely 90 percent of parity—it is full parity.”

Where does all this leave the lip-service in favor of government economy? When are we going to learn the economic absurdity of trying to subsidize everybody at the expense of everybody else? And when will the candidates of both parties realize that when they try to bribe each special group in turn, out of the public purse, they are participating in the debasement and eventual disintegration of our democracy itself?  

Even if it could be proved, in short, that the American people have made great advances in wealth, income, and productivity in the last twenty years, it would not follow that they had done so because of the New Deal and Fair Deal. This may have been merely a continuation of the rate of progress shown throughout our history. And it may have been made in spite of mischievous governmental policies.

But are the American people in fact better off today than they were, say, in 1939? Herbert J. Miller, executive director of the Tax Foundation, has made an impressive analysis to challenge the claim. Some of his results were summarized in last week’s Newsweek, but the question warrants further study.

The first thing Miller had to do with the statistics so glibly cited by Administration apologists was to adjust them to realities. Mere dollar comparisons are utterly misleading. A married man with two children, for instance, whose net income before taxes was $4,000 in 1939, would have to make $9,139 in 1952 to reach equivalent buying power after taxes and inflation. After reducing the inflated figures to a per capita basis and to a dollar of constant purchasing power, Miller comes up with some surprising results:

1—Per capita personal income, after taxes and in 1939 dollars, rose from $536 in 1939 to $760 in 1951, a 42 percent increase. Yet all the increase occurred between 1939 and 1944. There was a decrease, in fact, of 2 percent from 1944 to 1951.

2—While total individual net worth (assets minus debts) was 9.2 percent greater in 1951 than in 1939 (in 1939 dollars), it was 7.4 percent less per capita, 12.5 percent less per family, and 24.7 percent less per worker.

3—Individuals were 54 percent further in debt in 1951 than in 1939 even when debt is expressed in dollars of constant purchasing power.

4—There was a per capita increase in national wealth (excluding military assets) of about 9 percent in 1951 over 1939. But there was a decline of 4 percent in 1951 compared with 1929. (From $3,501 in 1929 to $3,356 in 1951, in 1929 dollars.)

Miller even understates the evil effects of inflation. It “has not been an unmixed blessing to put it mildly.” But inflation always affects different groups differently. And it can in fact be mathematically demonstrated that, given a state of reasonably full employment, at least about half the population must lose more from a further rise in the cost of living than it gains from a further rise in its own prices or income.

Administration spokesmen, when they forget that their theme is “You never had it so good,” inadvertently admit this. Said the Secretary of Labor in a bulletin of

Are You Better Off?
September 29, 1952

The Democratic theme song in the present election is “Don’t Let Them Take It Away.” The implication is that every increase in wealth, income, or production achieved by any American in the last twenty years has been due, not to his own efforts, but to New Deal-Fair Deal paternalism.

This is, of course, nonsense. As Macaulay pointed out in his History of England more than a century ago: “No ordinary misfortune, no ordinary misgovernment, will do so much to make a nation wretched as the constant progress of physical knowledge and the constant effort of every man to better himself will do to make a nation prosperous. It has often been found that profuse expenditure, heavy taxation, absurd commercial restrictions, corrupt tribunals, disastrous wars, seditions, persecutions, conflagrations, inundations, have not been able to destroy capital so fast as the exertions of private citizens have been able to create.”
his department last December: “Nearly 45 percent of the wage earners of the United States failed to keep pace with the 10.1 percent rise in the cost of living from January 1950 to June 1951.” And it was just last month that the Bureau of Labor Statistics thoughtlessly reported the rising cost of living has forced the average American city family to spend $400 more than its income after personal taxes (see page 73).

And Now, the Double-Deal?
October 6, 1952

“Doublethink,” according to the late George Orwell, who coined the word, means “the power of holding two contradictory beliefs in one’s mind simultaneously, and accepting both of them.” It seems to me that “double-talk,” now used with a vague range of meanings, would be most useful if it were employed only as the strict parallel of “doublethink”—to mean saying two contradictory things at the same time, and professing to believe both.

Doubletalk and doublethink are certainly not new in politics, but Governor Stevenson seems to have raised them to a systematic art. He is either as undecided as Hamlet, or emphatically in favor of both alternatives, like the impetuous young man who jumped on his horse and rode off furiously in every direction.

In his Labor Day speech, as I pointed out here in the Newsweek of Sept. 15, the governor at the same time proposed (1) government “recommendation of [strike] settlement terms,” “arbitration,” and “seizure” of the companies that hesitate to accept the government’s terms, and declared (2) that such governmental interference would “keep these cases out of the White House” and leave the settlement of labor disputes “where it belongs—and that’s with the parties.”

In his speech in Baltimore on inflation Stevenson was simultaneously for huge spending and drastic economy—and got rousing applause for both views. In the same speech he was simultaneously for “a free economy . . . free men . . . free markets,” and “if it has to come, tighter wage controls as well as tighter price controls.”

One trouble is that Stevenson would rather fondle a phrase than wrestle with a fact. He prefers the sound to the meaning of words. He is in favor of “the government’s cutting its non-essential expenditures to the bare bones of safety”—forgetting that if expenditures are “nonessential” they need not be made at all.

Many of his rhetorical pronouncements have a boomerang quality. How can he expect to impress taxpayers, one is tempted to ask, by declaring that the government “must spend every penny as though it were a $5 bill,” when the Truman government is already spending $5 bills as though they were pennies?

But the basic reason why Stevenson cannot talk realistically about inflation lies beyond his own limitations as a thinker and as an economist. He cannot tell the truth about inflation without, like General Eisenhower, putting the responsibility for it squarely where it belongs—on the spending and “cheap money” policies of the Truman Administration. Stevenson’s phrase about $5 bills was unfortunate because it reminds us that it is a literal fact, and not a joke, that the Truman Administration this year is spending more than $5 for every quarter spent by President Hoover in 1930. The $80,000,000,000 we are spending this year is twenty-seven times as much as we spent in 1929. And Stevenson has to pretend that all this has to be spent, and that if the government is now spending $53,000,000,000 for defense, for example, it must be buying us $53,000,000,000 of defense and not, say, only $20,000,000,000 worth.

Stevenson assumes that defense expenditures necessarily raise the average level of prices. But of course they would not do so if the government took just as much away from civilian income in added taxes as it used for added defense expenditures, and if it did not print more money.

It is the increase in the money supply, brought about by governmental policy, that is the basic cause of inflation. The money supply has been increased from $64,000,000,000 at the end of 1939 to $193,000,000,000 today. This is not even mentioned by Stevenson. Nor does he tell us that the Federal Reserve is once more buying government securities and adding to inflation. Instead, like Mr. Truman, he ignores all this, and comes out for the fraudulent remedy of price control “until prices stop going up”—in other words, until the government itself stops pushing them up by printing more money.

Foreign Trade Follies
October 13, 1952

One gathers from the report of Aug. 22 by Ambassador William H. Draper, Jr. that the European “dollar gap” is chiefly America’s fault. In this Draper reflects both European and American official opinion. The central economic problem, he thinks, is the “balance-of-payments problem of Western Europe vis-à-vis the dollar
area.” But the truth is that neither the “balance of payments problem,” the “dollar gap,” nor the “dollar shortage” would exist if it had not been created by unsound policies of European governments. The “problem,” the “gap,” and the “shortage” would all disappear overnight if those policies were changed.

What causes the so-called European dollar gap is the existence of monetary inflation in Europe combined with exchange control. The “unfavorable balance of payments” and the “dollar shortage” would vanish on the day the European governments stopped preventing their own citizens from buying, selling, or holding dollars or any other foreign currency in any amount they wanted and at any price they could agree upon. Europe’s so-called “cure”—exchange control—is the very disease that is choking it.

There seems to have been a tacit conspiracy among the bureaucrats of Europe and the United States in the last eight years that however we diagnose this disease, we must never call it by its real name—exchange control. And so we have been led from absurdity to absurdity. We have created, for example, the needless and futile institution called the European Payments Union, simply because European governments will not permit the only real solution—free exchange rates with full currency convertibility.

Even Draper now accepts the European myth that the balance-of-payments problem “has its roots in the huge excess of United States exports over its imports.” The explanation is completely upside down. To blame ourselves for an “excess of exports” is to blame ourselves for producing too much and for giving the excess away. It is to assume that it is somehow the duty of our citizens to buy European goods whether they want them or not. The problem is not our excess of exports; it is Europe’s excess of imports. The “balance-of-payments” problem would evaporate overnight if Europe allowed its own exporters to keep the dollars they earned or sell them for the best price they could get.

Free exchange rates would create an immense incentive, which they now lack, for European exporters. They would encourage American buyers, who could once more buy European goods at realistic prices. In the same way, either a higher dollar rate, or a halt in European inflation, would curb Europe’s present abnormal demand for American imports. If European production were freed from exchange controls, and once again rewarded in proportion to its efficiency, it would not only increase in total, but much more of it would flow into export channels.

Draper wants us to reduce our own tariffs still further, and to simplify our custom procedures. In this I would heartily concur. But as a barrier to foreign trade, our tariff today is of merely minor and academic importance compared with the insuperable barriers raised by European governments—the rigid import quotas, special licenses, bilateralism, exchange controls and prohibitions.

While European bureaucrats have complained more and more in recent years about the barrier of the American tariff, that barrier itself has been constantly declining. Data from the Department of Commerce show that last year tariff duties amounted to less than 6 cents for every dollar’s worth of imported goods. This compares with about 15 cents during the prewar years 1936–1940, and with 27 cents for every dollar’s worth of imported goods at the turn of the century in 1901–1905. The major immediate reason for reducing our tariffs still more at this time is not economic but political. It would remove the biggest excuse Europe still offers for failure to increase its exports. And it might shame European governments at last into abandoning exchange control.

**Stalin as Classical Economist**

October 20, 1952

Stalin now demands an entirely new official Communist textbook, and has turned in a 25,000-word memorandum to say exactly what it must contain.

Most of it is the usual hodgepodge of Marxist jargon, obscure dialectics, vilification of capitalism, derision of dissenters, and pure claptrap. Yet it is significant for one ingredient—the revisions that Stalin has been forced to make of Marxist, Leninist, and even of previous Stalinist doctrines in order to bring Communist theory into a more plausible relation with actual Soviet practice. These revisions tacitly concede that complete socialism is unworkable.

Stalin admits that he still doesn’t know how to bring about pure Communism and directly distribute goods to individuals in accordance with “need.” He admits that he still doesn’t know how to get rid of the much-abused capitalist price system. He specifically orders that the new textbook explain “why we . . . do not destroy production of commodities for the open market, money, trade, etc.” He admits that he still doesn’t know how collective farms can be completely socialized.

He even thinks it would be “senseless and criminal” to expropriate “small and medium-size producers in the villages and socialize their means of production.” But this is to concede that capitalism must either be right in principle, or must continue to be tolerated even in
Russia (after 35 years of absolute Communist dictatorship) at least as far as “small- and medium-size producers” are concerned. It is as if a state governor were to denounce grand larceny while contending that it is senseless and criminal to illegalize petty and medium-size larceny.

Stalin admits that he still doesn’t know how or when to achieve “the Communist formula ‘from each according to his abilities, to each according to his needs.’” He professes to be operating on the formula “from each according to his abilities, to each according to his work.” He even calls this “the Socialist formula.” But modify it a bit, make it “to each what he creates,” and you have, in effect, the capitalist formula, the basic principle of free enterprise.

Finally, Stalin admits that socialism and/or Communism cannot solve the vital problem of economic calculation, and must depend on capitalism and free markets for the answer:

“Our economic executives and planners made a proposal which could not but astonish members of the Central Committee, since according to this proposal the price for a ton of grain was proposed to be almost the same as the price for a ton of cotton, and in this the price for a ton of grain was made equal to the price for a ton of baked bread. In answer to the remarks of members of the Central Committee that the price for a ton of baked bread must be higher than for a ton of grain in view of the additional expenditures for milling and baking, and that the cotton in general costs much more than grain, to which also world prices for cotton and grain bear witnesses, the authors of the proposal found nothing intelligent to answer.”

Stalin, in short, cannot trust even the economic planners that he picks himself. He rejects their guess as to the relative values of cotton and grain; he knows it to be false, because it does not correspond with the verdict of the capitalist world and the capitalist price system, the verdict of supply and demand, of consumers’ choice, the verdict of free markets.

“What would have happened,” he asks, “if the proposals of these comrades had received legal force? We would have ruined the cotton growers and been left without cotton.”

Stalin, in short, now knows what Truman and Bowles and DiSalle and Woods have still to learn—that bureaucratic price fixing is a farce, a fraud, and a disaster; that the economic planners are presumptuous blind men groping in the dark, and that there is no substitute for free markets.

If Stalin lives long enough, and continues his progress, he may end up as the world’s leading classical economist, and its foremost champion of laissez-faire capitalism.

The Dilemma of Foreign Aid
October 27, 1952

In a book published in 1947, Will Dollars Save the World?, I pointed out that intergovernmental loans or gifts were “on the horns of this dilemma. If on the one hand they are made without conditions, the funds are squandered and dissipated and fail to accomplish their purpose. . . . But if the lending [or giving] government attempts to impose conditions, its attempt causes immediate resentment. It is called ‘dollar diplomacy’ . . . or ‘interfering in the internal affairs’ of the borrowing nation. The resentment is quickly exploited by the Communists. . . . The dilemma is, in fact, inherent. It lies in the attempt of one government to bribe another into following . . . policies which that other government does not believe in sincerely enough to follow without the bribe.”

I also devoted an article to this theme in Newsweek of Nov. 3, 1947.

The recent tiff between the French Premier and our ambassador is simply the latest illustration of the point. Ambassador Dunn left a letter saying that the United States could not promise the $650,000,000 in economic aid for 1953 hoped for by Premier Pinay, but only $525,000,000. In addition, Dunn left a memorandum indicating that the French would have to increase their military budget if they wanted more U.S. aid. Whereupon Pinay hit the ceiling, let it leak to the French press that he considered the memo “inadmissible,” and won acclaim at home as “a strong man who has been willing to say no to the Americans.”

In its news columns of Oct. 10, The New York Times explained that the Pinay government “has been under fire of the Socialist left and the de Gaullist right for ‘subservience’ to the United States. What is more natural than that the Pinay government should try to ‘get out from under’ by stealing the fire of the opposition on both left and right by proclaiming righteous indignation in the French press over some assumed indignity.”

What is more natural indeed? And what could more clearly demonstrate the futility, if not the boomerang nature, of our foreign-aid program?

Our State Department beat a quick retreat. “M. Pinay seemed to think,” it said, “that we were undertaking to say what the French budget will be, and he made it clear that that is a matter for the French to determine—and it is.” Why not carry this further? Why not point
out that the French budget is so completely a matter for
the French to determine that the American taxpayer,
with no say about it, has also no duty to contribute part
of it? Why not point out that the way for the French
Government to show its complete fiscal independence
would be to stop asking the U.S. for more handouts?

The foreign giveaway program was wrong from
the start. The real answer was the Atlantic Pact. But
this was not in fact even proposed until well after the
Marshall Plan had been launched. Under the Atlantic
Pact we should undertake to defend against Russian
aggression a free Europe that proves its own determi-
nation to defend itself. But by our hasty ambition to
assume something we like to call “world leadership,”
by our overanxiety to shower monetary contributions
in the absence of clear showing of need, by our pan-
icky insistence that Europeans increase their defense
budgets whether they themselves recognize their dan-
ger or not, we have done the precise opposite of what
we intended.

We have encouraged Europe to relax its own efforts
and to leave its salvation to us. We have increased
European “neutralism.” We have permitted to flourish
among Europeans the fantastic notion that we need
their help more than they need ours. We have given
the French the impression that when they increase their
armament they do it, not for self-preservation, but as
a favor to the United States. We have provided fuel
for Communist propaganda that we want to boss and
“enslave” Europe.

Incidentally, if we stopped these lavish hand-
outs, we would cut our budget by $9,000,000,000 or
$10,000,000,000 annually, which is the difference
between continuing inflation and halting it.

What Are We Deciding?
November 3, 1952

What is the central issue that will be decided in this
election? Perhaps the best way to find the answer to
this is to imagine that the election has already been
held and that the outcome is already known. Suppose
Governor Stevenson has won? What will the voters
have said?

The answer is clear. The election of Stevenson and
of another Democratic Congress will be almost uni-
versally accepted as an endorsement of the record of
Harry S. Truman and a call for the continuance of the
Fair Deal.

Nobody knows this better than Truman himself.
It explains his desperate campaign for the Democratic
ticket. He knows that the election of General Eisenhower
and a Republican Congress would be a repudiation of
his regime, while the election of a Democratic successor
would be a “vindication.” Stevenson knows it too. Since
his first feeble efforts to disassociate himself from “the
mess in Washington” he has not dared to differ from
Truman on a single important issue.

What will the voters have endorsed if they endorse
Trumanism? They will have endorsed the most unscru-
pulous campaign of slander that a President has ever
stooped to in our history. . . . Truman’s defamation
of the very man he had up until a few months ago
most honored and appointed to the highest positions
of trust. . . . Truman’s whole record of vilification of
those who have dared to differ with him, from “too
many Byrds” in Congress to the Marines’ “propaganda
machine almost equal to Stalin’s.”

They will have endorsed an incredible softness
to Communism, illustrated by Yalta, Teheran, and
Potsdam; the attempt to force Chiang Kai-shek to
take the Chinese Communists into his government;
the payment of ransom to a Communist government to
release captured American fliers; the tardiness in act-
ning on Vogeler; the virtual abandonment of Oatis; the
effort to dismiss the Alger Hiss case as a “red herring,”
the Tydings committee whitewash; Truman’s state-
ment that he liked “Old Joe” Stalin; his acquiescence in
humiliations to our Ambassadors to Russia; soft now-
don’t-do-it-again reproofs even when the Russians
deliberately shoot down American planes and men.

They will have endorsed the unbelievable vacilla-
tions and zigzags; that bungled us into a stalemate war
in Korea, leaving us today with 122,000 casualties and
a thin hope that the Communists may still be willing
to call it a draw and let us out.

They will have endorsed the widespread corrup-
tion symbolized by deep freezers, mink coats, and
the Kansas City vote frauds.

In the economic realm, if the voters return Stevenson
and a Democratic Congress, they will have endorsed the
most reckless spending in our history, the most burden-
some and destructive taxes, and a policy of deliberate
monetary inflation, especially for the campaign period.
In the five and a half months ended Oct. 15, for exam-
ple, money in circulation was increased $1,157,000,000
to a new high figure of $29,617,000,000—four times
the amount outstanding in 1939. This monetary infla-
tion has been brought about by deficit financing, gov-
ernment-bond support, and cheap-money policies. It
means soaring living costs and a rotting dollar, which
Truman pretends to offset by the futile and disruptive
device of price fixing.
Pour on top of this the fantastic campaign against the Taft-Hartley Act, the misuse of the Federal government to organize and build up unions and enforce their demands, and the openly declared aim of Stevenson to deprive the government itself of the injudicious power, even against strikes that imperil the national safety.

The issue in this election, in brief, is whether Federal intervention and Federal power shall be encouraged to grow until they choke out economic and personal liberty and leave us to the mercies of an increasingly arrogant and possibly irremovable bureaucracy.

Those who want this result will vote for Governor Stevenson. Those who have misgivings about it will vote for General Eisenhower.

A Letter to Harry S. Truman
November 17, 1952

My dear Mr. President:

I want to begin by congratulating you on the fine sportsmanship and patriotic sense of responsibility which prompted you to offer the President-elect an airplane to go to Korea and to invite him to sit in with you in the formulation of the new budget and other problems of the transition period. But this won’t meet the real difficulty that the transition raises, and I am taking the liberty of suggesting another course on your part that I believe will. You now have the opportunity, in fact, to set a history-making precedent that would control all your successors.

The dilemma that now confronts both you and Mr. Eisenhower is inherent in our present inflexible provisions for the transfer of power. Mere consultation, even with the best will on both sides, cannot solve it. You are now put by law in the absurd position of having to prepare a budget for a period—1953–54—in which you will be out of office and for which you cannot reasonably be held responsible. Mr. Eisenhower or his representative, on his side, will be confronted with a document as big as a telephone book, implementing scores of previous policies and made up of thousands of different items. Mr. Eisenhower could not possibly make informed decisions on these without consultation with department heads and bureau heads of his own choosing. It is unfair to ask him to take even an implied responsibility for this budget.

This is not your fault. The predicament, throughout our history, has been built into the provisions for the Presidential and Congressional succession. Prior to the passage of the Twentieth Amendment, the Presidential succession did not take place until the March 4 after the election. I need not tell you what the appalling costs sometimes were of this four-month interregnum. It was in the four months between the election and inauguration of Lincoln that seven states seceded from the Union and set up the Confederacy. Even if Buchanan, the outgoing President, “had been a man of great strength and ability,” as the historian James Truslow Adams put it, “it would have been almost impossible to strike out [on] a policy of his own, when he had only four months to serve and knew nothing of the policy of the man who would soon have to take up the reins.”

The cost of the interregnum period after Franklin D. Roosevelt defeated Herbert Hoover is still fresh in the minds of those of us who lived through it. The deterioration of business confidence between the election in November 1932 and the inauguration in March 1933 was rapid and profound. Roosevelt could not act because he was not yet in office; Hoover could not lead because he lacked public support. The country paid a needless and tragic price in mounting insolvencies, bank closings, and unemployment.

An attempt to solve this problem for the future was made in the adoption of the Twentieth Amendment in 1933. Unfortunately, the amendment did not abolish the four-month interregnum; it merely reduced it to two and a half. So once more we are faced with a period of uncertainty. You now have legal power without a popular mandate, and Mr. Eisenhower now has a popular mandate without legal power. Action is frustrated. Policy must mark time.

There is one clear solution, and to you has come the opportunity to be the first President to propose it. This is to offer to resign now and turn your office over to the President-elect, either immediately or on the first day he is ready to assume it.

No further tampering with the Constitution would be necessary. You could simply call an immediate special session of Congress and ask it to make the appropriate changes in the Presidential succession law. Congress might simply add a provision, say, that the outgoing President could appoint the President-elect to some office in which the latter would ex-officio succeed to the Presidency on the resignation of the incumbent President and Vice President.

It need hardly be said that such a revised law should impose no economic penalties on resignation. It should provide that the salary of any President who resigned in this way would be continued until Jan. 20, just as if he had remained in office.

The new law should also, preferably, give each outgoing congressman or senator the same right of
immediate resignation in favor of his elected successor, under similar salary provisions. The date of transfer of office for congressmen and senators could then be any time between the day after election and Jan. 3, and for Presidents any time between the day after election and Jan. 20. The actual date of transfer, within this period, could vary in each case, depending purely on the mutual wish or convenience of the two parties directly concerned.

There would be nothing obligatory about such resignations. But once legal provision were made for them, and the precedent set, both outgoing congressmen and outgoing Presidents, we may be confident, would be eager to take advantage of it. Nobody likes the label or the status of a lame duck.

The change would be in accordance with the tradition of virtually every democratic government of Europe, and of every parliamentary government of the British Commonwealth, including our neighbor Canada. In such governments the executive does not attempt to carry on a day after he has lost an election or a vote of confidence. But the change here proposed would be more flexible.

The formal inauguration ceremony, of course, could still take place on Jan. 20, whether or not the office had actually changed hands prior to that date. It is not unusual, in democratic practice no less than in coronations, for a formal ceremony to take place after the actual fact that it solemnizes.

If you call a special session now, Mr. President, it may still be possible to reduce the present interregnum period by six or seven weeks. But much more importantly, you have the opportunity to set a permanent milestone in American history, and to avert the possibility of any future two-month paralysis of government which could have consequences as grave as that of 1860–61 or of 1932–33.

The Dream World of the MSA
November 24, 1952

Not least among gains achieved by the election of Mr. Eisenhower and a Republican Congress is that it provides an opportunity for reexamining both the details and the principles of our foreign-aid program.

A few days before the election a New York Times story disclosed the contents of a “secret Green Book” prepared by the Mutual Security Agency “as a basis for discussion of next year’s program.” And what its proposals chiefly reveal is that MSA officials have learned absolutely nothing from mistakes of the past; that they are dreaming up more grandiose schemes than ever, involving still more bureaucratic agencies and jobs, still more economic controls, still more burdens on the U.S. taxpayer, still more drains on our national resources.

One of the proposals is for “a multi-billion-dollar currency stabilization fund to be called the Atlantic Reserve System.” The reader will not be surprised to hear that: “If coordinating the currencies of the North Atlantic community requires a substantial degree of pooling of resources, the major contributor to the pool by far must be the United States, which possesses over 80 percent of the gold reserves of the system.” Nor should he be surprised to learn of the hope of our MSA bureaucrats that “tying together the major currency systems of the Atlantic community . . . would end the preoccupation abroad with dwindling gold reserves that has prevented expansionist economic policies.”

In plainer English, this means that we are to be asked to give or throw away most of our gold reserves by allowing people everywhere to demand this gold in exchange for practically every European paper currency, no matter how overvalued, and that European governments are not only to be permitted but encouraged to continue the very paper money inflation (“expansionist economic policies” is the MSA euphemism) that causes gold drains.

This scheme is designed to bring about something called “managed convertibility.” The phrase (as well as the whole scheme) overlooks the fact that all currencies were freely convertible into each other when exchange rates and markets were free; that nothing but the existing exchange controls and other bureaucratic restrictions now obstruct this convertibility; that the system we have today is best described as one of managed inconvertibility; and that the way to get full convertibility is not by more management but by less of it.

The Atlantic Reserve System (so far as one can gather until further details are made available) is simply to be thrown on top of several organizations already designed to do virtually the same job—the International Monetary Fund, the International Bank, and the European Payments Union. This is another illustration of the bureaucratic maxim that what’s worth doing is worth overdoing.

Other schemes in the Green Book contemplate an “Atlantic Economic Board” and an “Atlantic Commodity Board.” The latter “would seek to stabilize production and prices of essential raw materials through long-term agreements with leading producer countries and thereby remove the need for restrictive
cartel arrangements.” In other words, the “need” for private cartels would be removed by setting up an enormous international governmental cartel, fixing prices and production quotas and allotting consumption quotas—in short, regimenting the world economy.

All this, it need hardly be said, is the very opposite of what the world now needs. What it desperately needs is a restoration of free markets, free prices, free production, free consumption, free trade. In the monetary field it needs an end to bureaucratic parlor tricks, to exchange control, to deficit financing, to artificially depressed interest rates, to more paper money. It needs a return to the gold standard. It is not foolproof and it is not perfect, but it is infinitely better than bureaucratic caprice.

What the world’s bureaucrats have still to learn, in brief, is that it is precisely their controls that create most of the problems they are trying to solve.

### Why Risk an Interregnum?

December 1, 1952

From 1886 to 1947, an outgoing President could have eliminated the dangerous four-month interregnum before the inauguration of his successor simply by his own act of resigning (together with the Vice President) after appointing the President-elect as Secretary of State. Though this possible course was closed by the Presidential succession act in 1947, it could be reopened by a mere amendment to that act. Such an amendment could be drafted and passed by Congress in less than a week. Yet rather than consider this simple step, many people who began by expressing concern over the risks of the eleven-week interlude before the inauguration of General Eisenhower are now trying to persuade themselves that the risks have been eliminated and the problem solved by a meeting of 70 minutes and a vague joint statement that amounts to little more than a gesture.

The truth is that an interregnum of eleven weeks between the election and inauguration of a new President is as needless, and potentially as dangerous, as the previous interregnum of four months. If it had not been for the interregnum of 1860–61, the disaster of the Civil War might have been averted. Without the interregnum of 1932–33, the banking panic of 1933 could certainly have been averted.

“Again and again,” wrote President Wilson to Secretary Lansing in 1916, “the question has arisen in my mind, what would it be my duty to do were Mr. Hughes to be elected? Four months would elapse before he could take charge of the affairs of the government, and during those four months I would be without such moral backing from the nation as would be necessary to steady and control our relations with other governments. I would be known to be the rejected, not the accredited, spokesman of the country; and yet the accredited spokesman would be without legal authority to speak for the nation. Such a situation would be fraught with the gravest dangers.”

It would be his duty, he went on, “to relieve the country of the perils of such a situation at once,” and if he could gain the consent of the persons involved, he would “then join the Vice President in resigning and thus open to Mr. Hughes the immediate succession to the Presidency.” He concluded: “The whole country has long perceived, without knowing how to remedy, the extreme disadvantage of having to live for four months after an election under a party whose guidance has been rejected at the polls. Here is the remedy. . . .”

Today a change in the law would be needed to adopt this remedy. But advantage could be taken of this, as I suggested here two weeks ago, for Congress to provide specifically that the salary of any President who resigned for this purpose would be continued until Jan. 20, just as if he had remained in office. Certainly no economic penalty should be placed on such a voluntary surrender of office.

Congress could also use this opportunity to deal with the problem of the change-over of Cabinet members. It could authorize the incoming President to appoint for terms of a few months as many Secretaries-General as there were existing members of the Cabinet. Each of these could be assigned to work with his predecessor or chosen successor, as the case might be. No Secretary-General would be granted specific powers, but he would have the standing and salary of a Cabinet member and whatever secretarial help he needed.

None of the legislation here proposed would impose any compulsion on anyone. It would merely permit an outgoing President to resign and turn over his office on any date before the following Jan. 20 that was agreeable to his elected successor. It would give flexibility instead of dangerous rigidity to the period of change-over. Even if Mr. Truman, because of the delay involved by legislation, was not now able to transfer office to Mr. Eisenhower until a few weeks before next Jan. 20, he could still establish a fine precedent and remove a grave risk for the future.
The Tools That Make Tools
December 8, 1952

A few weeks ago I attended and spoke before the annual meeting of the National Machine Tool Builders’ Association, which this year celebrates its 50th anniversary. The machine-tool industry does not deal directly with the consuming public, but with other industries. It makes the tools that make tools, the machines that make machines. It turns out the machines that turn out trucks, tractors, automobiles, radios, television sets, refrigerators, washing machines, lawnmowers, watches, razor blades, milk bottles, shoes, suits, pills—almost anything you can think of. Machine tools themselves can only be made by other machine tools.

Surely the men in this industry do not exaggerate when they call machine tools the muscles of America; when they point out that the better our tools, the greater our capacity to produce, the higher our standard of living, the stronger our military security. For we must have machine tools to produce guns, bullets, shells, tanks, aircraft, battleships, and bombs. The machine tool is the very basis of America’s industrial supremacy, of our whole mechanical civilization. It has enormously increased labor productivity. It is the secret of America’s unparalleled wages.

For technical reasons, changes in the demand for and output of consumers’ goods give rise to much more violent changes in the demand for and output of producers’ goods. And as the machine-tool builders are producers’ producers, they are the classic example of the prince-or-pauper, feast-or-famine, boom-or-bust industry. Yet Washington has been extremely slow to realize the industry’s special problems. It was not until August 1951 that price relief and priority assistance were extended to it. The price-control program has been stupid generally, yet as applied to machine tools it was almost disastrous.

Instead of offering incentives and inducements for the expansion of the American machine-tool industry since the outbreak of war in Korea, the Truman Administration in the main has provided deterrents.

The so-called excess-profits tax discourages growth generally; but it is particularly discouraging to an industry subject, like machine tools, to extreme swings in profits. For this tax is liable to take years of low earnings as the “normal” base, and so take away an extra heavy slice of earnings in the rare good years. Its effect, in other words, is to cut much more heavily into the average profits of industries subject to wide fluctuations in demand than into the profits of industries benefiting from steady demand. In this way it is depriving the

machine-tool industry of the needed reserves for lean years, of reserves for survival, not to speak of funds for the expansion of plant, or for the research necessary to keep ahead of our potential enemies.

The same considerations apply to the renegotiation of government contracts. The general effect of this practice is to place an arbitrary limit on profits, and so undermine the incentive to economies and efficiency in production. It may be seriously questioned whether renegotiation does not reduce defense output below what it would otherwise be, and actually cost the government much more money in the long run than it saves.

Finally, the American machine-tool builder has watched with misgiving a foreign policy which has subsidized his European competitors with his own tax dollars and then effectively prevented him from selling his own goods in the foreign market. Does it make sense even from a military standpoint, he asks himself, for us to build up the European machine-tool industry at the expense of our own, when Stalin’s hordes could overrun Europe and then use all this equipment against us?

The recent proposal by Henry Fowler, the Defense Mobilizer, to set up a government stand-by reserve of machine tools to be ready for use in the event of full-scale war is a step in the right direction. But the new administration should reexamine the whole policy toward the machine-tool industry—and, for that matter, toward industry in general.

The Cabinet Change-Over
December 15, 1952

Some readers may have wondered why a column devoted to business tides has been discussing the “political” problems of an Administration change-over. The reason is that the uncertainties created by the interregnum period can have, and have had, profound effects on business. The bank panic of 1933 was the direct result of the interregnum. That panic caused great unemployment and suffering for years. Its effects are still felt in the retention of such mischievous institutions as the Reconstruction Finance Corp., in the persistence of nonconvertible paper money, and in the excessive dread of deflation that has helped to cause continued inflation.

American action could be temporarily paralyzed even now if, for example, the Communist world should make some unexpected aggressive move before the present interregnum was over. And whatever threatens our national security of course profoundly affects business.

Yet there is great national reluctance to consider even minor changes affecting the Presidential office.
Though the Constitution makes explicit provision for the resignation of a President, there is a curiously widespread notion that it would be “unconstitutional” for a President to resign before his term expired on Jan. 20. And the proposal that a President be merely enabled by law to resign in favor of his elected successor is regarded by some as directed against the incumbent—though such a precedent, once set, would almost certainly control all his successors.

Fortunately, it is possible to discuss the change-over of a Cabinet with comparative freedom from the misconceptions and prejudices that encumber the discussion of a change-over of the Presidential office. And the Cabinet problem urgently needs consideration at this time. For months Defense Secretary Lovett has expressed a wish to be able to brief his successor fully before that successor takes office. General Eisenhower has taken the unprecedented step of naming his full Cabinet long in advance of his inauguration. His Secretaries-designate have already been holding conferences with incumbent Secretaries.

The new procedure undoubtedly serves the public interest. Yet under existing law it is unfair to the President-elect and his appointees. If they are expected to begin working on their new jobs even before officially taking office, then they ought not to be asked to do it without compensation. Congressman Hugh Scott says it is costing some $20,000 a week to keep a staff of 90 to 100 persons in the Eisenhower headquarters in New York, and that it is necessary in the public interest to keep this organization until Jan. 20. But the funds for it must now be supplied by private subscription.

There is a simple way in which Congress could deal equitably with this situation. It could authorize both an outgoing and a newly inaugurated President to appoint an Alternate Secretary for each existing Secretary. This Alternate would have the rank and the salary of a Cabinet member, and a modest budget for temporary clerical help. As his tenure would have a maximum duration of, say, three months, and as he would have no independent powers, his appointment would not need to be made subject to Senate confirmation.

With such legislation on the books, the President-elect could forward to the outgoing President a list of his intended Cabinet appointments. The outgoing President, as a courtesy, could name these as Alternate Secretaries. Even if this course were not feasible in a given case, the new President, when naming his new Cabinet after he took office, would still be empowered to name members of his predecessor’s Cabinet as Alternate Secretaries for a few weeks to give them time to brief their successors.

This legal provision for a smoother, fairer, and more orderly Cabinet change-over could either be made by Congress independently, on its own merits, or together with a provision permitting more flexibility in the change-over of the Presidential office.

The Collapse of Controls

December 22, 1952

On Oct. 18, the Wage Stabilization Board rejected the proposed increase of $1.90 a day for soft-coal miners. It ruled that $1.50 was the highest increase allowable under the stabilization policy. The miners then went on strike. This was embarrassing to Mr. Truman at the height of the election campaign. He saw John L. Lewis, and the strike was called off. As it is well-known that Lewis does not call off a strike and leave for South America merely on a nebulous promise that his case will be “reconsidered,” it was widely assumed that Mr. Truman had given him a definite assurance that he would retroactively approve the full $1.90.

Post-election developments have done nothing to shake this assumption. Mr. Truman’s action of Dec. 3, in discarding the counsel of his own stabilization officials and overruling his own wage board to grant the full $1.90 increase, stripped the last veil from any pretense that wage and price control was being administered honestly and evenhandedly.

The chairman of the board, and its industry members, promptly resigned. The chairman’s statement explained why he could not “usefully or conscientiously continue.” The industry members explained why they could not “be parties to what we believe to be the perpetration of a fraud upon the American people.” “If your action,” they wrote to the President, “means that the small and the weak are to be restricted by wage controls, while the big and the powerful are to be allowed whatever excessive increases result from the threat of a paralyzing strike, then there no longer exists the equality with which all law and all regulation should be applied in a republic. . . . We cannot participate in a program which would require us to grant special privilege to a few, and to make second-class citizens of all others.

On the other hand, if your action means that all employers and employees may put into effect increases as far in excess of sound stabilization policy as those you have approved for the coal miners, then we must advise again, as both we and the board’s public members advised in our coal case opinions, that wage controls become an empty shell, and a fraud upon the people.”
This logic is inescapable. The efforts of Mr. Truman and his remaining “stabilizers” to rationalize his action have only involved them in further contradictions and absurdities. Mr. Truman pretended that he overruled his own board just to save Mr. Eisenhower from a coal strike. But if he openly yields to every major strike threat, he cannot still pretend to have a stabilization program. Yet he does: “It is therefore my firm intention to continue a strong stabilization program and turn it over to the new Administration as a functioning, effective entity. If the new Administration then wants to scrap price, wage, salary, and rent controls it will be free to do so on its own responsibility.”

The intent behind this is transparent. It is to destroy the substance, and preserve the form; to act “for the record”; to destroy the fact of wage control but to keep the pretense—and then put the blame for “scraping” the program on the Republicans.

Meanwhile Mr. Truman’s stabilizers talk solemnly of “sealing off” the coal wage increase from the rest of the economy. This neat trick would require not only putting the entire burden on the coal companies, but refusing to all other unions the increases granted to the coal miners.

The new Administration should now drop all wage and price controls—not because Mr. Truman did not administer them honestly and impartially, or because “the need for them has now passed,” or because it would be politically difficult to restore them, but because they are wrong in principle. They do not prevent or combat inflation; they merely curtail and unbalance production. They owe their existence to blind envy and economic ignorance. Inflation is caused by the excessive creation of money and bank credit. At the same time as Congress drops wage and price controls, it should take steps to see that the continuous manufacture of more money and credit is brought to a halt.

The Age of Envy
December 29, 1952

I take the title from that of an excellent article in the September issue of U.S.A. by Helmut Schoeck, professor of philosophy and religion at Fairmont State College, West Virginia. Dr. Schoeck in his article quotes some words of mine from this place, and I am borrowing in turn a few of his points to write a variation on the same theme.

Envy has been an attribute of human nature from the dawn of history. But it has always hitherto been regarded as a sin. Ovid thought it “the meanest of the vices.” The Bible calls it a “rottenness of the bones.” “From envy, hatred, and malice, and all uncharitableness,” says the Book of Common Prayer, “Good Lord deliver us.”

Yet today envy is glorified as a virtue. Politicians advocate measures, not because they will bring any material benefit to anyone, but on the ground that they may assuage the public envy which they themselves have helped to inflame. Hitler promised that nobody would be permitted to have an income of more than 1,000 marks a month or be allowed to live on the income from investments. Franklin D. Roosevelt once proposed a limit of $25,000 a year on incomes.

People sometimes become Socialists or Communists through a desire to abolish poverty, but when their ill-conceived schemes fail to bring this result, their feeling too often degenerates into mere hatred and envy of the rich. The success of Marx sprang from his contemptuous dismissal as “utopianism” of all peaceable or constructive attempts to relieve poverty, and from his naked appeal to hatred, envy, and class warfare against the well-to-do and successful.

The prevailing ideology today is a diluted form of Marxism, even on the part of many of those who think themselves anti-Marxist or anti-Communist. The emphasis of most “welfare state” proposals today is on hurting or impoverishing the rich rather than on helping or enriching the poor. Most of these measures surely accomplish the former, and usually the opposite of the latter. They level down, not up.

Envy is the main drive behind the present fantastic tax rates on the upper-income brackets. “It should be remembered,” writes David McCord Wright, “that these high progressive rates have almost no revenue significance. They yield only a pittance compared with other taxes and the size of the government budgets. They are merely the reflection of ‘ethical’ prejudice.” It may be added that these rates, by choking incentives and draining savings, do incalculable harm to workers and to the poor. They retard the very growth of capital upon which the growth of productivity and real wages depends.

All this is even truer of the present rates of death and inheritance taxes. Even belligerently New Deal economists admit that such taxes “are unimportant as revenue producers, having as justification only our desire for less inequality of income and wealth”—in other words, the present passion for leveling down.

The main drive behind the so-called excess-profits tax is also to appease envy. The tax ignores the vital function of profits as the chief incentive to efficiency and economy and the regulator of production. It
promotes waste and reduces war output. It is defended by such high-sounding slogans as: “No one must be allowed to profit from war.” It would be just as logical to say that no one must be allowed to profit from sickness, or from death, or from arson, or from crime, and for that reason to refuse to pay doctors or undertakers or firemen or policemen. This is envy masquerading as a passion for justice. The general rule of free enterprise is not unjust. It is “to each in accordance with what he contributes; to each what he creates.” The way to achieve maximum output for war is to reward each in proportion to the value of his output.

In the Christmas season, above all, we should remind ourselves that this modern glorification of envy is not part of the Christian ethic. That ethic teaches not envy, but charity and compassion. It advocates individual voluntary help to the less fortunate, not forcible seizure.

“Charity suffereth long and is kind, charity envieth not.”
Is a Depression Coming?
January 5, 1953

I put the question in this extreme form because so many people put it that way after the election of General Eisenhower and a Republican Congress. That is because they were conditioned by twenty years of New Deal propaganda to assume that “Republicans-in-power” and “depression” were synonyms, or that the second followed automatically from the first.

But there is an assumption of a quite different nature in the minds of many who raise the same question. This is that booms and depressions originate wholly within the economic system, in accordance with mysterious laws of their own, not subject to alteration or control by political policies. The opposite assumption, on which most politicians operate today, is that governments have now surprised all the secrets of the business cycle, mastered all the devices for countering either an inflation or a slump, and have the will to “keep the economy on an even keel.”

Neither of these extreme assumptions is true. The ups and downs of business are partly due to what economists call “endogenous” conditions, originating from “inside” the business system, and partly due to “exogenous” influences from “outside.” The minor fluctuations seem to be most often endogenous and the major fluctuations exogenous. War or peace, a larger or smaller defense program, extreme monetary inflation or deflation, are “exogenous.”

This is one of the complexities that makes business forecasting such a hazardous occupation. Among their other headaches, the forecasters must try to guess what the politicians are going to do. If Mr. Truman had continued in power, the major guess could have been reasonably safe. He would have continued to inflate. Or more accurately, he would have continued the policy that has come to be known in most countries as “repressed inflation.” This consists in depreciating the dollar by increasing the money and credit supply—then pretending that the consequent rise is the result of “profiteering” and “greed,” and “fighting” it with price control.

The government’s inflationary policies have led to an increase in the country’s supply of money and bank credit from $65,000,000,000 at the end of 1939 to $175,000,000,000 at the outbreak of war in Korea in June 1950 and to $196,000,000,000 now. The outlook for 1953 has now been radically changed, however, by the coming of a new Administration. General Eisenhower’s appointments, both in the Federal Reserve System and in the Treasury, are tremendously encouraging. He has asked William McChesney Martin, Jr. to stay as chairman of the Federal Reserve Board. Martin is a strong believer in a Reserve system free from Treasury domination. The Secretary-designate of the Treasury, George M. Humphrey, has appointed Marion Folsom, treasurer of the Eastman Kodak Co., as Under Secretary, and W. Randolph Burgess, chairman of the executive committee of the National City Bank, as special assistant. The appointment of Burgess is particularly heartening. Few men in this country understand the problems of monetary policy and debt management as thoroughly as he does, and none has better recognized the need for an independent Reserve system.

These men are evidently determined to halt inflation, but their efforts will need public understanding and support. One weakness of trying to continue inflation is that in its later stages it inevitably gets more and more out of control. But trying to halt it also entails serious problems. Inflation always brings discrepancies in price and cost rises, distortions in demand and production, and a great deal of misdirected investment. When the inflation is brought to a halt serious readjustments are unavoidable. They are certain to mean recessions in some lines. We must understand the necessity for these readjustments and be willing to accept them. In that case they can be comparatively mild and short-lived. But if we try to prevent or postpone them by still further inflation, we only build up a much graver ultimate reckoning.

A Fallacy in the Forecasts
January 12, 1953

A business forecast, as frequently explained in this column (see “Pitfalls of Forecasting,” Newsweek, Nov. 22, 1948), can never be anything better than a guess. The future of business depends on countless factors, and no human mind can encompass them all. But some guesses are better informed and better reasoned than others. What troubles me about the current crop of forecasts for 1953 is that most of them rest on fallacious assumptions. The most important of these is the assumption that the future of business activity at this time depends primarily on the government’s defense-spending program. If that rises, we are told, business activity and prices will rise; if it is sustained, the boom will be sustained; but if it declines, there’s no telling how much business will deteriorate, unless the government steps in and does something desperate.
sweeping cancellation of war contracts. Government economists predicted that unemployment would reach 8,000,000 by the following spring. Nothing of the sort happened. By May of 1946, employment was actually higher than in July of 1945. So were prices. The primary reason was that the government continued to inflate the active money and credit supply. This was pushed up $8,000,000,000 between the beginning of August 1945 and the end of that year. I don't put this forward as an argument for monetary inflation, but as proof that prosperity is not dependent on defense contracts.

Estimates vs. Realities
January 19, 1953

Early January is the time when the forecasters, many of them in the government, tell us exactly what the gross national product is going to be in the year ahead, and how much 45,500,000 different families are going to spend. Unfortunately for the forecasts, it is also the time when the President presents his budget. The record for the completed fiscal year behind him, as well as his revised estimates for the current fiscal year, remind us that, so far from being able to predict what everybody is going to earn and spend in the year ahead, government officials can’t even predict successfully what the government itself is going to take in and hand out.

Yet contrast the appallingly bad estimates of our own Presidents over the last twenty years with those of George Goschen, for instance, the British Chancellor of the Exchequer from 1886 to 1892. He had none of our ultra-modern statistical techniques. He was utterly ignorant of Keynesian economics. But somehow, year after year, he stumbled on incredibly accurate budget forecasts. For 1892–93 for example, he forecast expenditures at £90,253,000; actual expenditures were £90,375,000. He forecast revenues at £90,453,000; actual revenues were £90,395,000. He missed by only six-hundredths of 1 percent.

The table below compares, for each year since 1934, the President’s estimates (in millions of dollars) of expenditures, receipts, and deficits for the following fiscal year with the realities of that year. We still do not have a responsible budget system. And maybe, also, we haven’t learned as much about economic forecasting in the last 60 years as we think we have.

*Revised estimate

**How to Cut the Budget**

January 26, 1953

No one will take Mr. Truman's budget for the fiscal year 1954 very seriously, and there is no reason why anyone should. It is, to begin with, a legal absurdity that an outgoing President should be required to frame and present a budget for a year in which he will not be in office and for which he cannot and should not assume any responsibility. Mr. Truman's budget estimates even for years in which he was in office were hopelessly wide of the mark. He overestimated expenditures for the current fiscal year, according to his revised estimates, by some $11,000,000,000.

But the budget for 1954 is not irresponsible merely because Mr. Truman framed it. As I have pointed out repeatedly in this column, we have an irresponsible budget system. It will continue to be irresponsible as long as Congress insists on the right to increase appropriations, even beyond those the President asks for.

Meanwhile, promises of substantial budget cuts cannot be taken too seriously. The economizers have
become timid even in their talk. The “economy extremists” among Republicans hardly dare mention a cut of more than $10,000,000,000. Yet if we take the Truman estimates at face value, we confront a deficit of $10,000,000,000 in the fiscal year 1954 even if we continue all present taxes. If we allow the excess-profits tax to expire on schedule this June 30 (and the termination of this tax is essential to the health of the economy) it might require a slash of $12,500,000,000 in proposed expenditures to balance this 1954 budget.

Contrary to most of what is now being written, it should not be at all difficult or dangerous to make such a slash. When General Eisenhower last June ventured the opinion that the Federal budget could be cut as much as $40,000,000,000 in the next few years, he was scolded even by Senator Taft. But is that goal really so extreme? After all, even in the fiscal year 1951 expenditures were $30,000,000,000 less than the estimate for the present fiscal year. In the fiscal year 1950 expenditures were $38,000,000,000 less than estimated expenditures for the fiscal year 1954.

Two main lines of argument are now put forward against serious economy efforts. One is the familiar device of treating every expenditure as sacred to which the label of “defense” can be plausibly attached. This is like a spoiled son’s argument that it is unreasonable to ask him to cut down his spending at the Twenty One Club or the Chambord Restaurant because a fellow has to eat. No one, it is true, could say prior to an investigation by experts just how much our military expenditures could now be safely cut. But what we do know is that almost every Congressional investigation of military expenditures in the last few years has revealed shocking lavishness and waste.

It is doubtful, moreover, whether whole allegedly sacrosanct categories of expenditures, such as the $7,800,000,000 budget for foreign economic and military aid, can be justified even in principle. The real argument put forward for the military aid is in fact not military but economic. It is the plea that European nations cannot afford to pay for their own defense. The evidence behind this plea has been far from convincing.

The second main line of argument against substantial budget cuts is that enormous sums have already been appropriated or “committed.” But Congress is not impotent. It can review unexpended appropriations, direct that some of them be used in lieu of new appropriations, or authorize the President to curtail expenditures by executive and administrative orders. The amounts that really have been morally and irrevocably committed by Congress are far smaller than most of the present estimates.

Space unfortunately does not permit me to discuss the various procedural reforms recommended by Senator Byrd, Representative Coudert, and Herbert J. Miller of the Tax Foundation, to make our Federal budget more responsible and controllable. But if the will to economy exists, the way is certainly not closed.

Making Currencies Convertible
February 2, 1953

Exchange control is a totalitarian device which until the outbreak of the second world war was confined to Communist Russia and to Nazi Germany. The democracies fighting Hitler themselves adopted exchange control, imitating Schacht’s techniques, after they became involved in the war. But no responsible statesman in the democracies suggested at the time that exchange control was anything but a war-emergency measure. In fact, though a necessary and inherent part of a totalitarian economy, it is completely incompatible with a free one. Yet England and nearly all the continental countries have retained exchange control since the war. It is the chief cause of their so-called “dollar shortage,” of their “international payments difficulties,” of their chronic excess of imports over exports, of “currency inconvertibility.”

Exchange control is a form of price fixing applied to money itself. The government of a country attempts to fix by fiat the rate at which its citizens are allowed to buy or sell its paper currency in terms of other currencies. This is only another way of saying that the government of a country under exchange control attempts to fix the price at which the currencies of all other countries are allowed to be bought or sold in terms of its own.

The consequences are like the consequences of price fixing in any other field. If the price of meat is arbitrarily fixed by an OPS below what it would bring in a free market, the consumption of—or demand for—meat increases, the supply coming to market diminishes, and there is very soon a “meat shortage.” So the next steps are consumer rationing, slaughter-hour licensing, processing quotas, and so on. In the field of currency, similarly, if the British pound is arbitrarily fixed at a price of $2.80 when the market thinks it is worth only $2.63, there is a “dollar shortage” because dollars are underpriced. Then dollars must be rationed through the imposition of import quotas, and international trade is put under an incredibly complicated system of licensing and controls.

This regiments and strangles an economy far more seriously than any other form of control. Through a
system of import licenses and quotas, a government can fix the exact amount of raw material that a given industry or individual firm may use. In that way it can freeze an industry or a firm at any size it wants. It can exercise life-and-death powers over every business or firm that depends on imports. It can indirectly freeze the whole economy and get the entire business community accustomed to lack of freedom, lack of initiative, and lack of incentive. But it can never basically cure the “dollar shortage” that its exchange control has itself created.

Ever since the Bretton Woods agreements of 1944, a bare handful of writers, including myself, carried on a rather lonely battle against exchange control. A terrific crack in the system came in September of 1949; but instead of a return to free markets, there were worldwide devaluations of currencies unparalleled in history. Today the battle against exchange control is no longer forlorn. The turn of the tide may be dated from Dec. 14, 1951, when Canada completely abandoned exchange control. The immediate flow of funds and investment into Canada instead of out, and the rise of the Canadian dollar against the American dollar, was the opposite of the consequence usually feared by those who are afraid to abandon exchange control in their own countries.

The argument against exchange control has now received powerful support in the January letter of the National City Bank of New York. The bank points out that $38,000,000,000 of American postwar aid to foreign countries has not cured their dollar shortage. It doubts that the fantastic proposal of The London Economist for an additional $35,000,000,000 contribution from us would cure it. It points out that free convertibility of the paper pound was successfully maintained in a fluctuating market over the period 1931–39. And it insists bluntly that the way to get convertibility is to let the free market do the job. “The way to make currencies convertible is to make them convertible.”

Convertibility vs. Control
February 9, 1953

British Government officials are said to have a plan to make the pound sterling freely convertible with the American dollar. The aim is laudable; but there are grounds for grave misgivings concerning the method that may be proposed to achieve it.

One step is indispensable. Britain must abandon exchange control. It must let the sterling rate go free. It must stop forbidding people to exchange pounds for dollars on any terms they can agree upon. The way to restore currency convertibility, in short, is simply to permit it.

Hitherto British officials have been frightened by the mere mention of convertibility. They cannot forget the quick collapse of the effort to make sterling convertible in the summer of 1947. But they still misinterpret the result. Britain was drained of dollar and gold reserves in those few weeks, not because the government had made sterling convertible, but because it had done so on the basis of a fantastically false conversion rate with the dollar. On Sept. 18, 1949, British officials at last admitted that the pound had been grossly overvalued. They slashed the official rate overnight from $4.03 to $2.80. But they failed to recognize even then that the only “realistic” rate for the pound is a free-market rate.

One would like to think that the subject is better understood now. Yet typical of the confusion which still exists even at the highest levels of British economic thought is the article by Prof. Lionel Robbins in the January issue of Lloyds Bank Review of London. This article makes some very sound points in an admirable way. It recognizes the weaknesses of “imperial preference.” It exposes the fallacies of the argument, seriously put forward by influential British and other European writers on economics, that productivity in the United States is so much greater than in England or elsewhere that trade equilibrium is impossible without a permanent aid program. As Professor Robbins points out: “The great principle of the division of labor is founded on just such differences; if there were no differences in productivity there would be no advantage in trade.”

But when it comes to the central issue Prof. Robbins still puts the cart before the horse. He is still opposed to currency convertibility through free exchange rates, the indispensable requirement for full convertibility. “I am yet to be convinced,” he writes, “that the dilemma is escapable that, when the general financial position is strong, free rates are usually unnecessary and that, when it is weak, they are apt to be a source of appalling danger.”

The real “dilemma” is in fact the reverse of this. When the general financial position of a country is strong, a pegged rate for its currency is unnecessary; and when it is weak, a pegged rate is an appalling danger. A pegged rate for the pound, higher than what a free market rate would be, necessarily brings a “dollar shortage.” It creates a chronic excess of imports over exports. It diverts production into the wrong channels, by reducing the relative incentives to export. It encourages the continuance of internal inflation. A pegged rate destroys the pressure-gauge readings by
which everyone could measure the extent of inflation and the changes in world confidence in the currency. You cannot tell the real condition of the patient if the thermometer is pegged at 98.6 degrees or the exchange rate at $2.80.

There is no historic justification for Professor Robbins’s fears of a free or “floating” rate for the pound. Convertibility of the paper pound was maintained in a fluctuating market over the period from 1931 to 1939. Canada’s return to a “floating” dollar has been followed by a rise, not a fall, in the quotation for its currency.

Of course, a “floating” rate, one can hope, would be merely transitional to an eventual return to a gold standard. But Professor Robbins does not even hint at this last possibility. American taxpayers should not be called upon to contribute another dollar to the maintenance of exchange control in Britain or anywhere else.

**Toward a Free Economy**

February 16, 1953

President Eisenhower’s State of the Union message to Congress marked a turning point in American history as dramatic and unmistakable as the early messages and fireside talks of Franklin D. Roosevelt twenty years ago. Roosevelt proclaimed the birth of the New Deal; Eisenhower delivered its funeral oration. The Roosevelt-Truman philosophy led us deeper and deeper into a managed economy; Eisenhower reasserted the philosophy of a free economy.

The contrast with the previous Administration was most striking in the discussion of price control. This lay not merely in Mr. Eisenhower’s decision not to ask for a renewal of the present price- and wage-control legislation which expires on April 30, but in the reasons that he gave for this decision. He began by pointing out—what has never been clearly acknowledged in the executive branch in the last two decades—that the basic cause of inflation is government policies themselves. He knows just what those policies are and what must be done to halt them:

“The first order of business is the elimination of the annual deficit. . . . A balanced budget is an essential first measure in checking further depreciation in the buying power of the dollar.” He wisely warned that expenditures should be reduced before any reduction of taxes. He called on the Federal Reserve Board for proper restraint on credit expansion. And then he pointed out: “The great economic strength of our democracy has developed in an atmosphere of freedom. . . . Direct controls, except those on credit, deal not with the real causes of inflation but only with its symptoms. . . . American labor and American business can best resolve their wage problems across the bargaining table. . . . Controls in their present forms . . . have proved largely unsatisfactory or unworkable. They have not prevented inflation; they have not kept down the cost of living. . . . I am convinced that now—as well as in the long run—free and competitive prices will best serve the interests of all the people.”

With equal wisdom Mr. Eisenhower recommended that “material and product controls should be ended, except with respect to defense priorities and scarce and critical items essential for our defense.” In spite of this clearly thought-out position, which apparently has the full support of Congressman Wolcott, who heads the Banking Committee of the House, of Speaker Martin, and of Senator Taft a group in Congress headed by Homer E. Capehart, chairman of the Senate Banking and Currency Committee, still wish to give the President “stand-by” powers over prices that he has not asked for. The mere existence of such stand-by legislation would bring an element of crippling uncertainty into innumerable business decisions, particularly those involving long-range plans and long term price contracts. Senator Capehart even wants to retain a skeleton controls organization. This would mean the retention on the public payroll of people with nothing to do—but nonetheless with a vested interest in persuading the President, Congress, and the country that the imagined “emergency” for which they had been retained had already arrived.

The economic soundness of the Capehart proposal needs to be seriously examined. Inflation can be prevented by proper monetary and fiscal policy; but if it is not, then it only does added harm to try to disguise the inflation by price control. For in time of total war, price rises for particular products, and relative changes in prices, induce conservation in the use of scarce goods, and lead to maximum production most quickly of the things that are most needed. Efforts to prevent these relative price changes do not speed up economic “mobilization” for war, but retard or prevent it.

As for the immediate situation, the Administration will probably find that once a definite date has been set, a few months off, for the termination of price and wage controls, it becomes almost impossible to relinquish such “controls” gradually.” The simplest and most workable procedure is to lift them immediately.
Farewell to Price Controls
February 23, 1953

President Eisenhower recommended the removal of price and wage controls for the right reason—because "free and competitive prices will best serve the interests of all the people, and best meet the changing, growing needs of our economy." But the termination of controls has probably met its widest approval for the wrong reason—that they are "no longer needed" except for prices "pressing upward against their ceilings." People who now acquiesce in the removal of price controls only for this reason will be demanding their reimposition at the first sign of another price rise. What we need to understand, if we are not to be easily stampeded into taking controls back, is that wherever conditions of real competition exist price fixing is always harmful. It is never more so than when "prices are pressing upward against their ceilings"—i.e., when they are being arbitrarily held substantially below the levels to which the free play of supply and demand would bring them. For prices have constant and indispensable functions to perform. Their changes give the quickest and best information obtainable concerning the existence and extent of surpluses and shortages of supply in relation to shifts in demand. They also promote the quickest and most efficient adjustment of supply to meet a new pattern of demand. A higher price for a scarce commodity is an immediate deterrent to its wasteful consumption and an immediate incentive to its increased production. The free play of prices, in brief, can bring a quicker conversion from peacetime output to war-needed output than any set of bureaucratic regulations.

Why, then, is there so much clamor for the imposition of price controls when a war breaks out? One reason is embodied in the specious slogan: "No one must be allowed to make a profit out of war." But any control that slows down war production and brings shortages of vital goods merely aids the enemy.

Another reason for the clamor for controls is a predilection for price "stability" for its own sake. But price stability at the cost of shortages and disrupted production is too dearly bought. That a free price sometimes shoots up and then falls again is never a proof (though price controllers invariably regard it as one) that the price flurry was unnecessary. It probably brought about the very increase of supply that corrected it. A more sophisticated argument for price control is that the supply of some goods is "inelastic," so that even a great increase in their price will not lead to an appreciable increase in their supply or rate of output. Only in rare cases does this academic contention describe actual facts. What those who make it usually have in mind are such things as housing, where the supply is not really "inelastic" but tends to respond to changes in price, rent, or demand only after a production-time lag. Yet the existence of such a lag is not a good reason for losing further time by forbidding any price incentive at all. And whether or not a rise in price brings an immediate increase in supply, it forces more economical consumption. A favorite analogy of those who argue that price control is indispensable in "total war" is that of a city under siege. The analogy is misleading. A city under siege cannot produce its own food, water, or fuel; a nation at war usually can. Price ceilings are usually harmful, moreover, even in a city under siege. They remove one of the chief deterrents to wasteful consumption. Priorities, allocations, and rationing may, of course, prove indispensable in a city under siege and in a nation engaged in total war. But priorities and rationing best achieve their purpose without price ceilings. Such ceilings merely give compulsory rationing more work to do.

But the rise in the average level of prices in wartime is caused chiefly by an increase in the supply of money and bank credit that the government has deliberately encouraged or enforced. But if the money supply is firmly controlled, there can be no spectacular general price advance and no excuse for government price ceilings.

The Price of Disinflation
March 2, 1953

We shall soon learn whether the American people really want to halt inflation, and whether they are willing to pay the price.

President Eisenhower has shown great political courage in his own resolve to halt inflation. What is perhaps even rarer in our political life, he has shown a clear understanding of the steps that must be taken. He and his chief financial advisers also see these steps in their proper order. First we must cut expenditures enough to balance the budget. From then on we can cut both expenditures and taxes by the same amount. Meanwhile we must stop using the banks as a dumping ground for additional government securities, and stop holding down interest rates arbitrarily. In brief, we must stop inflating the money supply.

But this program is already meeting serious opposition. Even the Republicans in the House want to start cutting taxes right away, and talk about cutting expenditures later. (The House Appropriations Committee,
stabilization" of prices. On the contrary, the prices of

Though Mr. Eisenhower has promised to support farm

prices at 90 percent of "parity" until December 1954, as required by present law, the opposition is already
talking hysterically about the decline in farm prices and shouting that even the present inflationary support program is not enough.

But the opposition to a halt in inflation threatens
to become even greater than this. Nearly all of us think
we are against inflation, but most of us, on examination, are two-faced about it. We are deflationists in our role as consumers, but inflationists in our role as producers. We want to see the prices of what we buy go down, but the price of what we sell go up. City workers think food prices are too high; farmers think industrial wages are too high. Yet though beef and veal are still selling at retail at 193 percent above the 1935–39 level, as compared with only 91 percent above as the average for all items, many who presume to speak for the cattle raisers are already talking about the recent fall in beef prices as if it were an intolerable disaster. And though average weekly factory wages are 222 percent higher than in 1935–39, compared with an increase in living costs of only 91 percent, the American Federation of Labor recently called upon all its affiliated unions to press for still higher wage rates this year "as a necessary measure to head off a major depression in 1954 or 1955." Another substantial boost in wage rates now, in fact, without a further expansion of the money supply to make the wage boost payable, would be precisely the way to bring on unemployment.

But the opposition to halting inflation will not come merely from farm and union leaders. To halt inflation may require a further rise in interest rates. This will be opposed by many business borrowers at the banks—precisely because it would discourage a further expansion of bank credit.

Just as inflation never means a uniform rise in all prices, so a halt to inflation would not mean a uniform "stabilization" of prices. On the contrary, the prices of some goods would be bound to fall; and the producers of these goods would start protesting. A halt in inflation would reveal, also, that the optimistic illusions which inflation breeds have resulted in the misdirection of investment into industries whose facilities have become relatively overexpanded. These industries would want inflation continued for their special benefit.

The Eisenhower Administration, in brief, must count the political cost of disinflation in advance, and be ready to pay it. And the rest of us must have the understanding to support it in that determination.

The Meaning of Savings
March 9, 1953

Dozens of different figures are now compiled, officially and unofficially, which purport to represent our personal or national "savings." A day seldom passes without some discussion of these figures in editorials, speeches or business forecasts. A frequent conclusion is that these savings present "unused purchasing power" which could "cushion" a slump. This conclusion is dubious and so are the figures themselves.

There are astonishing discrepancies in the estimates, partly because of differences in concept and definition of savings, and partly because of different ways of estimating their amount. The Council of Economic Advisers, on the basis of the Department of Commerce figures, estimates that net personal saving amounted to some $18,800,000,000 for 1952. The Securities and Exchange Commission, on the other hand, estimates that for the third quarter of 1952 total gross savings of individuals were running at an annual rate of $15,000,000,000 (compared with a Department of Commerce estimate of a rate of $20,300,000,000 for net personal saving in the same period). The annual rate of saving must not be confused with cumulative savings, and in turn must not be confused with liquid assets.

Even if the layman can keep all these distinctions in mind, he may doubt how much better off he is. He looks up the latest figure of total deposits in savings banks, and finds it to be $22,300,000,000. In addition there are $2,600,000,000 in the postal savings system. He also finds that there are $40,000,000,000 in time deposits in commercial banks. Should he include these in savings? If so, why not add also the $99,400,000,000 in demand deposits in the commercial banks. Surely they are the depositors' "savings"! And why not go on to the value of life-insurance reserves, the assets of savings and loan associations and of government pension and trust funds, the value of government bonds, and corporation bonds and stocks?

But what the layman has been adding up, the statisticians will now tell him, is the value of "liquid assets." And he will get different totals for these depending on whether he consults the Federal Reserve Board or
the Securities and Exchange Commission. Last year the SEC estimated that at the end of 1951 individuals had accumulated a total of $340,000,000,000 in liquid assets. This specifically did not include corporate securities, which would have raised the figure by $210,000,000,000 more. But this total would come close to equaling the estimates of national wealth! After the layman has collected such figures and (if possible) reconciled them with each other, what practical or predictive use can he make of them? Do savings, for example, provide a “cushion” against depression?

The first thing the layman is forced to recognize is that a “liquid asset” for the individual is not necessarily a liquid asset for the community as a whole. One man’s quick asset is usually somebody else’s quick liability. Considered individually, people have available savings. But collectively they cannot spend their savings—for the simple reason that these have already been spent.

When a man puts $1,000 in a savings-bank deposit, for example, the savings bank buys, say, a newly issued $1,000 bond with it, and the corporation that sells it the bond buys, say, a $1,000 machine tool with the proceeds. The depositor’s $1,000 has been spent on a machine tool. If the depositor later withdraws his $1,000 to spend it on consumption, the savings bank (in the absence of some offsetting deposit) has to sell its bond to someone else. But if this someone else buys the bond, he cannot then spend the same $1,000 on his own consumption. His new saving must compensate for the former depositor’s “dissaving.”

The only way in which savers can collectively spend their savings (except to the small extent that these have consisted merely in hoarded cash) is through new borrowing, direct or indirect, at the banks, against their securities or other assets as collateral. But this means that new money must come into existence. And this is a form of inflation.

**Stalin and Our Policy**
March 16, 1953

The death of Stalin opened up wide possibilities. The most hopeful, (made unlikely by the quick appointment of Malenkov) was that it might have the same sort of dramatic sequel as the death of the Mongol Khan Ogdaï in 1241. That sequel has been vividly described by Winston Churchill: “The chivalry and armed power of Europe was completely shattered by the Asiatic hordes. . . . It seemed that nothing could avert doom. . . . But at the critical moment something happened—the Great Khan died. The succession was vacant and the Mongol armies and their leaders trooped back on their ponies across the 7,000 miles which separated them from their capital in order to choose a successor. They never returned till now.”

The worst possibility is that Malenkov or those around him may decide that the best way to consolidate their power at home is to launch immediate aggressions abroad and to call for more “unity and vigilance.”

The probabilities, however, are favorable. History and the nature of the Russian despotism justify the hope that the would-be successors of Stalin, like the potential successors of Lenin and Caesar, will intrigue or war against each other.

But the consequences of Stalin’s death may depend much more on what we do about it than on what immediately happens in Russia itself. We have a tremendous opportunity. Much depends on whether we know how to exploit it.

We have missed almost every such opportunity in the past. By officially recognizing Stalin’s despotism we lost far more than we gained. In the war against Germany we had one opportunity after another to impose terms and conditions on Stalin, or to extract concessions or guarantees from him in return for the immense aid we were supplying. We missed them all. We continued to act as if we were mainly dependent on Stalin when he was mainly dependent on us. We bribed him to get into the Japanese war when there was no need for such a bribe. We surrendered more principles to get him into the United Nations, when we should have done far better to keep him out. The one real act of the United Nations against aggression—in Korea—was possible only because Stalinist Russia had made the mistake of a temporary walkout.

If Stalin is gone, the Communist ideology remains. Our chief task is still to know how to combat it. Neither the Roosevelt nor the Truman Administrations gave any evidence that they knew how. They not only tried to appease Russia, but they showed constant sympathy for anticapitalistic ideas and measures both abroad and at home. At home they encouraged monetary inflation, which is the kind of heady stimulant that undermines and can eventually destroy private enterprise and the free market. Truman in effect supported Iran in its breach of contract with the Anglo-Iranian Oil Co. and its seizure of the properties. He openly espoused the socialist “principle of nationalization.” He even offered American aid to Mossadegh, the weeping, pajama-clad dictator, to help him finance the oil seizure.

Our policies in recent years have rather consistently encouraged such foreign “nationalization”—i.e.,
expropriation with inadequate compensation or none at all. Our representatives abroad have encouraged and even demanded so-called “land reforms” that violate all the principles of private property, demoralize production, and are hardly distinguishable from Communist land seizures.

In brief, the ideology fashionable in Washington and Europe in the last twenty years has favored the doctrine that the way to combat Communism is to compromise with it or to imitate it. If this doctrine persists, even the present opportunity may be lost. We can combat the ideology of Communism only with the ideology of freedom. Right principles will dictate right policies and right tactics vis-à-vis the Communist menace. President Eisenhower, unbound by the ideology of his last two predecessors, has a golden chance to use the death of Stalin to restore hope and peace and honor in the world.

Trade, Plus Aid
March 23, 1953

It was in Britain and in Europe, and not here, that the catchy slogan originated: “Trade, Not Aid.” The implication of this was that the countries of Europe no longer were asking for subsidies and handouts. All they were asking for was that the United States remove the artificial barriers that it had put in the way of receiving imports. They would do the same, and then they would balance their foreign trade through their own efforts.

But in practice European officials have been giving an appallingy one-sided interpretation to their own slogan. It turns out to mean more demands on us without corresponding concessions. Some of their demands are entirely justified. They ask that we simplify our customs procedures, that we abolish any quota limitations on imports from them, and that we lower our tariffs still further. We should do all these things. They are as much in the interest of the American consumer as of the European producer.

But the quid-pro-quo that European officials offer are virtually non-existent. They usually fail to suggest any reciprocal lowering of their own tariffs. Even when they do, they make such a reduction worse than meaningless by proposing to continue quotas and discriminations against American goods, and to continue bilateralism, special license requirements for imports, price-pegging for their own currencies, and rationing of dollars. Moreover, their “Trade, Not Aid” slogan turns out to mean, after all, “Trade, Plus Aid.”

All this was illustrated in the series of talks just completed between British and American officials on the problem of convertibility of the pound. The British officials seem to assume that to make the pound convertible would be primarily a favor to the United States, and that therefore we should be willing to pay them to do it. What they appear to have in mind is that we put up some $2,000,000,000 to $4,000,000,000 as a stabilization fund to support the pound. Of course as long as we stood ready to pay over $2.80 to anyone who wanted to convert a pound into dollars we could make the pound “convertible” at that rate as long as our money held out. But at the end of that time we would be just where we were at the start (except for our $4,000,000,000) and the problem would remain unsolved.

The blunt truth is that “convertibility” of the pound is not a problem that even British officials (let alone ours) have to solve. All that British bureaucrats have to do is to stop preventing its convertibility. The British pound is pegged at $2.80 by law. Except under specified conditions, it is made inconvertible into dollars by law. All the British bureaucrats have to do is to repeal these prohibitions. Then currency convertibility will take care of itself, as it has from time immemorial.

Two unwarranted fears have hitherto prevented this simple solution. The first is that the pound will sink and keep sinking. It will do so only if the British Government follows policies that undermine confidence in the pound. But if it keeps the discount rate high, if it keeps the paper pound scarce, if it keeps its budget balanced, if it turns its back firmly against threats of further socialism and property seizure, it will find such a fear groundless, as Canada did when it freed its own dollar.

The second fear is a “flight of capital.” This also is groundless unless government policy provokes such a flight. As an extra safeguard, the government could adopt, as a transitional measure, the device used by Peru. That country, although it forced its exporters to turn the dollars they had earned over to the government, gave them equivalent dollar “certificates” in exchange which they in turn were allowed to sell within Peru for whatever price (in soles) they could get in a free market from would-be importers. Thus there was at least free convertibility within national borders.

It is primarily to Britain’s advantage, rather than to ours, to make its currency convertible. If the will exists, the techniques of doing it present no serious problem.
A Tale about Taxes
March 30, 1953

The other day I met a friend who is a large stockholder in General Motors, and he told me a story. A few weeks before, his son had used somewhat excessive strength on the mixing valve in his bathroom and broke the handle off. The local plumber couldn’t repair it, so he ordered and installed a new valve. The valve turned out to cost $22.50. The installation, at $4 an hour, brought the total up to $100.

That sounded steep enough; but it was not until my friend had made some mental calculations that he realized how steep it really was. His income falls into the 90 percent tax bracket. So he figured that in order to acquire the $100 with which to pay this plumber’s bill, he had to receive $1,000 in dividends from General Motors. (For the benefit of the non-mathematical, $1,000 in dividends minus $900 in taxes on them leaves $100 to pay a plumber’s bill.)

But this is only the beginning. In order to pay $1,000 in dividends, General Motors has to earn more than $4,000 before taxes. (General Motors earned $1,502,000,000 before payment of taxes in 1952. It had to pay $943,000,000 in taxes, leaving it $559,000,000 in net income, out of which it paid $362,000,000 in dividends. So for every $1,000 it paid out in dividends, it had to earn $4,149 before taxes.)

But in order to earn $4,149 before taxes, General Motors had to sell $21,570 worth of cars—say eighteen Chevrolets—to its dealers. (GM total sales and income in 1952 amounted to $7,645,000,000.) To sum up, because of cost and tax erosion, in order for my stockholding friend to replace a bathroom valve, General Motors had to make and sell eighteen Chevrolets.

“So what?” some reader may ask. “If this fellow pays a 90 percent income tax, he must be rolling in it. Don’t expect me to weep.”

The point of the story is not that anyone should stop to weep, but that a few of us should stop to think. The question is not what our incredible burden of taxation is doing to this rich individual or that, but what effect is going to have in the long run on our whole economy—on productivity, wages, and employment.

Obviously a continuation of this rate and kind of taxation must undermine incentives, discourage new business ventures, and even prevent the formation of new capital for such ventures. For every dollar that General Motors paid to stockholders last year, it had to pay $3 to the government (not counting what it collected and paid in excise and sales taxes). The case of General Motors, in this respect, is not exceptional.

The Department of Commerce estimates that corporate profits before taxes in 1952 were $39,700,000,000; that out of this the corporations had to pay $22,600,000,000 in taxes, and that they paid out $9,100,000,000 in dividends. In other words, the government took an average of 57 percent of all the earnings of the corporations.

And for every dollar that the corporate stockholders got in dividends, the government got $2.48.

Even this does not tell us what the stockholders were able to keep in dividends after paying personal income taxes. A stockholder whose income gets into the top tax bracket of 92 percent can keep only 8 cents out of each dollar of dividends. The government gets the other 92 cents. Adding this to the $2.48 that it has already taken from the corporation gives the government $3.40. In other words, the government gets 42 times as much out of the average corporation as the investor in the top income-tax bracket is allowed to get and keep.

This may seem like a wonderful racket for the government while it lasts. But Congress should not be entirely astonished if it wakes up one day to discover—we hope not too late—that this division of the profits does not furnish the highest incentives for private investment in new enterprises; and that new venture capital has been drying up, with unpleasant effects on wages, employment, and production, and even on government revenues themselves. If we do not want to repeat the present predicament of England, we should not imitate the policies that brought her to it.

No Stand-By Controls
April 6, 1953

No sooner have we got rid of the self-imposed incubus of price control than agitation has begun for setting up stand-by wage- and price-control powers to take effect immediately should we ever get into a third world war. The proposal is unsound both economically and politically.

Senator Capehart of Indiana has taken the leadership in pressing for this legislation. He has been supported by the testimony of Bernard M. Baruch. It was Baruch’s testimony in the summer of 1950, in favor of “an overall ceiling across the entire economy,” that was chiefly responsible for the subsequent enactment of price-control legislation. Baruch’s prestige in many fields is richly deserved. But his price-fixing proposals disregard the most elementary economic facts and principles.

In 1950 he proposed that all prices and wages be “rolled back” to and frozen as of June 25, the day...
hostilities broke out. Now he is supporting the Capehart plan for an across-the-board, 90-day freeze of prices and wages in an all-out war. He has even urged that such a freeze should be extended to a year.

Of all forms of price control, an overall freeze is the most unworkable and the most harmful. To provide that in the event of a total war prices and wages must be absolutely frozen is like providing that in the event of a theater fire everybody must be strapped to his seat to avoid disorder.

Baruch often refers to our control experience in the first world war. The late Benjamin M. Anderson, in his book, *Economics and the Public Welfare* (1949), pointed out: “Wages we did not try to fix in World War I. . . . Price fixing we engaged in cautiously. There was . . . recognition of economic fundamentals. Prices have work to do. Prices have the important function of accomplishing priorities, allocations, and rationing. . . . It is the work of free prices and freely moving wages to determine whether labor and supplies shall be drawn to the production of commodity ‘A’ or of commodity ‘B.’ Rising prices mean more production. Falling prices mean less production. . . . With freely moving prices and freely moving wages, the goods in most urgent demand are produced, and the production of the less urgently demanded goods declines. Price fixing by itself tends to derange perversely the control of production and consumption.”

At the outbreak of total war, what is desperately urgent is the quickest possible change-over from civilian output to military output. It is precisely this that a blanket price-and-wage freeze would prevent or delay.

And how would a blanket-freeze formula be applied? To wages, for example? If we froze weekly wages we would discourage or prevent overtime work, just when such work was most essential. If we froze hourly rates, but allowed the customary 50 percent overtime premium, we would immediately get more overtime in the production of military goods. But this would raise the unit labor cost of such goods. If we did not allow the price of these goods to go up, we would discourage or prevent their production. If we did allow the price of these goods to go up, the blanket-freeze formula would already be breached. (An overall wage freeze would, of course, also prevent the producers of military goods from offering higher wages to attract labor away from the production of civilian goods. This would necessitate government direction of labor—i.e., telling each worker what job he must take.)

On Jan. 26, 1951, our price controllers actually announced a so-called overall price-and-wage freeze. The very next day an executive of the Office of Price Stabilization said that his agency was working intensely to “cure the absurdities and inequities inherent in such a sweeping order.” In total war we may need quick priorities and rationing—but these work best without price controls.

If the government follows proper fiscal and monetary policies in a total war it will not need price control. If it follows inflationary fiscal and monetary policies, price control will be not only futile but pernicious.

### Inflation Must Have a Stop

April 13, 1953

In recent weeks there have been signs of a recession. Wholesale prices, of course, have been sliding since they reached a peak of 116.5 in February-March 1951. By March 10 the price of steers dropped nearly 30 percent from the beginning of this year. Though the Office of Price Stabilization removed the last price ceilings on March 17, the decontrol has had no important effect on the average level of wholesale prices. The official index, in fact, dropped slightly to 110 in the week ended March 24. At the end of March, the Dow-Jones spot commodity price index stood at 168; a year previous it was 192. Chrysler announced automobile price cuts on March 25. On March 30 the stock market suffered the worst break since Oct. 22, 1951.

The stock-market break was generally attributed to the latest Korean peace overtures. Now if we take these seriously, they might adversely affect the price of securities in two ways. Some corporations are heavily dependent on direct war orders. If these declined, they might not find it easy to replace them. A drop in defense spending, moreover, could mean an end to inflation. Commodity and stock prices based on the assumption of continued monetary inflation would fall.

It would be absurd, however, to rush from this to the conclusion that a truce in Korea, or a lessening of the threat of a third world war, would be bad for our economy in general. Such a conclusion assumes that the best thing for business, employment, and the well-being of consumers would be the continued wasteful production of arms and ammunition.

This is merely a special case of the ridiculous reasoning which assumes that prosperity depends on the volume of government spending. What this reasoning overlooks is that the less the government must spend on armament or anything else the more it can reduce taxes. Then people can spend more of their own money for the things they want rather than have it seized by the government to be spent on the things it wants.

“War prosperity” is produced not by the volume of defense spending but by the inflationary method...
of financing it. It is produced, in other words, by an increase in the supply of money and bank credit. As the present inflationary boom shows signs of slackening off (which it did long before the latest Korean truce overtures) there will be increasing pressure on the Eisenhower Administration to resume inflation in one form or another. The increased pressure for more and higher farm price supports is a mere foretaste.

Willingness to accept some adjustment and recession now will be a test of the sincerity of all those who have been affecting to deplore inflation. More important, it will be a test of their understanding. It is true that the present inflationary boom could be kept going for a time by further doses of inflation. But to inject these now would be to build up for an inevitable crisis and collapse.

In an article in the Feb. 19 issue of The Commercial and Financial Chronicle, the economist L. Albert Hahn drew a striking parallel between the present inflation as it has developed since the autumn of 1949, and a previous "second postwar boom"—from 1921 to 1929. Both booms, he pointed out, rested on money and credit inflation. Between the end of 1948 and today total loans and investments of the commercial banks have been increased from $114,000,000,000 to $140,000,000,000. This compares with a rise from about $38,000,000,000 in 1921 to $50,000,000,000 in 1929.

Wholesale prices in the present period have increased (even after their recent decline) by roughly 12 percent. Wholesale prices between 1921 and 1929 actually showed a slight decline, in spite of monetary inflation. This led to the false belief that there was no inflation; and warning signals were ignored. Hahn argues that a monetary and credit inflation without a price rise ("inflation without inflation") can be as dangerous as any other. To prevent a future depression, he advises, we must put "brakes on the [present] boom before it enters its excessive phase."

Would Peace Be a Disaster?
April 20, 1953

I predicted in this place last week that fears of peace in Korea would lead to "increasing pressure on the Eisenhower Administration to resume inflation in one form or another." Typical of the comment already appearing is a dispatch in The New York Times of April 8 from James Reston.

"The Soviet 'peace offensive'," it begins, "has had at least one good influence [in Washington]. It has alerted the government planners whose job it is . . . to make provision for the day when defense spending will not assure full employment. . . . For seven years the Russians have tried to scare us into isolation and inflation; now, as the experts here see it, one of their objectives seems to be to smile us into disarmament, deflation, unemployment, and depression. . . . Labor union leaders . . . already have started appealing to the President to plan at once for the day when the vast government orders for munitions will drop off. . . . The observers think that . . . the Soviet hierarchy is trying to bring the United States up against the major problem of keeping its people employed when it shifts to a modified peace economy."

Notice how the dispatch rolls "disarmament, deflation, unemployment, and depression" all into one package, implying that the first necessarily involves the last. Notice the implied labor-union-leader plea to maintain the present fantastic rate of government spending at all hazards.

It was only a few months ago that the Russian Communists were accused of threatening war mainly to force us to spend ourselves into inflation and bankruptcy. Now they are accused of threatening peace to force us to economize ourselves into unemployment and depression. A regular technique seems to have developed among our would-be planners, official and unofficial. If they want to get us to do something, they immediately charge that the Russian Communists are trying to force us to do the opposite.

"In the Soviet mind," The Times dispatch continues, "the capitalist world cannot close the gap between its production and consumption without vast expenditures for war." Whether or not this is the Soviet theory, it is certainly the theory of most of our home-grown planners. They might admit, perhaps, that we don't need vast expenditures for war. But we certainly, in their opinion, need vast government expenditures for something if we are to "close the gap between production and consumption."

As this column has often pointed out, this theory is pure Keynesian nonsense. It is astounding that it could have survived the experience immediately after Japan surrendered in August 1945, when a sweeping cancellation of war contracts was followed by even higher employment in the spring of 1946. How often must it be pointed out that if the government spends, say, $10,000,000,000 a year less on defense, the taxpayers have $10,000,000,000 more of their own money to spend on themselves?

What the planners and "experts" in The Times dispatch are really arguing for is the continuance of monetary inflation. Indeed, a school is now developing
that openly embraces Perpetual Inflation. Listen to Prof. Seymour Harris of Harvard. Perhaps the present Administration’s monetary authorities, he writes in a letter to The New York Times of April 5, “will tell us where, in the absence of bank purchases [of government bonds], the money is to come from which will be required over the next 25 years on the conservative assumption that real income would rise by 100 percent and prices by only 50 percent. . . . For when the banks buy, additional deposits are created.”

In other words, Harris insists that even if production of commodities doubles, their prices ought to be raised by at least 50 percent. This result could only be brought about, of course, by an enormous further inflation (of some 200 percent) in the money supply.

With such doctrines on the loose, the Administration is going to find it extremely difficult to hold to a course of economic, fiscal, and monetary sanity.

Inflation without Tears?
April 27, 1953

A book just published, Money, Men and Machines, by Waddill Catchings and Charles F. Roos (Duell, Sloan & Pearce-Little, Brown, $2.50), attempts to supply a new answer to the problem of how to avoid both “inflation” and “deflation” and still keep continuous full employment.

Catchings is chiefly known as co-author with William T. Foster of Money (1923) and Profits (1925). Roos was director of research for the NRA and is now president of the Econometric Institute in New York. Their book is short, lucid, handsomely printed, and extremely readable. It contains, among other merits, a well-reasoned argument for economic freedom and an excellent description of the workings of what the authors call the “price-and-profit mechanism” in our system of private competitive enterprise.

But the answer that the book offers to the problems of “monetary management” is vague and disappointing. The authors are opposed both to the orthodox solutions of the past and practices of the present. They accuse the Federal Reserve Banks of “mismanagement of our money supply” in 1929, in 1937, and in 1948–49. They don’t like what they call the Reserve Board’s “zigzag methods of monetary manipulation,” by which they mean the lowering and raising (especially the raising) of discount rates.

They speak constantly of the dangers of a “dear-money policy” but never define “dear” money.

“Throughout much of 1951 and 1952,” they write (p. 109), “the Federal Reserve System pursued a dear-money policy. The result was that the long-term interest rate rose by more than 10 percent, and the short-term rate by more than 50 percent.” These increases, calculated in this way, sound startling. But the authors neglect to tell us that even after this “dear-money” policy the average interest rate on four-to-six months’ prime commercial paper in 1952 was only 2.33 percent, and on three-month Treasury bills only 1.76 percent. On the best-grade corporate bonds the average yield in 1952 was 2.96 percent—as compared with an average yield of 5.07 percent, for example, in the ten years from 1920 to 1929 inclusive. If the short- and long-term interest rates of 1952 represented “dear” money, it would be interesting to know what the authors’ idea is of really cheap money.

Their own proposals, as I have said, are vague. The Federal Reserve Board is to be “directed to provide a supply of money that is adequate but not excessive.” This is not a solution, but merely a statement of the problem, which is precisely how to determine what money supply is “adequate” and what is “excessive.” “It is only necessary for Congress to declare that the purpose of managing money is to provide the people with the amount they need to produce according to their ability and desire.” This is just as nebulous.

Catchings and Roos don’t like the international gold standard: It “sacrificed domestic prosperity for the stability of foreign exchange.” And instead of control of the money supply through changes in the discount rate, they prefer the clumsier method of changing reserve requirements. But they do not consider what the effect of this would be on interest rates, nor do they tell us whether they would try to change reserves or reserve requirements while forbidding consequent changes in interest rates.

In short, the reasoning of the authors, on their central proposal, is confused. By an “adequate” supply of money, they obviously don’t mean an unchanged supply. “To be adequate, our money must increase regularly from year to year.” The wage-price spiral, they correctly tell us in italics on page 90, exists “only because the Reserve Board allows the money supply to increase.” But on page 101 we learn that if a wage-price spiral does start, we must provide more money to sustain it.

The basic proposals of Money, Men and Machines would be inflationary in effect. If we intend to halt inflation, we must begin by allowing interest rates to rise. And eventually we must return to a real gold standard.
To Restore Budget Control
May 4, 1953

Congress has allowed its Constitutional power of the purse to slip through its fingers. As Roswell Magill, former Under Secretary of the Treasury, recently testified: “Congress has lost annual control of expenditures.” He pointed out that $53,000,000,000 of the $78,600,000,000 expenditures proposed for the fiscal year 1954 is “not subject to control or review” by Congress this year. “Even if Congress failed to appropriate a dime during this session, the agencies and departments of the Federal government would have available for expenditures on June 30, 1953, more than $100,000,000,000 of unexpended balances from previous authorizations.”

As a first step to cure this situation, and to stop the deficits that the Federal government has incurred in twenty out of the last 23 years, Representative Coudert of New York has introduced a bill (H.R. 2) to provide that Federal expenditures shall not exceed revenues except in time of war or grave national emergency.

The bill provides, in other words, that there shall be no more deficit financing and no more resort to printing-press money, except upon at least a two-thirds vote of each house and a resolution declaring a national emergency. Such a measure would put a statutory limit on spending. It would tie spending directly to tax revenues. It would enable Congress to reassert its power of the purse and regain annual fiscal control.

The Coudert bill has the support of several governors and of the Conference of State Taxpayer Executives representing 38 state taxpayer associations. One of the witnesses in its favor was Governor Herter of Massachusetts. “Ten years spent here in Congress,” he said, “taught me one lesson so well, and gave me one warning so imperatively, that I shall not forget either. The lesson was that unless Congress maintains rigid control over the spending agencies of the Federal government we may one day find ourselves facing a national crisis of the first magnitude; and the warning was that Congress has lost such control. I believe that nothing more important can be done at this session than to regain it and thus establish national solvency.”

Governor Herter also reminded Congress that the procedure prescribed by the Coudert bill is essentially no different from the one which already exists in many states, including his own. “As governor, it is my Constitutional duty to submit [an annual] budget . . . and at the same time to submit a schedule of revenues to balance what I propose to spend. . . . The legislature may thereafter increase appropriations beyond my recommendations, but it may not be adjourned until it has provided the revenues to pay for what it appropriates.”

I am sorry to report that the new Secretary of the Treasury and the new Director of the Budget, while endorsing the aims of the Coudert bill, opposed the procedure it prescribed as too “inflexible.” This objection is without substance. The most flexible spending control that Congress can exercise (without actually abdicating its Constitutional responsibilities) is to set an overall ceiling on expenditures and allow the executive branch a very wide latitude in proposing whatever budgetary allocation of detailed expenditures it deems wise within that overall total. This is the way every individual business firm and every individual household is compelled to operate. Its total expenditures must be kept within its total income. If this is a “strait jacket,” it is a desperately needed one.

Nothing, certainly, could be more unrealistic than the procedure so often recommended—that “Congress should vigorously pare down spending, bill by bill and item by item.” A Federal budget of $78,000,000,000 is made up not merely of thousands, but of hundreds of thousands of individual items. No assembly of 531 men can possibly have the time and the knowledge to consider the merits of each item. But it can and does know that a chronically unbalanced budget and an intolerable burden of taxation can lead us to disaster.

Repeal the Taft-Hartley Act
May 11, 1953

It has remained for John L. Lewis to make the most sensible suggestion of any witness before the Senate Labor Committee on what to do about the Taft-Hartley Act: “Since management has cried out so sorely against the Wagner Act and all the manifold injustices alleged to be contained therein, let them now join us in repealing the Taft-Hartley Act in toto, lock, stock, and barrel, including the Wagner Act itself, upon which Taft-Hartley is founded. This would give to this country, its employers and employees, an opportunity . . . to practice for a season true, free, and genuine collective bargaining without governmental interference. . . . Leave the Norris-La Guardia and the Clayton Acts as the Federal rule and guide in the field of labor-management relations. . . .”

Most of us, including Senator Taft and a multitude of business groups, have forgotten that the Taft-Hartley Act is merely an amended Wagner Act, and retains most of the unsound principles embodied in the parent law. The Wagner Act abridged the freedom of
has created, exacerbated, and prolonged far more labor strife and strikes than it has prevented. Last year’s steel strike is an outstanding example.

Why not, as John L. Lewis suggests, try the pre-New Deal labor-law situation for a while?

No End to Superspending?
May 18, 1953

The announcement of President Eisenhower on April 30 that he would ask Congress “to appropriate $8,500,000,000 less new money for fiscal year 1954 than had been asked for by the previous Administration” made a good one-day headline. But it will not bring much comfort to taxpayers who examine the situation closely. This $8,500,000,000 is not a proposed cut compared with the previous rate of Truman spending. It is merely a cut from President Truman’s estimate for a fiscal year when he would not be in office and for which he knew he could not be held responsible. And it is a cut only in requested new appropriations, not necessarily a cut in actual rate of spending. In last week’s issue, Newsweek estimated that the Eisenhower spending budget for the fiscal year 1954 would approximate $74,200,000,000. This would be about the same as is being spent in the present Truman-Eisenhower fiscal year which ends on June 30. But it would be $8,000,000,000 more than was actually spent in the last full Truman fiscal year of 1952 and almost $30,000,000,000 more than was spent in the Truman fiscal year 1951. The Korean war was being fought during the whole of both these years.

Mr. Eisenhower complains that when he took office he found “a total carry-over of $81,000,000,000 in appropriated funds, largely committed. . . . It’s just as if the late Administration had gone to the store and ordered $81,000,000,000 of goods, which we’ve got to pay for as they’re delivered, in addition to paying the regular household running expenses.”

But two questions must be raised about this: (1) Is the whole of this $81,000,000,000 in appropriated funds, largely committed. . . . It’s just as if the late Administration had gone to the store and ordered $81,000,000,000 of goods, which we’ve got to pay for as they’re delivered, in addition to paying the regular household running expenses.”

But two questions must be raised about this: (1) Is the whole of this $81,000,000,000 in appropriated funds, largely committed. . . . It’s just as if the late Administration had gone to the store and ordered $81,000,000,000 of goods, which we’ve got to pay for as they’re delivered, in addition to paying the regular household running expenses.”

But two questions must be raised about this: (1) Is the whole of this $81,000,000,000 in appropriated funds, largely committed. . . . It’s just as if the late Administration had gone to the store and ordered $81,000,000,000 of goods, which we’ve got to pay for as they’re delivered, in addition to paying the regular household running expenses.”
1953 with a carry-over of more than $70,000,000,000 unspent appropriations into 1955.

“I have always firmly believed,” said Mr. Eisenhower in his statement of April 30, “that there is a great logic in the conduct of military affairs. There is an equally great logic in economic affairs. . . . If . . . these two are allowed to proceed in disregard one for the other, you then create a situation either of doubtful military strength or of such precarious economic strength that your military position is in constant jeopardy.”

This is admirably said. But the specific budget decisions Mr. Eisenhower has so far announced seem in fact to disregard economic logic. His message of May 5, urging Congress to authorize $5,800,000,000 for the foreign-aid program in the fiscal year 1954, is an outstanding case in point. True, this was a reduction of about $1,800,000,000 from the previous Administration’s 1954 budget. But Mr. Eisenhower is asking for it on top of some $9,000,000,000 of prior appropriations for foreign aid that still remain unspent at this time.

Nor did the statements either of Mr. Eisenhower or Mr. Dulles really explain why this additional $5,800,000,000 is needed. It is not enough merely to contend that the United States must “carry out its responsibilities of leadership in building up the security of the free world.” It must be shown that this particular method is the way to do this, and that no less than this amount is necessary. The answers to these questions so far have been little better than rhetorical. Our whole foreign-military-aid program, in fact, rests on the constantly reiterated but still unproved contention that Europe cannot afford to pay for its own defense.

Our own economy is in real danger from the present appalling rate of spending and intolerable load of taxes. If it is undermined by these the defense of the whole free world will really be imperiled.

Asking for More Inflation
May 25, 1953

In the issue of March 2, I wrote here: “We shall soon learn whether the American people really want to halt inflation, and whether they are willing to pay the price.” The answer so far has not been reassuring.

Let’s begin with the budget. The burden of taxation is already as high as the American economy can possibly stand. Inflation can be halted only by a slash in the present fantastic level of Federal expenditures large enough to wipe out our chronic deficits. One would not suppose such a slash to be supremely difficult. The $73,700,000,000 that we are spending in the current fiscal year alone is more than Franklin D. Roosevelt spent in the full eight years of his first two terms. It is nearly $30,000,000,000 more than even Harry Truman spent in the fiscal year 1951, during the whole of which the war in Korea was in progress.

It was less than a year ago that Mr. Eisenhower himself ventured the opinion that the Federal budget could be cut as much as $40,000,000,000 in the next few years. But when he recently announced reductions that would still keep spending in the 1954 fiscal year at a level of $73,500,000,000 (according to the Stamos estimates for Congress), there was a chorus of outcries that these economies would imperil the country.

Now it is always possible, even in a budget of these incredibly swollen overall dimensions, to “economize” in the wrong place, to cut down on the wrong thing—on long-range air power, let us say. But what is disheartening is that so few of the critics of specific cuts bother to suggest where the cuts might be made instead. Even on the present program, according to the Stamos estimates, there will be a deficit in the current fiscal year of more than $7,000,000,000, and in the next fiscal year of nearly $6,000,000,000. But this is being treated as if it were a matter of no particular concern.

Even more ominous, so far as the outlook for a halt in inflation is concerned, is the attitude being taken both inside and outside Congress toward the efforts of our monetary authorities finally to end the inflationary spree that has wiped out more than half of the purchasing power of the dollar since 1939. Twenty Democrats in Congress, including their leader in the House, Sam Rayburn, and their whip, John W. McCormack, have sponsored a resolution calling on the Federal Reserve Board to start supporting government bonds again at par. If they really understand what they are asking for, they ought to say outright: “We want more inflation.”

Let us see what the course they demand would mean. At the moment of writing this, some of the government’s 2½ percent bond issues are selling around 91 or 92. How many billions of dollars worth of bonds the Federal Reserve Banks would have to buy to bring these up to 100—and keep them there—is anybody’s guess. The Reserve Banks would create deposit credits to “pay” for these bonds. These credits would then become the basis for several times as much new money and bank credit—in short, for inflation.

The action would increase not only the available supply of inflationary credit but the demand for it. In
fact, to order the Federal Reserve Banks to buy all government 2½ percent bonds offered to them at par is only another way of ordering them to increase the money and credit supply enough to keep long-term interest rates down to 2½ percent. And such low interest rates, thus artificially produced, encourage more private borrowing. This is the main explanation for the increase in the supply of bank deposits and currency from $63,000,000,000 at the end of 1939 to $192,000,000,000 at the end of this January.

Yet people are shouting about “dear money” and “deflation” when the discount rate is 2 percent and when, as W. Randolph Burgess of the Treasury has pointed out, unemployment is at a minimum, the index of production made a new record high in the latest reported month, and personal income has reached a new high rate of $282,500,000,000 a year.  

Spending Can Be Cut More

June 1, 1953

President Eisenhower's radio talk of May 19 on the budget, and his tax message to Congress the next day, once more illustrated his deep honesty and earnestness in grappling with our major national problems. Yet his announced decisions, on net balance, must be set down as disappointing.

He is planning expenditures for the coming fiscal year of more than $74,000,000,000. This would be higher than was spent in any fiscal year under Truman. It would leave an estimated deficit under present tax laws of $6,600,000,000. Even if Mr. Eisenhower gets all the tax extensions he is recommending (and most of which are unwise), his proposed expenditures would still leave an estimated deficit of $5,600,000,000.

Do expenditures of more than $74,000,000,000 in 1954 in fact represent an irreducible minimum? Mr. Eisenhower himself has some admirable words to say in this connection: “Words like ‘essential’ and ‘indispensable’ and ‘absolute minimum’ . . . are spent with wild abandon.” Yet his actual spending budget is made up in large part of “absolute minimums” that turn out on examination to be very dubiously minimum. He seems to accept the whole $81,000,000,000 of unspent appropriations from the Truman Administration as irreducible and noncancelable, and his own budget apparently contemplates carrying forward some $70,000,000,000 of unspent authorizations into 1955.

Suppose we disregard the evidence of shocking waste in military expenditures uncovered in the last few years by Congressional committees, and accept all the military-spending estimates as irreducible. The budget still includes expenditures with worse than no economic justification. One need merely point for illustration to the billions spent and to be spent on farm-price supports which make food dearer for the American consumer.

The arguments for expenditure on a major item—the $5,800,000,000 being asked as an additional appropriation for foreign aid—are still rhetorical rather than factual. This is illustrated by General Ridgway's testimony before the Senate Foreign Relations Committee on May 19. He treated concern for economy with some contempt: “I don’t believe the civil authorities would want me to change my professional judgment as to the minimum requirements I believe necessary just because someone says it costs too much. . . . Money values assume somewhat different importance when all you hold dear is at stake.”

This perhaps misses the point that what we hold most dear may depend for protection just as much on our long-term economic strength as on our immediate military expenditures. The $5,800,000,000 that the President and General Ridgway are asking for foreign aid in 1954 is about the size of the inflationary deficit we are planning for that year. It is fair to point out, therefore, that if this amount were not spent for foreign aid in 1954 we could either avoid the deficit entirely, or avoid the tax prolongations that Mr. Eisenhower himself admits to be unsound. (His judgment on the excess-profits tax is that it “actually penalizes thrift and efficiency and hampers business expansion.”)

The huge foreign-aid program is now costly to our own economic health. And it rests on the very dubious contention that Europe cannot afford to pay for its own defense. This is primarily an economic, not a military, contention; and General Ridgway is not a final authority on its soundness.

It is impossible, of course, to consider the budget without considering the wisdom of specific government policies and attempted functions. Even where it is agreed that the taxpayer's money should be spent in a given direction, there is always the further question, how much? The present budget quandary once more suggests the need for drastic procedural reforms. Certainly a minimum first step would be the adoption of something like the Coudert resolution (see this column of May 4). We still have a budget system under which responsibility cannot be clearly fixed.
Unneeded Stand-By Controls
June 8, 1953

The original Capehart proposal to give the President power to impose a 90-day freeze on prices, wages, and rents in the event of a “grave national emergency” was so transformed as it emerged from the Senate that the House may not even consider it. This would be just as well.

Though the original proposal was approved by the Banking and Currency Committee by a vote of 12 to 3, the minority report ably summarized the objections to it: “It embodies stand-by control provisions for which the President did not ask. It embodies a philosophy counter to the views expressed by the President in his inaugural address. . . . If enacted into law, it would embed an economic fallacy into the functioning of the American economy for the life of the legislation.”

The minority convincingly refuted the contention of the majority report that it was price controls which finally stabilized prices during the Korean war. “If controls were holding the prices from going higher, the wholesale price-index graph should show a horizontal line at ceiling levels. Instead it shows a sizable drop below ceiling levels. . . . Final removal of price and wage controls has resulted in no general or significant increase in either prices or wages despite the forecasts of alarmists.”

It was the political and not the economic objections of the minority to the Capehart proposal, however, that were effective in securing changes in the Senate. The minority pointed out that under the original bill an overall freeze could be imposed “upon a simple finding that a ‘grave national emergency’ exists. . . . The bill would amount to a grant of power to invoke the freeze whenever bureaucratic advisers . . . could persuade the President to make the required finding.” The Senate therefore revised the bill to require a concurrent resolution of the Senate and House to find that an emergency existed before the President could call for a freeze.

But it was because the Senate majority accepted the economic ideology of the bill’s sponsors that it defeated the proposal of Senator Bricker to strike out all authority to impose a price-and-wage freeze. The Senate bill even requires the President automatically to freeze wages, prices, and rents if the United States declares war on a foreign nation.

All such price-and-wage freeze proposals rest on lack of economic understanding. It is significant that the long majority report never once mentions the huge increase in the supply of money and credit that took place after the outbreak of the Korean war. This was the real cause of the price-and-wage rise, which could have been stopped at any time by proper fiscal and monetary measures. Instead the government encouraged the increase in the money and credit supply, and then “fought” the consequent inflation with price control.

The majority report’s argument depends heavily on a false analogy. It speaks of “economic mobilization” for war. Like Bernard Baruch, it identifies such mobilization with a price-and-wage freeze. Now mobilization, in the military sense, means “to assemble . . . an army or a fleet.” It certainly doesn’t mean compelling everybody to stay just where he was before the war broke out. A price-and-wage freeze would be, in fact, the greatest obstacle to economic mobilization for war. Price changes are necessary to tell us the truth about comparative surpluses and shortages. They provide the incentives or deterrents that divert production most quickly into the lines where it is most needed. Free prices act faster than fumbling bureaucrats.

One element of sense in the “economic mobilization” idea is that it may be necessary, on the outbreak of a major war, for the government to put into effect some immediate priorities and allocations. But not only can all this be done without government price fixing; it can be done quicker and better without price fixing. When there are shortages, price ceilings make priorities and rationing more necessary, not less. Priorities and rationing, on the other hand, can in themselves restrain price rises.

Why Foreign Arms Aid?
June 15, 1953

For the fiscal year beginning July 1 we face an estimated deficit under present tax laws of $6,600,000,000 and, even if Mr. Eisenhower gets all the tax extensions he wants, of $5,600,000,000. We profess not to know how to solve this problem. Yet we are planning to give away $6,500,000,000 to foreign countries.

Our foreign-aid program, once mainly “economic,” is now mainly for “defense.” Congressmen hesitate to criticize it because they think it involves primarily a “military” question. It still involves, in fact, primarily an economic question, for it rests on two invalid economic assumptions: (1) that Europe cannot afford to pay for its own defense and (2) that the amount we give for defense aid all goes to increase foreign defense.

Here are this fiscal year’s armament expenditures of ten of our aid beneficiaries stated as a percentage of their total central governmental expenditures (TGE)
and (2) their gross national product (GNP). The record of these European countries is compared with our own:

</table>

The United States, in brief, is spending on national defense more than four times as much absolutely as these ten nations combined (some $53,200,000,000 against a total of $11,800,000,000). It is also spending much more relatively—15 percent of its gross national product against an average of 7 percent for the ten beneficiaries.

Many Europeans argue that this is just as it should be. They advocate a sort of international progressive income tax. This rests on the theory that the man or country that produces more and earns more somehow owes the difference to the man or country that produces less and earns less.

Yet the United States, which is giving the defense aid, is spending some 70 percent of its total budget on defense, whereas the countries receiving the aid are spending on the average only some 30 percent of their total budget on defense. This is another way of saying that while we in the United States can afford to spend only 30 percent of our total budget on defense items, the European beneficiaries of arms aid are lavishly spending some 70 percent of their total budgets on nondefense items. They are robbing their own defense at the cost of comparative luxuries (including deficits on their nationalized industries).

This relationship cannot be excused on the plea of poverty. On the contrary. In the foregoing table it is Greece and Turkey that have the highest relative defense budgets. Yugoslavia devotes some 80 percent of its total spending budget to defense, and Nationalist China about 57 percent. The ten countries in the table spend altogether a modest $11,800,000,000 on defense and some $34,200,000,000 on nondefense. Suppose we assume that we are contributing some $4,200,000,000 a year to their defense. Why can’t they, instead, take this out of their nondefense expenditures (which would still leave them some $30,000,000,000 for this purpose) and add it to their defense expenditures (which would still be only about half of their nondefense expenditures)?

It is relevant here to point out that whatever money or material we give to a European government for defense aid, however specifically earmarked, can simply release that much of that country’s own funds for additional nondefense expenditures. The only way we could make sure that this diversion is not taking place would be to dictate and supervise every item of that government’s budget. And no one would dare propose such dictation. ❖

A Budget Out of Control
June 22, 1953

We are witnessing once more the sad spectacle that has repeated itself again and again over the last twenty years—the utter rout and defeat of the forces for economy.

President Eisenhower, who started off so bravely a year ago with the statement that the Federal budget could be cut as much as $40,000,000,000 in the next few years, is planning to spend in the next fiscal year more than $74,000,000,000—an amount higher than was spent in any fiscal year under Truman. Yet it is not these terrific expenditures that are receiving the brunt of criticism in Congress and in the press, but the one major economy proposed in the military budget. And nowhere else in the budget is a major cut even being seriously proposed.

That the forces of economy should have been routed in 1934, when Federal expenditures jumped to nearly $7,000,000,000 and the debt to $27,000,000,000, was deplorable enough. But that the forces of economy should be just as thoroughly routed in 1954, when Federal expenditures are to be $74,000,000,000 and the Federal debt is scheduled to exceed $270,000,000,000, is enormously more serious. If proposals for government economy are dismissed even more peremptorily today than they were twenty years ago—though the rate of Federal expenditures and the national debt have both increased tenfold—then there must be some persistent factor at work that calls for the most urgent analysis and correction.
That factor is not mysterious. It is the lack of anything approaching a responsible budget system. Even the accounting is so chaotic that no one seems to know where we stand. President Eisenhower has been complaining that he has no real control of the budget because of a carryover into the next fiscal year of some $81,000,000,000 of funds appropriated and committed but not yet spent. He is treating this carryover as practically irreducible and non-reducible. Yet the Joint Congressional Committee on Reduction of Nonessential Federal Expenditures (the Byrd committee) pointed out in a recent report that some $5,200,000,000 of this amount was in fact still uncommitted and unobligated. And it added: “Experience indicates the firmness of some of the so-called obligations may be subject to review.” On the other hand, the committee includes not only this $81,000,000,000 in its total of unexpended balances, but more than $20,000,000,000 of “revolving and management funds”—bringing its own total estimate to $102,000,000,000.

Our budget “system” is set up for the spenders, not for the economizers. Almost any of the reforms that have been suggested would do at least some good. This is particularly true of the Byrd proposal for a single annual appropriation bill, and of the Coudert proposal for keeping Federal expenditures within revenues except in time of war or grave national emergency (see this column of May 4).

But we will never have a responsible budget in this country until we have removed the chief reason for irresponsibility. This is the power of the House of Representatives to increase expenditures beyond those proposed by the President and the power of the Senate to increase expenditures beyond those voted by the House. The result is a triangular competition in extravagance.

Nothing quite parallel exists in any other leading country. No other country could afford it. In Great Britain the wholesome rule has been immemorially established that Parliament has no power to increase expenditures beyond those proposed by the government. “The Congressional “power of the purse” can be rightly understood only as the power of withholding or denying the purse. When Congress can put its own hands in the purse, in order to propitiate pressure groups, then there is no one left to represent the interests of the taxpayers. It is only when Congress has the power of reducing expenditures, but not of increasing them, that competition in economy will supplant the present competition in extravagance.

Can We Prevent Depressions?
June 29, 1953

The views of Arthur F. Burns, now serving as Economic Adviser to the President, should be of interest to every businessman, for they may affect the future of his firm. An excellent synopsis of them can be obtained from Dr. Burns’s last annual report, just published, as director of research of the National Bureau of Economic Research, the private organization from which he has taken a leave of absence to assume his government job.

Much in Dr. Burns’s statement is excellent. Government action against depressions, he reminds us, must also mean action against the preceding unsound booms. Yet political officials, “while earnestly resolved to do away with depressions, sometimes seem to neglect the need of controlling booms and trust too exclusively in our ability to check any contraction that may get under way.” What preceding official has had the economic insight, sincerity, and political courage to point this out so clearly?

Dr. Burns says many other good things. “There are no adequate grounds, as yet, for believing that the government will resist inflation with as much tenacity as depression. Not only is the art of contracyclical action as yet imperfectly understood, but there are practical obstacles [such as the existence of political pressure groups] to the effective use of such knowledge as exists.”

But after he has said all this, Dr. Burns still seems to be convinced that governments both can and should undertake what he calls “contracyclical policy.” He quotes with apparent approval the statement of Mr. Eisenhower that “never again shall we allow a depression in the United States. . . . [If signs appear] of any depression that would put . . . men and women out of work, the full power of private industry, of municipal government, of state government, of the Federal government will be mobilized to see that that does not happen.”

Dr. Burns himself makes the following statements: “Since 1929 . . . social control of business cycles has emerged as a political necessity, both domestically and internationally. . . . Our economic system will continue to generate cyclical tendencies . . . . It is reasonable to expect that contracyclical policy will moderate the amplitude and abbreviate the duration of business contractions in the future. . . . Perhaps, before many years pass, an economic general staff will emerge within the government and take on some of the characteristics of military general staffs.”

Some of the implications of these statements are disturbing. They imply that there is some inherent
the determination of the monetary unit’s purchasing power independent of the policies of governments and political parties. . . . It makes it impossible for them to inflate.”

Today, unfortunately, only a minority of economists agree that it is both possible and desirable to return eventually to a gold standard. When it comes to such questions as when? under what conditions? how? and at what rate? even this minority of gold-standard advocates is split 40 different ways.

Mises’s answer runs something like this: Monetary reform presupposes first of all a change in the prevailing economic ideology. “There cannot be stable money within an environment dominated by ideologies hostile to the preservation of economic freedom.” The first step must be to put an absolute halt to any further monetary inflation. “The main thing is that the government should no longer be in a position to increase the quantity of money in circulation and the amount of checkbook money not fully—i.e., 100 percent—covered by deposits paid in by the public. . . .”

“At the same time all restrictions on trading and holding gold must be repealed. The free market for gold is to be re-established. Everybody, whether a resident of the United States or of any foreign country, will be free to buy and to sell . . . to import and to export, and, of course, to hold any amount of gold, whether minted or not minted. . . . In this first period of the reform it is imperative that the American Government and . . . the Federal Reserve System keep entirely out of the gold market. . . .”

“It is probable that the price of gold established after some oscillations on the American market will be higher than $35 per ounce. . . . It may be somewhere between $36 and $38, perhaps even somewhat higher. Once the market price has attained some stability, the time has come to decree this market rate as the new legal parity of the dollar and to secure its unconditional convertibility [into gold, and vice versa] at this parity.”

Regardless of their merits, these proposals are unlikely to get serious official consideration at this time. Very few monetary economists, for example, today favor anything as drastic as a prohibition of any increase in bank deposits (and, incidentally, in bank loans) beyond an increase of the same amount in gold reserves. Even most supporters of a return to the gold standard merely wish to stop the kind of credit expansion that comes through bank purchases of government bonds, not the kind that comes from an increase in the total volume of loans to business. And even most of those who favor a restriction on loans to business wish to carry it out solely through increases in interest rates (and perhaps

The Return to Gold

July 6, 1953

It is good news that the Yale University Press has made available a new edition of *The Theory of Money and Credit*, by Ludwig von Mises (493 pages, $5). In his introduction to the English-American edition in 1935, Lionel Robbins wrote: “In Continental circles it has long been regarded as the standard textbook on the subject.”

To this latest edition the author has added a new section of 44 pages on the present problems of monetary reconstruction. No two economists seem to agree in every detail regarding the monetary policies that should now be adopted and the order in which particular steps should be taken, but Mises’s discussion seems to me on the whole the soundest, most thorough, and most illuminating that has so far appeared.

No one, for example, has explained better than Mises the detailed process of inflation and the exact nature of the evils it entails. His basic argument for a return to the gold standard is nontechnical: “The excellence of the gold standard is . . . that it renders tendency in the capitalistic system to “generate” cycles and depressions, but that continuous government intervention could correct or at least “moderate” this. They assume that party politicians will act with more foresight and objectivity than private producers. An economic general staff, in particular, implies a quasi-military staff giving orders to businessmen on when to expand and when to contract. Some of us had assumed that the main trouble in the Communist, Fascist, and Socialist countries was that they already had such “economic general staffs.”

I would like to suggest a different approach to business cycles. It is no accident that the most violent fluctuations in prices, production, and employment have corresponded with the period of most government interference in business. Most major modern business oscillations have been the result either of credit and currency expansion deliberately instigated by government, followed by inevitable collapse, or at least by failure of government to halt an unsound credit expansion until too late. The best government “contracyclical” policy would be to keep an inflationary boom from starting, not to try to whip it up again after it has begun to flag. Governments need no encouragement to do the latter; it is, in fact, almost impossible to stop them. But they have no appetite whatever for doing the former and have almost never been known to try. ✺
in member-bank reserve requirements) rather than through any direct quantitative limitation.

But though there will be dissent from some of his detailed conclusions, Mises’s answer cannot be neglected by any serious student of the problem of returning to a gold standard. And that return is imperative if the world is not to drift even deeper into monetary chaos.

Return to Inflation
July 13, 1953

The Eisenhower Administration started out bravely to halt inflation. It refused at first to resume Federal Reserve support of government securities. It tried to get away from the inflationary policy of financing Treasury deficits by short-term notes, certificates, and bills sold to the banks. It resolved to start financing itself with long-term bonds, even though it had to pay 3¼ percent. But as soon as interest rates, as an expected consequence, became a little tighter, a chorus of complaints came from Congressmen, labor officials, bankers whose old bond holdings were dropping in value, and business firms which had to pay more for borrowing. The Administration took fright. In mid-May, the Federal Reserve System began purchasing Treasury bills in the open market. By June 17, it had bought $525,000,000 of government securities.

Then on June 24 it took the most inflationary step of all. It reduced the reserve requirements of member banks. This action, it estimated, would release $1,156,000,000 of reserves, which in turn would give the country’s banks another $5,780,000,000 or so in lending power. All this was frankly done in anticipation of Treasury needs of some $6,000,000,000 of “new money” in the next three months.

Between the end of 1939 and the end of April this year, the country’s supply of money and bank credit was increased from $64,700,000,000 to more than $195,000,000,000. This tripling of the money supply is the inflation that everybody talks about. It is the primary reason for the great increase in prices. Now the government wants to increase the money supply by $6,000,000,000 more. It is back in the business of printing fiat money for deficit financing.

It is being said in apology for the Federal Reserve action that the system could not help itself. The deficit at the end of the fiscal year just closed was $9,389,000,000, the largest in peacetime history. The deficit expected for the fiscal year just begun is $6,000,000,000 to $7,000,000,000.

As one commentator has shrewdly put the matter: “So long as the government runs a deficit the deficit will control the money managers and not the money managers the money.” Yet this is only partly true. The Treasury could conceivably finance the deficit by long-term bonds paid for out of real savings. But it just doesn’t want to pay the interest rate which this would involve.

The new Administration, moreover, cannot escape responsibility for the state of the budget. Mr. Eisenhower was in charge of spending for nearly six months of the fiscal year just closed. He will be in charge of spending for the entire fiscal year just begun. In spite of heavy spending commitments carried over from the Truman Administration, Mr. Eisenhower is not powerless. He could cut the budget in scores of places where he has not done so. There is no sound economic reason, but only political reasons, for the billions we are paying out for high support prices for farm commodities. There is no longer any impelling reason (if there ever was one) for giving billions of the taxpayers’ money away to foreign countries. Yet we are in fact planning to give some $6,500,000,000 away (or just about the amount of the expected inflationary deficit) in the present fiscal year. Several of his statements and actions, indeed (including his appeal to Congress for power to give away “surplus” food to foreign countries) indicate that Mr. Eisenhower has been infected by Mr. Truman’s foreign handout ideology.

In brief, on top of an inflation that the Democrats have been building up for twenty years, a Republican Administration is planning another heavy dose of inflation. This record demolishes the entire dream—theory that we can depend for salvation on something called “governmental contracyclical policy.” Governments know only how to inflate; they have no stomach for halting an inflation, and never try until it has gone so far that it cannot be stopped without threatening a crisis. The best contracyclical policy is to deprive governments of the power to inflate.

End Foreign Aid Now
July 20, 1953

The United States has spent $92,500,000,000 in foreign aid since 1941. Now, at long last, there are signs in Congress of a revolt against indefinite continuance of the program.
Agricultural production in general exceeded prewar levels in most European countries by 1947, and in all of them by 1951. Industrial production had reached prewar levels in most European countries by 1947, and in all of them by 1951. Agricultural production in general exceeded prewar levels by 1949.

So far as defense aid is concerned, I pointed out in this column of June 15 that the United States is spending on national defense more than four times as much absolutely as ten European arms-aid-receiving nations combined. It is also spending—twice as much relatively—15 percent of its gross national product against an average of 7 percent for the ten beneficiaries. Finally, the United States is spending 70 cents out of every tax dollar on defense, whereas these European nations are spending only 30 cents out of every tax dollar on defense. They are spending the other 70 cents on such things as deficits on their socialized industries, overgrown social-security systems, and subsidies to unprofitable and inefficient industries. Some of them act as if their defense were primarily a favor to us, and we should pick up the check.

It is beginning to be recognized, finally, that our economic aid has not only failed to speed up a return by Europe to sound economic policies, but that it has actually been used to finance the socialization of Europe. As the economist F.A. Hayek has put it: “There can be no doubt that, because of American financial assistance, governments of many countries now control economic activity to a much greater extent than would otherwise have been the case. Because of the form in which the United States has chosen to provide capital for these countries, their governments, in turn, have become the main dispensers of capital. When a government thus becomes the main source of investable funds, if inevitably speeds up the process of government domination of business.”

Will Congress really accomplish anything by setting a deadline for foreign-aid “programming” in 1955, and for spending in 1957? This is more likely to be interpreted abroad as a promise to keep the handouts going at least until that time. Paul Hoffman used to announce frequently the forthcoming termination of ECA; but it merely changed its name to MSA and cost us just as much.

Why not terminate new foreign-aid appropriations right now? After all, more than $10,000,000,000 of unexpended balances for foreign aid still remain on the books, even if Congress does not appropriate another penny.

If Congress does think it has to appropriate more, why not make the funds available strictly in the form of loans, to be paid off, say, in equal monthly installments of principal and interest over 25 years? Congress would probably be surprised at how little need European governments found for such repayable loans. Congress might even supplement this by limited government guarantees of private loans abroad under the strict conditions suggested by F.A. Hayek in an article in The Freeman of April 6.

We just had a deficit for fiscal 1953 of $9,389,000,000. We face a deficit for 1954 approaching $7,000,000,000. Surely the day of the huge handout to foreign nations, on any sort of facile rhetorical plea, ought to be over.

How We Support the World
July 27, 1953

The Senate Appropriations Committee has received a staff report which questions whether the French “will ever put their fiscal house in order and balance their budget by collecting the proper amount of taxes as long as they receive United States aid. . . . Taxation of the rich is on a primarily low level. . . . What we are doing with our economic aid is simply giving the French a certain amount of money and exercising no real control over how it is spent.”

These observations are harsh but justified. Yet there is nothing particularly new about them, except that a Congressional committee staff has now had the courage to make them. It has been inherent in the situation all along that without American dollars the government of France (or of any other country receiving our aid) would either have to spend less money or increase its own taxes. It is also inherent in the situation that the only way in which we could exercise real control over how our dollars are spent would be to dictate and supervise every item of the French budget—which no one has dared to propose.

It is obvious that it does little good—that it is in fact fatuous as well as futile—to “earmark” our foreign-aid
funds for specific purposes, to set up special “counter-
part funds,” and all the rest. To the extent that we pay
for France’s defense, France does not have to use its
own money for defense. Therefore its government can
use the money it saves on defense to spend for any other
purpose it pleases: In the fiscal year 1952, in fact, 62
cents out of every dollar it spent went for nondefense
items.

On July 14, a dispatch from Harold Callender, Paris
correspondent of The New York Times, attempted to
answer the Senate committee staff’s report, but missed
the point completely. The Mutual Security Agency,
wrote Callender triumphantly, “controls the use of the
funds granted to finance a specified list of defense pur-
chases . . . or to increase French productivity. Its control
is constant.” But none of this proves that the French
would not otherwise be spending their own money for
these purposes, or that they could not have increased
their own taxes to do so.

As I wrote in illustrating this point in Will Dollars
Save the World? published six years ago: “If you make a
loan to a family that keeps a car for pleasure, nothing is
gained by the assurance that the particular dollars you
have loaned have gone only to buy food, and that the
automobile was bought and run with the family’s own
earnings. Even if you could verify by the numbers on the
bills that your particular dollars were spent only for
food, you would know that your loan was being used in
effect to keep the car—because the family would other-
wise have to give up the car and use its own earnings
for the food.”

So it is just as fair to argue that the dollars we pour
into France pay the deficits on its nationalized indus-
tries, or support its overexpanded social-security system,
or relieve its rich citizens of taxes, as to contend that
they go only for defense or the purposes for which they
are “earmarked.” It is also just as fair to say that we are
prolonging our excess-profits tax, with all its admitted
harm to our new enterprises, efficiency, and produc-
tion, in order to help subsidize Europe’s socialism, or
to relieve Europe’s wealthy citizens of heavy taxes so
that they may continue to patronize the luxury hotels
on the Riviera.

We are doing all this because we have got ourselves
snarled up in economic, political, and moral confu-
sions. We have been sold the idea that we must assume
something vaguely called “world leadership”—which
turns out to mean “assuming our world responsibili-
ties”—which turns out to mean supporting people all
over the world so that they may realize what they call
their “legitimate aspirations.” We have acquired a Santa
Claus complex, an Atlas fixation, and a giveaway mania.

And we are solemnly told by our own leaders that if
we ever halt our foreign bounties the world will “lose
confidence in us,” and our allies will last only as long
as our handouts.

How to Help Small Business
August 3, 1953

The blunders and scandals connected with the
Reconstruction Finance Corp. led to a mounting
demand that the agency be abolished. So Congress has
voted to terminate it—and to create something just as
bad to take its place.

The new institution will be known as the Small
Business Administration. Congress seems to think this
will be better, because it will not be authorized to make
any individual loan of more than $200,000. But it may
actually be worse. What caused the public demand for
the abolition of the RFC were the mink-coat scan-
dals in connection with the $37,500,000 loan to the
Lustron Corp. and the misgivings that grew out of the
$69,400,000 loans to Kaiser-Frazer. These large loans
captured the headlines. But where no one loan is big
enough to dramatize the situation, blunders, politics,
and corruption may continue to be tolerated.

Loans by a political agency are inevitably more
political than economic. Congressmen did not hesitate
to bring pressure on the RFC to grant loans to their
constituents. Obviously they will hesitate much less to
do this in connection with small loans than in connec-
tion with large ones.

The sentiment in favor of government loans to pri-
ivate business rests on a belief that there are all sorts of
worthy projects, particularly small ones, that cannot get
started because private bankers or investors do not have
the courage and vision to see the possibilities in them.
No doubt there always are a few worthy projects of this
sort. Private bankers and owners of loanable capital are
not omniscient. But it does not follow that a govern-
ment lending agency will know how to correct these
private errors. On the contrary, it is enormously prob-
able that for every sound project it finances that private
capital would not finance, it will finance half a dozen
marginal projects, from snack bars to snake farms, that
private capital had quite wisely turned down.

Government agencies are bad gamblers from the
nature of the case. The private investor risks his own
money.

He may stand either to make a handsome profit
or to lose his entire capital. Therefore he is likely to
scrutinize a project very carefully before he risks that capital. A government agency, on the other hand, is not risking its own money, but merely the taxpayers'. The SBA loans are almost certain to be dubious, moreover, from the very terms under which they must be made. Private-loan sources must be exhausted before a small business can come to the SBA for a Federal loan. This means that the SBA can risk the taxpayers’ money only on projects in which no one has been found willing to risk his own money.

Some people suppose that a government agency will at worst finance some unsound projects, and only the long-suffering taxpayer will take the loss. But at any given time there is a limited amount of available capital. The government does not create any new capital; it merely takes some away from the taxpayer. So the capital that the government agency lends to Y for an unsound and unprofitable project is in effect taken away from X, who would have got it for a sound project from taxpayers who had to turn it over to the government lending agency instead. A government lending agency, in short, because it is never primarily concerned with profitability, not only finances inefficient and unprofitable ventures but indirectly deprives efficient and profitable ventures of funds.

The best thing the government can do for small business is not to “aid” it but to stop penalizing it. The best way to have stopped penalizing it was to have let the excess-profits tax expire instead of forcing its extension. The government, having tied the legs of profitable, efficient, and growing small business by extending the excess-profits tax, is trying to compensate by giving crutches to unprofitable and inefficient small business through a new lending agency. The real way to help small business is to let inefficiency and bad judgment suffer their natural penalties, and efficiency and good judgment reap their natural rewards. ✡

**Competition in Extravagance**

*August 10, 1953*

Immediately after the House voted to slash $1,115,050,000 from the $5,157,232,000 President Eisenhower had asked for foreign aid, he appealed to the Senate to restore the cut. The Senate Appropriations Committee—and the Senate—promptly restored approximately half of it.

The House rightly decided that, above all in an inflation and in the midst of a private-housing boom, there was no excuse for continuing a public-housing program. It voted to eliminate it. The Senate restored the program to 35,000 houses, whereupon the House was compelled to compromise on 20,000.

The House voted for only some $60,000,000 for the Overseas Information Service. The Senate increased the amount to $80,000,000.

And so it goes. There is nothing unusual in this record. In every session of Congress the Senate pretty regularly outbids the House in its vicarious generosity with the taxpayers’ money. The Senate’s record in this session, in fact, is much better than usual; there are even cases in which it made a smaller appropriation than the House.

The main reason for this superior extravagance of the Senate is simple. The House usually acts first on appropriation bills. A senator has little to gain politically merely by me-tooing the liberality of the House. The way to political credit for generosity is to vote for an increase above the House appropriation. Thus we have a system which creates a three-way competition among the President, the House, and the Senate to outbid the others in the amount of money each recommends or offers for special purposes or to special groups at the expense of the American taxpayer.

It may be seriously doubted whether this corresponds with the intent of the framers of the Constitution. Article I, Section 7, provides: “All bills for raising revenue shall originate in the House of Representatives.” In practice this has been strictly interpreted to apply solely to tax bills; but the framers probably also had appropriation bills in mind. They seem to have thought of appropriations and the taxes to pay for them as inseparable parts of a single legislative process. This is indicated by the odd fact that the Constitution nowhere directly and explicitly, but only by implication, confers power on either house to make appropriations.

There are three ways in which the present triangular competition in extravagance among the President, the House, and the Senate could be ended:

1—The Constitution could be amended so that the Senate would have to wait until the House had acted first, not only on tax bills, but on appropriation bills; and the Senate would be given power to eliminate or reduce, but not to increase, any appropriation made by the House.

2—Better (corresponding to British practice), Congress as a whole would have power to reduce, but not to increase, any appropriation asked for by the President.

3—Still better, the House would have power to reduce, but not to increase, any appropriation asked for by the President, and the Senate would have power to
reduce, but not to increase, any appropriation made by the House.

This last arrangement would substitute a three-way competition in economy for the present three-way competition in extravagance. It would change the entire atmosphere of budgetary discussion. With no power to increase appropriations or to outbid the Executive or the Congressional majority, the minority in opposition would devote its zeal and ingenuity to suggesting economies. This would tend to eliminate from Federal public life the worst type of politician, who gets into office by out-promising his rivals concerning handouts from the public till.

It may be objected that this whole proposal is utopian because neither the Senate, nor Congress as a whole, would ever consent to give up its present prerogatives. But on the other hand, we are rapidly reaching the point where the country can no longer afford the present system.

Raising the Debt Limit
August 17, 1953

It is fortunate that Congress did not immediately grant the President’s request to increase the legal national-debt limit from its present level of $275,000,000,000 to $290,000,000,000. Immediate acquiescence by Congress, as Senator Byrd put it, would have been “an invitation to extravagance.” A suspended decision, on the other hand, will give both time and occasion to re-examine the whole problem of government spending.

The Administration’s argument for raising the ceiling was that the national debt was already more than $272,000,000,000, and that expenditures between now and Jan. 1 are expected to exceed receipts by $7,300,000,000. In reply, Senator Byrd pointed out that the Treasury already had a $9,000,000,000 cash balance in the general fund, “which should be ample to cover this five-month deficit, and if not, there will remain $3,000,000,000 in addition which may be borrowed under the existing debt limit.”

In addition, Senator Byrd said: “The President has the authority, if he chooses to use it, to place every agency of the government on an expenditure ration and limit the expenditures in such manner as he deems best. . . . We all know there are thousands of ways to reduce government spending that can be accomplished by Executive order without impairing benefits as measured by real value.”

The basic solution of the debt problem, in short, is not to keep raising the debt limit but to balance the budget by bringing expenditures down to a reasonable level of taxation. Spending in the fiscal year 1954 seems likely to equal or approach spending in the year that ended June 30. That itself was higher than in any full Truman year. Yet Mr. Eisenhower fought hard to get Congress to authorize very dubious 1954 expenditures, such as the tremendous sum of $6,652,000,000 for foreign aid.

One of the arguments of Secretary Humphrey in favor of raising the debt limit was the need of keeping a huge cash balance: “You can’t run this government with this level of expenditures on less than about a $6,000,000,000 cash amount because you are spending at the rate of about $6,000,000,000 a month.” This argument may boomerang. It may remind the country that we are now spending in a single month almost as much as Franklin Roosevelt in his first term spent in a full year.

It is of course self-contradictory for Congress to approve tax cuts and expenditure increases that make additional debt inevitable, and then refuse to approve the additional debt. The question has even been raised whether a legal debt limit serves any valid purpose at all. Yet it does. It acts as an alarm clock, a pressure gauge, a “dangerous curve ahead” sign. It is merely a foolish and perilous misuse of these devices to turn off the alarm and go back to sleep, to substitute another pressure gauge when the first one reaches the red mark, or to move the sign beyond the curve instead of in front of it. This is in effect what Congress has been doing over the years. From 1941 to 1945 it raised the debt limit five times. It is worse than pointless for Congress to set a debt limit unless it really means it.

Though it may now be too late for Congress to refuse to raise the debt limit at its next session (or even at a special one), it would be folly to grant that increase without insisting on some quid pro quo in return. This might take the form of passage of the Coudert resolution (already approved by the House Government Operations Committee) which would prohibit the Administration from spending more than it took in during any year except in wartime or of grave emergencies declared by Congress. Congress might even, in return, submit a constitutional amendment to give the President power to veto individual items in appropriation bills. Better, it might deny itself the power to appropriate more than he had recommended. Any one of these moves would help to substitute competition in economy between Congress and the President for the present competition in extravagance.
Eisenhower So Far
August 24, 1953

The most important economic achievement of the Eisenhower Administration so far has been the abolition of price control. The Truman Administration had imposed price control on the excuse that it was needed to “fight inflation.” All that it really did was to unbalance and curtail production, bring on shortages, and enable partisan bureaucrats to exercise life-and-death powers over particular industries and firms, and encourage the continuance of inflation by diverting public attention away from its real cause, which was the creation of more money and credit by the government itself. Spokesmen for the Truman Administration kept shouting that to allow price controls to lapse would be to turn over the country to “the profiteers” and to let loose the floodgates of an uncontrollable inflation.

President Eisenhower nevertheless moved boldly ahead and dismantled price control within a comparatively few weeks. The predicted “inflation” never came. On the contrary, the wholesale price level fell from an index number of 109.9 in January to 109.4 in June, while the cost-of-living index remained about stationary. Once more a complete demonstration had been made of the fraudulence of price control as a cure for inflation. But if any New Dealer has acknowledged the folly of his prediction, I have yet to hear of it. Instead we have the comic spectacle of Sam Rayburn, for example, simultaneously complaining about a rise in prices and about a fall in prices: “Prices of many commodities are rising. . . . Farm income is down 14 percent.” But farm income is down only because farm prices are down. City workers are paying less for foodstuffs.

What really brought inflation to a halt was the courage of the Eisenhower Administration and its monetary managers in halting the policy of cheap money. But the government suddenly took fright at the complete success of its own hard-money program and threw it into reverse. On June 24 it reduced reserve requirements in order to give the country’s banks some $5,780,000,000 in additional lending power.

This sudden reversal of the anti-inflationary policy was symptomatic partly of a loss of political nerve on the part of the Eisenhower Administration and partly of acceptance of the New Deal economic philosophy. The same performance was repeated in farm policy. Secretary Benson made one bold speech against the fantastic farm-price supports and ran away from it as soon as the bricks began to fly. Mr. Eisenhower in his campaign talked boldly of economy and tax reduction. He has ended by setting up a spending budget for fiscal 1954 of $74,000,000,000—higher than in any full Truman year. He has insisted on a huge foreign-aid program of $6,652,000,000 a year. He has asked for authority to raise the debt ceiling to $290,000,000,000 (though his recent economy order gives renewed grounds for hope).

Finally, and most ominous, he has allowed officials in his Administration to prepare amendments to the Taft-Hartley Act that would scuttle practically every reform brought about by that law and put individual workers, employers, and the country at the mercy of irresponsible union bosses.

It is surely not without good grounds that the Democratic National Committee boasts that most of the Eisenhower achievements in office so far “are merely continuations of Democratic programs.” I happen to agree that one or two of these “Democratic” policies—such as extension of the reciprocal-trade program and the simplification of customs regulations—were sound and praiseworthy. But if Mr. Eisenhower decides to continue the bulk of the New Deal spending, taxing, deficit, inflation, foreign and domestic handout, and pro-union-boss policies, he is not only likely to head the country into economic crises but to lead his party into defeat in 1954 and 1956. The American people in the last election voted for a change. There is still plenty of time for Mr. Eisenhower to renew the courage and convictions of his original start.

The Futility of Foreign Aid
August 31, 1953

Nothing has more conclusively demonstrated the complete futility of our foreign-aid program than what has been happening in France. One of the chief purposes of the foreign-aid program was to try to put France politically and economically on its feet, to remove or reduce the influence of the Communists, and to help make France into a strong and dependable ally. Not one of these objectives has been achieved.

Certainly we did not spare expense. A recent report by a Senate staff committee headed by Alex L. Hillman estimated that from April 3, 1948, to Jan. 31, 1953, United States assistance to France and Indo-China alone totaled some $10,900,000,000. This is more aid than went to any other country in that period. What have we got in return?

What really brought inflation to a halt was the courage of the Eisenhower Administration and its monetary managers in halting the policy of cheap money. But the government suddenly took fright at the complete success of its own hard-money program and threw it into reverse. On June 24 it reduced reserve requirements in order to give the country’s banks some $5,780,000,000 in additional lending power.

This sudden reversal of the anti-inflationary policy was symptomatic partly of a loss of political nerve on the part of the Eisenhower Administration and partly of acceptance of the New Deal economic philosophy. The same performance was repeated in farm policy. Secretary Benson made one bold speech against the fantastic farm-price supports and ran away from it as soon as the bricks began to fly. Mr. Eisenhower in his campaign talked boldly of economy and tax reduction. He has ended by setting up a spending budget for
confidence that it will be stabilized even where it is. The budget has been chronically unbalanced. The government has been reduced to short-term borrowing at the Bank of France—i.e., to printing more paper money. As A.E. Jeffcoat pointed out in a recent article in The Wall Street Journal, French public spending, which swelled from 1949 to 1953 by 40 percent (while national income rose only 9 percent) presently chews up nearly half of France’s national income. Government “investments” in both nationalized and private industry take up about 26 percent of state spending. Subsidies to groups like exporters and alcohol distillers use up 9 percent of the nation’s budget. The state social-welfare program consumes about 12 percent.

Our aid has not brought political stability to France. A French government now stays in power, at best, for a few months. Weeks may pass with no government at all. About as many voters still vote Communist as before Marshall aid began. The Communists can still impose paralyzing strikes. In fact, the Communists are hardly needed for this purpose. It has now been demonstrated that if any Premier even attempts to take the measures that are absolutely essential to halt inflation and restore solvency, unions of every political color will go on strike.

Has our military aid made France a strong and dependable ally? There is little evidence of it. As I have pointed out here in previous columns, to the extent that we pay for France’s defense, France does not have to use its own money for defense. In the fiscal year 1952, 62 cents out of every dollar the government spent actually went for nondefense items—largely of the welfare-state type specified above.

Has our aid to France and other countries brought us their gratitude, friendship, and good will? Has it made them into stauncher allies? Almost every dispatch from Europe today reports the opposite. On Aug. 10, William Philip Simms wrote to the Scripps-Howard newspapers: “The biggest peril to American people today is not Soviet Russia, but the growing anti-Americanism here in Western Europe. And it is rankest among those for whom we have done the most.”

Warren H. Phillips made a similar report to The Wall Street Journal a few weeks before, explaining how anti-Americanism has been caused by our help: “Taking charity by itself is pride-destroying. But it is doubly so when the recipients come to believe that their governments have bartered their foreign policy and domestic political independence, too, in return for U.S. aid.”

The money we are now pouring into foreign aid is worse than thrown away. It subsidizes and prolongs extravagance and socialistic policies that Europe would otherwise have been forced to abandon long ago. It produces anti-Americanism in European foreign policy as a proof of “independence.” Yet we are scheduled to spend the tremendous sum of $6,652,000,000 for foreign aid in the present fiscal year, and the President has implied to Congress that foreign aid must continue indefinitely.

‘Foreign Economic Policy’
September 7, 1953

President Eisenhower and Congress have jointly appointed a seventeen-member Commission on Foreign Economic Policy, under the able leadership of Clarence B. Randall, which is to make a thorough study of the subject and report to Congress next spring.

Actually, the subject is not nearly as intricate and baffling as it is usually made out to be. Most of what is worth saying on the subject has already been said many times. Lewis W. Douglas, for example, our former Ambassador to Great Britain, has already turned in a report to the President that covers most of what the commission is likely to find out. Given the mixed political composition of the commission, indeed, the country will be fortunate if its report turns out to be, on the whole, nearly as sensible and balanced as the Douglas report. Obviously, the best way to increase the volume of world trade is to reduce or remove the barriers to it. And as it is always sound ethical policy to extract even a mote from our own eye before calling attention to even a beam in our neighbor’s, the first thing for us to do, as Douglas insists, is “to commence to remove from our own policies the impediments to freer trade and currencies.” The Eisenhower Administration has already made a good start by continuing the reciprocal-trade treaties and by some simplification of customs procedures. But to set a good example it should reduce tariffs even further. Certainly it should abolish import quotas, which are far more disruptive to foreign trade and good relations than even a formidable tariff barrier.

Nevertheless, if we were to wipe out the last vestige of our own tariffs and quotas, it is doubtful whether, except in a few special items, our imports would increase very much. For by far the major barriers to foreign trade today are erected by other nations. Bilateral treaties, import quotas, and prohibitions, and above all, exchange control, which are practiced, with our tacit approval, by most of our aid recipients, not only reduce and disrupt foreign trade incomparably more than tariffs do, but inevitably lead to “planned” and regimented domestic economies.
The Douglas report also emphasized the need of restoring international private investment. This would promote the most rapid world economic expansion, particularly the expansion of the so-called underdeveloped areas. But what is still not generally recognized is that the greatest obstacle to the restoration of international private investment is the existence of governmental handouts from the United States. For private investment is made only where the political and economic climate is attractive. This means, among other things, assurance against socialization, seizure, excessive taxes, onerous price-fixing, wage-fixing, or profit limitation, and obstacles to the transfer of profits or currency. But it has been found by experience (what should have been obvious anyway) that as long as an "underdeveloped" country can cajole or blackmail the United States Government into giving it handouts, it need not make, and will not make, any of the reforms necessary to attract private capital.

Iran provides a perfect illustration. Mossadegh having impoverished both the government and the country by seizing the British oil refineries, his successors demand our aid while still insisting that they must keep the stolen property. And if (under their threat or our fear that they will otherwise go Communist) we are foolish enough to give them this aid without demanding the return of the expropriated property to its British owners (or at the very least reasonable compensation for it), then we shall not only be condoning but encouraging such seizures everywhere, thereby still further postponing any restoration of international private investment. The policy of making U.S. Government handouts to foreign socialistic governments not only fails to enrich the world but tends to impoverish it, because it sets back the economic recovery of the recipient country as well as our own.

**How to Kill Capitalism**

*September 14, 1953*

There has lately been a rising protest against the tremendous tax burden now placed on the American people. The protest is most impressive when it rests, not primarily on the argument that our present tax structure is inequitable (though that is true enough), but on the ground that existing taxes are killing incentives and thereby undermining the productiveness of the entire economy.

An excellent speech on what taxes have been doing to incentives was delivered this spring at a conference of the National Industrial Conference Board by David McCord Wright. Professor Wright devoted himself particularly to assailing the alleged "statistical proof" on the part of some of his academic colleagues "that incentives are unnecessary, that the harder you tax the businessman the harder he will work; and that . . . the American 'rags to riches' myth is mostly bunk anyhow."

Wright did not have too much trouble in disposing of the alleged "scientific basis" of these statistics, or in revealing the bias behind them. He caught some of his colleagues arguing in the same breath that the destruction of capitalistic opportunity has been a good thing, and, anyway, that such opportunity never existed. And he found that they failed also to distinguish between the effects of present onerous taxes on the incentives of the older generation, who formed their working habits and ambitions in an earlier era, and the effects of such taxes on a younger generation who are forming their habits and ambitions now. "The older men," he concludes, "may stick in hectic business or professional life under present taxes, because, already caught in the rat race, they may still work hard in order to keep their accustomed standard. The younger men, I believe, will increasingly just say: 'What the hell!'"

Wright’s argument is mainly negative. He shows, that is, that the alleged statistical proof that business executives “will work harder if you tax them more” is spurious and worthless, just as the proposition itself is on its face contrary to common sense.

But he could have gone on to show, if he had wished, that there is plenty of statistical evidence, of a far less dubious nature, that excessive taxes destroy incentives. In the case of personal income taxes, for example, it is notorious that higher tax rates have failed to yield proportionately higher revenue. In fact, in the highest income brackets there is the strongest statistical evidence for the conclusion that present confiscatory rates have actually reduced Federal revenues. In these brackets, in other words, lower rates would increase revenues.

These results occur because excessive tax rates reduce the income to which they apply. They reduce it by destroying the incentives to earn it. The consequences of this trend, if long continued, are very grave for the future of our economy. Our present taxes are both undermining the incentives, and destroying the funds, for new investment. And it is precisely on these funds that the nation depends for increasing its productivity, which means the productivity, wages, and welfare of its workers.
All this should be obvious from a glance at present tax rates. Corporations pay the government a basic rate of 52 cents out of every dollar of earnings. Corporations that make “excess” profits pay the government 82 cents out of every dollar of them, or as high as 70 cents on every dollar of total earnings. This means that every individual who invests in a corporation, no matter if his own income is $5,000 or less, pays a 52 to 70 percent tax on his earnings out of that corporation before he even gets them. If the corporation pays out all of its earnings in dividends, the stockholder may be taxed anywhere from 22.2 to 92 percent, in accordance with his personal income, out of what remains over from the first tax! Out of a corporate investment that would otherwise return him $1,000 a year, say, a taxpayer in the highest brackets might have just $24 left over for himself. What is that going to do to incentives to new investment? *

Economists vs. Astrologers
September 21, 1953

I have tried to explain several times in this column not only why I do not attempt to forecast business conditions but why I do not believe that a science of economic forecasting is even possible. Therefore I was happy to see, in *Lloyd’s Bank Review* of London in April of this year, the slashing attack by Prof. John Jewkes of Oxford on the fashionable idea that economists can predict the future:

“It cannot be too strongly emphasized that there is nothing in economic science which enables us to foretell events. Those who claim otherwise are dragging their subject down to the level of astrology. . . . There is nothing in history to suggest that the expected will normally happen. . . . Economic prediction as a scientific method is not merely absurd, because impossible, but dangerous, because seductive.”

Yet Professor Jewkes seems to me to commit the rare sin among economists of overstating the case against prediction. He does not distinguish between conditional prediction, which is possible, and categorical prediction, which is presumptuous.

He piles up, for example, a truly impressive list of economic predictions that have gone wrong in the last generation. But he does not distinguish between those that went wrong because the relevant facts were not known, and those that went wrong because of fallacies in economic reasoning that were detectable at the time they were made. Thus he cites the now discredited view “accepted by many economists, and disputed by few” before the war, “that all advanced industrial countries were rapidly passing into a condition of maturity and secular stagnation.” But those who did dispute the view at the time correctly pointed out the fallacies on which it rested.

“It does not need much thought to understand,” writes Jewkes, “why prediction is so hazardous. It can almost be summed up in one word: invention.” But while unforeseen inventions are an important reason why some economic predictions go wrong, they are far from the sole or even the main reason (especially where short-term predictions are concerned). There are two main reasons. One is that the facts and factors which must be taken into account to predict the future are too numerous and complicated for any human mind to grasp. The other is that, in human affairs, predictions themselves change the future they predict. A belief that prices of stocks will rise next year, for example, if prevalent enough in Wall Street, will cause speculators to act in such a way as to bring about a price rise immediately.

Yet Jewkes seems to overstate, as I have said, the case against economic prediction—which means, among other things, the case against business forecasting. And this is all the more remarkable in view of some of his admissions: “Every businessman must make decisions, particularly regarding investment, where hazard and conjecture are inherent. . . . Although no one can be sure about the future, men must by hook or by crook take thought for, and strive to be wise about, the future.”

It is precisely here, I think, that economic reasoning can play a more useful role than Jewkes assumes. While economic forecasting can never be a science, it can sometimes be a help. This necessarily follows from Jewkes’s own admission that economists may properly concern themselves with cause and effect. To understand cause and effect is to that extent to be able to predict. Once we understand, for example, that an increased supply of money causes prices to rise, we can predict that if the government increases the supply of money, then, other things remaining unchanged, prices will rise. An honest business forecaster will, however, make all his forecasts frankly conditional, and merely probable. He is entitled to say: “If X, then probably Y.” This may not seem to offer much to those who are looking for certainty. But it may reduce the number and extent of our bad guesses and increase our batting average of good ones. And that can make a vital difference. *
Italy's Creeping Capitalism
September 28, 1953

ROME—Controlism, statism, and socialism have lost a great deal of their former prestige in Western Europe. Yet even the statesmen who have ceased to believe in controls and government ownership do not seem to know how to get rid of them. Italy is an outstanding example. After eight years of leadership of anti-Fascist and anti-Communist Premier De Gasperi, the government is now in the hands of his former Treasury Minister, Premier Pella, a conservative who used to be described by De Gasperi as his economic conscience.

Although Italy several years ago got rid of general price fixing, a formidable network of controls remains. Under nationwide union contracts an employer cannot drop workers without giving them heavy terminal pay which may run a month for every year of service. This penalty, of course, makes for immobility of labor and forces employers to keep unneeded men. It produces featherbedding and inefficiency and discourages new hiring. If an employer is too inefficient to meet competition and has no more money to pay his surplus workers, the government subsidizes him.

Here we encounter a remarkable agency known as Istituto per la Ricostruzione Industriale, popularly known as IRI (pronounced Erie). This organization owns stock in most large Italian industrial companies. It uses the earnings of the profitable ones to pay losses in others. The government makes up the deficit that still remains. This, of course, promotes inefficiency, keeps the companies in business making the wrong things, reduces the capital available for expansion of needed production, and both directly and indirectly puts a needless drain on the government budget. The government owns and operates the railroads directly. Like our own government it subsidizes its wheat growers. It has kept rent control on old houses, which both discourages new building and further restricts the mobility of workers. Externally, it imposes exchange control and requires special licenses on dollar imports. In fact an Italian must get a license even to set up a new business at home. The individual Italian communes (roughly equivalent to our counties) often impose restrictions on the movement of workers and goods across communal lines. Italy retains the equivalent of general wage control. The Confindustria (a sort of super-NAM) and big unions (Communist and non-Communist) negotiate a master contract covering practically the whole of Italian industry. This is collective bargaining with a vengeance for it sets a bloc wage scale that controls every employer and worker. Registered unemployment is about 2,000,000 out of a working force of 19,400,000. The cost of living, as the result of past inflation, is now 56 times as high as in 1938. Where 31 percent of the electorate voted for Communism in 1948, 35 percent voted for it in the elections a few months ago. Such facts make the Italian economic situation look black. Yet in some major respects, it has never been better. The average hourly wage rates of all industrial workers are 75 times as high as in 1938; thus more than keeping pace with living costs. As measured by per-capita consumption of such important items of diet as sugar, milk, butter, and eggs, the Italians are eating better than ever before. And the official index of industrial production is more than 50 percent higher than in 1938.

Not the least important, Italy’s inflation, as measured by the stability of the lira, has been halted. The official rate of 625 to the dollar was established in 1949 and the black-market rate has now fallen to practical identity with this. The import of gold coins, an important index to the lack of confidence in currency, has dwindled from 43 tons in 1951 to practically nothing. (In short, Italy is still suffering from a totalitarian hangover—from the days of Mussolini’s Fascism—but it is well on the path to reform. If it can now maintain a government devoted to the philosophy of economic freedom, its revival could become one of the most dramatic in the present era.)

The Welfare State in France
October 5, 1953

PARIS—Every economic discussion in France begins and ends with the political problem. If France could once get a stable government, great economic reforms would be possible and therefore it would be worth discussing them seriously. But as long as the political problem remains unsolved, economic discussion remains largely academic and controversialists deal in sweeping generalities rather than in any scrupulous study of the facts.

Take for example the case of wages. France is seething with labor discontent. One is told again and again that the French workers are shockingly underpaid but meaningful statistical comparisons are seldom even attempted. Here are a few for what they are worth: Wholesale prices in July of this year were about 25 times as high as in 1938. The cost of living in Paris was about 23 times as high as in 1938. Average hourly wages in 1952, however, were only about 15 times as high as in 1938.
This comparison, on its face, seems appalling. But the wage figures do not include the heavy social-security benefits. From the standpoint of the employer, these social payments are formidable. They total, on the average, 43 percent of his payroll. This total is made up of such individual items as family allowances, social insurance, workman’s compensation, and a wage tax. But while all this adds tremendously to the employer’s labor cost, it does not correspondingly help the individual worker, whose immediate income depends more on his family status than on his skill and effort. In April of this year, for example, the average wage of unmarried workers was 5,780 francs a week, whereas the average wage of a worker with a dependent wife and two children was 8,410 francs a week.

France has been trying to do, in short, what Italy also has been trying to do. It has been trying to transform the wage mechanism into a huge social-security system. But when a man with a couple of children gets 45 percent more than a bachelor, mainly because of a family-allowance system, the incentive to acquiring children becomes greater than the incentive to acquiring a skill. To put it another way, the incentive to reproduction becomes greater than the incentive to production. Such a system does not help the whole body of the workers; it hurts them instead. It is based on the false assumption that only “distribution” is of any real importance, and that production is somehow fixed and automatic. It leads to many bitter quarrels over exactly how an inadequate cake ought to be sliced and to neglect of the real problem of increasing the size of the cake.

It is the consensus of informed opinion that even when social benefits are included, an unmarried worker is worse off than he was before the war, although a man with three children is better off today. Such a system underpays and discourages the young at the outset of their career, precisely when their income is likely to be lowest anyway.

It should be obvious from the statistics that the workers in France are paying for their own social security. This is merely what economic theory would have led one to expect. But the fact is widely interpreted here as a result of the cupidity of the French employer. The explanation is at best inadequate. It ignores the fact, among a number of others, that French employers, as a result of result of many monopolistic protections, do not have to compete very strenuously with each other. If these employer protections were removed, the result might be dramatically different.

I am sorry that space does not permit a discussion of the results of rent control in France, or of the quantitative restrictions on credit. But one summary statement is possible: The cure for the evils brought about by present French welfare measures is not still more radical welfare measures; it is the return to a free market, the revival of competition, the restoration—in a word—of genuine free enterprise. But the crucial question is whether this solution will be applied before it is too late.*

**Does England Need Controls?**

October 12, 1953

LONDON—Everywhere in the world, where people are still free to express themselves, the prestige of socialism is clearly on the wane. Nowhere is this more strikingly demonstrated than in England. The Labour Party itself is split wide open on the subject of further nationalization. One speaker at the Margate Conference even declared that “nationalization is not the object of this party.”

But it is a little difficult to say exactly how far the change in British social thought has gone. If the British people are beginning to be fed up with nationalization, they still give very few signs of being fed up with government “planning” and its accompanying controls. Nowhere is this better illustrated than in the case of exchange control. Exchange control is a totalitarian measure. Before the second world war it was imposed in Europe only in Hitler’s Germany. Under it the citizens of a country are forbidden to buy or sell their own currency, or exchange it for any other, except at the fiat rate set by the government. To enforce such a control, the government must control all foreign trade. It does not allow exporters to keep or sell freely the dollars they earn. It does not allow its own citizens to buy what they wish from abroad, but only specified amounts of specified goods from specified countries or areas after they have obtained a special import license. A free-born Englishman is not even allowed to spend more than £40 ($112) a year on foreign travel for pleasure.

When the government controls foreign trade in this way it in effect controls the whole economy. Under exchange control a free economy is impossible.

Now the most important step away from exchange control (implying, in fact, its virtual abandonment) is for a government to permit its currency once more to be fully and freely convertible into any other. And this is a more important requirement for sterling than for any other currency in the world. For London has been traditionally the world’s banker. The world did business mainly in sterling.
Banks and business firms everywhere kept sterling balances in London to facilitate their trading operations and as temporary investments. As the value of sterling as a world currency lies precisely in its convertibility (into goods and other currencies everywhere), it follows that anything that prevents or restricts this convertibility lowers the value, the prestige, and the demand for sterling, and retards British recovery and expansion. Yet most of the bankers and government officials with whom I have talked here treat the problem of restoring sterling convertibility with indifference. Some of them even talk as if sterling convertibility were mainly something that Americans were pressing for and as if restoring it would be primarily a favor to us.

Even most of those who want to see convertibility restored treat the problem as too formidable for any present action. The British have, in fact, developed an altogether unhealthy sense of dependence on America. They talk as if the main requirement for convertibility were still further aid from us and a drastic reduction in American tariff barriers (with no corresponding reduction in theirs). Nearly everybody talks, in fact, as if the economic future of England were wholly dependent on the economic future of the United States. As one official put it to me: “When you get a cold, we get double pneumonia.”

The question an American is asked on all sides is, “When are you going to have a depression?” which is like being asked, “When are you going to be sick?”—and a serious answer is expected. This is rather like building up an alibi in advance; the next bad turn for England or Europe is going to be, by prior definition, America’s fault. This state of opinion is pathological. It paralyzes British initiative; and it is not supported by the facts. In 1952, for example, less than 6 percent of the exports of the United Kingdom went to the United States. If England threw away its crutches, it would be surprised to find how strong its legs really were.

**How America Can Help**

October 19, 1953

The slogan “Trade, Not Aid” was coined by the British, but most of them do not really mean it. What they still want, as I have pointed out here before is Trade Plus Aid; and their conception of Trade is one-sided rather than reciprocal. Some of them are candid enough to admit, when pressed, that what they want us to do is to abolish our tariffs entirely, while permitting them not only to keep theirs but to continue to discriminate against American goods by quotas or prohibitions. All this is necessary, they blandly explain, to permit them to “close the dollar gap,” to “restore the balance of payments,” and to “build up reserves.”

And they cannot, some of them insist, make the pound convertible unless America is ready not only to abolish its trade barriers but to make them a loan or gift of, say, some $2,500,000,000 to add to their present “totally inadequate” gold and dollar reserves of $2,500,000,000.

The American observer abroad finds, in fact, that our tariff is Europe’s great alibi. For most Europeans it explains why they buy so much more from us than they sell to us; why they have a “dollar shortage”; and why their currency is weak. And they talk, usually, as if the American tariff were fantastically high, and as if their own countries had merely nominal trade barriers or were virtually practicing free trade.

A few facts might somewhat correct these notions. A study by the United States Tariff Commission has shown that the level of our tariffs dropped from 10.6 percent on all imports and 25.8 percent on dutiable items alone, before the Reciprocal Trade Agreements were adopted to 5.4 percent on all imports and 13.3 percent on dutiable items alone in 1951. By contrast, the American Tariff League has published figures to show that ratio of duties to all imports of the United Kingdom in 1951 was 25.6 percent.

Such crude averages, taken merely by themselves, provide inadequate comparisons. But they are enough to indicate that America is today not the sole or even the chief culprit in the matter of tariff barriers. Compared with the exchange controls, bilateralism, quotas, and prohibitions now prevailing in Europe, in fact, the American tariff is today a minor factor in restricting two-way international trade. As a result of a careful study, for example, Howard S. Piquet, formerly chief of the economics division of the United States Tariff Commission, has estimated that if all our tariffs and quotas were suspended it would mean an increase in our imports today of only $800,000,000 to $1,800,000,000 a year.

Nevertheless our British and other European friends have a case: and it would be well for us to heed it. It concerns immediately not so much the absolute level of our tariff as the uncertainties surrounding its future. A British manufacturer, for example, may hesitate to expand his output or sales for our market, as long as he fears that our customs officials may suddenly make some new adverse decision or that Congress may suddenly increase the tariff rate. So if any of us
may presume to anticipate the report of the Randall commission (which, judging from that body's composition, is likely to be split or ambiguous anyway) I should like to suggest that the President call upon the present Congress to pass a resolution pledging itself not to increase any import duty or impose any further quota restriction during its term. The worldwide economic and political effect of such an act could not fail to be wholesome.

Further measures would of course be desirable. The first of them would be to wipe out all our import quotas. And then we might do well to emulate what we did in the tariff of 1833. This provided for a gradual reduction of rates over ten years to a general level of 20 percent. Why couldn't we now, say, provide for a gradual reduction over ten or twenty years of all tariff rates above 20 percent down to that maximum level, with the sole exception of rates on items vital in time of war, the continued production of which could not be assured in any better way?

More about American Help
October 26, 1953

In this space last week I discussed some of the things that this country could do to help both itself and the world. My first proposal was that the President call upon the present Congress to pledge itself not to increase any import duty or impose any further quota restriction during its term. My second proposal was to wipe out all our import quotas. My third was to emulate the principle that we followed in the tariff of 1833, and provide for a gradual reduction over ten or twenty years of tariff rates above 20 percent down to that maximum level, with the possible exception of some items vital to defense.

The purpose of this last proposal would be to reduce the hardships of tariff readjustment to a minimum. As Prof. Yale Brozen has put it: "In moving toward free trade, we must reduce our tariffs slowly in order to give . . . those who have invested in skills and equipment specialized to our protected industries . . . the opportunity to depreciate their equipment and to adjust to the new situation." (See the "economic forum" pamphlet, The Economics of Tariffs, 112 pages, National Industrial Conference Board, $1.)

It may be asked whether, instead of such a unilateral reduction of our tariffs, it would not be better to extend the reciprocal-trade-agreements program for a period of twenty years. Among the arguments of those who favor this are that it would provide us with better leverage in getting tariff reductions from other nations and that more attention could be paid to the specific merits of each tariff rate. But the arguments against continuing the reciprocal-agreements program seem to me to outweigh these. For the program rests on the false tacit assumption that a reduction in tariff rates is primarily a favor to the other country's producers rather than to one's own consumers. And precisely because such a program does treat each rate on its own alleged merits, it makes every rate a source of special haggling, multiplies lobby pressures and the pull and tug of special interests, and violates the spirit of the most-favored-nation principle even when it adheres to it technically.

We are brought back once more to the question of foreign financial aid. The whole foreign-aid program from the beginning has rested on a false diagnosis of the ills of Europe and the "underdeveloped" countries and a false conception of the remedy. In practice, instead of inducing the beneficiary countries to return more quickly to sound policies and free enterprise, our aid has subsidized socialism and encouraged these countries to continue statist controls far longer than otherwise.

But the foreign-aid program can be terminated with less shock, and the proper reforms encouraged, if for a limited transition period our government would undertake to guarantee private loans to private foreign borrowers against political risks, especially against the risk of nontransferability of profits, along the lines and on the firm specific conditions suggested by F.A. Hayek in The Freeman of April 6. This program, however, should in no case be in addition to present foreign governmental aid, but as a short-lived substitute for it, to ease adjustment to a free system.

At the very beginning of the Marshall Plan, our government could have obtained far more results with far less money if it had offered to make loans solely for currency stabilization on strict conditions of eligibility. But the time for that has now passed. If a government fails or refuses to follow sound monetary, fiscal, and economic policies, no foreign loan can be large enough to do any permanent good. Its proceeds would only be drained away as were those of our $3,750,000,000 loan to Britain in 1946. If, on the contrary, a country follows sound monetary, fiscal, and economic policies, it can get private loans if it needs them, and is unlikely to need any outside governmental help at all. Perhaps the worst result of our whole foreign-aid program has been to divert attention away from the measures a country must take to help itself and to stand on its own feet.
In the Sweet By and By
November 2, 1953

Just before the Republican convention of 1952, General Eisenhower expressed the opinion that the Federal budget could be cut as much as $40,000,000,000 in the next few years. In his State of the Union message on Feb. 2 of this year he said: “The first order of business is the elimination of the annual deficit.” But he has successively explained that he could not balance the budget for the 1953 fiscal year, or for the current 1954 fiscal year. On Oct. 12 his Director of the Budget, Joseph M. Dodge, warned: “The budget-balancing problem in the 1955 fiscal year is at least the same in magnitude as the one we faced this year.”

This pattern, in which the budget is going to be balanced by and by, but of course not now, is ominously reminiscent. Let us recall some statements by Franklin D. Roosevelt:

“The plan is to reduce the cost of current Federal government operations by 25 percent.”—Oct. 19, 1932.

“For three long years the Federal government has been on the road toward bankruptcy. . . . [By the end of the fiscal year 1934] we shall have piled up an accumulated deficit of $5,000,000,000. . . . Too often in recent history liberal governments have been wrecked on the rocks of loose fiscal policy. . . . I give you assurance that if this [passing of the economy act] is done, there is reasonable prospect that within a year the income of the government will be sufficient to cover the expenditures of the government.”—March 10, 1933.

“We should plan to have a definitely balanced budget for the third year of recovery and from that time on seek a continuing reduction of the national debt.”—Jan. 4, 1934.

“We can look forward with assurance to a decreasing deficit.—Nov. 29, 1935.

“We approach a balance of the national budget. National income increases; tax receipts, based on that income, increase without the levying of new taxes.”—Jan. 3, 1936.

“If [the national income] keeps on rising at the present rate, as I am confident it will, the receipts (of the government) . . . within a year or two, will be sufficient . . . to balance the annual budget.”—Oct. 1, 1936.

“The Treasury is all right and we are balancing that budget—you needn’t worry.”—Oct. 3, 1937.

“It has taken courage for the Federal government to go into the ‘red’ . . . but it has been worth it.”—July 8, 1938.

“I here and now prophesy: That the Republican leadership, conservative at heart, will seek to run with the hare and hunt with the hounds, talking for balanced budgets out of one side of its mouth and for opportunist raids on the Treasury out of the other. . . . —Jan. 7, 1939.

“For several years we have been compelled to strengthen our own national defense. That has created a very large portion of our Treasury deficits.”—Jan. 4, 1940.

And here are a couple of statements from Harry S. Truman:

“The budget for the fiscal year 1949 calls for total expenditures of $39,700,000,000. Receipts during this period are estimated under existing tax laws at $44,500,000,000. This will balance the budget and provide $4,800,000,000 which should be used to reduce the public debt.”—Jan. 12, 1948. (There was actually a deficit of $1,811,440,000.)

“In a period of high prosperity it is not sound public policy for the government to operate at a deficit. A government surplus at this time is vitally important. . . . I am, therefore, recommending new tax legislation. . . . ”—Jan. 10, 1949. (The deficit for the fiscal year 1950 was $3,122,102,000.)

Space forbids further quotations, but the reader, I am sure, gets the idea. Each President began with pious promises of a budget balance, but there were always reasons why this could be done only in some indefinite future, and not now. Meanwhile, the national debt keeps mounting and the purchasing power of the dollar keeps shrinking and a Republican budget director is warning against “the disturbing effects on the economy” of spending cuts that are “too abrupt.” Isn’t this where we came in? ✤

Myth of Perpetual Boom
November 9, 1953

The air is full of talk of “recession,” and yet we are still close to what is so far the highest point in the greatest inflationary boom in our history. Look at some of the figures in the latest monthly statistical report of the President’s Council of Economic Advisers. In July, August, and September of this year the country’s gross national product—its total output of goods and services—was running at the tremendous annual rate of $371,000,000,000. This was a slight shade under the rate of $372,400,000,000 in the preceding quarter, but
was otherwise the highest on record, comparing with $348,000,000,000 in 1952 and (just for one flashback) with $91,300,000,000 in 1939.

Other comparisons conform. Employment in the third quarter was at the highest level in our history—63,000,000. Unemployment was estimated at only 2 percent of the labor force. Average hourly wages in manufacturing, at $1.77, were also at a record high. So were estimated annual corporate profits before taxes.

Why, then, all the jittery talk about recession? Apparently because every index is not at an absolute peak. Net farm income this year is estimated at about $12,500,000,000, as compared with a postwar average of $14,500,000,000. Cattle raisers, it is true, have been hit hard. But what leads such a situation to be discussed as a sort of national crisis, calling for immediate action at the public expense, is a new ideology.

The assumption seems to run through most public discussion today that we must never tolerate or permit a recession or a readjustment in anything. The reason so many of us talk this way is that we have become convinced that we now know how to prevent depressions or recessions and there is no excuse for not doing so. This explains such statements as President Eisenhower’s: “Never again shall we allow a depression in the United States.”

But do we in fact know how to prevent any future depression or to curb any present recession? Certainly the most popular assumption about how this can be done is wrong. It is assumed that what principally determines the level of economic activity is the volume of government spending. But if Federal spending were slashed from $72,000,000,000 a year to $50,000,000,000, for example, and if taxes were cut correspondingly, the taxpayers would have as much more to spend as the government had less. What would take place, other conditions remaining unchanged, is not a decline in total demand but a shift from a demand for defense items and governmental goods and services to a demand for more civilian goods and services.

If the absolute level of government spending determined the issue, then there would have been a huge depression when Federal spending dropped from $98,700,000,000 in the fiscal year 1944–45 to $60,700,000,000 in the fiscal year 1945–46, and a still worse depression when it fell to $39,300,000,000 in 1946–47. Here was a drop of nearly $60,000,000,000 in the rate of government spending within a two-year period. Yet instead of there being a depression, employment and national income rose.

What has produced these ever-rising monetary totals, these miracles of national income and prosperity, has been, simply, inflation. This is sufficiently pointed up by the new record-high level in the cost of living. The inflation has been brought about by continuous budget deficits (not the same as the volume of spending) and, more directly, by the continuous increase in the supply of money.

But inflation is not a guaranteed way of keeping full employment and averting a recession. On the contrary, it “works” only as long as prices keep ahead of costs and maintain profit margins. If wages shoot ahead of prices, there will be unemployment in spite of inflation. And inflation, contrary to present popular assumption, cannot be “planned” or controlled. Sooner or later it gets out of hand. Those who, under the pretense of “preventing deflation,” would try to keep the inflationary boom whipped up to new peaks, are recklessly playing with fire.

Is Depreciation a Subsidy?

November 16, 1953

Most socialists and left-wingers have few scruples about the kind of argumentative weapons they use in their attacks on private business. But some charges are sillier than others, and one of the silliest is that “accelerated amortization” constitutes a government “subsidy” to business and a sort of scandal. I would have supposed, to cite only one example, that the speech on the subject by Irving S. Olds, chairman of the board of the United States Steel Corp., on May 3, 1951, would have permanently silenced this nonsense. But as late as a few weeks ago Gordon R. Clapp, chairman of the Tennessee Valley Authority, was still repeating it in all its original impurity.

“Perhaps you have heard,” he told the Memphis Kiwanis Club on Sept. 30, “of tax certificates for accelerated amortization.” These, he went on, constitute a “big bonanza,” a “magic Federal-aid program,” “interest-free loans from the taxpayer,” and, in short, government “subsidies” for the private utilities.

He demanded an “explanation” of them, and so I offer one. All plants, machines, and equipment in time either become obsolete or wear out. Suppose a machine costs $1,000 to install and has a probable useful life of ten years. Then the man who owns it ought to deduct, say, $100 a year from his apparent profits on the machine, and set this money aside. At the end
of ten years, if his estimate of the useful life of the machine has been correct, he will have deducted a total of $1,000 as an allowance for depreciation, and he will have this amount to replace the old machine that has become useless. If he has not been making this bookkeeping deduction he has been deceiving himself as to the amount of his real profit. If he has not set aside the funds to replace the machine he may find himself out of business.

Now the tax-collecting Internal Revenue Bureau has been very strict regarding the annual rate at which it permits a company to write off depreciation. But under the Revenue Act of 1950, in order to encourage companies to put up new plants deemed essential to the defense program, Congress permitted them to “write off” such plants within a period of five years.

This privilege offered only one advantage to the company that obtained it. If the defense emergency lasted for only five years, and the new plant became useless at the end of that time through lack of orders, at least the company would not have been paying taxes on profits that turned out to be fictitious because they did not allow enough for the loss on the investment. Otherwise a company stands to benefit from the privilege only on the assumption (disappointed after the second world war) that the corporate tax rate will be lower after the specified five-year amortization period than during it.

In the vocabulary of the Clapps, of course, whenever the government seizes less in taxes from you, even temporarily, than it did before, you are being “subsidized” by it. But even by this reckless perversion of words it is hard to see how permission for a shorter amortization period can be called a “subsidy.” For a facility can not be depreciated by more than 100 percent of its value, and it can only be depreciated once. Whether a $1,000 machine is depreciated over one year or over twenty, only $1,000 in all can be deducted, and if the same rate of tax is levied over the whole period, the same total tax is paid to the government.

There is in fact an inequity in the depreciation rules of the Internal Revenue Bureau, but it is exactly the opposite of what Clapp contends. It consists in allowing corporations to deduct only against original investment and not against cost of replacement. A machine bought at $1,000 in 1939 would probably cost more than $2,000 to replace today. In a period of inflation, industry that is allowed to deduct depreciation only against original costs, and not against cost of replacement, is paying taxes on profits that are illusory when measured in real terms. The real tax rate is even greater than the nominal rate, and capital consumption is concealed.

For a Responsible Budget
November 23, 1953

The Administration is being forced to adopt all sorts of expedients to keep from breaking through the debt limit of $275,000,000,000. This does not prove that Congress was wrong in refusing last summer to grant immediately the President’s request for an increase in the debt limit to $290,000,000,000. The postponement has not reduced spending, but it has at least drawn increased attention to its prodigious rate and to the continuation of huge deficits and borrowing. And to act as a warning signal is, in fact, the chief function that a legal debt limit can serve.

The Administration will be forced to go again to Congress for an increase in the debt limit, and Congress now has no alternative but to grant it. But it would be folly to grant it without some quid pro quo. The minimum condition (which could be tied to the debt-increased authorization) should be the Coudert resolution or its equivalent. This would prohibit the Administration from spending more than it took in during any year except in time of war or of a grave national emergency declared to be such by a two-thirds vote of each house of Congress.

But even this measure would be only a stopgap. What is now imperative is a responsible budget system: Today the House of Representatives has the power to increase expenditures beyond those proposed by the President, and the Senate has the power to increase expenditures beyond those voted by the House. The result is a three-way competition in extravagance.

The only fundamental cure for this situation would be to adopt the wholesome British rule under which the Legislative branch may reduce, but cannot increase, the total expenditures proposed by the Executive branch. One of the foremost functions of a representative assembly is to act as watchman of the Treasury, and it cannot be depended on to perform that function as long as it is free to put its own hands in the Treasury.

The constitutional revision which this would imply probably goes beyond what Congressional or public opinion today is prepared to accept. But there are changes which have already been successfully tested in many of our states and which would at least bring us much closer to full budget responsibility.

We may cite as one example the kind of budget procedure that prevails in New York State. Under this system the governor’s annual budget must not only give estimated expenditures and revenues for the next fiscal year, but must be accompanied by a bill or bills
White's Mischief Lives On
November 30, 1953

In his Newsweek column of last week my colleague Raymond Moley described some of the irredeemable harm that had been done to the United States and the world through the influence of Harry Dexter White. But White fathered one institution that is still with us, and still working immense harm—the International Monetary Fund.

Some of us have repeatedly called attention to the harmfulness of the fund since the day of its conception. In the Newsweek of Dec. 31, 1951, for example, I wrote: “The chief remaining obstacle to a world restoration of freedom and sound money is the International Monetary Fund, an unnecessary institution set up, under the influence of the late Lord Keynes and Harry Dexter White, on a completely unsound basis.”

But the analyses of myself and others fell on deaf ears, chiefly because of the myth that the fund was the product of the objective judgment of the world’s monetary experts. Actually, the experts from other countries were in fact government bureaucrats who approved it on the principle that it involved a huge American handout and that you don’t look a gift horse in the mouth.

The story of the part that White played in the formation of the fund is described in R.F. Harrod’s biography of John Maynard Keynes, published in 1951.* In the light of what we now know about the real aims of White it makes fascinating reading.

In America during the second world war, writes Harrod, there was active discussion of postwar economic problems, “indeed quite an intellectual ferment. In this the central figure was undoubtedly Harry White. . . . He was a very remarkable figure, who should be accorded an honorable place in British annals. . . . When Mr. Morgenthau became Secretary of the Treasury in 1934 he asked Prof. [Jacob] Viner to undertake a study of Treasury problems. Among the economists whom Viner brought in was Harry White. . . . He won the confidence of Mr. Morgenthau. His influence in the Treasury was always more important than the post which he held. . . . During the second [world] war he became the leading figure in the Treasury.

“He . . . was an ardent admirer of Keynes’s economic work; he also had great practical energy and a forceful personality, which could readily dominate a committee. He was blunt and downright in speech, and also fervent. . . . His influence came to extend beyond the Treasury. He made enemies. In his determination to get his way, he adopted methods which might be labeled those of an intriguer. He was distrusted in the banking world, and also by some seasoned public servants. He gained the reputation of being a difficult man to deal with. But he was single-minded in the pursuit of his aims. He was a reformer of genuine conviction.” Harrod lists as among White’s supporters Frank Coe and Lauchlin Currie. “It is probably true to say that but for White’s assiduity and galvanic personality a large scheme of the kind for which Keynes was working in Britain would never have come to birth at Bretton Woods.”

And what was this scheme? It was extremely ambitious, not to say grandiose, and Harrod is lost in admiration of it. “This American group [under White] also produced a bulky volume, which, however, was not a sandwich with a thin layer of internationalism in the midst of it, but all solid internationalism.” It certainly was. It proposed to solve every other nation’s problem at the expense of the American taxpayer. It gave “rights” to other nations to exchange their currencies, at rates far above their market value, for American dollars. It adopted the shiny new White-Keynesian
principle (really what debtors have always suspected) that if the debtor can not repay the creditor it must be at least partly the creditor’s fault, and the creditor should be punished for it. The creditor was expected to be, of course, the United States, and the main debtor, England.

And it was finally White who drafted the “American” proposal that “if creditor countries increase their credit beyond a [certain] level, their currencies would be declared ‘scarce’ and would be allotted under a scheme, and thus debtor nations would have a fully authorized right to discriminate against the exports of the creditor countries.”

“This,” correctly declares the British economist Harrod, “was a very remarkable concession. If the United States was really to maintain over a term of years the oppressive role of creditor, which all predicted for her, it would mean that she was by this clause authorizing other nations to discriminate against the purchase of American goods . . . and to maintain their own full employment in the presence of an American depression.”

In fact, when Harrod first read this concession he “felt an exhilaration such as only comes once or twice in a lifetime. . . . Here is the real thing, because it will save us [England] from a slump.” He wrote immediately to Keynes: This “gives us [the British] what we should never have dared to ask for or hoped to get . . . namely, that we (and other countries) should be allowed to discriminate against American goods if dollars are running short. . . . From now on our main object should be to hold the Americans up to the principles of S.F.7 [the concessions].” Keynes in reply expressed doubt that the State Department realized what was being given away by “this document of Harry White’s” and thought it would withdraw approval as soon as it did.

But, triumphantly concludes Harrod in his account: “The Americans did not run out. The scarce-currency clause was incorporated, in a much stronger form than it had in the original draft, in the Bretton Woods Act passed by Congress in July 1945.”

So that was how the IMF and its principles were put over. And in his farewell speech at the Bretton Woods conference, Keynes, speaking for England, was not ungrateful: “I am certain that no similar conference within memory has achieved such a bulk of lucid, solid construction. We owe this not least to the indomitable will and energy . . . of Harry White.”

**European Isolationism**

December 7, 1953

It is hard to see how the seventeen-member Randall Commission on Foreign Economic Policy, composed both of protectionists and low-tariff spokesmen, can possibly turn in a unanimous report. But if it is looking for sensible and practical compromise proposals on which a substantial majority might unite, I recommend its earnest attention to the suggestions put forward by Juan T. Trippe, president of Pan American World Airways, Inc., at the recent convention of the National Foreign Trade Council. Trippe proposes extension of the Reciprocal Trade Agreements Act for two years; repeal of the Buy America Act; further customs simplification along the lines of the Jenkins bill, and encouragement of private investment abroad by permitting the President “to conclude reciprocal treaties with other nations, exempting income earned abroad from domestic taxes.”

I should personally prefer, of course, to see the Randall report go much farther than this in the direction of lowering tariff rates and other trade barriers. In fact, I should regard as more urgently necessary than any of Trippe’s proposals the total abolition of our present import quotas.

But while Trippe’s practical suggestions are all in the right direction, his assignment of blame for the present world-trade situation, like that of so many other Americans, is oddly one-sided in its self-reproachfulness: “Many Americans are still isolationists in their economic thinking . . . Much of our past world-trade policy makes little sense . . . Twenty-five years ago, our imports amounted to 5 percent of the annual value of our national income . . . Today, with the rest of the free world in need of dollars to buy our goods and products, our imports are but 3 percent. A generation ago, when Great Britain was the world’s great creditor nation, her businessmen invested abroad each year some 2.5 percent of her national income. Today, we Americans invest abroad but ½ of 1 percent.”

The implication here is that this comparative situation is solely or chiefly America’s fault. It is chiefly, on the contrary, the fault of Europe and the rest of the world. Bad as our international economic policies have been in some respects, those of most European and Asian countries have been incomparably worse. Their exchange controls, artificial currency valuations, bilateralism, import quotas, license requirements, and direct prohibitions, not to speak of their network of internal restrictions, have done far more to throttle two-way trade than the American tariff barrier. Indeed, at one point Trippe himself points out that our average tariff...
rate of 5 percent on total imports compares with an average of 13 percent on total imports for the fifteen Western European countries. Even when tariff barriers are considered merely by themselves, in other words, ours may be less restrictive.

And our comparatively small amount of foreign private investment is certainly far more the result of hostility to private capital in the would-be borrowing countries—with their confidence-destroying policies, such as vexatious laws, excessive taxation, exchange control, currency inconvertibility, and outright expropriation—than of any lack of eagerness of Americans to invest abroad. In fact, as long as these foreign countries get American taxpayers’ money as a gift, they do not need to pay for their imports from us with equivalent exports to us. And as long as these foreign countries get American taxpayers’ money as a gift they have far less need to make the reforms necessary to attract private American capital.

The greatest barrier to a free flow of international trade today, in brief, is not American economic isolationism but European economic isolationism and Asian economic isolationism. That most of Europe, following more isolationist policies than at any time since the seventeenth century, should have succeeded in turning the isolationist charge primarily against us, is certainly not the least remarkable example of the Alice-in-Wonderland ideological climate of the present age.

Resumption of Inflation

December 14, 1953

The Eisenhower Administration, which so bravely abolished price controls and made such a promising effort to halt inflation when it first came into office, has reversed its direction. It seems to have embraced almost the whole economic philosophy of the New Deal, and above all its policy of continuous inflation. And it has resumed this policy under the old New Deal–Fair Deal pretense of “fighting deflation.”

The turnabout first became apparent in mid-May, when the Federal Reserve System began purchasing Treasury bills in the open market. Then on June 24 came the much stronger inflationary step of reducing the reserve requirements of member banks. This action was taken to release $1,156,000,000 of reserves in order to give the country’s banks another $5,780,000,000 in lending power. This was frankly done in anticipation of Treasury needs of some $6,000,000,000 of “new money.”

The action had the hoped-for results. In the month of July alone the total loans and investments of the nation’s banks were increased by $4,700,000,000. The country’s money supply (total bank deposits plus currency outside of banks) increased by about the same amount. At the end of September the nation’s money supply stood at the record high level of $204,900,000,000. This was three times the money supply at the end of 1939.

As a result of this policy, interest rates were brought down again. In the week ended Nov. 28, three-month Treasury bills sold to yield only 1.488 compared with a yield of 2.231 in June. Commercial borrowing rates were correspondingly lower, thus encouraging business to borrow more. As of Oct. 15, the cost of living rose for the eighth month in a row, and to a new high level.

In recent weeks, and especially since the Republican Congressional defeat in Wisconsin, there have been increasingly unmistakable signs of a decision in the White House to resume inflation. Secretary Benson has to all but a minor extent capitulated to the extreme farm-price-support demands in Congress. A few weeks ago William D. Mitchell was suddenly fired as head of the Small Business Administration. His chief crime seemed to be that he had been cautious in his lending policies, and tried to save the taxpayers money. Immediately after he left, the SBA indicated that government loans would be available to almost any type of business, not just to defense contractors or “essential” producers.

Then on Nov. 18 President Eisenhower announced at his press conference that the Administration had given up all hope, not only of balancing the budget in the present fiscal year, but even in the fiscal year 1955. He also declared that “when it becomes clear that the government has to step in . . . the full power of government, of government credit, and of everything the government has will move in to see that there is no widespread unemployment.”

The Wall Street Journal, in a news story the next day, declared that this statement was not merely offhand, because the Eisenhower Administration was hammering out, for use “when and if needed,” an elaborate “antirecession program.” This included all the usual Federal Reserve devices for loosening credit—lowering bank-reserve requirements and rediscount rates, and the purchase of government bonds. In addition, the story ran, seven “task forces” were working under Dr. Arthur Burns, chairman of the President’s Council of Economic Advisers, to study Federal credit insurance for home modernization and repair, liberalization of
unemployment insurance, Federal aid to new construction, tax relief, public works, and the “whole field of community and private business planning.” Finally, private financial institutions, such as banks and insurance companies, were “being eyed to see where they fit into depression-fighting schemes.”

Most of these “depression-fighting schemes” seem to me to bear a striking resemblance to the New Deal’s inflationary devices, and its philosophy of “spend and spend, elect and elect.” But I could be wrong, and I hope I am.

Our Blind Labor Laws
December 21, 1953

What has to happen in order to awaken the American public and its representatives in Congress to the unreality, hypocrisy, and blindness of our present labor laws?

If facts and crises are capable of teaching anything, New Yorkers, at least, have just received an intensive educational course. A few weeks ago workers in the milk industry decided to shut off the milk supply for 12,000,000 men, women, and children in the New York district until their demands were met. Meanwhile their pickets held up trucks, dumped milk, or poured kerosene over emergency shipments for schools and hospitals. Next, the New York newspapers were hit by a photoengravers’ strike. These photoengravers were getting $120 to $131 for a basic week of 36 ¼ hours. Some of them, with overtime, earned as much as $10,000 a year. But they demanded a $15 weekly increase and a 32-hour week and refused the publishers’ offer of arbitration.

The photoengravers have only about 400 men in their union. It would have been easily possible to publish newspapers without them. But they threw picket lines in front of the newspapers, and other unions decided to “respect the picket lines.” The result was that practically the whole New York daily press was shut down for eleven days.

This situation, it is true, brought forth some indignant comment about labor-union dictatorship. It was pointed out that the decision of other unions to “respect picket lines” was tantamount to a sympathy strike of their own in violation of contract, and that the constitutional right of the press to publish without restraint had been infringed by irresponsible private groups.

Yet when it came to ways of preventing the recurrence of such a situation, what was mainly heard were demands for still more legal coercion. Editor & Publisher, the industry’s magazine, spoiled an otherwise excellent editorial by calling for a prohibition of strikes and “mandatory arbitration” in “any communications industry.” But mandatory arbitration is merely another name for government wage-fixing. It leads inevitably to complete abolition of a free-enterprise system. And it is hard to see any more reason why newspaper strikes should be prohibited than, say, milk strikes.

What is really needed is a complete reexamination of the basic assumptions and actual effect of our present labor law. The Taft-Hartley Act, like its predecessor the Wagner Act, of which it is merely an amendment, abridges the employer’s freedom to bargain, to hire, and to fire. The ability of the unions to deprive New York’s millions of families of milk and newspapers was made possible by the Taft-Hartley Act. Under that act the milk companies were compelled to bargain solely with the striking milk drivers’ union; and the newspaper publishers were compelled to bargain solely with the local AFL photoengravers’ union. Both sets of employers were legally prohibited from “recognizing” or bargaining with any other union or with individuals.

And this Federal law is supplemented and supported by local police action that enforces the picket line rather than the right to work. But mass picketing, whatever its pretenses to “peaceful persuasion,” is a device for intimidation. For customers, to “respect the picket line” is to support the strike. For employees, to “respect the picket line” is to participate in the strike. And to argue that all picket lines must be respected is to argue that all strikes must be supported, regardless of their individual merits.

But the right to strike does not necessarily imply the right to win a strike, and the right to quit work does not imply the right to prevent others from working. The way out of the present union dictatorship is not compulsory arbitration, but repeal of the Taft-Hartley Act (or removal of its abridgements of the right of either workers or employers to associate or not to associate) and local enforcement of the common law against intimidation and violence.

The Ethics of Picketing
December 28, 1953

Last week, in connection with the New York milk and newspaper strikes, I pointed out that mass picketing, however much it may pretend to be “peaceful persuasion,” is a device for intimidation, and that the right to quit work does not imply the right to prevent others from working. But these elementary propositions are forgotten or denied today by our labor laws and by our
A typical case was brought to light in New York by a decision of the Appellate Division on Dec. 15. It involved the picketing of a retail liquor store that has been going on for two years. In October 1951, a union tried to enroll the three sales clerks of the store. They refused to join. Thereupon a picket line, with signs intimating that the employer was unfair to union labor, was placed in front of the store. Even after two years of this exhortation, the clerks refused to join the union.

The proprietor, Sydney J. Wood, then petitioned the New York State Labor Relations Board for an election to determine whether the union represented his employees. At that time the union made no claim to represent any of the employees. Yet Wood’s petition was dismissed by a vote of 2 to 1 on the ground that the union was engaged in organizational activity. The New York Supreme Court later dismissed his complaint on the same ground.

Now New York’s Appellate Division has reversed this decision. “The conclusion is inevitable,” it declares, “that the picketing here included an unlawful objective in that it sought to coerce the employer into signing a contract with the union, and as it was doing so by exerting economic pressure against the employer in order to force him to violate the State Labor Relations Act by compelling the employees to join the union against their will or, in the alternative, to drive the plaintiff out of business, plaintiff . . . is entitled to the relief he seeks.”

It is important to notice, however, that this decision did not grant the employer relief because he was being coerced, but because he was being coerced into violating the state labor law. The recent trend of Federal decisions has not been such as to discourage coercive picketing. On Dec. 14, for example, the U.S. Supreme Court handed down two decisions which in conjunction make it almost impossible for the states to enforce sensible laws on picketing. The court ruled in one case that franchised automobile dealers come under the Taft-Hartley Act even when their own automobile buying and selling are wholly within a single state. Under such fantastically extended interpretations of the Constitution’s interstate-commerce clause, it is hard to see what important powers over labor relations and local labor peace will remain to the states and cities. In another Dec. 14 decision, in fact, the Supreme Court ruled that states cannot enforce their own antipicketing laws even when these laws coincide with the Taft-Hartley Act.

Mass picketing is commonly defended on the ground that it is merely a peaceful exercise of the right of free speech—a notice to the public that a strike is going on and that the employer is “unfair.” But this purpose could be amply secured if the police permitted, say, no more than two pickets to an entrance. If the police and the law and the labor boards permit a picket line of a hundred, on the other hand, yelling abuse and insults at customers and at workers who continue on the job, then in all consistency they should allow the employer to hire an equally large picket line to yell back counter-statements. Their failure to do so exposes the hollowness of the “free speech” argument. In many cases today, in fact, the police enforce the picket line rather than the right to work. It is the people who try to get through the line who are accused of disturbing the peace.

Peaceable and balanced labor relations are most likely to come through the repeal or drastic revision of the Taft-Hartley Act and local enforcement of the common law against coercion, intimidation, and violence.
Why Return to Gold?
January 4, 1954

Forty years ago practically every economist of repute supported the gold standard. Most of the merits of that standard were clearly recognized. It was, for one thing, international. When the currency unit of nearly every major country was defined as a specified weight of gold (previous to 1934 the American dollar, for example, was defined as 23.22 grains of fine gold) every such currency unit bore a fixed relation to every other currency unit of the same kind. It was convertible at that fixed ratio, on demand, to any amount, and by anybody who held it, into any other gold currency unit. The result was in effect an international currency system. Gold was the international medium of exchange.

This international gold standard was the chief safeguard against tampering with the currency on the part of politicians and bureaucrats. It was the chief safeguard against domestic inflation. When credit inflation did occur, it produced a quick sequence of results. Domestic prices rose. This encouraged imports and discouraged exports. The balance of trade shifted “against” the inflating country. Gold started to flow out. This caused a contraction of the bank credit based on the gold, and brought the inflation to a halt.

Usually, in fact, the chain of consequences was shorter, quicker, and more direct. As soon as foreign bankers and exchange dealers even suspected the existence of inflation in a given country, the exchange rate for that country’s currency fell “below the gold point.” Gold started to flow out. Then the central-bank managers of the country that was losing gold raised the discount rate. The effect was not merely to halt credit expansion at home, but to draw funds from abroad from lenders who wanted to take advantage of the higher short-term interest rates. The gold flow was stopped or reversed.

Thus so long as the gold standard was resolutely maintained, a whole set of related benefits ensued. Domestic currency tampering and anything more than a relatively moderate inflation were impossible. As gold convertibility had to be maintained at all times, confidence had to be maintained not only through every year but every day. Unsound monetary and economic policies, or even serious proposals of unsound policies, were immediately reflected in exchange rates and in gold movements. Unsound policies or proposals had to be quickly moderated or abandoned.

Because there was a fixed and dependable exchange ratio as well as free convertibility between one currency unit and another, international trade, lending, and investment were undertaken freely and with confidence. And, finally, the international gold standard established (apart from differences caused by shipping costs and tariffs) uniform world prices for transportable commodities—wheat, coffee, sugar, cotton, wool, lead, copper, silver, etc.

It has become fashionable to say that in a major crisis, such as war, the gold standard “breaks down.” But except to the extent that the citizens of a country fear invasion, conquest, and physical seizure of their gold by the enemy, this is an untrue description of what happens. It is not that the gold standard “breaks down,” but that it is deliberately abandoned or destroyed. What the citizens of a country really fear in such crises is inflation by their own monetary managers, or seizure of their gold by their own bureaucrats. This inflation or seizure is not “inevitable” in wartime; it is the result of policy.

In short, it is precisely the merits of the international gold standard which the world’s money managers and bureaucrats decry. They do not want to be prevented from inflating whenever they see fit to inflate. They do not want their domestic economy and prices to be tied into the world economy and world prices. They want to be free to manipulate their own domestic price level. They want to pursue purely nationalistic policies (at the expense or imagined expense of other countries), and their pretenses to “internationalism” are a pious fraud.

Gold Means Good Faith
January 11, 1954

Nothing has more clearly demonstrated the need for the gold standard than its abandonment. Since that occurred, in Britain in 1931 and here in 1933, the world has been plunged, both in wartime and in peacetime, into a sea of paper money and unending inflation.

While the inflation everywhere has been blamed on “the war,” it has occurred in nations that were never involved in the war (throughout Latin America, for example), and it has continued to rage since the war ended. As an indirect index of this, wholesale prices have increased in this country 60 percent since 1945; in Britain 92 percent; in France 600 percent. And everywhere this result has been due primarily to the increase in the paper-money supply.

The monetary managers are fond of telling us that they have substituted “responsible monetary management” for the gold standard. But there is no historic record of responsible paper-money management. Here and there it is possible to point to brief periods of a
“stabilization” of paper money. But such periods have always been precarious and short-lived. The record taken as a whole is one of hyperinflation, devaluation, and monetary chaos. And as for any integrity in paper-money management, we need merely recall the record of Sir Stafford Cripps, who, in the two-year period preceding his devaluation of the pound sterling on Sept. 18, 1949, publicly denied any such possibility no fewer than a dozen times. (The record was cited in this column in Newsweek, Nov. 21, 1949.)

This is what happens under monetary management without the discipline of the gold standard. The gold standard not only helps to insure good policy and good faith; its own continuance or resumption requires good policy and good faith. The gold standard is not important as an isolated gadget but only as an integral part of the whole economic system. Just as “managed” paper money goes with a statist and collectivist philosophy, with government “planning,” with a coercive economy in which the citizen is always at the mercy of bureaucratic caprice, so the gold standard is an integral part of a free-enterprise economy under which governments respect private property, economize in spending, balance their budgets, keep their promises, and above all refuse to connive in inflation—in the overexpansion of money or credit.

So if, as it should, the government decides to return to a full gold standard, its first step must be to bring inflation to a halt. Without this preliminary or accompanying step any attempted return to gold would be certain to collapse. And once again the gold standard itself, rather than the inflation, would probably be discredited in the popular mind.

How, then, does one halt inflation? The economist Ludwig von Mises has maintained that no increase whatever should be allowed in the quantity of money and bank credit that is not 100 percent covered by deposits paid in by the public. While this is basically the result that should be aimed at, it would be politically more acceptable, I think, if this result were brought about by means in accordance with our own best practices and past traditions. I therefore suggest that the halting of inflation should be achieved by these four means:

1—Start balancing the budget.
2—Stop using the banking system to buy and peg government bonds at fixed rates. In fact, the total volume of government securities held by the country’s banking system should not be increased.
3—Insist that the Federal Reserve Banks impose discount rates that would penalize borrowing by member banks rather than make it profitable. This means that the rediscount rate should be kept above the rate to prime borrowing customers at the great city banks.
4—Restore the legal reserve requirements of the Federal Reserve Banks to 40 percent from their present “war emergency” reserve requirement of only 25 percent. There is no more effective way in which Congress could register its own opposition to further inflation—if it really is opposed to further inflation.

What Price for Gold?

January 18, 1954

Granted that it is desirable, and even imperative, to return to a full gold standard, by what methods should we return? And at precisely what dollar-gold ratio—i.e., at what “price for gold”? These difficult problems have split into dissident groups even the minority of economists who are actively urging a return to a gold standard.

One group, for example, contends that we can and should return to a full gold standard immediately, and at the present price of $35 an ounce. It bases this contention on the arguments that we are already on a limited gold standard at that rate (foreign central banks, at least, are permitted to buy gold from us and sell it to us at $35 an ounce); that we should not suspend this limited gold standard even as a transitional step for a few months; that in the interests of good faith and stability there should be no “further tampering” with this rate; and that at this rate we would in fact have a large enough gold reserve to maintain full convertibility against present outstanding paper currency and deposit liabilities.

These arguments, however, rest on debatable assumptions. Some superficial comparisons, it is true, seem to support them. At the beginning of 1933, the United States money supply (time and demand bank deposits plus currency outside of banks) was $44,854,000,000, and the country’s gold holdings (measured at the old rate of $20.67 an ounce) were $4,237,000,000, or only 9.4 percent of the country’s money supply. Today our outstanding money supply is $205,400,000,000, and our gold holdings against it (measured at the current rate of $35 an ounce) are $22,100,000,000, or 10.7 percent.

Thus our gold reserve situation appears on the surface to be as good as that in 1933. But do such comparisons really prove anything? Let us remember, first, that we were thrown off gold in 1933. (Or, more accurately, we had the choice of going off gold, which we did, or suffering still further deflation.) The run on gold in
1933, before payments were suspended, means that the gold reserves were not in fact sufficient, in relation to other conditions, to maintain confidence.

These comparisons overlook, moreover, that prior to 1933 the United States held a much smaller percentage of the world gold supply than it holds today. In December 1926, the United States held only 45 percent of the world’s monetary gold supply (excluding Russia); in December 1933 it held only 33.6 percent. Today it holds 60.8 percent. If the United States alone returned to gold it could conceivably continue to hold this abnormal percentage for a certain time. But if other countries followed suit within a few years (which would be both desirable and probable), they would presumably attract their previous proportion of the world’s gold. If our own supply were forced back to, say, 40 percent, our reserves would be drawn from the present $22,100,000,000 to only $14,600,000,000. This would leave us with gold reserves against present liabilities of only about 7 percent.

But the real error of those who think we could safely return to a full gold standard at a rate of only $35 an ounce lies in the assumption that there is some fixed “normal” percentage of gold reserves to outstanding money liabilities that is entirely safe under all conditions. This, in fact, is not true of any gold reserve of less than 100 percent. In periods when public confidence exists in the determination of the monetary managers to maintain the gold standard, as well as in the prudence and wisdom of their policy, gold convertibility may be maintained with a surprisingly low reserve. But when confidence in the wisdom, prudence, and good faith of the monetary managers has been shaken, a gold reserve far above “normal” will be required to maintain convertibility. And today confidence in the wisdom, prudence, and good faith of the world’s monetary managers has been all but destroyed. It may take years of wisdom, prudence, and good faith to restore it. Until that is done, any effort to resume a full gold standard at $35 an ounce might precipitate a violent deflation.

How to Return to Gold
January 25, 1954

If we grant that there is a great potential danger in trying to return immediately to a full gold standard at $35 an ounce, by what steps are we to return? And how are we to determine the dollar-gold ratio—which would decide the new “price of gold”—at which the return should be made? It is a sound general principle that unless there are the strongest reasons for change, the dollar-gold ratio, once fixed, ought not to be tampered with. This rule certainly applied to the pre-1933 rate of $20.67 an ounce, because that was a real rate, at which anybody was entitled to demand gold, and got it. But the $35 rate, fixed by Roosevelt-Morgenthau whim in 1934, is not a rate at which real convertibility has existed. It is only foreign central banks, not American citizens, that are permitted to buy gold from our Federal Reserve Banks at $35 an ounce, and even they are allowed to do this only under certain conditions. For example, they are not supposed to buy from us at $35 an ounce in order to resell it at a profit in the open market. The present $35-an-ounce gold standard is a window-dressing standard, a mere gold-plated standard, a sham gold standard. We have been able to maintain it only because most other nations in the last twenty years have been inflating even more than we have. There is no reason for treating the $35 figure as sacrosanct.

The new dollar-gold ratio that we should aim at is one at which gold convertibility can be permanently maintained, and that will not be in itself either inflationary or deflationary—that will neither, in other words, bring about a rise or a fall in prices.

There are some economists who contend on unconvincing evidence that $35 an ounce is that rate. Others profess to have some mathematical formula for arriving at such a rate, and on this basis confidently advocate $70 an ounce or some other figure. Their diverse results in themselves invite suspicion. Values and prices are not set by mathematical calculations, but by supply and demand operating through free markets.

And because of the enormous inflation in the twenty years since we departed from a real gold standard, and the enormous shock to confidence that inflations, devaluations, and repudiations have produced, we must test the state of confidence in a temporary free market for gold—a market that will also give us a guide to a new dollar-gold ratio that we can hold.

This time schedule of gold resumption is set forward chiefly for purposes of illustration:

1—The Administration will immediately announce its intention to return to a full gold standard by a series of steps dated in advance. The Federal Reserve Banks and the Treasury will temporarily suspend all sales or purchases of gold, merely holding on to what they have. Simultaneously with this step, a free market in gold will be permitted.

2—After watching this market, and meanwhile preventing any further inflation, the government, some time before June 30, 1955, will announce the dollar-gold ratio at which convertibility will take place.
President Eisenhower has taken over one bad habit from his Democratic predecessors. He points out that because of the payment of social-security payroll taxes, not offset by equal benefit payments, there will be a balance in the “cash” budget in the fiscal year 1955. But this “cash” balance has significance only because it does not cause immediate inflation. It is not a substitute for a balance in the regular budget. The workers are told that they are paying employment taxes to build up a reserve for their own social security. When the government spends these taxes for other purposes as they come in, and slips farther backward in its debtor position, the reserve fund becomes fictitious.

The government could cut spending even further and wipe out this prospective deficit of $2,900,000,000. It might even be able to balance the budget after allowing the scheduled corporate-tax and excise-tax reductions to go through.

Where could the reductions in spending be made? No cuts need be made in the amounts proposed for our national defense. But in the $44,900,000,000 allotted to the whole “national security” program, there is an amount of $4,275,000,000 for arms aid to other countries. This is the highest amount ever proposed for this program. The argument for this expenditure is that the recipient countries cannot afford to pay for their own defense. I have pointed out in previous articles that for most of the beneficiary countries the case for relieving their own taxpayers from their own defense burden and putting it on the American taxpayer has never been proved, or even made very plausible.

In addition, we are planning to give away to other countries in economic and technical aid $1,125,000,000 more in 1955. The case for this will simply not stand realistic economic or political analysis. The whole prospective deficit of $2,900,000,000 could be saved out of the $5,400,000,000 foreign giveaway program alone. Moreover, a period of great inflation, and one in which a further deficit is in prospect, is surely not the time to pile on additional spending for social security, housing, education, and health programs. Whatever the merits of such expanded programs may be, they should at least be postponed until they can be carried out within a balanced budget. President Eisenhower has himself stated that the test of expenditures should be “necessity rather than mere desirability.” And as he put it so well: “The objective will be to return to the people, to spend for themselves and in their own way, the largest possible share of the money that the government has been spending for them.” This objective should be followed now. This budget, already within

**Balance It Now**

February 1, 1954

There is cause for gratification in more than one feature of President Eisenhower’s budget for the fiscal year ending June 30, 1955. Here at last is real progress toward a reduction in spending.

Estimated expenditure for the fiscal year 1955 totals $65,600,000,000. This is $5,300,000,000, less than the estimate for the current fiscal year, $12,300,000,000 less than Truman had recommended for this fiscal year, and $8,400,000,000 less than was spent in the Truman-Eisenhower fiscal year 1953.

But if we go a little farther back the comparisons are less favorable. The proposed expenditure is just about the same as that in the fiscal year 1952. It is actually $21,600,000,000 higher than in the fiscal year 1951. And in both of those fiscal years Truman was President and the Korean war was going full tilt. Considerable further reductions are possible in expenditures in the fiscal year 1955.

Mr. Eisenhower estimates a deficit in 1955 of $2,900,000,000. This is lower than the $3,300,000,000 deficit expected in the current fiscal year or the actual deficit of $9,400,000,000 for fiscal 1953. But it is still a deficit. It will be the 22nd annual deficit in the last 25 years. And there is no excuse for it, above all at a time when our national income is running at the highest levels on record.
They acknowledge the need of “moving toward greater freedom of trade.” But they recognize that complete “free trade is not possible under the conditions facing the United States today.” They acknowledge that “the United States employs impediments to trade, primarily through tariffs and in only limited fields through quotas.” But: “Other countries also employ these devices. Beyond this, they employ the quota procedure far beyond our use . . . and also employ exchange controls and many other devices not used here. . . . We fully recognize the dangers of using averages; yet it seems clear by any test that can be devised that the United States is no longer among the higher tariff countries of the world. Taken by and large, our trade restrictions are certainly no more of a cause of payment imbalances than the rigidities maintained by other nations.” It is high time this reply was made by an official body to the countries that have been self-righteously demanding a one-sided reduction of trade barriers by the U.S.

Finally, the report is to be praised because it recommends an immediate but gradual reduction of our trade barriers. The extension of the Trade Agreements Act for at least three years; authority to the President to reduce present tariff rates, in trade-agreement negotiations, by 5 percent a year during the next three years; to reduce tariff rates by not more than one half of rates in effect Jan. 1, 1945, on products being imported in negligible amounts; to reduce, over a three-year period, to 50 percent ad valorem, or its equivalent, any rate in excess of that ceiling—these are moderate objectives on which agreement should be possible if we are to arrive at any sensible solution of the foreign-trade problem at all.

When President Eisenhower at his press conference on Jan. 27 was invited to comment on statements by some observers that his program was an “extension of the New Deal,” he is said to have told the reporter “in a tone of steely indignation” to compare Mr. Truman’s budget with his own.

But such a comparison is not in itself convincing. It is true that Mr. Eisenhower’s proposed Federal expenditure for the fiscal year 1955 is $12.3 billions less than Mr. Truman recommended for this fiscal year; but it is not less than Mr. Truman actually spent in 1952, his last full fiscal year in office; and it is actually $21.6 billions higher than Mr. Truman spent in the fiscal year 1951. During both those fiscal years, incidentally, the Korean war was being fought.
Nor was Mr. Eisenhower’s second reply to the reporter’s question much more helpful. “When it comes down to dealing with the relationships between the human in this country and his government,” he said, “the people in this Administration believe in being what I think we would normally call liberal, and when we deal with the economic affairs of this country, we believe in being conservative.” I must confess that I do not know quite what this means, because I have always assumed that all economic affairs were human affairs, and that all economic welfare meant human welfare.

Yet Mr. Eisenhower could have convincingly drawn many sharp contrasts between his own policies and the policies of the New Deal. He removed the New Deal wage and price controls—an achievement of the first importance. In the early part of his Administration, he put at least a temporary halt to inflation. In the economic report that he transmitted to Congress on Jan. 28, he put a stress that the New Deal would never have done on fostering economic growth through economic freedom, in creating “an environment in which individual enterprise can work constructively to serve the ends of economic progress.”

If we wish another contrast, we can compare his statement: “It is well to recall the accumulated experience of generations which has taught us that no government can of itself create real and lasting prosperity,” with Mr. Truman’s first “basic economic principle,” announced in his own final economic report in January 1953, that: “Full employment must be a constant objective of policy.”

Some of us could wish, however, that these contrasts were more frequent and consistent. When it comes to concrete policies, the contrasts sometimes seem to be outnumbered by the similarities. We may point especially to the recommendations for additional spending for social security, housing, education, and health programs, as well as to the ambiguous attitude toward public spending. There is the constant intimation, throughout the economic report, that at the first real sign of a downturn the government would throw itself into pump-priming projects. Take this, for example: “The government will not hesitate to make greater use of monetary, debt management, and credit policy, including liberalized use of Federal insurance of private obligations, or to modify the tax structure, or to reduce taxes, or to expand on a large scale the construction of useful public works, or to take any other steps that may be necessary.” And at another point the President declares that his antirecession policies will not be allowed to “interfere any more than is necessary [my italics] with the fiscal objective of bringing down the scale of Federal expenditures, reducing taxes, and arriving at a budgetary balance.”

This seems to take over from the New and Fair Deals the essence of the Keynesian ideology—the belief in “compensatory spending,” the belief that any decline from a peak of inflationary prosperity can and should be offset and rectified by an increase in deficit spending—in brief, by further inflation. My belief is that this ideology is unsound and dangerous; but it is still not clear just to what extent Mr. Eisenhower holds it. As long as its ambiguities and vacillations continue, we will not be unjust in calling its present policies the Semi New Deal. ✤

Coffee, Butter, and Politics
February 22, 1954

Others—The Wall Street Journal and economist Sumner Slichter, for example—have already pointed to the striking contrast between the attitude of some of our congressmen toward coffee prices on the one hand and butter prices on the other. But the contrast will bear further emphasis.

Some of our congressmen have been furiously indignant about the high price of coffee. As the gentleman from Iowa or New York orders another Martini at 75 cents a throw, he tells us what an outrage it is that his coffee at home now averages him about 3 cents a cup. The price of butter is also high; but in reply to this his only comment is that it isn't high enough. Could it be that this strange contrast has anything to do with the fact that coffee growers don’t vote in his district, while dairy farmers do?

The chief reason for the recent rise in coffee prices has been a shortage in the supply. For the past seven years the world has been drinking more coffee than it has been producing. This has worked down the carry-over. And in the last crop year drought and frost in Brazil killed millions of coffee trees. As people in the trade have pointed out, no Congressional investigation will increase the world’s supply of coffee by a single pound.

But the price of coffee, we are told by some of our Washington solons, has been pushed up by “speculation” and “manipulation.” In a free market economy, of course, speculation enters into the price of practically everything. And it usually confers a benefit on society by doing so. If speculators bid up the price of coffee, for
example, because they correctly anticipate or recognize the existence of a shortage, they help to prevent the shortage from becoming as bad as it otherwise might. For the high price not only discourages wasteful consumption, but encourages increased production.

The chief reason why coffee is subject to comparatively violent fluctuations in price is not speculation (which actually tends to mitigate fluctuations) but a fact of nature. It takes about five years for a new coffee tree to start bearing in commercial amounts. After it does start bearing it usually continues to do so for ten to twenty years. So no matter what happens to the price, it normally takes a few years for supply to adjust itself. To force the price down artificially, however, would only further prolong the period of adjustment.

It may be that the Senatorial sleuths will find some real “manipulation” of the price of coffee. But suppose they do? Will it even begin to compare with the open manipulation by our own government of the price of butter? Not to speak of cheese, dried milk, wheat, cotton? Our government is running a gigantic butter cartel which is at this moment holding off the market 264 million pounds of butter in order to force American working families to pay more for it. From this comparison we may judge the hypocrisy of the Congressional outcries against the high price of coffee.

I do not mean to imply that Brazil has always been guiltless of any attempt to manipulate coffee prices. On the contrary, in its efforts to force up coffee prices, the Brazilian Government for years burned coffee or dumped it into the sea. During 1931 to 1934, for example, the government burned 27 million bags of coffee as locomotive fuel.

This was the same kind of beggar-my-neighbor policy that our own government is trying to follow today with our own farm exports. Instead of hypocritically denouncing the immorality of such policies when pursued by others, our congressmen and our own farmers might more profitably study their consequences. Insofar as Brazil’s coffee-burning had any effect in holding up prices, it merely encouraged Colombia and other Latin American countries to increase their own plantings. The result was that Brazil, which in the 1920s supplied two thirds of the outside world’s coffee, supplies less than half today.

So Brazil’s destruction of coffee in the end hurt the very producers it was intended to benefit. This is the real lesson for our farm price support pressure groups to ponder, as tons of butter turn rancid in storage while oleomargarine consumption grows.

The Dollar-Gold Ratio
March 1, 1954

One of the most serious hurdles in the path of a return to the gold standard is the wide disagreement, even among those who favor such a return, regarding the exact dollar-gold conversion rate at which that return should be made.

The gold-standard supporters are divided into three main groups: (1) those who think we could safely return to a full gold standard at $35 an ounce; (2) those who urge return to a full gold standard at some specific higher price for gold (e.g., $70 an ounce) which they claim they already know to be the “correct” one; and (3) those who recommend that we permit a temporary free market in gold for the guidance it will provide in fixing a final dollar-gold conversion rate.

I have already discussed (Newsweek, Jan. 18) the main arguments of those who urge a return to gold at $35 an ounce, and what I consider to be some of the shortcomings of those arguments. Those who are urging that we set the price of gold at a higher figure, and who claim to know already what that figure should be, commonly base their conclusion on some comparison of price levels. For example, since 1932, the last full year in which we were on a real gold basis (at $20.67 an ounce), wholesale prices have increased 162 percent. On the argument that only a corresponding increase in the price of gold could prevent a fall in prices if we went back to a full gold standard, the new price of gold would have to be about $54. Again, the price of gold was set at $35 an ounce on Jan. 31, 1934. For the next seven years wholesale prices averaged only 47 percent of their present level. If we assume that $35 was the “right” price of gold in those seven years—1934–40—then the price of gold necessary to maintain the present wholesale price level might have to be about $75.

The dubious nature of the assumptions behind such calculations is clear. But the rate at which we return to a full gold standard is not a matter of indifference. Charles Rist, one of the world’s leading monetary economists, argued in a powerful article in Foreign Affairs in April 1934 that one of the major causes of the world crisis of 1929–33 was the attempt of leading countries, including the United States, to maintain or return to gold convertibility at their prewar rate for gold after having enormously multiplied their paper currency circulation.

The case of Great Britain is clear. It had gone off gold in the first world war. The pound had dropped from a gold parity of $4.86 to a low of $3.18 in February 1920, and had returned in late 1924 to approximately 10
percent below the gold parity. But wholesale prices in Britain in 1924 were still 70 percent above their prewar level. The British Government decided to resume the gold standard at the old par in 1925. The result was a steady fall in wholesale prices over the next seven years from an index number of 171.1 (1913 equals 100) in January 1925 to 99.2 in September 1931, the month in which England abandoned the gold standard. As the British all during this period were unwilling to make corresponding cuts in retail prices and wage rates, the result was falling exports, stagnation, and unemployment. And it was the gold standard itself, not the false rate (or the internal inflexibility of wages), that got the popular blame.

The British repeated this pattern in essence in the summer of 1947, when they tried to make the pound convertible into the dollar at the wholly unrealistic rate of $4.03. When that experiment broke down within a few weeks, the British once more blamed convertibility itself, and not the false rate, for the breakdown.

It is of the highest importance not only to our own economic future, but to the future of the world, that we do not repeat the British errors by trying to return to gold convertibility at an overvaluation of the paper dollar (which would mean an undervaluation of gold). A temporary free market in gold would give us more guidance regarding what the new conversion rate should be than either an adamant insistence on $35 an ounce or some dubious calculation based on a pure theory.

**Still More Inflation?**

March 8, 1954

There are ominous signs that President Eisenhower's budget is bursting apart at the seams, and that a demagogic scramble for votes will launch us into still more huge deficits and inflation.

Mr. Eisenhower's 1955 budget was not sound in the first place. He planned a deficit of $2.9 billion, which would be the 22nd annual deficit in the last 25 years. Whereupon both Republicans and Democrats began to advocate still further tax cuts, especially in excises. And they even began to talk of his $65.6 billion budget as "pinchpenny."

Then Mr. Eisenhower further weakened his own position by his remarks at a press conference on Feb. 17. He said that if employment did not pick up in March we would have a very definite warning that would call for a number of measures, and tax reduction might be one of the first to be considered. He added that the government wouldn't hesitate one second to do everything to stop any real recession.

These remarks were disturbing for more than one reason. They attached a peculiar importance to the month of March that experience does not warrant. They placed an undue importance on unemployment statistics that are themselves largely a matter of guesswork. (The Commerce Department's result was revised as much as 30 percent when it changed its sampling.) Unemployment statistics are also among the most laggard of business indexes.

But most disturbing of all was the implication that the President had accepted the heart of the Keynesian and New Deal philosophies, which throw all their emphasis on consumer spending and assume that the one sure way to avert depression and keep a boom whipped up forever is to unbalance the budget and resort to pump priming and more inflation.

Two days after the President's press conference, Democratic Senator George, hitherto regarded as a rock of financial conservatism, started to anticipate and outbid Mr. Eisenhower by calling for an immediate increase of $200 in personal exemptions for all income-tax payers. And two days after that Democratic Senator Douglas threw whatever economic prestige he has left into endorsing the proposal. The first effect of this scheme would be, of course, to increase the deficit enormously. It has been calculated that an increase in the personal-income-tax exemptions from $600 to $800 would mean a loss of $4.6 billion in this year's revenue. So even without any further increase in expenditures or additional tax reductions, this means that the prospective deficit, instead of being $2.9 billion, would be $7.5 billion. Unabashed by this, Senator George even proposed a further increase of the exemptions to $1,000 next year, which would mean a loss in revenues of $9.2 billion annually. And now it is generally assumed that the Republicans will be "forced" into raising the exemptions to $1,000 at least $100 annually. This would mean a revenue loss of $2.3 billion annually—or a deficit, other things being equal, of $5.2 billion. Such a procedure would be utterly irresponsible. The alleged economic reasoning behind it is a mere rationalization of political expediency. Naturally it appeals to politicians who want to make the popular gesture of cutting taxes without the unpopular action of cutting expenditures. This is naked inflationism, proposed by men who still pretend to be "fighting depression" though our national income in 1953 was the highest in our history.

President Eisenhower can successfully combat this demagoguery, irresponsibility, and inflation only if he takes a solid stand on principle. He cannot hold the
The result of the panic of 1873 was greatly to increase inflationist sentiment. The Resumption Act was passed on Jan. 7, 1875, but by a repudiated lame-duck Republican Congress that had nothing more to lose. Even more ironic, it was passed, the economist J. Laurence Laughlin tells us, “only under the delusion that it was an inflation measure,” because “on its face it looked like a bill to expand the national bank circulation.” Many commentators today think it was foolish and needless for the Resumption Act to put off the actual day of resumption to Jan. 1, 1879 four years after passage of the act. They forget, however, that time, skill, and determination were required to accumulate a gold reserve so impressive that gold would not be demanded when the day of resumption came. And they forget, too, that returning to gold at the original parity involved a still further decline (of about 30 percent) in American commodity prices to bring them into line with world gold prices. This decline took place between 1875 and 1879, and the whole period was one of liquidation. In 1878, for example, the record of insolvencies far exceeded even that of the panic year 1873. Many commentators today attribute the recovery that came in the second half of 1879 to the return to gold redemption. The facts do not support them. “With hardly an exception,” writes the economic historian, Alexander D. Noyes, “the country’s staple industries sank, during the early months of 1879, into complete stagnation.” What suddenly turned the tide was an unparalleled coincidence: Europe suffered the worst crop disaster in many years, whereas the American wheat crop reached a new high record. This meant high prices and crop exports unparalleled up to that time.

All this is not to argue that after the greenback inflation of the Civil War this country should have returned to gold at a lower parity for the dollar. It is simply to point out that we had to pay a heavy price for the course we actually took, even though our economy was far more flexible then than now, particularly as regards wage rates. We must take care that when we return to gold this time we do so at a rate that involves neither inflation nor serious deflation.
Economists have long pointed out what is wrong with such a belief on theoretical grounds. In 1933 Rufus S. Tucker put together indexes which tended to show that since 1815 “real” wages in the United States (i.e., the purchasing power of money wages) had been rising at an average annual rate of 1 percent. But until rather recent times the available statistics have been scattered and uncertain. A few weeks ago Leo Wolman, professor of economics at Columbia University and a former member of the National Labor Board, presented before the American Statistical Association a study of wages since 1914 which brought out some remarkable results.

Dr. Wolman’s paper dealt with hourly wages in five industrial classifications—manufacturing, Class 1 railroads, building, anthracite and bituminous coal mining. He found that in the period from 1914 to 1953 both money and real hourly wages multiplied many times. Anthracite money wages increased more than nine times, the real wage rose 3.5 times. In manufacturing, money wages rose 7.5 times; real wages 2.8 times. In building, money wages increased less than sixfold, and real wages little more than doubled.

Even more striking is a comparison of money and real manufacturing wage rises in different periods:

<table>
<thead>
<tr>
<th>Period</th>
<th>Money Wages</th>
<th>Real Wages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1914–1920</td>
<td>155</td>
<td>25</td>
</tr>
<tr>
<td>1920–1929</td>
<td>......</td>
<td>19</td>
</tr>
<tr>
<td>1929–1940</td>
<td>16</td>
<td>42</td>
</tr>
<tr>
<td>1940–1953</td>
<td>156</td>
<td>34</td>
</tr>
</tbody>
</table>

These comparisons lead to several striking conclusions. In the whole period from 1914 to 1953, “real” wages (i.e., wages in terms of what they will buy, after allowance is made for changes in the cost of living) “showed marked improvement whether money wages were increasing much or little, or whether business conditions were good or bad, favorable or unfavorable to price increases, or whether unions were strong or weak.”

Another remarkable result emerges when we compare two separated periods of about the same length. In the fifteen-year period from 1914 to 1929, real hourly wages increased 48.5 percent. In the thirteen-year period from 1940 to 1953, real hourly wages increased 34 to 39 percent. In other words, there was a greater annual increase in real hourly wages in the earlier period, when union membership rose from 2.6 to only 3.6 million workers, than in the later period, during which union membership rose from 8.9 to 16.5 million workers.

There was, it is true, an extraordinary increase in real hourly wages, in the period from 1929 to 1940, of 42 percent, which would doubtless not have been as great except for the policies followed by the government and the unions. But it is significant that that period also showed the highest unemployment on record. And in the anthracite industry, which showed the greatest increase in wage rates of any of the five groups over the whole period, employment dropped from 170,000 in 1914 to 59,500 in 1952. From this preliminary statistical study Dr. Wolman’s own conclusions are cautious. But the figures tend to confirm certain conclusions that many economists have long held through previous evidence and analysis:

1—There is little reason to suppose that over the long run, and considering the whole body of labor, unions have brought about much if any of the increase in real wages that has historically taken place.

2—Wherever a union in a single industry has been able to force up wages beyond the level that competition would have brought about, the rise has been mainly at the expense of the real wages of other workers, by raising their living costs.

3—Wherever unions have for a time succeeded in raising the general average of wages above their “equilibrium” point, they have done so only by creating unemployment.

For Whom the Tax Bell Tolls
March 29, 1954

Elsewhere in this issue Raymond Moley deals with the political implications of the Democrats’ attack on the Administration tax program. I shall confine myself here to their proposals for raising personal-income-tax exemptions.

President Eisenhower, in his courageous and statesmanlike TV talk, had no difficulty in exposing the transparently demagogic character of these proposals. Even a $100 increase in the personal-income-tax exemptions would mean 4 million fewer taxable returns than the present total of about 47 million, and a loss of $2.4 billion in annual revenues. A $200 increase in the exemption, as proposed by Senator George, would mean a loss of 7.6 million such returns, and a loss of $4.5 billion in annual revenues.

Let us pass over for a moment what this would mean in terms of deficits and inflation, and concentrate on its demagogic implications. Even the present
personal-income tax has become a class tax, particularly so far as rate progression is concerned. The Democratic proposals would make it more of a class tax than ever. To relieve 4 to 8 million more people of the necessity of paying an income tax is to relieve that many voters of any concern about governmental extravagance and to foster in them the illusion that “the other fellow” is paying the bill.

If taxes are to be reduced any further at this time, the real place where the reduction ought to begin is precisely where no one in public life has had the courage to suggest—from the top. Personal-income-tax rates for this calendar year run up to 91 percent. Yet if the government were willing to lose as much as $2.5 billion revenues a year in some other way than by increasing exemptions by $100, it could eliminate all tax progression beyond the rate of 34 percent (which now applies to net income brackets between $8,000 and $10,000) and lose no more than that.

The present steeply progressive income-tax rates are a reflection chiefly of envy and vindictiveness. They represent a desire to punish success rather than to maximize government revenue. The workers of this country are being cruelly deceived when they are led to think that “the rich” are paying most of the taxes because of these confiscatory rates. Of the $31 billion that the personal-income tax yields, only about $1 billion comes from the rates above 50 percent. Only $3 billion, or one tenth, comes from the rates above 30 percent. In fact, if there were no tax progression at all, and the income tax never rose higher than the 20 percent rate that now applies only to the net-income tax brackets below $2,000, the total maximum revenue loss would amount to less than $5.4 billion.

It is a safe presumption, indeed, that the upper-bracket income-tax rates are already far above the rates of maximum return. If the rates were cut to a maximum of 50 percent, the income tax would within a few years (if not, indeed, even in the first year) yield more revenue from net incomes above $18,000, not less.

But the worst harm done by these rates is not that they reduce government revenue, serious as this is. The worst harm is that they discourage the most productive people from producing and earning what they would otherwise produce and earn. They deprive the nation of this production and of the new enterprises that would otherwise be launched. These confiscatory rates siphon off the cream of the very funds that would otherwise go into new investment—the new investment that not only creates new jobs but in the past has created the marvelous machines, factories, and technological advances that have multiplied the productivity and wages of the American worker beyond those of the workers of any other country or any other period in history.

It is hard for most of us to put aside our envy when the question is raised of lowering the tax rate on some income bracket higher than our own. But it is all of us who are losing income by these confiscatory rates. And therefore never send to know for whom the high-tax bell tolls; it tolls for thee.

Soak Rich and Hit Poor
April 5, 1954

The present drive to raise the income-tax exemptions and relieve millions of voters from the obligation to pay any income tax whatever is merely the latest illustration of how easily the progressive income tax can be turned into a demagogic weapon and a political football.

In the light of the ideological history of the tax this development should not be too surprising. In the Communist Manifesto of 1848, “a heavy progressive or graduated income tax” is listed as the second point of a ten-point program that Marx and Engels demanded in order to make “despotic inroads on the rights of property” and as “unavoidable as a means of entirely revolutionizing the mode of production.” In the course of time “bourgeois” economists came to recommend such a tax in increasing numbers. But the excesses to which it has been carried (and which would have delighted Marx) have recently begun to produce a revulsion of feeling and thinking on the part of some economists who have had the courage to speak out.

A few years ago, for example, Harley L. Lutz of Princeton, arguing for a proportional income tax, contended that there was no logical stopping place to the progressive principle, based on the current specious form of the “ability to pay” theory, short of “complete equalization of incomes by confiscation of all incomes in excess of the lowest amount received by anyone.” And more recently two University of Chicago lawyers, Walter J. Blum and Harry Kalven, Jr. (in The Uneasy Case for Progressive Taxation, University of Chicago Press), and the economist F.A. Hayek, have subjected the progressive-income-tax principle to searching criticism.

Let’s try to set down some of the main objections:

1—It is a dubious moral principle, an abuse of democracy, and an invasion of minority rights, for a majority to impose on a minority a higher tax rate than it accepts for itself.

2—The legal requirement of time-and-a-half wage rates for overtime is based on the assumption that
progressive incentives are necessary to get people to work longer and that progressive rewards are justified as the workload increases. But the present income tax is based on precisely the opposite principle of decreasing rewards for increasing work. Take, for hypothetical illustration, a top-level surgeon who averages $500 an operation and might take on 240 paid operations a year. This would bring his income before taxes to $120,000. For his first operation in January he would get and keep $500. Going into February he would only be earning net (after income tax) $310 per operation. Along about June he would be getting (net) only $140 an operation. And when he got into November he would be turning over $445 of every $500 fee to the government and getting only $55 for himself. Under the present income tax the same principle applies, if less dramatically, to the incomes of all of us. The more hours we work, the less we get paid per hour.

3—Under this system people are penalized in direct proportion to their productiveness. Inevitably this tends to kill incentives to production and reduces the total national income and living standards.

4—The progressive income tax skims off precisely the funds most likely to go into new investment—into building the new tools and equipment that increase the productivity of the country and lift the living standards of the workers. It slows down the rate of economic progress.

5—And lastly, these confiscatory rates do not even raise revenue. They destroy the sources of revenue. The great illusion of the present age is that through these confiscatory rates we have been able to throw the burden of huge government spending on to the very rich. But analysis shows that only 8 percent of the personal income tax is paid by those making more than $100,000 a year, and only 16 percent is paid by those making more than $50,000 a year. Looking at the matter from the other end, 74 percent of the income tax is paid by people earning less than $25,000 a year, and 59 percent of it is paid by people earning less than $10,000 a year.

Trade, Not Giveaway
April 12, 1954

Much in the President’s recommendations on foreign economic policy is thoroughly sound and should receive the full support of Congress.

This applies to his plea for a three-year extension of the trade-agreements act which would authorize him to reduce present tariff rates, in trade-agreement negotiations, by 5 percent a year during the next three years; to reduce tariff rates by not more than one half of rates in effect Jan. 1, 1945, on products not being imported or being imported in negligible amounts; and to reduce, over a three-year period, to 50 percent ad valorem, or its equivalent, any rate in excess of that ceiling.

These are moderate objectives. They are the recommendations of the Randall commission. One of the assurances to which European exporters are surely entitled is that if they plan to sell in the American market, and can successfully do so, we will not suddenly start to increase the barriers against them. Legislation permitting further tariff reductions will help to give this assurance.

For the same reason Congress should accept Mr. Eisenhower’s proposal exempting from provisions of the so-called Buy America acts bidders from nations that treat our bidders on an equal basis with their own.

Another welcome statement in Mr. Eisenhower’s message is that “economic aid cannot be continued indefinitely. . . . [Such aid] on a grant basis should be terminated as soon as possible . . . [and] to the maximum extent appropriate should be in the form of loans.” It is unfortunate that the President did not see fit to apply this principle to military aid also. The contention of European governments that they cannot afford to pay for their own armament programs will not stand serious analysis.

Unfortunately, other parts of the President’s foreign economic program are not as sound as his proposals for lowering tariff barriers and reducing the dimensions and cost of the giveaway program. He approves, for example, the Randall commission’s recommendations “that the United States withhold reductions in tariffs on products made by workers receiving wages which are substandard in the exporting country.” This proposal is wholly objectionable. The question of what wages are “substandard” by another country’s standards is a matter of arbitrary opinion. We could not determine the facts about wages in a foreign country unless we insisted that our own snoopers be allowed to enter it and investigate. The proposal would breed backdoor efforts to keep protectionism under the pretense of deep concern for the welfare of the workers whose products we discriminated against.

The President also asks for excessive discriminations in favor of foreign investment. Such discriminations would have the effect of increasing the tax burdens on domestic investment. It is one thing to argue that there should be no discrimination against foreign trade and investment. It is quite another thing to argue that
investment in foreign countries is better for us than investment in our own. This is untrue. And rather than expand, at the taxpayers’ expense, government guarantees of bad private foreign loans, no further guarantees should be offered.

The Export-Import Bank should not finance foreign-development projects. It is more than doubtful, in fact, that it should continue to exist. And there is certainly no reason why our government should grant still more loans to foreign governments to make their currencies convertible when they could achieve that end simply by ceasing to forbid convertibility.

Mr. Eisenhower declares that the foreign economic policy he presents is an interrelated whole in which each part “requires the other.” But even if we pass over his failure to ask for repeal of import quotas, several of his leading recommendations are quite inconsistent with each other. Lower and simpler tariffs make for greater freedom and trade. More and bigger giveaway programs make for inflation or heavier tax burdens at home and more statism everywhere. The President should not imperil what is sound in his program by tying it to what is dubious.

Three Budgets
April 19, 1954

On April 6, Finance Minister Abbott presented the new annual budget for Canada, for the fiscal year which began on April 1, and Chancellor Butler presented the new annual budget for Britain, for the fiscal year which began on the same date. To an American what is most noteworthy about each of these budgets is the simple fact that it is balanced.

In contrast, our own Federal budget is officially expected to show a deficit for the current fiscal year, which ends on June 30, of $3.3 billion. For the new fiscal year to begin on July 1 it carries an estimated deficit of $2.9 billion. Both deficits are expected in actuality to be even higher.

The explanation of our own budget deficits, compared with the budget balance of our two principal friends and allies, is threefold. The first part of the explanation is that Canada and Britain both have budget systems for which responsibility can be definitely fixed, whereas the United States does not. The British Parliament, for example, approves the government’s budget, including both proposed expenditures and proposed taxes, as a unified whole. And once the budget has been approved, Parliament abides by a wholesome rule under which it cannot make any appropriation for which the government has not asked.

No such rule prevails here. The budget presented annually by the President is nothing more than a compilation of estimates and recommendations which Congress is free to accept or reject or ignore, and which it never in fact adopts as an integrated whole. Congress can appropriate more money than the President asks for. It can make tax reductions that he has not asked for. The President has no power to veto individual items in appropriation bills. So one explanation of the Canadian and British budget balance as compared with our chronic deficits is that they have a more responsible budget system.

But this is only part of the explanation. It is one of the paradoxes of the present situation that America, which has a budget deficit, is contributing defense aid to Britain, which has a balanced budget. This becomes less of a paradox when one recalls that it is partly because we are granting defense aid to other countries that we have a budget deficit, and it is partly because Britain gets defense aid from us that its budget is balanced.

A third point is this. American military expenditures are not only much higher than Canadian or British military expenditures in absolute terms, as we might expect, but such expenditures also constitute a much higher percentage of our total budget. Canada’s defense expenditures will constitute about 43 percent of its total budget; Britain’s about 36 percent; and ours about 68 percent. What percentage is “right” is largely a matter of opinion, to which only iffy answers are possible. But it is a pretty safe assumption that most of our Federal expenditures today, and above all the grand total, are larger than they need to be, particularly in relation to what we get for them. This at least is the conclusion at which the Committee on Federal Tax Policy, a private group under the leadership of former Under Secretary of the Treasury Roswell Magill, has just arrived after a most careful study. Scrutinizing proposed expenditures by major items, the committee finds that a total of at least $8 billion could be cut from Federal budget obligations for the fiscal year 1955 without even touching defense items. And only a cut of these dimensions, it thinks, will solve our fiscal problem:

“If we accept the principle that a balanced budget is a desirable end and that tax reduction is essential to the continuation of a healthy economy, the only alternative is to reduce expenditures....

“The fundamental trouble with the Federal tax system is that we are trying to raise too much money with it. Any tax system for collecting revenues of the order of $70 billion is bound to be burdensome, inequitable, and
otherwise go into improved machines and new factories to increase productivity, jobs, and wages.

But a hardly less important effect is to diminish the incentives to bring such earnings into existence in the first place. This means not merely a loss to the taxpayer who does not trouble to earn the money. It means a loss to the wealth of the whole nation and a loss even to the Treasury itself. Let me begin by reprinting the table from my 1947 article. (The dollar figures stand for millions of dollars.)

<table>
<thead>
<tr>
<th></th>
<th>1926–28 average</th>
<th>1942 average</th>
</tr>
</thead>
<tbody>
<tr>
<td>National income</td>
<td>$77,000</td>
<td>$122,000</td>
</tr>
<tr>
<td>Incomes over $300,000-</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total amount</td>
<td>$1,669</td>
<td>$376</td>
</tr>
<tr>
<td>Taxes paid</td>
<td>$281</td>
<td>$292</td>
</tr>
<tr>
<td>Top tax rate applicable</td>
<td>25%</td>
<td>88%</td>
</tr>
<tr>
<td>Number of returns</td>
<td>2,276</td>
<td>654</td>
</tr>
</tbody>
</table>

Let’s recall what this meant. During the same period that the total personal incomes in the nation increased 58 percent, total incomes over $300,000 fell 77 percent. If the aggregate of such incomes had risen no more than proportionately to the whole national income, the total would have reached $2,637 million—seven times greater than it actually was. And if this income had been taxed at the same schedule as in 1926–28, with a top rate of only 25 percent, the yield to the Treasury would have been $444 million, or 50 percent greater than the actual yield from the greatly reduced income total taxed at a top rate of 88 percent.

Now let’s take comparisons (again in millions of dollars) since 1947:

<table>
<thead>
<tr>
<th></th>
<th>1947</th>
<th>1950</th>
</tr>
</thead>
<tbody>
<tr>
<td>National income</td>
<td>$191,000</td>
<td>$226,706</td>
</tr>
<tr>
<td>Incomes over $300,000-</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total amount</td>
<td>$575</td>
<td>$1,165</td>
</tr>
<tr>
<td>Taxes paid</td>
<td>$402</td>
<td>$764</td>
</tr>
<tr>
<td>Top tax rate applicable</td>
<td>86%</td>
<td>84%</td>
</tr>
<tr>
<td>Number of returns</td>
<td>1,074</td>
<td>2,132</td>
</tr>
</tbody>
</table>

Though total personal incomes, to point to only one comparison, increased 148 percent between 1926–28 and 1947, incomes over $300,000 fell to about a third of their earlier total. Even if the aggregate of incomes over $300,000 had increased merely in proportion to
the total of all incomes (though even per capita incomes increased 75 percent), it would have been more than seven times as great as it was. The most important reason for this fall was a top tax rate of 86 percent compared with a top tax rate of 25 percent. A sharp reduction in top tax rates below the present level of 91 percent would increase government revenues.

**The Policy Is Inflation**

**July 5, 1954**

The Eisenhower Administration’s monetary policy has now become clear. It is the same as that of the Democratic New Deal and Fair Deal administrations—inflation. Conclusive evidence was supplied on June 21 when the Federal Reserve Board cut by $1.5 billion the reserve requirements of member banks. This will permit those banks to increase their loans by a total estimated from $7.5 to $9 billion.

There is little doubt regarding the primary reason why this was done. The federal government is still running a deficit. It is expected to borrow something like $10 billion between now and December. Their increased borrowing power will enable the nation’s banks to buy the government’s new securities and to pay for them, in effect, by creating new paper money.

The lowered reserve requirements will also permit the banks to create and lend additional money to business. They will enable the government itself to borrow cheaper. By allowing business to borrow at very low rates it is presumed that they will encourage business and employment and incidentally make the November elections safer for the Republicans.

This latest move of the Federal Reserve Board does not stand in isolation. Just about a year ago, on June 24, the Eisenhower Administration, which until a few months before had been making serious efforts to halt inflation, took the drastic inflationary step of reducing the reserve requirements of member banks to release at that time about $1,156 million of reserves. This was done to give the nation’s banks about another $6 billion in lending power—in anticipation of Treasury needs of some $6 billion of “new money” in the following three months. Since then, most of the Administration’s moves have been in the inflationary direction.

How necessary was this June’s new shot of inflation? Was it needed to pull the country out of a serious slump? On the contrary, it came on the same day that The New York Times’s combined average of 50 stocks reached the highest level in 24 years. It came when the latest cost-of-living index reached a level of 115 percent of the 1947–49 average, higher than a year before and within 1 percent of the highest monthly average ever reached by the cost of living. It came a week or two after the Treasury sold 91-day bills at an average yield of 0.616 percent, the lowest in seven years.

This low borrowing rate was not, of course, the result of any higher standing on the part of our Federal government’s credit. That government is still running a deficit, bumping against its legal debt ceiling of $275 billion and trying to get Congress to lift the ceiling still farther. The low money rate is the result chiefly of an abundance of paper money and manufactured credit. As compared with $64.7 billion in 1939 (total bank deposits and currency outside of banks), the money supply had been more than tripled up to April of this year to $202.3 billion. This increase in the money supply is overwhelmingly the main reason for the rise in prices and living costs in the period.

How does it come about that a Republican administration, manned in the main by conservatives, and originally determined to halt the New Deal-Fair Deal inflationary policies, should end by continuing most of them? It is because the more politically powerful and belligerent section of public opinion, represented by CIO leaders, farm organization leaders, many business leaders and college professors, have become habituated to inflation and cannot tolerate its termination. Today, at the slightest sign of readjustment, we get the jitters and talk about another major depression.

We are all Keynesians now. We are all monetary inflationists. And everything would be fine if the Keynesian theory were really true that full production and employment could be uninterruptedly maintained, and no dangerous or debilitating consequences would follow, by the “correct” dose of monetary inflation at the slightest sign of a setback, and that all the orthodox and old-fashioned methods of readjustment were not only intolerable but quite unnecessary.

**Foreign Aid Forever?**

**July 12, 1954**

For the last six or seven years a strange performance has been annually re-enacted in Washington. The Administration in power has decided that it is somehow America’s duty to provide handouts to an increasing number of nations all over the world. The Administration officials then tell Congress that the money is necessary to bring “world recovery”; “to avert world war three”; “to fight Communism,” and to get or keep allies. Most of these contentions have been pure
rhetorical assertions. The simple truth is that no convincing economic case was ever put forward in favor of our far-flung economic program, and that Congress has never been given sufficient factual data on which to base an intelligent decision regarding the need and size of the military-aid program.

The so-called military-aid program, moreover, is merely another name for an economic-aid program. This is an elementary point, and yet it never seems to get any serious discussion or debate in Congress. The argument for “military aid” is at bottom an economic, not a military argument. The argument is not that Ruritania needs so-and-so-much defense, but that it cannot afford to pay for its own defense. More precisely, the argument is that while Ruritania needs y plus x millions for defense, it can only dig up y millions of its own, and it is up to us to supply x millions. Yet I have never seen a serious calculation put forward in detail for such a contention with regard to any particular nation, or the totality of aided nations.

If we supply Ruritania with x millions for defense, then Ruritania has more millions to spend than it would otherwise have. Unless we are sure that it spends x more millions on defense than it otherwise would have done (and we can never confidently answer this might-have-been) then it has that many millions more to spend, say, on deficits on its socialized industries, regardless of whether we earmark our funds for military uses.

The $3.5 billion that President Eisenhower asked for this year’s foreign-aid program is greater than the $2.9 billion deficit estimated for the fiscal year. If we could save this money we could balance the budget. The President pointed out that part of his proposed funds were for Europe, part for the Near East, Africa, and South Asia, part for the Far East and the Pacific, and part for Latin America. How did we ever get into the position where we thought it necessary to spend so much to support so many? And what, for example, are we now likely to get in return for the hundreds of millions we have poured into the war in Indo-China? Would not this money have been far better spent in building up our own defense program?

President Eisenhower this year recommended one good germ idea—that the new legislation should reserve for loans, rather than grants, not less than $100 million of the fiscal year 1955 funds. It would be much better, in fact, if nearly all the aid were offered in the form of loans. International loans are in themselves no more sound politically than international grants. But if we followed, say, something like the practice now followed in private mortgage loans, and offered these funds at, say, 3 percent or less, repayable, beginning immediately, in equal monthly installments over not more than the next twenty years, we could accomplish two substantial results. Having no large sums to repay at any one time, the foreign debtors could not start plausible complaints about the budget problem or the “transfer” problem. And there would probably be a surprising shrinkage in the size of funds requested from us.

Funds that a nation or an individual gets for nothing, whether for military defense or any other purpose, are seldom spent with much of an eye to economy and efficiency. Sums that have to be repaid are spent carefully, and only when the spender is convinced they are necessary. Most of the recipient nations can in fact afford to pay for their own defense. By such a shift from grants to loans, we would not only come far closer to getting our money’s worth, but far closer to bringing the whole foreign-handout system eventually to an end.

Mistakes of Inflationists
July 19, 1954

Two weeks ago I remarked here, hyperbolically, that we are all Keynesians now. But I could have said in sober truth that while most of those now controlling policy are inflationists, they are being pushed from behind by hyperinflationists.

A good example is the National Planning Association, a group of statist planners who manage to get their bizarre pronouncements on the front pages of leading newspapers. Their latest report declares that the country must step up its production of goods and services by “at least $25 billion” over the next twelve months to keep the economy healthy. Why, as long as they are merely tossing out figures, stop at a mere $25 billion? Apparently because they estimate that unemployment is still between 5 and 6 percent of the civilian labor force, that population and output per man-hour will grow, and that in the first quarter of this year the nation’s gross national product was at the annual rate of “only” $356 billion.

This pronouncement is so typical of current inflationist fallacies that it is worth a little analysis. The NPA firmly believes that what primarily caused the recent “recession” was a drop in defense spending, and therefore what can pull us out is a boost in defense spending. Such a judgment, however, finds no support in either economic theory or experience. In the fiscal year 1944 the Federal government spent $95 billion; in
the fiscal year 1947 it spent $39 billion. Here was a drop in the annual Federal spending rate in this three-year period of $56 billion. Yet, far from there being a recession in this three-year period, there was a substantial increase in employment, wages, and prices.

Nor is there any reason to suppose even in theory that wages and employment should depend primarily on the volume of defense spending, or government spending for any other purpose. If the government spends $10 billion less on defense and reduces taxes by the same amount, then the taxpayers have as much more to spend as the government has less. The total volume of spending is unchanged. It would be a monstrous as well as a foolish doctrine that we must increase the volume of wasteful expenditure on armament, not for the sake of defense, but for the sake of “creating prosperity.”

So far as the inflationary effect is concerned, what counts is not the amount of defense spending or total government spending, but the size of the deficit, and even more directly, the amount of new money supply. Even the NPA statement at one point seems willing to settle for a deficit achieved through civilian public works or even a cut in taxes. It even recognizes at one point that private plant and equipment modernization might help to create employment. But it pays scant attention to the fact that only the continuing prospect of profits, and only the ability of the profit-earners to retain enough of these from the income-tax collector, can make possible that continued investment of new capital which is essential to put better and better tools in the hands of the workers and constantly to increase their real wages.

What is most characteristic of the whole NPA statement is that its proposed statist remedies for unemployment utterly ignore the effects of wage rates. No matter how much we are inflating, no matter how high the absolute level of national income or “purchasing power,” we can always bring about unemployment by pushing wage rates too high in relation to prices and sales. Yet in recent weeks, with the steel industry operating at only two thirds of capacity, the steel-workers’ unions fought for and got a new increase of wages which forced a further increase in steel prices of $3 a ton. This is not the way to assure full employment.

This points to the error in the Keynesian propensity to look only at such huge overall money aggregates as “national income” and “purchasing power.” Maintenance of employment depends on expectation of profits in each industry; this expectation depends on relationship of costs to prices which means relationship of prices to each other and wage rates to prices. ❐

Convertible Now
October 11, 1954

Speaking before the joint meeting of the International Fund and International Bank on Sept. 25, R.A. Butler, British Chancellor of the Exchequer, declared that any real steps toward convertibility of the pound must depend on “more marked progress in the United States toward more liberal trade policies which would increase the dollar earning opportunities of the rest of the world. . . . We need time for the consideration of many intricate problems” before making the pound convertible.

These are extraordinary statements. So far as time is concerned, Britain has already had nine years since the end of the second world war. The pound is still inconvertible. And he was addressing his strictures to the nation that had made the British a heavy loan nearly nine years ago to make the pound convertible, and which both during the war and since then has poured billions of dollars of free grants into Britain to bolster its economy.

What Chancellor Butler’s remarks chiefly reveal is the psychopathic frame of mind to which continued controls finally bring a country. It is an economic scandal that so-called free, democratic nations still retain exchange control nine years after the end of the second world war. Exchange control is price fixing in currencies. It can be maintained only by forcing exporters to turn over the dollars they earn to the government and by undisguised discrimination against American goods through prohibitions and quotas. Such a system involves at least partial control by the bureaucracy of the internal economy. Directly and indirectly it dictates how British consumers shall spend their money and what British producers shall produce.

Now British officials have formed the habit of blaming their controls not on themselves but on us. Take the supposed requirement that America must reduce its tariff barriers even further to make a convertible pound possible. It is hard to see how British officials have the hardihood to lay down such a condition. Let us grant that our customs regulations are needlessly complicated and many of our tariff rates unjustifiably high. The truth is that they are as nothing compared with the barriers to trade that Britain (and, so far as that is concerned, all the countries that have exchange control) have set up.

Even if we ignore the incomparably greater barrier of exchange control, the tariff comparison alone is already in our favor. The Tariff Commission recently calculated that the American tariff averaged about 5½ percent of the value of all our imports. On the same basis, it has
been calculated, that the British tariff averaged more than 25 percent of the value of all British imports.

A few months ago Prof. Gottfried Haberler of Harvard published a carefully reasoned pamphlet, *Currency Convertibility*, explaining how and why British fears of the economic consequences of returning to convertibility are misplaced. (American Enterprise Association, Washington, $1.) But recent reports stress a new fear not mentioned in the Haberler pamphlet. This is based on the threat of the Labour Party, if it comes back into power, to reimpose exchange control. As a result of such threats, it is said, the Conservatives have postponed their plans for convertibility from next spring till a year or two later.

But so far from this threat being a reason for hesitation, it should be a reason for the Conservative government to permit convertibility now. New-found freedom once experienced is not easily surrendered. The more free the Conservatives make the British economy the more difficult the Labour Party will find it to return to power or to push the British people back into planning and controls. Since President Eisenhower took his bold action in eliminating price controls, for example, we do not find even Harry Truman calling for their restoration. Everything points to the wisdom of Britain's returning to convertibility, at least at first, at a free and flexible rate rather than a fixed one. But such details are another story. The time to return to convertibility, in the interest of world economy, is now.

**What Kind of Convertibility?**

October 18, 1954

Last week I pointed out here that after nine years of exchange control, Britain has acquired a morbid fear of any return to currency freedom. Primarily this irrational dread was caused by the breakdown of the 1947 experiment in convertibility, followed by a complete misinterpretation of the causes of that breakdown. It came chiefly because Britain foolishly made a pound worth about $3 convertible into $4. The result was that everybody who had a pound was eager to get $4 for it, and nobody who had $4 wanted a pound for them. The conversion was all one way; England's gold and dollar reserves drained out alarmingly. Conversion had to be stopped after a few weeks.

Now strangely, though there is in Britain great fear of a repetition of this consequence, when the British seriously talk of restoring convertibility at all, they usually talk of restoring the same kind of fixed-rate convertibility that collapsed in 1947. They talk of restoring convertibility at a rigid $2.80. But this would mean either putting the pound on a dollar-exchange basis (which would be neither flattering to British pride nor very wise), or it would mean an immediate return to a fixed external gold standard, which the British are supposed to view with horror. And if the real equilibrium rate for the pound turned out to be less than $2.80, it would mean an indefinite drain on British gold and dollar reserves.

Fortunately there is a sensible alternative. This is to restore convertibility (both of the pound and other currencies) at flexible rates, at free market rates, at what is now disparagingly called floating rates. This is what our neighbor Canada has so successfully done in the last few years. This, in fact, is what Britain itself did in the period from 1931 to 1938. When the conversion rate is a free market rate, reserves do not have to be enormous. Any one-way drain on them stops as soon as the rate for the domestic currency has fallen to the real equilibrium rate.

There has developed incredible confusion of thought about the implications of such free rates. We are told that they mean still another “devaluation.” The experience of Canada, whose dollar is actually at a premium with the American dollar, should be itself a sufficient refutation of this. Whether a currency rate falls or rises is in the long run for that nation's own monetary managers to decide. If a freed pound began by falling 10 percent, say (in terms of dollars), then Britain's imports would cost about 10 percent more in terms of dollars. This would raise average British living costs. But British exports would be purchasable for 10 percent less in terms of dollars. (Or some British exporters would be able to raise their sterling prices and make higher profits.) The tendency, in other words, would be to cut down imports, to increase exports, and to bring Britain a more “favorable” balance of trade.

If the British monetary managers did not wish the pound to fall 10 percent, they could restore its value in the free market by increasing confidence in it—chiefly by making pounds more scarce, which could be done in turn chiefly by boosting internal interest rates. With a free exchange market to guide them, the monetary managers would have the enormous advantage of knowing at all times how the outside world valued the pound and what stabilizing steps to take.

Britain has asked for all sorts of assurances from the United States before it consents to go back to convertibility. But the chief external assurance it needs is not from us, but from other European countries. It needs assurance that they too will go back to convertibility to relieve undue pressure on the pound. But this is exactly
what Germany, Holland, and Belgium now seem eager to do.

Our own government should not prod Great Britain to return to convertibility. Such a return would be primarily to the advantage of Britain itself. But it is high time that we stopped subsidizing European exchange control as we have been doing for the last nine years by monetary handouts and encouragement of discrimination against American goods.

**Why America Is First**

October 25, 1954

What makes this book remarkable, coming as it does from a contemporary European economist, is not only the generosity with which it acknowledges and insists upon the economic superiority of the United States, but the still rarer generosity with which it attributes this superiority not merely to good luck—such as great natural resources or escape from the direct destruction of the two world wars (the usual European explanation)—but primarily to the character and the free economic institutions of the American people.

“The United States is today,” writes Professor Rappard, “by far the richest nation in the world because it is by far the greatest producer of wealth. And it is the greatest producer of wealth less because its territory has been generously endowed with natural resources than because it has succeeded in deriving from the labor of its people a much better material result than its competitors in the rest of the world.”

Professor Rappard establishes this thesis with admirable lucidity and logic. He takes nothing for granted, but starts out first of all to prove beyond dispute the superior productivity of the United States. He does this by national comparisons of income, and of the output and use of scores of commodities, notably petroleum and gasoline, coal and coke, iron and steel, electrical energy, automobiles, and telephones. He proceeds to show that there has been a consistent balance of trade in favor of the U.S. maintained over many years by loans and gifts to the rest of the world.

Next he views the problem historically, and shows by quotations from foreign observers—Adam Smith in 1776, de Tocqueville in 1831, Michel Chevalier in 1835, John Stuart Mill in 1848 and 1865, the Englishman Arthur Shadwell in 1906, and then by contemporary testimony from both American and European authorities, that the per capita production and income of the American worker has exceeded that of the European from our very beginning as a nation.

To some this proof may seem superfluous. But Professor Rappard, like a true scientist, is determined to establish his facts before he undertakes to explain them. In our higher productivity, therefore, Professor Rappard finds the primary cause of the economic superiority of the United States. He knows that the full explanation of this is complex. But he selects four main elements:

1.—Mass production.
2.—The application of science to production.
3.—A passion for productivity.
4.—The spirit of competition.

Professor Rappard places special emphasis on our internal “free market without equal on the face of the globe.” That the spirit of competition prevails far more in America than in Europe, he concludes, is beyond question. He documents this with liberal quotations from both European and American sources. He admits that there are a few American economists who deny that real competition prevails here. Though he makes what is broadly the correct answer to these, his answer could have been more conclusive had he known of and drawn upon such statistical studies as those of George Stigler and A.D.H. Kaplan.

I hope that Professor Rappard’s work can be translated into English and published here. This European sees our achievement in better perspective than most of us do ourselves. We Americans do not need to be reminded of our own economic achievement in order to be smug or boastful about it. But we do need to be reminded that this economic achievement has been the result above all of a free, dynamic, private, competitive economy. It can be preserved only by preserving this type of economy, and not by imitating the socialism, statism, and security-mindedness that have failed so dismally elsewhere.

**Interpreting the Elections**

November 1, 1954

On the basis of the returns from Maine and Alaska, and of their own opinion samplings, the political pundits have been forecasting a Democratic Congressional
victory. What would be the probable economic consequences of such an outcome?

These would certainly depend in part upon the interpretation generally placed on the election results. Millions of voters will vote as they do for hundreds of different reasons. Yet among the political factors now at work we may select three that are outstanding:

1—The Eisenhower Administration may be punished as much for its merits as for its defects. This is always what is likely to happen when pressure groups have been encouraged to think that they have a right to be subsidized at the public expense. Many farmers, for example, have come to feel through long custom that they have this right. The President and his Secretary of Agriculture have courageously fought the continuance of fantastic support prices that have built up appalling surpluses, drained the taxpayers of billions, and raised the cost of food for city workers. The Administration’s own compromise proposals have been nearly as bad, but it may be rebuked at the polls even for its attempt to mitigate the evil.

In the last year and a half, again, the policy of the Eisenhower Administration has been inflationary. But it has not been recklessly inflationary enough to satisfy the Stevensons or the Reuthers, or to wipe out every pocket of unemployment everywhere no matter what its special cause. And for this restraint the Administration may again be punished.

2—One defect from which the present Administration suffers more than any within living memory is political amateurishness and inarticulateness. It just does not seem to know how to dramatize its achievements or defend itself against attacks. It is true that President Eisenhower has recently made a couple of speeches ably summarizing some of his major achievements. Foremost among these was stopping “the futile sacrifices in Korea.” Others were abolishing stifling controls, slashing taxes by $7.4 billions, cutting expenditures, getting the government out of some socialistic activities. Yet the President has continued and promised expansion of many New Deal programs.

3—It is this so-called middle-of-the-roadism, this semi-New Dealism, which will probably be the main cause of a Republican Congressional defeat if it occurs. It is amazing that President Eisenhower should exactly duplicate the incredible error that caused Governor Dewey to snatch defeat out of the very jaws of victory in 1948. Like Dewey, he has ignored the traditional Republican philosophy in order to go after the votes of the supposed moderate New Dealers—the so-called middle-of-the-roaders of both parties. Like Dewey, he has taken for granted the votes of the orthodox Republicans on the assumption that they cannot vote for New Deal Democrats and therefore “have nowhere else to go.” But Republican conservatives proved in 1948 as they seem only too likely to prove again in 1954—that they do have a place to go. That place is anywhere but to the polls. They can stay home, play golf, or take a walk.

This is precisely and demonstrably what they did in 1948. Only 49 million voters bothered to vote for a President in that year compared with 62 million in 1952. Truman won by default. He got the votes of only about 25 percent of the total eligible electorate. Mr. Eisenhower’s real problem today, like Dewey’s unrecognized problem in 1948, is not that the American public is hot for a return to Trumanism and New Dealism; the real problem is the indifference and apathy of conservative Republicans.

And the real danger is that a Republican Congressional defeat this year will be just as grossly misinterpreted as the Dewey defeat in 1948. It may be taken as a mandate for a resumption of New Deal spending, inflation, and paternalism of big government. The voters may collectively bring about a result that the majority of them do not individually foresee or intend.

Keynesian Thinking
November 8, 1954

Arthur F. Burns, now chairman of the Council of Economic Advisers, is one of the country’s outstanding statisticians. Yet there is in his implied economic philosophy much to cause misgivings. He has, it is true, several times criticized “Keynesian thinking” (see The Frontiers of Economic Knowledge, Princeton University Press). Yet in this very criticism he seems to me to accept the four principal assumptions, so far as practical policy is concerned, of Keynesian doctrine: (1) That “full employment” is the paramount economic goal; (2) that a private competitive economy, left to itself, tends to generate from mysterious inner forces a perpetual cycle of boom and bust; (3) that it is the “responsibility” of government—tacitly assumed to be wise, disinterested, and benevolent—to pursue “contracyclical” policies to eliminate or mitigate these otherwise inherent booms and slumps; and (4) that the basic contracyclical policy is deficit spending. Let us look at these assumptions more closely.

1—In “The Frontiers of Economic Knowledge,” Dr. Burns declares: “The principal practical problem of our own generation is the maintenance of employment, and it has now become—as it long should have been—the
principal problem of economic theory. This transformation of economic theory is due in large part to the writings of John Maynard Keynes.” This surely sums up present fashionable doctrine. But is it true?

The principal practical economic problem of our own, as of proceeding generations, is the creation of the maximum material welfare for the great body of the people. This can be mainly achieved through maximizing the production and consumption of the right things (including leisure). Maintaining employment is, of course, one of the necessary means to this end. But to erect it into the “principal” end itself is a hopeless confusion. And as I wrote in Economics in One Lesson eight years ago: “Nothing is easier to achieve than full employment, once it is ... taken as an end in itself. Hitler provided full employment with a huge armament program. The war provided full employment for every nation involved.” The slave labor camps in Russia today provide full employment.

2—Now in a speech in Detroit a couple of weeks ago—on Oct. 18—Dr. Burns made what seems to me another disturbing statement. “Since our system of free and competitive enterprise is on trial,” he said, “the government cannot stand aloof from the private economy but must be ready to take vigorous steps to help maintain a stable prosperity.” In the last two centuries the system of free and competitive enterprise has shown itself to be the most productive ever known to man. In what sense is it still “on trial”—except in the sense in which every human institution and every human being may be said to be on trial? Is it more on trial than socialism? Or state planning? Or Dr. Burns’s beloved “contracyclical policy”? The tacit assumptions in Dr. Burns’s statement are not only that a free and competitive private economy cannot be trusted to be reasonably stable, but that the government —i.e., the politicians in power—can be trusted to know and to do exactly what is needed to keep it stable. Both assumptions are debatable.

3—“Contracyclical policies” is a fancy and flattering phrase, but I cannot recall any example, historical or contemporary, of their consistently intelligent, disinterested, and successful application. On the contrary, the record of nearly every government in the world, in our time, is one of recurrent or continuous monetary inflation. It is to this monetary inflation that the apparent “successes” of full employment policies are due.

4—Dr. Burns seems at one with the Keynesians, in spite of his reservations, in regarding deficit financing as one of the chief “weapons” of “contracyclical policy.” But this modern superstition, if persisted in, must lead toward economic and political catastrophe. Largely as a result of its dominance, we have had budget deficits for 22 out of the last 25 years; and the end of the deficit orgy is not in sight.

When Government Lends
November 15, 1954

The follies, scandals, and self-contradictions of government meddling in business become more apparent every day; yet Washington seems to learn nothing from them.

A recent dispatch in The New York Times, for example, tells us that “The Eisenhower Administration may soon decide whether to liberalize the lending policies of the Export-Import Bank to help maintain adequate world markets for United States industry in the face of growing competition.” Foreign competition is now described by some exporters as “fierce.” It has been “developing rapidly over the last two years in the wake of Europe’s dramatic recovery.” So a new scheme is being put forward for further “liberalization” of the Export-Import Bank’s lending policies. The last Congressional session already increased the bank’s lending authority by $500 million to a total of $5 billion.

The new proposal is particularly ironic when one recalls that it was the American taxpayers’ money in the first place which was used to subsidize Europe’s “dramatic recovery” and its present “fierce” competition. We not only poured into Europe billions of dollars of the American taxpayers’ money in order to subsidize the retooling and modernization of Europe’s factories (at the indirect expense of our own) but, also at the taxpayers’ expense, we sedulously taught our European competitors all we could about our “know-how.” Not content with that, we insisted on placing defense orders, paid for with American taxpayers’ money, with European factories. For example, as was brought out recently by a contract cancellation, our government gave one contract for a destroyer escort to an Italian firm dominated by Communist workers in a majority of seven to one.

Having given away the taxpayers’ money to build up European competition, Washington now proposes to use more of the taxpayers’ money to help individual American exporters meet this competition.

Now not only is there no sound reason for expanding the operations of the Export-Import Bank; there was no sound reason for setting up the bank in the first place. What the bank does is to extend to foreign buyers, to finance sales to them, loans that are so dubious that neither the American exporting firm itself, nor any private American bank, will itself assume the full risk. The bank is based on the inconsistent assumption that
there are projects sound enough to risk the taxpayers' money in, though not sound enough for any private lender to risk his own money in.

This was also the basic assumption of the old Reconstruction Finance Corp. That institution finally got so involved in bad loans, scandals, and corruption that it was terminated. But Congress then blandly proceeded to set up in its place the Small Business Administration for precisely the same purpose. The chief difference is that the new agency cannot lend more than $150,000 to any one firm. Just why the new SBA setup is supposed to involve less risk of political favoritism and scandal than the old RFC I don't know. In fact, it was precisely the big individual bad loans made by the RFC—such as the $37 million to the Lustron Corp.—that made the front-page headlines which finally led to efforts at correction.

When government goes into the lending business a disproportionate number of loans are bound to be economically unsound. When private lenders risk their own money they examine with great care the profitability of the borrowing enterprise, the integrity of the borrower, and the chances of repayment. But when bureaucrats lend other people's money these economic aspects are too apt to get a merely formal notice and to be subordinated to political considerations. The recent tremendous Federal Housing Administration scandals, which grew out of government loans in excess of what any private agency would have been willing to grant, are merely one more illustration of the same lesson. There are half a dozen other major examples of unsound government lending. The only real remedy is not for Congress to "set up more safeguards," but to get the government out of the lending business.

Lessons of the Election
November 22, 1954

The real danger of the Republican defeat on Nov. 2 lies not in the narrow Democratic majorities themselves, but in the dominant interpretation that may be put upon the election results. The danger is that not merely the New Deal Democrats, but the Administration Republicans themselves, may interpret the result as a repudiation of President Eisenhower's more conservative policies and a public demand for return to New Dealism—to big government, big spending, inflation, and subservience to labor-union bosses.

Sober analysis, however, gives no support to this interpretation. Outstanding left-wingers, both Republican and Democratic, were certainly elected to the new Congress; but so were outstanding conservatives. And the Administration's most successful holding operations, and even gains, were made in the farm belt. It is instructive to recall that in the early part of Mr. Eisenhower's Administration it was the opposition of his Secretary of Agriculture, Ezra Taft Benson, to the continuation of high, rigid farm-price supports that was the principal target of the Democrats in Congress and the principal fear of the Republicans from the farm districts. It seemed politically impossible that the Republicans could come out for lower subsidies than the Democrats and still keep farm support. But Secretary Benson stuck to his guns; he explained and defended his program; and he received the outspoken support of the President. The result was that the Republicans' principal electoral successes were achieved precisely where it was feared until a few months ago that they might fare worse.

An outstanding illustration is Iowa, heart of the farm belt, which elected a solid delegation of eight Republicans and no Democrats to the House, and which retired the Democratic Sen. Guy Gillette, a vigorous opponent of the Benson program, and elected a Republican, Thomas E. Martin, who defended the program. Many other remarkable Republican successes were achieved through the farm belt.

The unequivocal and courageous stand on farm policy, unfortunately, was an exception in the Eisenhower Administration. An example of quite another kind was set when Attorney General Brownell exposed the shocking record of the Truman Administration in the Harry Dexter White case, only to find his exposure virtually disowned by the President within a few days. The Administration has since blown hot and cold on the tremendous issue of Communist infiltration in the government. It has almost apologized at times for its record in removing subversives.

The Administration has been equally irresolute on the question of spending. True, it has made some substantial cuts. But it still runs huge deficits and continues indefensible spending of billions—for example, in continuing the New Deal foreign giveaway program.

Much the same may be said about labor policy. True, the Eisenhower Administration has not been shamelessly subservient to the union bosses, as was its predecessor. But though it has thereby earned the implacable opposition of the union bosses, it has failed to gain the compensating friends it needs because it has continued timorously to appease and curry favor with the union bosses rather than begin firmly to curb some of their abuses of power. Mr. Eisenhower does not yet seem to have clearly distinguished between the
interest of the small-but-vocal clique of labor-union leaders, on the one hand, and the interest of the whole body of workers (which involves, of course, the freedom of the individual worker), on the other. Not until the Republican Party grasps this distinction clearly can it hope to regain the majority of the so-called “labor vote.”

The turnover in the control of Congress was accomplished by a net shift of only twenty out of a total of 435 seats in the House, and a net shift of only one seat in the Senate as compared with the situation in 1952. Surely this is no reason for any loss of nerve on the part of the Administration, or for the belief that it can gain anything by moving farther in the direction of New Dealism.

The Giveaway Mania Grows
November 29, 1954

When Secretary Marshall proposed his grandiose foreign-aid plan more than seven years ago, even he suggested that it should cover no more than “the next three or four years.” Marshall-Plan administrators constantly assured Congress that it would not run beyond four years. But when the four years were up the foreign giveaway continued; it merely kept changing its name and declared purposes. In the fiscal year ended June 30 last, our total foreign-aid expenditures were still above $5 billion—an amount greater than the total expenditures of the Federal government for any of the years from 1921 to 1933 for all purposes put together.

Yet the air is full of ever-more proposals for ever-bigger giveaways of indefinite duration. It is now considered the duty of the American taxpayer to support the entire world.

On Nov. 8, for example, Japan’s Premier, Shigeru Yoshida, delivered a speech before the National Press Club in Washington in which he advocated a Marshall Plan to multiply tenfold—to about $4 billion—the amount that we should pour annually into Asia to “tip the scales against Communism.” And a few days after this speech—on Nov. 11—it was announced from Washington that the Eisenhower Administration had given its blessing to a proposed $100 million international corporation to help finance private industrial enterprises in the so-called underdeveloped countries.

These ever-new schemes for ever-bigger handouts seem to be proof against all sober analysis and against all our experience, however disappointing. The arguments of Premier Yoshida for his new Asian Marshall Plan are depressingly familiar. Asia, he tells us, is eager to “break with the misery and poverty of the past.” This aim, of course, deserves the sympathy of everyone in the Western world. Asia’s effort to raise its living standards, he goes on, “is hampered by a lack of capital.” But he does not stop to analyze what it is that has caused this lack of Asiatic capital, not only now, but for untold generations past. He simply leaps to the familiar conclusion that the problem can easily be solved if the American taxpayer is forced to supply that capital.

Yet he does, inadvertently, reveal the basic reason not only for the shortage of capital in Asia but for the shortage of capital wherever it exists. “The economic climate in the proud new nationalistic countries of [Southeast Asia] is not, at this crucial moment, the kind that encourages private investment.” It certainly is not. Nor, we might add, is the political climate, threatened as those countries are by Communist infiltration, subversion, or invasion. It does not follow, however, that the American government can afford to overlook what private investors cannot afford to overlook. It is folly to throw in money that might only fatten up a country for Communist conquest. And it is folly to lend money to borrowers who will not adhere to the conditions necessary to make that investment productive or repayable.

On the other hand, as soon as the would-be borrowing nations do learn and offer the conditions and assurances necessary to attract private capital, they will begin to get as much capital not only from American investors but even from their own investors as they can profitably absorb. We do not need a Point Four, for example, in order to coax private American capital into Canada.

As for the Eisenhower Administration’s new lending scheme, it is perhaps not as bad as more pure giveaway; but it is certainly not sound. It is bad enough for our government, through such institutions as the World Bank and the Export-Import Bank, to lend money to foreign governments for projects too dubious to attract private capital. But it is much worse for our government to put money into foreign private enterprise. Surely we should have learned enough of a lesson from the errors and scandals of the RFC loans to American enterprises, where we had enormously better facilities for continuous supervision and control, and for assuring repayment, than we could possibly have in any foreign country.

‘Watchdogs’ for Congress
December 6, 1954

Last week I pointed out the constant tendency of our foreign giveaway schemes to grow rather than to taper
off. This tendency to expand is certainly not the result of any demonstrated efficacy in these schemes. Our billions of economic aid have not led Europe or Asia to abandon harmful governmental controls. On the contrary, they have subsidized the prolongation of such controls. There is no clear evidence, in spite of constant reiteration, that the postwar recovery of Europe has been any faster than it would have been without our aid. On the contrary, the most dramatic recovery has been made in West Germany, which was not receiving our aid. Instead of buying gratitude and dependable allies, our handouts have been accompanied by a steady loss of American prestige abroad.

And wherever our government-aid program has entered we have reduced the incentive to self-help. As long as foreign governments are assured of funds from the American Government, they will not bother to make the reforms necessary to attract private capital. Yet only these reforms can bring lasting prosperity.

Individual congressmen, certainly, are not unaware of these disappointing or harmful qualities of our foreign-aid program. But when the time comes for our foreign-aid agencies to ask Congress for a new annual appropriation, these agencies let loose a tidal wave of propaganda that overwhelms and drowns out the criticisms and misgivings of disinterested individuals. Within these agencies are hundreds of bureaucrats whose very jobs depend upon the continuance or enlargement of the foreign-aid program. Many of these bureaucrats become full-time propagandists for it. Moreover, often the officials appointed to direct the U.S. aid program abroad see themselves as fairy godmothers and forget that their easy benefactions are at the expense of the American taxpayer.

In addition, committees in Congress that have jurisdiction over foreign aid, the chairmen of which usually wish to carry out the Administration’s program, call as witnesses mainly the officials of the foreign-aid agencies themselves. The minority members of the committees, or those who have misgivings about the program, have no equal means of obtaining the factual information, or the analysis, to combat the government agency’s expansion arguments. A congressman is compelled to make decisions on a hundred different issues. He seldom has time to keep fully abreast even of the particular issues that he must follow as a committee member. And so Congressional decisions usually follow, by a sort of default, the recommendations of executive agencies that are clearly not disinterested.

Yet this situation could be remedied, at least in large part, if Congress were to appoint a committee of private citizens, outstanding authorities on the subject, whose sole function it would be to study the activities of the foreign-aid agencies and report to Congress their own appraisal of the annual recommendations for new appropriations and activities made by these agencies to Congress. Congress would then be assured of a systematic, authoritative, and relatively disinterested judgment of the foreign-aid agency’s proposals.

A committee of the type proposed would preferably be one whose members served without salary. But it should be authorized to employ one or two full-time salaried researchers and a modest secretarial staff. This private committee should be as far as possible nonpartisan. Such an objective could probably best be assured by allowing the majority and minority members of the appropriate Congressional committees to select the makeup of the private advisory committee in the same ratio as the committee balance within Congress itself.

In fact, if a similar private year-round “watchdog” committee were appointed by Congress to study the work and recommendations of, say, every Federal agency that spent more than $100 million a year, the effect would be to restrain the present alarming expansion of spending programs and to save the taxpayers billions of dollars a year.

Labor Law and Gangsterism
December 13, 1954

On Nov. 25 the International Longshoremen’s Association negotiated a two-year contract with the New York Shipping Association. It gave the union a 17-cent hourly wage-welfare package increase—and a union shop. The implications of this settlement are worth some study.

The old ILA was found by the New York State Crime Commission to be dominated by gangsters. The American Federation of Labor expelled it and then tried to set up a new union in its place. The National Labor Relations Board, in accordance with the Taft-Hartley Act, held an election last May. The ILA polled 9,407 votes; the AFL, 9,144 votes. Though the outcome obviously indicated heavy dissatisfaction with the record of the old ILA, it had nevertheless retained a narrow majority. And therefore, once more under the provisions of the Taft-Hartley Act, the ILA became officially the exclusive bargaining agent for the longshoremen. The AFL union then had no status whatever.

And now that the ILA has secured a union-shop provision, all those dissenters who voted for the AFL must once more join the ILA in order to hold their jobs. As A.H. Raskin, labor reporter for The New York Times,
puts it, though the record of the ILA has been one “characterized by shakedowns, sellouts, and betrayal of the union rank and file,” the AFL must now do everything it can “to persuade its members to go back into the ILA as an alternative to economic suicide.” And the union-shop status won by the ILA in the new agreement “will make it possible for corrupt forces to do far greater damage to the welfare of the port [of New York] than was possible in the past.”

Yet nobody in the Federal government has so far shown any recognition of the appalling legal implications of the whole New York waterfront episode. The present outcome was forced on the dissatisfied union members, as well as on the employers, by the Taft-Hartley Act.

We must never lose sight of the fact that the Taft-Hartley Act is merely an amendment to the Wagner Act and retains the latter’s central and most dubious provisions. It provides that any union able to secure a majority of votes from the workers in an “appropriate unit” (designated as such by the National Labor Relations Board) must be recognized and dealt with by an employer as the exclusive bargaining agent of all the workers in that unit. This provision does two strange things that the law does not dream of doing in any other field. It gives a private group a quasi-official status. It becomes illegal not to bargain with it. It becomes illegal to attempt to bargain with any other group. In brief, no matter how unreasonable or how intransigent the demands of this union, the employer is legally compelled to deal with it and nobody else. And by giving a mere majority exclusive bargaining powers it makes it almost impossible for any competing union to establish itself.

Again, though the Taft-Hartley Act begins by declaring it to be an “unfair labor practice” for an employer “by discrimination in regard to hire or tenure of employment, or any term or condition of employment, to encourage or discourage membership in any labor organization,” it ends, in complete contradiction to this, by authorizing the union shop, under which the employer is compelled to dismiss a man who does not belong to the union. The Taft-Hartley provisions in combination force racketeering unions on employers and make the individual worker powerless. He must join the union or commit “economic suicide.”

Finally, the Taft-Hartley Act and Supreme Court decisions have created a dangerous divorce and gap between a Federal decision-making power and a local policing power, and left a no man’s land in which union gangsterism can flourish. The New York police could have cleaned the gangster from the waterfront but never did. One of their excuses has been that jurisdiction over the ILA is in the hands of a Federal agency. Yet this Federal agency is legally blind to local gangsterism, and is not equipped to halt it even if it could take cognizance of it.

**Who Speaks for America?**

December 20, 1954

The mania for giving the American taxpayer’s money away to foreign countries has grown to such an extent that, with some honorable exceptions, there now seem to be only three schools of thought in Washington: Those who want to pour more of the money into Europe; those who want to pour more of it into Asia; and those who want to pour more into Latin America.

The arguments of some of these groups are less distinguished for cogency than for unintended humor. No one should miss the outburst of Congressman James G. Fulton at the recent inter-American conference in Brazil: “We are handing out billions to Europe and Asia and we are offering a mere pittance to our own family in Latin America.” How the Argentine, say, got to be part of “our own family” in some sense in which democratic Britain does not deserve the term, we need not pause to inquire. More significant is the use of the fact that we are “handing out billions to Europe and Asia” not as an argument for reducing these handouts but as an argument for handing out still more somewhere else. Apparently we must give every nation or area relatively as much as the one to which we have already given the most so that no one can feel slighted. In fact, it is precisely by taking this kind of argument seriously that we have already made postwar grants or loans to more than 60 different nations.

Nor should we overlook the recent speech here of the Prime Minister of Ceylon, who told us in effect that it was up to us to support an enormous giveaway program to Asia, but that we ought not to have the effrontery to ask for anything in return. “We want economic help in abundance,” remarked the Prime Minister. “We want financial aid without being tied in strings. . . . The nations of Asia . . . do not believe the first need is a defense pact against aggression. The first aid they need is economic aid.”

None of these extravagances, nor all our jolts and disillusionments of the past, seem in the least to discourage the Administration advocates of more giveaway. Secretary of State Dulles and Harold E. Stassen, the director of the Foreign Operations Administration, are spearheading a proposed new program of economic aid...
to the underdeveloped countries of Asia in the hope of “winning their friendship.”

We need not go over again here all the reasons why this program is thoroughly unsound—politically, militarily, and economically. From the economic standpoint, handouts from the American Government to the backward countries of Asia cannot do anything substantial to raise the living standards of these countries. Those living standards will not be noticeably raised until the countries of Asia learn what is meant by free enterprise and make the thoroughgoing reforms that would be necessary to permit free enterprise to flourish. Experience has shown that handouts from the American Government merely delay such reforms. They lead the political rulers of Asia to think they can get all the money they want for their statist and socialist schemes without bothering to create the economic climate necessary to attract the economic climate necessary to attract private capital.

But while these huge handouts would not help the underdeveloped countries of Asia and Latin America, they are draining and weakening us. Our tax burden is already as high as the American economy can stand. There is hardly a man in Congress who does not concede this. The Democrats are talking, not of increasing taxes but of demanding even further reductions beyond those that the Eisenhower Administration has already made.

Yet even with our present spending program, the Federal treasury is expecting a deficit in the current fiscal year, which closes at the end of next June, of $4.7 billion. This deficit means a continuance of inflation, further undermining of the dollar, and a still higher mountain of debt. At the same time we are spending more than $5 billion in the current fiscal year on foreign aid. Anyone who can put these two figures together ought to be able to draw his own conclusion. This is the time to diminish or eliminate the foreign giveaway program, not to dream up grandiose new schemes.

The Right to Work
December 27, 1954

On Dec. 7, speaking before the annual convention of the CIO in Los Angeles, President Eisenhower’s Secretary of Labor, James P. Mitchell, showed himself even more willing to subserve the wishes and increase the powers of union bosses than any of his New Deal predecessors had done.

Among other things, he attacked the “right to work” laws now in existence in seventeen states. Under these laws employers and unions cannot enter into contracts that make it compulsory for a worker to join a union as a condition of holding his job. Mitchell demanded that the states wipe such laws from their statute books. This speech apparently came as a complete surprise to the White House. Mr. Eisenhower declared at his press conference the next day that the Secretary of Labor had not necessarily represented the Administration’s views in any part of it. On the day after this comment, Walter P. Reuther, president of the CIO, called this a “repudiation” of Mitchell, and accused the President of perpetrating a “political fraud.” “The Secretary of Labor is not a member of the Cabinet,” he said.

I hope Reuther is right, and that the President will ask for Secretary Mitchell’s resignation. Nothing short of this can clear the air.

When the speech was first published, it looked as if the President, frightened by the election returns, had decided to swing far to the left on the labor issue in one more effort to woo the so-called labor vote. Reuther’s savage attack indicates how futile such appeasement of the union bosses would be even if the President supported the Mitchell program. For the Republicans to adopt that program would be such a reversal of policy that they would lose the voters’ respect, and with it lose far more votes than they could possibly gain.

From the standpoint of principle, the case for the Mitchell program is even worse. To compel a man to join a union as a condition of holding his job puts irresponsible power in the hands of union bosses and is a gross infringement on the individual’s right to work.

Two other major issues are raised by the Mitchell stand. The first is states’ rights. Recent Supreme Court decisions have taken the position that since Congress has chosen to exercise jurisdiction in the labor-management relations field, the Taft-Hartley law takes precedence in any conflict with state law, and any state law in conflict with the Taft-Hartley law is invalid. At the same time the court has been so fantastically stretching its definition of what constitutes “interstate commerce,” subject to Federal law, that it has all but annihilated the powers that the Founding Fathers thought they had reserved to the states in the Tenth Amendment. Unless there is a reversal of this trend, states’ rights will soon be wiped out without the submission of any constitutional amendment by Congress. The general acquiescence in the doctrine that Congress has the right to invalidate state labor laws that apply to what is dominantly or almost wholly commerce within a state shows how far this process has already gone.
Another major point once more raised by the Mitchell stand is the hypocritical and self-contradictory nature of the Wagner-Taft-Hartley act itself. As I pointed out here two weeks ago, that act begins by declaring it to be an “unfair labor practice” for an employer “by discrimination in regard to hire or tenure or employment, or any term or condition of employment, to encourage or discourage membership in any labor organization.” Yet it ends by authorizing the union shop, under which an employer is compelled to discharge a man who does not belong to the union.

This contradiction can be resolved only in one of two ways: (1) Congress can repeal the Wagner-Taft-Hartley act in its entirety, leaving employers and workers once more free to make their own bargaining arrangements; (2) if Congress wishes to intervene to forbid discrimination against union members, then in all consistency and honesty it should intervene to forbid discrimination against nonunion members. As it stands today, the law merely turns the Federal government into a union-organizing agency.
How to Read a Forecast
January 3, 1955

This week and next, newspapers and business magazines will overflow with forecasts of business conditions in the coming year. In previous Newsweek columns (e.g., Nov. 22, 1948, and Sept. 21, 1953), I have tried to explain why, though I recognize the necessity for business forecasts, I so seldom indulge in them. Business forecasting can sometimes be a help, but it can never be a science. There are two main reasons for this. One is that the facts and contingencies that must be taken into account to predict the future are too multitudinous for any human mind to encompass. The other reason is that, in human affairs, predictions themselves affect the future they predict.

There are much greater similarities, in fact, than most business forecasters would care to admit, between their own occupation and that of race-track tipsters. (I will get to the differences later.) Business forecasters boast of the occasions in the past when their forecasts turned out to be right; so do race-track tipsters. A race-track tipster may be right for the wrong reasons; so may a business forecaster. A tipster may falsely inform a client that a race has been fixed for a certain horse to win. That horse may win nevertheless. A business forecaster may base his prediction of a recovery or recession on fallacious economic reasoning. But as business can only go up or down, there is a 50-50 chance that his falsely based prediction may turn out to be right.

A business forecaster may contend that all his forecasts are based on careful study and analysis of available statistics and existing conditions. But this may also be true of the forecasts of an intelligent racing analyst. The latter may know everything there is to know about the past records of all the horses involved, supplemented by honest fresh information from owners or trainers. On this basis he can of course make more intelligent and informed guesses than persons who lack his information. Nevertheless he cannot predict the outcome of any race with certainty. All we can say is that the informed racing analyst will on the average stand to do much better than the uninformed. Though he will never know certainties, he will know much more about probabilities. And that is the best we can say for the most intelligent and best-informed business forecaster.

Moreover, the individual race-track gambler, or the stock-market speculator or the businessman, seldom stands to gain much merely by knowing such facts and probabilities as are already known by the majority of his fellows or competitors. For unusual profit or success, he must know more than his competitors know; he must guess right sooner than the rest. It is common to say in the stock market that an expected future event has already been “discounted.” This means that it has already been taken account of in the present price of the stock. This sort of thing also happens at the racetrack. Known probabilities (i.e., the composite general guess regarding the probabilities) are already embodied in the betting odds. A man who always bets on the favorite would stand to win more often than a man who bets on the long shots; but it does not necessarily follow that he would lose less money in the long run. For when he won he would win comparatively little, because too many people were right with him.

But though there are similarities between the position of the racetrack gambler and that of the speculator or the businessman, there is one vital difference. The risks in betting on horses are invented and unnecessary; the risks in speculation or in business enterprise are inherent and inescapable. Somebody must assume them. And he who assumes them intelligently confers a public benefit, whether or not that was his intention. He prevents wasteful use of resources.

So the honest and intelligent business forecaster performs a needed function. A forecaster is a nuisance only when he is cocky and self-assured, clothes his opinions in a pompous abracadabra, parades pretentious charts and mathematical formulas, and tries to give you to understand that his guesses are the verdict of science.

It Can Be Balanced
January 10, 1955

It is increasingly sad to follow the record of the Eisenhower Administration on the budget.

Just before the Republican convention of 1952, General Eisenhower expressed the opinion that the Federal budget could be cut as much as $40 billion in the next few years. In his first State of the Union message, on Feb. 2, 1953, he said: “The first order of business is the elimination of the annual deficit.” He has since successively explained why, because of this or that unforeseen condition, he could not balance the budget for the 1953 fiscal year, or for the 1954 fiscal year, or for the present 1955 fiscal year which ends on June 30. The same dismal note was sounded once again on Dec. 6 by Treasury Secretary Humphrey, when he declared that “we cannot balance the budget” for the fiscal year 1956. This statement was followed a week later by an announcement that the President would ask Congress
to cancel the $3 billion in corporate and excise tax reductions that had been scheduled for April 1.

There is, alas, nothing novel in this record. It merely continues the record of the last quarter of a century.

In *Newsweek* of Nov. 2, 1953, in a column called “In the Sweet By and By,” I presented in as full detail as space would permit the budget record of Franklin D. Roosevelt and Harry Truman. It was a record of constantly promising a balanced budget—but always for some day in the future, never now. “The plan is to reduce the cost of current Federal government operations by 25 percent,” said candidate Roosevelt in 1932. “We should plan to have a definitely balanced budget for the third year of recovery,” he was saying on Jan. 4, 1934, “and from that time on seek a continuing reduction of the national debt.” “We approach a balance of the national budget,” he was announcing on Jan. 3, 1936. And so it went.

Harry S. Truman, in his budget message of Jan. 12, 1948, promised not only a balanced budget but a surplus of $4.8 billion for the fiscal year 1949. There was, alas, actually a deficit of $1.8 billion. In his budget message of Jan. 10, 1949, he once more deplored deficits, and once more promised a balance. Nevertheless the deficit for the fiscal year 1950 was $3.1 billion.

To sum the whole matter up, we have had deficits in 22 out of the last 25 years. And now we are told we must have still another.

It is not true. The budget can be balanced. And it can be balanced in the next fiscal year. What stands in the way is not, as apologists declare, either military or economic necessities. It is false economic theories and lack of political courage.

There is neither space nor need to go into the subject in great detail here. In April of 1954 the Committee on Federal Tax Policy, a private group under the leadership of former Under Secretary of the Treasury Roswell Magill, made a careful study and concluded that a total of at least $8 billion could be cut from Federal budget obligations for the fiscal year 1955 without even touching defense items.

The budget is not to be cut by a horizontal slash of expenditures by 10 or 20 percent all along the line. Such proposals are hopelessly naïve when they are not plainly insincere. The chief way to cut the budget is to abandon whole categories of expenditures that are being made either because of naïve delusions (this applies to almost the whole of the $5 billion a year we are throwing away on foreign aid) or because of sheer political expediency (i.e., the farm price-support program which raises the price of food for city workers and has created appalling surpluses).

There is unfortunately still another leading factor responsible for the continuance of deficits. This is the belief, concealed or candid, that deficits are necessary to prosperity, full employment, and re-election. It is the doctrine of salvation through inflation.

So this is how the matter really stands. Anybody who sincerely believes that the budget cannot be balanced in the next fiscal year, or that the present fantastic level of expenditures cannot be cut without danger, is a victim of delusions.

---

### Raising Wages by Fiat

**January 17, 1955**

President Eisenhower’s decision to support an increase in the Federal minimum wage from 75 to 90 cents an hour marks another step toward the New Deal philosophy.

If wages can be raised to any desired amount by law, without harmful consequences, why stop at a minimum of 90 cents an hour? The CIO, in fact, has been demanding a minimum of $1.25 an hour. But why not $1.50, $2—or even more? The blunt truth is that so far as a law is effective in forcing wages above the levels at which competitive market forces would fix them, it creates unemployment. Marginal firms which cannot afford the higher costs are forced to drop their marginal workers or go out of business entirely.

It is often argued that “business” (treated in such an argument as if it were a single big firm) can simply “pass on” forced wage increases by raising “its” prices. But even where competition is mild enough to permit this, the higher prices result in lower sales. These mean lower production and hence smaller employment in the firms and industries affected.

The Fair Labor Standards Act went into effect at the end of October 1938. Unemployment jumped from 8.1 million in October that year to 9.6 million in December and to 12 million in January 1939. In 1949, President Truman demanded that the legal minimum wage be boosted from 40 cents to 75 cents an hour. This went into effect Jan. 1, 1950. Unemployment rose from 3.5 million in December 1949 to 4.5 million in January 1950.

Of course the government can always resort to still further monetary inflation to enable industry to pay the higher wage rates it enforces. But in that case the higher money wages are offset by price increases and become illusory.

It is a mistake to suppose that the effects of an increase in the Federal minimum wage would be
The New New Deal
January 24, 1955

About a year ago (Newsweek, Feb. 15, 1954) my article in this place carried the title “Ike’s Semi New Deal.” The present headline conforms to the new state of affairs as revealed in the President’s messages to the new Congress.

This is no mere personal judgment. It is a state of affairs acknowledged by the Democratic New Dealers themselves. The Democratic House leader, Congressman John W. McCormack, said of the State of the Union message: “On domestic matters most of it might be termed New Dealish.” And the Democratic whip of the Senate, Earle C. Clements, declared: “I am glad to see him embracing so many things that the Democrats have so long stood for and on which he has been unable to get the support of his own party.”

The New Deal policies now adopted by Mr. Eisenhower are so numerous, in fact, that it is easier to point to exceptions. I can think of two: Private instead of socialized electric power and flexible instead of fixed farm supports. Toward both, the President seems to take a mainly defensive attitude. His retreat from the previous farm-parity formula is so mild that we are still piling up enormous surpluses at the expense of the taxpayer and consumer. As for nearly all the other policies advocated, Harry Truman might have delivered the latest State of the Union speech, and did deliver a score of speeches like it.

Yet when Mr. Eisenhower dealt in broader generalities in that speech he paid at least lip service to a program of another kind: “The aspirations of most of our people can best be fulfilled through their own enterprise and initiative, without governmental interference. . . . Our government must not impair the self-respect, freedom, and incentive of the individual.” But he followed this with an array of programs for increased governmental interference, and less freedom and incentive for the individual (particularly if he happens to be a taxpayer); for more government spending, more taxation, more deficits—in brief, for a huge paternalistic “welfare” state.

Mr. Eisenhower called for a continuance, and in some directions for an expansion, of the Truman foreign-aid and the Truman Point Four programs. He asked for a billion-dollar upper Colorado River basic development project. He outlined a $101-billion ten-year highway-modernization program. He asked for more public-works programs; special aid to low-income farm families; more loans of the taxpayers’ money to “small business”; still more government-subsidized housing; a Federal health-reinsurance program; Federal aid to build more schools. He asked Congress to raise the Federal minimum wage from 75 to 90 cents an hour and to expand its coverage. He asked amendment of the Taft-Hartley Act—in directions demanded by union-leader propaganda. He asked for a general pay
Wonderland Trade Policy
January 31, 1955

President Eisenhower has renewed his request to Congress to extend the trade-agreements act for three years, and to authorize him, in trade-agreement negotiations, to make gradual and moderate tariff reductions over that period. Congress should grant the President these powers. But it must be added in all candor that even if it does so, its action under present conditions will prove largely academic and all but futile in bringing about the results that the President intends.

The truth is that the President’s “foreign economic policy” message is confused, and that the policies we have actually been following are self-contradictory. Mr. Eisenhower, in pleading for lower tariff barriers, bases his case largely on the wrong reasons. The main reason for reducing the American tariff is to benefit the American consumer—to enable him to buy foreign goods cheaper. But the President bases his case, as the Truman Administration did, mainly on the argument that it is our duty to lower trade barriers in order to gain the good will and increase the prosperity of foreign countries. Lower American tariffs would, incidentally, have these effects. But to stress this philanthropic argument is far less effective politically than to stress the argument that we ought to reduce tariffs directly for the advantage of our own people.

Moreover, Mr. Eisenhower once more accompanied this request for lower tariffs with a request for continuance of our huge foreign giveaway program. This creates needless confusion and helps to give Congress the impression that more trade, like more handouts, is primarily a favor to foreigners.

On the other hand, Mr. Eisenhower wrongly separated his argument for lower American tariffs from other necessary changes without which such lower tariffs would be meaningless. He did not point out, for example, that trade is necessarily two-sided, and that European economic isolationism has been and still is a far greater barrier to its expansion than our own policy. He did not point out that European countries still directly discriminate against American goods and put them under import quotas. He did admit, rather indirectly, that most European currencies are still inconvertible; but he spoke of this as if it were an affliction imposed on them from without, rather than a policy deliberately adopted by European governments to conceal the extent of their inflation and to bolster their economic nationalism.

And finally, the President’s message did not point out, except by a vague and slight hint, that the tariff policy he recommends is directly contradicted by our farm policy. In order to protect our farm-price supports we have put quotas on agricultural imports that have created resentment in half a dozen foreign countries (to many of which we are giving aid). And in trying to get rid of the appalling farm surpluses that our government has piled up through its price-support policy, we are proposing to “dump” part of the surplus abroad, undercutting world prices and disorganizing export markets, and thereby alarming and antagonizing scores of nations.

The Randall commission, a year ago, courageously and clearly faced up to this contradiction. The President glosses over it. His flexible farm-support policy, it is true, is not as bad as the ultrahigh supports on which the farm bloc is still insisting; but even the present flexible policy will continue to do great harm. Since the middle of last year our government has succeeded in getting rid of more than $800 million of farm surpluses, by selling them below cost, giving them away at home, or giving them away to foreign countries. But in spite of this huge loss to the taxpayer, the government on Nov. 30, through new acquisitions, still held about $7 billion worth of farm surpluses, compared with about $6 billion in July. If we had the courage to abolish this
program, we would make a far greater contribution to freedom of trade and to regaining the good will of foreign countries than we could do merely by acting directly on tariffs, and leaving our farm-price support policy unchanged.

Deficits without End?
February 7, 1955

Mr. Eisenhower is planning the 23rd deficit in the last 26 years. We are supposed to be pleased about this because the expected deficit is only $2.4 billion in the fiscal year 1956 compared with an expected deficit of $4.5 billion in the current year. Yet Mr. Eisenhower a year ago predicted a deficit of only $2.9 billion for the current year. If events force him to write up his present estimate even as much as he has been forced to write up last year’s, we are headed for a new deficit of $4 billion. But Mr. Eisenhower’s present estimates are far more optimistic all along the line even than his estimates a year ago. Raymond Moley discusses this phase of the budget in his own column in this issue. But the devices that have been resorted to are so extraordinary that I cannot forbear calling further attention to them: (1) In order to get his estimate of budget receipts up to $60 billion, the President must assume that employment and production will be increased. (2) In order to keep his apparent total of expenditures down to $62.4 billion, he proposes to set up special budgets (e.g., for roads and schools) outside the Federal budget. (3) The budget gives one set of figures covering the Army, Navy, and Air Force in detail. These add up to $35,750,000,000. But for the three military services as a whole he gives a total of only $34 billion. He deducts this $1,750,000,000 because the Secretary of Defense believes there are possible (but unspecifiable) savings and “slippages.” In other words, allowance is made for unforeseen economies but none for unforeseen spending increases!

There is, of course, always a possible margin of error in estimates of future expenditures and receipts. But that is precisely why conservative Treasury Secretaries of the past aimed at a safe surplus rather than an exact balance.

When Mr. Eisenhower presents a table of annual expenditures in the first part of his budget message, he carries it back only to 1952. This happens to be the last year with which spending comparisons are still in his favor. Had he carried back his comparison only one year more (as the appended table shows), he would have brought out the fact that his proposed spending for 1956 is $18.4 billion more than Mr. Truman spent in 1951. And in both fiscal 1951 and 1952 the Korean war was going full tilt. What is most disheartening about the new budget is the whole spending philosophy implied. Mr. Eisenhower’s message continues to give lip service to conservative spending principles; but his words are not supported by his program. There is, for example, the familiar device of showing as many expenditures as possible under the sacrosanct classification “national security programs.” Mr. Eisenhower thereby gets a total for such programs of $40.5 billion, or 65 percent of the entire budget. Yet this includes $3.7 billion for foreign military aid, the excuse for most of which has vanished. Yet not even plausible perfunctory reasons are presented to explain why a now-prosperous Europe still cannot pay for its own defense. In fact, total expenditures for foreign aid are estimated at $4.7 billion for the fiscal year 1956, which is actually $400 million more than we are spending in the current year.

Then $2.2 billion is to be spent for a farm-price-support program which raises food costs for city workers and makes a liberal trade program impossible; $4.6 billion is allotted for veterans’ benefits—$219 million more than in the current year; and in the offing is a grandiose $101 million ten-year road program.

Mr. Eisenhower has drifted far from the day two years ago when he declared to Congress: “The first order of business is the elimination of the annual deficit.”

Inflation Was the Trick
February 14, 1955

The present Council of Economic Advisers is a much more distinguished body than that in the later years of the Truman Administration. This fact is reflected in an annual Economic Report that is better reasoned, more
carefully documented, more informative, lucid, balanced, and less flagrantly political than those to which we had become accustomed.

But after I have said all this, I am sorry to arrive at the same conclusion announced several times in this place over the last eight years—to wit, that a Council of Economic Advisers that makes public reports cannot be an independent, disinterested, and scientifically objective body but is forced to become an apologist for what the administration in power has done or has decided to do.

The reasons for this are inherent in the setup of the council. Appointed and removable by the President, and making public reports to the President, it can hardly criticize the economic policies that the administration has followed or recommend the opposite of what it knows the administration intends to do. Therefore the CEA’s latest report, as I remarked of those under the Truman Administration, still “consists mainly of giving ‘scientific’ and ‘economic’ reasons for what the President has done or wants to do for political reasons” (Newsweek, Jan. 28, 1952).

The new Economic Report, in fact, goes down the line for every economic recommendation of President Eisenhower, however dubious, in all his other messages. I could repeat about it verbatim, with complete truth, many of the things I wrote about President Truman’s older economic reports. For example: “The report was full of expressions of faith in a free economy. Yet one recommendation after another was based on the assumption that the economy would not in fact be stable without government intervention and control at a score of crucial points” (Newsweek, Jan. 27, 1947).

Now a government can continue for a long time to maintain the appearance of prosperity through monetary inflation. This is in fact the policy that the Federal government followed in 1954; and it is in fact the reason why it was able to turn the recession of late 1953 and early 1954 into a resumption of the boom.

This fact is not disputed; it is candidly acknowledged (but not of course under the nasty name of inflation) by the Eisenhower Administration itself. In his letter transmitting the Economic Report to Congress, the President declared: “Fiscal and monetary measures fostered an expectation of improving economic conditions and encouraged people to maintain a high rate of expenditure.” The council’s lengthy report is more explicit. It describes how the government increased the money supply by about $10 billion in 1954 by cheap money policies. The “Federal Reserve Banks lowered their rediscount rates. The reserves that member banks are required to hold in support of their deposits were reduced once again.” Then, “As a result, the loans and investments of commercial banks increased by about $10 billion during 1954 and the money supply increased further—especially in the second half of the year. Had it not been for the increased availability of credit and the easing of terms, the fast pace of . . . construction . . . would not have been attained,” etc.

And later (page 100), the CEA admits that: “More than half of the overall expansion in bank loans and investments was in holdings of U.S. Government securities. These increased by about $6 billion . . . The increase of $2.6 billion in total loans clearly was not due to commercial and industrial loans . . . These loans were still lower at the year end than they had been at the end of 1953. The increases in the total were in large part the result of increases in real-estate loans, in loans to brokers and dealers, and to others for purchasing and carrying securities, and to a minor degree in agricultural loans.” But after this admission of the way in which government policies stimulated a booming stock market, the CEA and the President deplore the “over-emphasis of speculative activity!”

Time for Reappraisal
February 21, 1955

If developments in Russia, France, or Formosa force an “agonizing reappraisal” of our foreign policy, they call no less for reappraisal of our foreign economic policy. Yet this reappraisal need be agonizing only in the sense that it may force some of us to abandon a few of our pet ideas.

The necessity for diverting more of our military resources to the protection of Formosa must increase our expenditure in that direction. But this need not mean that our total budget expenditures must be increased by the same amount or even that this total must necessarily be increased at all. The need for more expenditures in one direction underlines, rather, the need for more economy in other directions.

Yet this need is getting almost no attention. Army partisans are using the Formosa crisis for a dubious insistence on more foot soldiers. And our armchair strategists are somehow certain that even a defense expenditure of $40.5 billion a year is not enough. One of their most persistent fallacies is the assumption that the amount of defense we get is directly measured by the amount of money we spend. This assumption has survived repeated exposures of shocking misdirection and waste in military spending before Congressional committees.
Foreign economic policy cannot be treated in a separate compartment from foreign political, diplomatic, and military policy. What is needed especially at this time is a clarification of our whole relationship to our so-called “allies.” Since the end of the second world war this relationship has been strangely one-sided. We have showered other countries with money, goods, armament, and agreements to defend them. We have asked and got in return only the vaguest assurances regarding what they will do in a crisis to help defend us. One of the chief purposes of having military allies has always been to economize the use of one’s own resources—to have others share the burden of defense or war. But our own so-called alliances have been one-way contributions and assurances that have increased, not reduced, our defense expenditures.

This applies to the nearly $50 billion that we have thrown into foreign aid since the end of the second world war. It applies to the $4.7 billion that we are planning to spend in the same way in the next fiscal year. Almost the whole of this new sum, at least, could be saved. We must of course continue to give aid in certain special situations, as in Korea and Formosa. But there is no earthly reason why we should continue to bribe a now-prosperous Europe to defend itself, or continue the Truman giveaway program known as Point Four. We need not go again into all the fallacies and follies that lie behind our foreign-aid program. I have already done this in scores of Newsweek articles over the last eight years, as well as in a book, Will Dollars Save the World? (1947), and in a pamphlet, The Illusions of Point Four (1950). (Both published by the Foundation for Economic Education, Irvington, N.Y.) Fortunately there is now a growing recognition of the futility of our foreign-aid program. One evidence is the appearance of such new books as The Dollar Dilemma: Perpetual Aid to Europe? by Melchior Palyi (Regnery; $2.75) and Billions, Blunders, and Baloney, by Eugene W. Castle (Devin-Adair, $3.50).

The fantastically one-sided nature of the “alliances” we have made was glaringly exposed in the Korean war. It was a “United Nations” war. But the United States supplied not only more than 90 percent of the money, but (apart from South Korea itself) 90 percent of the men and casualties. Yet when it came to deciding how we were to conduct this war, and what the true terms were to be, our token allies had apparently as much to say as if they had shared equally in the blood, sweat, and tears. We suffered, in brief, all the disadvantages of an alliance with none of its advantages. Such a situation should never be allowed to occur again. If we are now forced to carry alone the burden of defending Formosa, we can at least stop wasting subsidies on European countries that seem apathetic even about defending themselves.

Truth Must Be Repeated

February 28, 1955

In his attitude toward the Dixon-Yates contract, Mr. Eisenhower has been merely defensive. He has made no counterattack against the fanatic devotees of socialized electric power. In the world of party politics this is losing strategy.

Occasional and reluctant defensiveness is even less likely to succeed with relentless enemies like Communist Russia and its satellites. Hardly a day has passed in the last ten years in which the leaders of these countries and its official press have not vilified the United States and the whole “capitalist” world. Yet our official answers have been sporadic, often timid, and nearly always merely defensive.

True, we have the Voice of America. The United States Information Agency is spending $77 million this year and wants to spend $86 million next year. But it is impossible to believe, in the face of results, that this spending has been very effective. On its face it is not reasonable to expect too much, for example, even if we do reach a few isolated and helpless men and women behind the Iron Curtain through their short-wave sets.

What really needs to be done would not cost the taxpayers an extra cent. Yet, ironically, we are not doing it. We should make a full, daily, public reply to every Chinese or Russian Communist attack upon us. Our government would not need to put this on radio or television; it would broadcast itself. Its primary purpose should be, not to “penetrate the Iron Curtain,” or to convince a Khrushchev or a Chou Enlai of the error of his ways, but to convince and solidify the opinion that we can and do reach—that of the non-Communist world.

What the American Government needs to provide today is systematic propaganda on behalf of the true opposite of Communism, which is free enterprise—or (to use the smear word invented by Marx) capitalism. Our spokesmen occasionally do defend something that they vaguely call “democracy.” This makes little impression, because the Communists call our democracy “capitalism” and reserve for their own political system the name of “people’s democracy.” What we must defend in our system, if we ever hope to win the ideological war, is the element of freedom in it—particularly freedom of private competitive enterprise, because it is precisely
The Salaries of Congress
March 7, 1955

It was a disturbing symptom when the House and Senate, by big majorities, rushed through fat increases in their own pay, effective immediately, raising Congressional compensation from $15,000 a year to $23,750.

There may be good arguments for an increase in Congressional salaries. But that is beside the present point, which is whether congressmen ought to raise their own salaries during their own unexpired terms.

The history of Congressional pay is instructive. In 1789 the compensation of senators and representatives was fixed at $6 for each day’s attendance; in 1815 at $1,500 a year; in 1817 at $8 a day; in 1855 at $3,000 a year; in 1865 at $5,000; in 1873 at $7,500 (reduced to $5,000 again in 1874); in 1907 at $7,500; in 1925 at $10,000; and in 1946 at $12,500 plus $2,500 for expenses. The increase of March 3, 1873 (also retroactive, as in this year’s House bill, to the beginning of the Congressional term), was denounced by the country as a “salary grab”; and on Jan. 20, 1874, it was repealed.

For congressmen to raise their own salaries during their own terms is not contrary to the letter of the Constitution, but clearly contrary to its spirit. Two explicit provisions are relevant. One is Article I, Section 6: “No senator or representative shall, during the time for which he was elected, be appointed to any [Federal] office . . . which shall have been created, or the emoluments whereof shall have been increased, during such time.” The purpose of this is plain. The Constitution provides, again (Article II, Section 1): “The President shall, at stated times, receive for his services a compensation which shall neither be increased nor diminished during the period for which he shall have been elected.” The purpose of this should also be plain on its face. Any doubt is removed by the contemporary explanation of Alexander Hamilton in “The Federalist” (No. 73) that it was inserted precisely that Congress should not be able to “tempt” the President “to surrender his judgment to their inclinations. . . . They can neither weaken his fortitude by operating on his necessities, nor corrupt his integrity by appealing to his avarice.” But the Founding Fathers could not foresee everything; and so they neglected to limit the power of congressmen to change their own compensation. But surely the same considerations that led to the constitutional provisions just cited would indicate that the President ought not to curry Congressional favor by asking Congress to raise its own salaries. They would also suggest that Congress, when it does see fit to raise Congressional salaries, should make the increase apply, not to congressmen already in office, but only to those to be elected in future. Is this too much restraint to ask? Are congressmen’s necessities too great for them to get along on their recent salaries for the next two years? How many of those who voted to increase their own pay explicitly notified the voters during the election of their intention to do so?

This brings us to an even more serious aspect of the self-salary-raise. Congress for the last quarter-century (and the present Congress has not yet shown itself to be any exception) has tolerated, encouraged, and helped to create constant deficit financing and continuous
inflation. It has acted on the assumption that almost any problem, domestic or international, can be solved at the expense of the American taxpayer.

When it is suggested that the exorbitant personal or corporate income-tax rates might be slightly reduced, Congress, with a shrug of the shoulder, has expressed perfunctory sorrow that it cannot be done now. But now it pleads that the inflation it has itself encouraged and helped to create has raised its own cost of living to a point where it must raise its own salaries for relief. If congressmen can continue to inflict inflation on the rest of us, and escape the consequences for themselves by raising their own pay, what hope can the country have for a cut in spending, a cut in taxing, or a halt to inflation? If more congressmen had seen the subject in this light, fewer might have voted to raise their own pay.

**Deficits Are Poison**
March 14, 1955

President Eisenhower was thoroughly justified when he called the Democratic proposal to cut everybody’s income tax by $20 (plus $20 more for each dependent) “the height of fiscal irresponsibility.”

This is in effect the same proposal Democratic leaders made a year ago to raise everybody’s personal-income exemption by $100. It has all the disadvantages of that former proposal. The deficit for the current fiscal year is estimated at $4.5 billion; for 1956 the deficit is already estimated (optimistically) at $2.4 billion. This $20 cut proposal would raise the annual revenue loss by $2.1 to $2.3 billion more.Hardly less serious, it would relieve some 5 million more voters of the necessity of paying any income tax at all, and so relieve them of any concern about governmental extravagance by fostering in them the illusion that “the other fellow” was paying the bill.

What makes this proposal even more irresponsible is that it was tacked on as a rider to a bill designed to maintain excise and corporation tax rates, so that revenues from them would not fall by $2.8 billion a year. The Democrats said in effect to the President: “If you want to keep this $2.8 billion of revenue we will charge you $2.3 billion for the privilege.”

This was demagogy outsmarting itself. Even should the rider be passed by Congress in some form, it is politically easy for the President to veto it. He would stand, at worst, to lose only about $500 million net in revenues. And economically this would be in every way a better tax cut than the one the Democrats proposed. A cut in the excise taxes would stimulate sales. A cut in the onerous corporation taxes would stimulate investments that create jobs. And Mr. Eisenhower could accompany his veto with a reiterated demand that Congress pass his tax-maintenance proposal in its original form. If the Democrats refused to do so, they would find themselves bearing the onus of “favoring the big corporations.”

But how did Mr. Eisenhower get into this difficulty in the first place? By abandoning the goal of his State of the Union message two years ago: “The first order of business is the elimination of the annual deficit.” When he abandoned that, he lost his anchor and was himself adrift. At his press conference of Feb. 23 he gave an excellent description of the kind of proposal the Democrats had made. It would mean inflation. “Whenever you have inflation, the immediate effect is to hurt first the people of fixed incomes, white-collar workers . . . the person who lays aside savings in the forms of pensions, insurance plans, and savings bonds. . . . Now we are going back to deficit spending, the most insidious thing that can happen to a free economy.”

True words; well spoken. But, alas, Mr. Eisenhower has himself never got out of deficit spending. He has allowed himself to be led astray by the Keynesian and New Deal doctrines of a “compensated economy,” which treat an annually balanced budget as a minor and even a dubious objective. He has himself proposed huge new spending programs. This leaves him no firm ground on which to stand against the fiscal demagogy of the Democrats. He can hope to combat it only by submitting a completely balanced budget—and for 1956.

My comment in *Newsweek* of March 8, 1954, on the Democratic proposal for an increase of $100 in all income-tax exemptions would cover the present situation with hardly a change even in the figures: “President Eisenhower can successfully combat this demagogy, irresponsibility, and inflation only if he takes a solid stand on principle. He cannot hold the line if he merely tries to stick by his January budget. He cannot convincingly argue that a deficit of $2.9 billion is all right but a deficit of $5.2 billion is all wrong. He can succeed only if he stands on the firm economic and political principle that the budget must be fully balanced, and now. And then he can demand of any group in Congress that wants the fun of cutting taxes that it first of all cut expenditures by the same amount. The only alternative to this course is economic and political demoralization.”

Deficits Are Poison
March 14, 1955

President Eisenhower was thoroughly justified when he called the Democratic proposal to cut everybody’s income tax by $20 (plus $20 more for each dependent) “the height of fiscal irresponsibility.”

This is in effect the same proposal Democratic leaders made a year ago to raise everybody’s personal-income exemption by $100. It has all the disadvantages of that former proposal. The deficit for the current fiscal year is estimated at $4.5 billion; for 1956 the deficit is already estimated (optimistically) at $2.4 billion. This $20 cut proposal would raise the annual revenue loss by $2.1 to $2.3 billion more. Hardly less serious, it would relieve some 5 million more voters of the necessity of paying any income tax at all, and so relieve them of any concern about governmental extravagance by fostering in them the illusion that “the other fellow” was paying the bill.

What makes this proposal even more irresponsible is that it was tacked on as a rider to a bill designed to maintain excise and corporation tax rates, so that revenues from them would not fall by $2.8 billion a year. The Democrats said in effect to the President: “If you want to keep this $2.8 billion of revenue we will charge you $2.3 billion for the privilege.”

This was demagogy outsmarting itself. Even should the rider be passed by Congress in some form, it is politically easy for the President to veto it. He would stand, at worst, to lose only about $500 million net in revenues. And economically this would be in every way a better tax cut than the one the Democrats proposed. A cut in the excise taxes would stimulate sales. A cut in the onerous corporation taxes would stimulate investments that create jobs. And Mr. Eisenhower could accompany his veto with a reiterated demand that Congress pass his tax-maintenance proposal in its original form. If the Democrats refused to do so, they would find themselves bearing the onus of “favoring the big corporations.”

But how did Mr. Eisenhower get into this difficulty in the first place? By abandoning the goal of his State of the Union message two years ago: “The first order of business is the elimination of the annual deficit.” When he abandoned that, he lost his anchor and was himself adrift. At his press conference of Feb. 23 he gave an excellent description of the kind of proposal the Democrats had made. It would mean inflation. “Whenever you have inflation, the immediate effect is to hurt first the people of fixed incomes, white-collar workers . . . the person who lays aside savings in the forms of pensions, insurance plans, and savings bonds. . . . Now we are going back to deficit spending, the most insidious thing that can happen to a free economy.”

True words; well spoken. But, alas, Mr. Eisenhower has himself never got out of deficit spending. He has allowed himself to be led astray by the Keynesian and New Deal doctrines of a “compensated economy,” which treat an annually balanced budget as a minor and even a dubious objective. He has himself proposed huge new spending programs. This leaves him no firm ground on which to stand against the fiscal demagogy of the Democrats. He can hope to combat it only by submitting a completely balanced budget—and for 1956.

My comment in *Newsweek* of March 8, 1954, on the Democratic proposal for an increase of $100 in all income-tax exemptions would cover the present situation with hardly a change even in the figures: “President Eisenhower can successfully combat this demagogy, irresponsibility, and inflation only if he takes a solid stand on principle. He cannot hold the line if he merely tries to stick by his January budget. He cannot convincingly argue that a deficit of $2.9 billion is all right but a deficit of $5.2 billion is all wrong. And then he can demand of any group in Congress that wants the fun of cutting taxes that it first of all cut expenditures by the same amount. The only alternative to this course is economic and political demoralization.”
To Get a Responsible Budget
March 21, 1955

The Democratic proposal for a $20 cut in everybody’s income tax is the most disturbing example so far of the almost complete fiscal irresponsibility in Washington.

The Federal budget has become a political football. Fiscal responsibility has been forgotten in a sordid scramble for partisan advantage. For this situation neither party can escape blame, nor can the Congress or the President. Mr. Eisenhower in January submitted a budget which carried the 23rd deficit in the last 26 years. We were supposed to be gratified because this deficit was “only” $2.4 billion. Yet a year ago the President estimated a deficit of $2.9 billion for the current fiscal year, which is now estimated at $4.5 billion. The deficit for the new fiscal year seems even more underestimated than the last one. In addition, Mr. Eisenhower has proposed huge new spending programs on schools and roads outside the Federal budget. Even without the proposed Democratic cut, the budget deficit threatens to reach $4 billion.

This is what made it so difficult for Mr. Eisenhower to present a convincing case against a Democratic proposal that would have raised the deficit by at least $2 billion more. In the present situation, in fact, only a handful of men in either party dare to talk of a budget balance or of real economy.

This is fiscal demoralization. It has become all but futile to argue against specific spending schemes or the perpetual deficit. Real hope lies only in a complete reform of budgetary procedure itself. We must establish a responsible budget system.

For 22 years one man in Congress, Senator Byrd of Virginia, has stood above all the rest in the courage and persistence he has shown on behalf of economy and fiscal responsibility. He has now introduced a proposed constitutional amendment which recognizes the urgency of a reform in fiscal procedure itself. This amendment would permit Congress by law to authorize the President to veto any item in an appropriation bill, without being forced to veto the entire measure.

A similar proposal has long been advocated by outstanding leaders in both parties, conservatives and liberals alike. It was urged in 1937, for example, by Republican Senator Vandenberg, and supported then by President Roosevelt. The power of “item veto” over revenue bills is already possessed by the governors of thirty-seven states. Some of them also have the power of reducing any item.

A constitutional change of this sort would surely bring us nearer to fiscal responsibility. But it may be doubted whether in today’s conditions it would go far enough. Perhaps Senator Byrd drafted his amendment in the form he did—merely giving the President the power of item veto, and making even that subject to authorization by Congressional law—because he feared that anything stronger would have difficulty getting through Congress. Yet the most wholesome system for controlling the budget, if it could be achieved here, is that which has long prevailed in Great Britain, under which the legislative branch may reduce, but cannot increase, the total expenditures proposed by the executive branch.

A budget procedure very close to this, in fact, is prescribed by the constitution of New York State. The governor’s annual budget must not only give estimated expenditures and revenues for the next fiscal year, but must be accompanied by a bill or bills containing all the proposed appropriations and any proposed new taxes. The legislature (I quote the state constitution) “may not alter an appropriation bill submitted by the governor except to strike out or reduce items therein.” If the legislature wishes to increase or add any appropriation, it must be by separate items or bills “each for a single object or purpose” which “shall be subject to the governor’s approval.” In addition to this control, the governor is given explicit power to veto individual items in appropriation bills.

Nothing short of these combined restraints, I fear, can now give us a responsible Federal budget.

The Stock-Market Boom: Whodunit?
March 28, 1955

The present Senate investigation of the stock market reminds me of one of those whodunits in which it is discovered at the end that the crime was after all committed not by the suspects who were grilled but by the detective in charge of the investigation.

The recent extraordinary rise in the stock market is of course in large part due to the present earnings of corporations, and to confidence in the outlook for business. This confidence is in part the result of the less hostile attitude toward business taken by the present Administration as compared with its immediate predecessors. But a good deal of the stock-market rise of the last eighteen months has been due to the existence of money-and-credit inflation, as well as to the belief that this inflation will continue.

The government increased the money-and-credit supply in 1954 by about $10 billion through cheap-money policies. The long-run overall figures speak
for themselves. At the end of 1939, the country’s total money supply (as measured by total bank deposits and currency outside of banks) was $64.7 billion. At the end of 1953 it was $205.7 billion; at the end of 1954, $214.5 billion.

Spokesmen for the Eisenhower Administration have argued that there was no inflation in 1954 because wholesale commodity prices stood at an index number in January 1955 of only 110.2, compared with 110.9 in January 1954, while the cost of living in December 1954 stood at only 114.3 compared with 114.9 in December 1953. There are even those who contend, in the face of an increase of more than $24 billion in the money-and-credit supply between the end of 1951 and the end of last year, that there was a “deflation” in that three-year period, because wholesale commodity prices dropped from an average index of 114.8 in 1951 to 110.3 this February.

This illustrates the confusion we get into when we define inflation, not as an increase in the money-and-credit supply, but simply as the rise in commodity prices that is usually a consequence of such an increase. (But a consequence that may sometimes not take place.) The same confusion existed in 1929 and helped to increase the dimensions of that debacle. A standard index of security prices rose from an average of 100 in 1926 to 216 in September 1929. It was argued at the time that this certainly could not be the result of any inflation because the official index of wholesale prices had meanwhile fallen from an average of 100 in 1926 to 96 in September 1929. Yet monetary inflation was in fact going on. Deposits of Federal Reserve member banks rose from $29 billion at the beginning of 1926 to $32.5 billion at the beginning of 1929. By present standards, this overall credit increase may seem moderate. But the inflation was pouring into the stock market. In this respect it is only the developments of recent months that bear any realistic comparison with 1929. In 1929, brokers’ loans were more than $8 billion; today they are less than $2 billion. This illustrates not only the excusable discrimination but the absurdity involved in the suggestion of some witnesses before the Senate committee that margin requirements on stocks should be raised by the Federal Reserve Board from the present 60 percent to 100 percent.

It may be, as one witness in favor of the 100 percent margin requirement insisted, that there has been a 54 percent advance in stock prices in the last sixteen months, compared with a 78 percent rise in the sixteen months before the 1929 crash. But when we take longer and broader comparisons this one hardly seems ominous. In fact, whereas compared with 1929, Standard & Poor’s stock-market index shows an increase of 13 percent, the cost of living shows an increase of 56 percent, wholesale commodity prices an increase of 78 percent, and hourly manufacturing wages an increase of 225 percent.

Yet in spite of the fact that security prices have lagged far behind the general price rise, there are outcries from a Harvard “economist” and a former Federal Reserve official for still further discrimination against stocks, so that stocks would become the one thing that nobody was allowed to borrow on at all. Winthrop H. Smith, the managing partner of the country’s largest brokerage house, was one of the few who raised a pertinent question. If we are to eliminate borrowing on securities listed on the national exchanges, why not eliminate borrowing on homes, on all real estate, on motor cars, on furniture, television sets, air conditioners, or whatnot?

The comparison points up the demagogic discrimination to which the government has already resorted. It is now encouraging people to buy houses or almost any consumption goods or luxury on a shoestring margin. But some “economists” and senators want to prohibit people from borrowing at all if they prefer to save their money and invest it in industrial corporations—that is, in the plant and equipment that is necessary to raise the productivity of the country, to increase wages, and create jobs.

Such discrimination has reached a degree that would be comic if it were not disturbing. Installment credit now outstanding exceeds $22 billion. This is being encouraged. Mortgage debt on one-to-four family houses has nearly quadrupled in ten years to an estimated $75 billion. This, too, is being encouraged. But brokers’ loans against stocks are less than $2 billion. And this is so alarming that it calls for investigation and repression!

This so-called “qualitative” credit control is not only dangerous, because it permits the government to dictate just who shall have credit and who shall not, but it is also futile. Even if a man is prevented from borrowing on stocks, what is to prevent him from borrowing on his home or government bonds or his merely personal credit and using the proceeds to buy stock? We cannot flood the country with credit and throw arike around the stock market.

And so we are back to our starting point. If the present stock-market boom is something that somebody should be blamed for, then the blame rests squarely on the Federal government itself. It is a result of its general policy of credit inflation. So the Senate investigators, if they really want to find the culprit, need not search for him somewhere in Wall Street. They need not go outside of Washington. ✽
That Capital-Gains Tax
April 4, 1955

One good outcome of the Senate stock-market inquiry may be the public education it has provided on the effects of the capital-gains tax.

This is supposed to be a tax on capital gains. But as it is only collected when an asset is sold, it is, in effect, a tax on selling. An investor must pay, say, a tax of 25 percent on his capital gains on his shares in company X—if he sells them. As long as he holds on, he need pay nothing. If he could be sure that his X shares were going to fall, or even that shares in company Y were going to do relatively much better than X shares, he might make the switch in spite of the heavy tax penalty. But as he can almost never have such absolute assurance, he is likely to stay put. This is what is meant when it is said that many investors are “locked” into their investments.

The tax on long-term capital gains therefore raises comparatively little revenue. But by so heavily penalizing sales or exchanges of property, it makes holdings less liquid and the economy less flexible. It discourages people from acting in accordance with fresh knowledge or new conditions. It thereby not only distorts the relative prices of securities and other goods but prevents much capital from flowing into new enterprises or into the lines where it would be most productive. It is locked up where it already happens to be.

A great injustice of the capital-gains tax is that in an era of inflation it is a tax on gains that do not even exist. If a man bought property in 1939 for $10,000 and sells it for $15,000 today, he is taxed on a supposed profit of $5,000. But this “profit” exists only in paper dollars. In terms of what he can buy with the proceeds he actually has a loss. For the cost of living has gone up 92 percent in the meantime, and wholesale prices have risen 120 percent.

Another injustice in the capital-gains tax is that it is levied by the government on the cynical principle of “heads I win, tails you lose.” For the government taxes capital gains without allowing corresponding deductions for losses. True, it allows deduction of capital losses from capital gains. But though it taxes short-term capital gains, for instance, up to any amount just as if they were income, it allows no more than $1,000 deduction of capital loss against income. This negligible pretense of balance does not change the cynical unfairness toward investors with heavier net losses.

Senator Fulbright asks, even today, why even long-term capital gains shouldn’t be taxed as straight income. The question reveals his ignorance of the history of this measure. The government once did treat both capital gains and capital losses for tax purposes exactly like income. And it was appalled at the results. When the stock market fell from 1929 to 1932 Federal revenues collapsed—because taxpayers deducted their capital losses even from their already reduced incomes.

The crucial revelation came on May 23, 1933, when the famous banker J.P. Morgan disclosed before a Senate committee that he had paid no income tax for the two preceding years. The reason was simply that his capital losses had exceeded his income in those years. But the very idea that J.P. Morgan could skip income tax for any reason at all so shocked headline writers and congressmen that it was decided to change the law. An honest change might have been to treat capital gains and losses as the British Government does. By and large it neither taxes gains nor allows losses to be deducted against income. But our own government insisted on eating your cake and having it too. It in effect decided, with trivial qualifications, to tax its citizens’ net capital gains and ignore their net losses.

It is easier to point to the inequities in the present tax treatment of capital gains, and to the harm it does, than to suggest an acceptable alternative. The truth is that when a country has progressive income-tax rates running up to 91 percent, it is impossible to work out any fully satisfactory solution of the problem of capital gains and losses. But probably the best solution is that adopted in Britain.

Double-Taxation Blues
April 11, 1955

As he gropes and calculates and curses his way through his income tax, the taxpayer is apt to curse the wrong man. When he is asked for his Social Security number or some other information in a space obviously too small to hold it, his wrath turns on the bureaucrats who framed the forms. But sober second thought should convince him that the main culprits have been his elected representatives who framed the laws the bureaucrats must apply.

It is the complications in the law that cause the complications in the income-tax blanks. Nearly all these complications arise from the fact that our lawmakers refuse to grant to persons with high incomes the deductions which, as a matter of simple fairness, they grant to persons with moderate incomes. If capital gains are to be taxed as if they were income, then capital losses should be fully deductible from income. But Congress arbitrarily limits the deduction to $1,000. If medical expenses above a certain amount are fair and proper

Business Tides
deductions from taxable income, then they should be fully deductible above that amount. But Congress and New York State put an arbitrary limit on the deduction. If, finally, it is wrong in principle and harmful in consequences to tax the same income twice, then it is wrong to remove double taxation on a few moderate incomes but retain it on higher incomes.

The calculations that the taxpayer must go through in order to figure the amount of tax relief he is allowed on income from dividends are so fantastically complicated that a new Mark Twain or Bob Benchley could not think of anything more absurd. Yet after the taxpayer is all through, he can only exclude $50 of income from his dividends and get a tax credit of 4 percent on part of them.

These complicated calculations are necessary simply because the last Congress, in granting this merely token relief from double taxation of dividends, was in deadly fear of the accusation that rich stockholders would benefit from it. Yet from a political standpoint the Republican Congress responsible for the token relief gained nothing from all its super-caution. The CIO bosses and the Democratic dervishes are still shouting that the Republicans allowed rich men tax deductions on unearned income from dividends but refused to allow poor workers to make any corresponding deductions in income from wages.

If the Democrats should now try to throw out this dividend tax relief, in the form in which it now exists, the Republicans would be well advised either to let them do it or to offer an amendment of their own.

The double tax on corporate dividends is still flagrant. If a man invests his money in a corporation he pays a tax of $52 out of every $100 that his investment earns even before he gets it. Then, on the $48 that is left (or whatever part of it is paid out to him in dividends), he must pay a tax of up to 91 percent (now minus a 4 percent credit). On any dividend on which he pays the maximum tax rate he has only $6 left for himself out of every $100 the corporation earns. The government grabs the other $94.

Instead of giving the individual taxpayer this extremely complicated but negligible relief on his own tax, it would be much simpler all around to tax corporations themselves in a slightly different manner. Instead of requiring them to pay a 52 percent tax on their total net income for the year, for example, they could be asked to pay 52 percent on the amount of net income they retain, and, say, 48 percent on the amount they pay out in dividends. (In 1954, corporations had profits before taxes of about $35 billion, from which they paid out $10 billion in dividends.)

This would be an approach toward the British system of corporate taxation. Such a change in system would save the individual taxpayer an enormous headache, would be easier to explain to the inexpert, and would take phony issue away from the Democratic left-wingers. The individual taxpayer would once more pay precisely the same rate in his own tax bill on income received in the form of dividends as on any other income.

**Competition in Spending**

April 18, 1955

The proposed constitutional amendment of Senator Byrd would make it possible for the President to veto any item in an appropriation bill without being forced to veto the entire measure. This would surely bring Washington much nearer to fiscal responsibility. But it would still fall short of that goal. We will not achieve a fully responsible budget until we are ready to accept the system that has long prevailed in Great Britain, under which the legislative branch can reduce, but cannot increase, the expenditures proposed by the executive branch.

The proposal that Congress should actually deprive itself of the power of voting appropriations not proposed by the President is so contrary to what we are accustomed to that it may strike some readers as shocking or chimerical. Yet it is our own Federal procedure that would seem shocking in most foreign countries. They simply could not afford the fiscal irresponsibility of the American system. Nor can we ourselves afford it much longer.

The rule that the legislature should not be allowed to increase expenditures beyond those proposed by the executive is not novel. It is accepted, in fact, in the overwhelming majority of governments in the world today. It prevails in many of our own states.

The rule rests on a fundamental principle of government. The only proper fiscal function of Congress is to be the watchdog of the people’s Treasury. Its members will not properly perform their function as watchmen if they can put their own hands in the Treasury. The Congressional “power of the purse” properly consists solely of the power to guard or to refuse the purse.

If this principle could once be established it would end forever the present shocking competition among the President, the House, and the Senate, and among individual representatives and individual senators, to outspend each other—to prove that each can be more generous than the others in appropriating the taxpayers’
American workers are now getting by far the highest wages paid anywhere in the world. They are the highest wages ever paid even in American history. The aristocrats even among American workers are the automobile workers, who today get an average of $2.24 an hour and more than $96 per week.

Walter P. Reuther, head of the United Auto Workers CIO, who has never understood, and never tried to understand, what has made possible the miracle of American wages, has decided to plump for a guaranteed annual wage. The worst thing that could happen to American labor would be to win such a demand.

The first thing to be understood about the employer is that he is merely a middleman, a go-between. He can never pass on to workers more than he gets from consumers. The employer cannot guarantee an annual wage to his workers unless consumers will guarantee him the required volume of sales. The late Philip Murray, Reuther’s predecessor as head of the CIO, understood this. “Experience to date,” he wrote in 1940, “raises doubt as to whether annual-wage plans can be extended over a wide area of business activity, for back of their success is the stabilization of operations.”

The paradox of the guaranteed annual wage is this. When a company’s volume of business is really stable all year round, there is no need to insist on a guaranteed annual wage. Steady employment and the annual wage will exist anyway. But where the volume of sales fluctuates widely, it is impossible to guarantee an annual wage. In the automobile industry the best selling season is usually spring, and manufacturers must gauge production closely to current demand.

Reuther’s childish theory is that if he can force the employer to pay an annual wage he can “force” him to stabilize his sales. He forgets that it is already strongly to the employer’s interest to stabilize his sales to the best of his ability. This enables him to keep his skilled working force intact, to maintain its morale, and to hold down his hourly wage rate. (Durable goods industries, less stable than nondurable goods industries, today pay wages averaging 28 cents an hour more.)

It is important to notice that Reuther is demanding guaranteed pay rather than guaranteed employment. What he proposes is not steady work, but that men be paid for not working. One of his slogans reads: “40 Hours Pay Any Week You Work—52 [Weekly] Paychecks If You’re Laid Off.”

The Reuther plan might more accurately be entitled: A Plan to Undermine the American Enterprise System and to Cripple the Companies on Which You Depend for Employment. For the first effect of his plan would be to penalize and discourage the expansion that has been the life of American business. If the employer had to pay for an entire year’s idleness to every man who had worked for him two or more years, he would be extremely reluctant to take on workers who might

Who Will Guarantee Business?
April 25, 1955

American workers are now getting by far the highest wages paid anywhere in the world. They are the highest wages ever paid even in American history. The aristocrats even among American workers are the automobile workers, who today get an average of $2.24 an hour and more than $96 per week.

Walter P. Reuther, head of the United Auto Workers CIO, who has never understood, and never tried to understand, what has made possible the miracle of American wages, has decided to plump for a guaranteed annual wage. The worst thing that could happen to American labor would be to win such a demand.

The first thing to be understood about the employer is that he is merely a middleman, a go-between. He can never pass on to workers more than he gets from consumers. The employer cannot guarantee an annual wage to his workers unless consumers will guarantee him the required volume of sales. The late Philip Murray, Reuther’s predecessor as head of the CIO, understood this. “Experience to date,” he wrote in 1940, “raises doubt as to whether annual-wage plans can be extended over a wide area of business activity, for back of their success is the stabilization of operations.”

The paradox of the guaranteed annual wage is this. When a company’s volume of business is really stable all year round, there is no need to insist on a guaranteed annual wage. Steady employment and the annual wage will exist anyway. But where the volume of sales fluctuates widely, it is impossible to guarantee an annual wage. In the automobile industry the best selling season is usually spring, and manufacturers must gauge production closely to current demand.

Reuther’s childish theory is that if he can force the employer to pay an annual wage he can “force” him to stabilize his sales. He forgets that it is already strongly to the employer’s interest to stabilize his sales to the best of his ability. This enables him to keep his skilled working force intact, to maintain its morale, and to hold down his hourly wage rate. (Durable goods industries, less stable than nondurable goods industries, today pay wages averaging 28 cents an hour more.)

It is important to notice that Reuther is demanding guaranteed pay rather than guaranteed employment. What he proposes is not steady work, but that men be paid for not working. One of his slogans reads: “40 Hours Pay Any Week You Work—52 [Weekly] Paychecks If You’re Laid Off.”

The Reuther plan might more accurately be entitled: A Plan to Undermine the American Enterprise System and to Cripple the Companies on Which You Depend for Employment. For the first effect of his plan would be to penalize and discourage the expansion that has been the life of American business. If the employer had to pay for an entire year’s idleness to every man who had worked for him two or more years, he would be extremely reluctant to take on workers who might
become such liabilities. He would rather miss sales than take such a risk. This is not only common sense; it is proved by experience. After the second world war, Italy passed a law that virtually prohibited the layoff of workers. Dismissal of workers there is still subject to very heavy separation pay. The result is that Italy has had heavy chronic unemployment for years. Its labor leaders blame the result on everything but this glaringly obvious cause.

The guaranteed annual wage, in brief, would hurt most of all the very workers it is designed to protect. It would make even the American economy stagnant. It would bring permanent unemployment. It would eat up the reserves that now provide the new equipment which by increasing American productivity in the past has enabled us to pay the highest wages in history.

And the demand for a guaranteed annual wage hasn't even a plausible excuse. We already have nationwide unemployment insurance. Reuther’s guarantee is to be thrown on top of this. It is designed, in fact, to allow a man to “maintain the same living standards as when fully employed,” thus removing his last incentive to get another job.

When Government Lends
May 2, 1955

Our direct official government debt is $277 billion. This in itself should be colossal enough to disturb any citizen who studies its implications. But the Hoover commission, in its report of March 13 on Federal lending agencies, found, in addition, that government loans, guarantees, insurance, and contingent liabilities, created through more than a hundred different Federal agencies, totaled $244 billion.

The commission's report made various suggestions for reducing the government's proliferating lending agencies and putting others more nearly on a business basis. Yet moderate as its suggestions were, five of the twelve commission members thought they went too far.

The majority recommendations were based in part on a report of 257 pages prepared by a group headed by Paul Grady, a partner of Price, Waterhouse & Co. This task-force report was not made public until later. It is hard to see how any member of the commission could have read it and still remained blind to the mischief and danger of government lending to private business.

Whoever was principally responsible for drafting the task-force report not only knew the principles of accounting, but had a firm grasp of both economic and political principles and a gift for pithy, aphoristic statement. The first 25 pages are a model of what such a report should be. It would be a tragedy if it should gather dust while more billions of the taxpayers’ money are recklessly “loaned” away.

The temptation to quote from this report is limited only by space. A few excerpts may indicate its quality:

"It sometimes happens that a program accomplishes its original objectives, and then continues to function ostensibly for the same but actually for other purposes.” (This might be said of much more than lending programs; it is a sort of universal bureaucratic law.) “REA is an example. . . . Although more than 90 percent of the nation’s farms are electrified, the sponsors of the REA program foresee no end to the need for ever increasing amounts of government loans for rural electrification.” The report goes on to cite the RFC and other examples:

“Ever since the depression of the early 1930s, we have made virtually a fetish of financial security for the individual, and by our successive governmental efforts to enhance it, we have loaded more and more of the inherent financial risks of our economic life on the Federal Treasury. . . . No economic system is free from risks of loss. . . . The savings of our people must stand the losses of our enterprises if there are losses. There is no way around this, no matter how remote we are able to make the settlement appear. . . .

“We may not like to acknowledge it, but it is an essential truth that many in our society, though they may honestly wish to try, are not capable of being successful businessmen, successful farmers, or even successful home owners. The failures of such people may be personal misfortunes but there seems little justification for assessing the taxpayers to cover their losses. . . .

“It is not possible for the government to assist one competitor without placing handicaps in the path of another. . . .

“Human nature and politics being what they are, occasional windfall profits are virtually an inevitable accompaniment of government lending. Subsidies in one form or another are an essential characteristic of government lending and a windfall profit is only a subsidy grown up. . . .

“Government lending programs and government guarantee programs have a fatal attraction politically. They can be used handily to bestow favor on particular groups and persons. . . . Because it is attractive politically, government lending grows and grows. Each successive national administration offers more than the last lest there appear to be retrogression.”

Finally, the task force quotes from the prophetic statement of the first Hoover commission in 1949:
“Direct lending by the government to persons or enterprises opens up dangerous possibilities of waste and favoritism. . . . It invites political and private pressure, or even corruption.”

Foreign Aid Forever?
May 9, 1955

Once a government bureaucracy has been set up to do any job whatever, it will find endless excuses for expanding, prolonging, or perpetuating that job. This is the sad history of our postwar foreign aid.

Originally urged by Secretary Marshall in 1947, to meet what was then regarded as a temporary emergency situation, foreign aid has gone on and on, from year to year, constantly changing its stated purposes, constantly changing its name, but showing not the slightest tendency to terminate or even taper off. It may come as a jolt to some readers to discover that the President is actually recommending an increase in the amount to be spent in the next fiscal year even over the amount being spent in the current fiscal year. He wants foreign aid to rise from $4.3 billion in 1955 to $4.7 billion in 1956. Worse than this, far from even suggesting a tapering off, the President in his letter to Secretary Dulles of April 16 made it clear that he thought foreign giveaway should be a “continuing” program under “a permanent government establishment.”

The President’s April 20 message to Congress on foreign aid gives the perfunctory and mainly rhetorical arguments for it that we have been hearing for the last nine years. The message raises a hundred doubts about details. I can mention only one or two.

It is a program for scattering the taxpayers’ money over nearly the whole world—practically to every country outside of the Iron Curtain. To a few countries, in the world as it is today, continuance of military aid is unavoidable. This now applies most notably to Formosa and Korea. The President’s message makes out a less obvious but still persuasive case for aid to Iran, Greece, and Turkey. But having mentioned these specific countries, he suddenly plunges into the wholesale and unsupported generality that it is the duty of the American taxpayer “to promote welfare and growth for the peoples of Africa.” Next we find that it has become somehow our duty to shower money all over Latin America. Where a “critical situation” exists, as in Guatemala or Bolivia, we must toss in still more. Then we must continue to give to Yugoslavia and India, though there is not the slightest assurance that these countries will be on our side when the chips are down.

This is dangerous business. To scatter aid all around the globe is not only inexcusably wasteful, but its effect must be to reduce the aid we can give, for example, to Formosa, where it is urgently needed. The argument for such indiscriminate largess seems to be that having given aid to countries A, B, and C, we must give it to D, E, and F to prevent resentment.

The President’s foreign-aid program still allots substantial funds for “economic” aid, Truman’s Point Four, and all the rest. We are told that “three out of every four dollars” in our foreign giveaway program “will be immediately spent within the United States.” This is like trying to appeal to the self-interest of an automobile dealer by telling him that if he makes you a gift of $4,000, you will use $3,000 of it to buy one of his cars. Yet an “economic” argument that would be rejected as ridiculous if made to a private business firm can be solemnly made to a nation.

Again, the President tells us that we cannot be secure in our freedom unless, elsewhere in the world, we destroy “the conditions under which totalitarianism grows—poverty, illiteracy, hunger, and disease.” Are these really the reasons for Communism—or any other form of totalitarianism? Germany went Nazi with less poverty, illiteracy, hunger, or disease than any country outside the United States.

It is ironic, in the light of our foreign-aid program, to compare the budgets of the United States and Great Britain. In its last fiscal year Britain had a surplus of $1.2 billion; the U.S. will have a deficit of more than $4 billion. In the fiscal year ahead Britain plans a surplus of $414 million; we plan a deficit of $2.4 billion. Yet the country that had the surplus got $120 million of aid last year from the country that had the deficit. And we think it was Alice who lived in Wonderland!

States’ Rights and Labor Law
May 16, 1955

A thoughtful, authoritative, carefully documented, and long overdue study has just been made by Gerard D. Reilly of States Rights and the Law of Labor Relations (Washington, D.C.: American Enterprise Association, $1).

Reilly is a Washington lawyer who has been Labor Department Solicitor and was a member of the National Labor Relations Board from 1941 to 1946. He begins by pointing out that “No aspect of labor law is in a state of greater confusion today than the power of the states to regulate labor-management relations.” This has
gone to the point where “parties to labor disputes are frequently unable to learn until after months of costly litigation whether their rights to relief lie in state or Federal tribunals.”

There is one provision (Sec. 14 b) in the Taft-Hartley Act in which Congress did make a clear delegation of power to the states. This allows the states to forbid any kind of compulsory union membership contracts. Eighteen states have done so. The provision has recently become the subject of bitter debate. Yet it is not the only issue dividing states’ rights advocates from union leaders. Others include the authority of state courts to grant relief against secondary boycotts, jurisdictional strikes, and coercive union picketing.

The history of Federal and state relations in this field is ironic. Prior to 1937, when the Supreme Court sustained the constitutionality of the Wagner Act, it had been assumed in previous Supreme Court decisions that only the states had authority to regulate labor relations in manufacturing and mining industries, even though the products of these industries might enter the channels of interstate commerce. But once the Supreme Court decided that Congress did have the right to legislate in this field at all, it went on from decision to decision extending its interpretation of Federal power and correspondingly restricting its interpretation of state power until it arrived at the doctrine (in 1953) that when Congress passes a law on a matter within its jurisdiction it “pre-empts the field,” and deprives the states of jurisdiction over such matters regardless of whether their laws are “in coincidence with, as complementary to, or as in opposition to, Federal law.”

This and subsequent decisions have left the subject in legal confusion. Crucial provisions of state labor laws have been struck down whether or not they were in conflict with the Taft-Hartley Act. A sort of legal “no man’s land” has been created. The Federal government has no means of policing local strikes, or of preventing coercive mass picketing or outright violence; and the Taft-Hartley Act is practically blind to the existence of such matters. In fact, in past rulings of the National Labor Relations Board or of Federal courts, assaults by pickets or the throwing of rocks have been condoned or dismissed as “animal exuberance” or mere picket-line “scuffles.” Yet Federal-court decisions have thrown a fog of doubt around the power of the states and localities to control violence and coercive picketing.

Reilly’s statement of the case is moderate in tone, and his own legislative recommendations are also moderate. He believes that Section 14 (b) of the Taft-Hartley Act, which permits the states to enact right-to-work laws, should be preserved. And as the Federal government is not equipped to handle all labor-management problems (especially those concerned with mass picketing, sabotage, violence, etc.), he feels that the right to legislate in some of these matters should be reserved to the states and that Congress should clearly define “those areas which it intends to leave unregulated and those which it intends to leave to separate or concurrent regulation by the states.”

But the history and facts that Reilly so admirably presents raise questions that go much beyond his own recommendations. Does the Federal government, in fact, constitutionally actually have the sweeping powers of intrastate labor regulation that Supreme Court decisions of the last twenty years have awarded to it by their far-fetched reasoning? ❏

No Need for OTC
May 23, 1955

Senator Byrd, as the event proved, showed good sense in putting aside the President’s proposal for an international “Organization for Trade Cooperation” and getting quick action to extend the Reciprocal Trade Act on its own merits.

The OTC proposal places a serious question before Congress. Indeed, it places a serious question before all those who, like the present writer, earnestly wish a lowering or removal of international trade barriers, but doubt whether the creation of one more permanent international organization is the way to get it.

Does the world need, does any single nation need, an elaborate multilateral trade agreement, requiring the consent of 34 nations, and an elaborate bureaucratic machinery, in order to lower trade barriers? Obviously not. The world has already had the old General Agreement on Tariffs and Trade (GATT) since 1947, and international trade barriers where never more fantastic. Yet prior to the first world war, and for that matter prior to the second, the barriers to international trade were far less serious than they are today. If each individual national understands that free trade or at worst only moderate trade barriers are primarily in its own interest, then each national will follow such a policy in its own interest and no international agreement will be necessary. And unless such an understanding exists within individual nations any international agreement or organization will be worthless.
The President’s message to Congress of April 14, advocating U.S. membership in the proposed OTC, was not convincing. Its reference to our membership in the International Monetary Fund, for example, mainly recalls the futility, and worse, of that organization. Mr. Eisenhower’s argument that OTC could “help establish conditions favorable to convertibility of currencies” is depressingly familiar. The IMF was established precisely to stabilize currencies and make them convertible; its actual effect has been to prolong for ten years completely inexcusable policies of internal inflation, external exchange control, trade discrimination, and state control of industry.

All this is not to deny that the revised GATT is in some respects an improvement over the old GATT (and of the proposed ITO), and that in it 34 nations have embodied many sound principles likely to appeal to proponents of freer trade. But the new GATT also embodies and gives official sanction to some thoroughly unsound principles.

Even the new GATT expressly denies the right to require the removal of any country’s quantitative import restrictions which are the result of balance-of-payment difficulties caused by “full employment policies” or by a country’s “underdevelopment.” This is economic claptrap. Can we, or any nation, afford to give it official sanction? So-called “balance-of-payment difficulties” are almost invariably the result of internal inflation combined with exchange control; the country brings them on itself by its own bad policies. It is no consolation to learn that the United States succeeded in obtaining a special concession allowing it to impose quantitative import restrictions itself to protect its farm price-support program. This again gives official sanction to thoroughly unsound policies. These provisions alone, not to mention many others, are enough to invalidate GATT. Why embody this dangerous nonsense in a permanent agreement with an enforcing organization?

The OTC in fact, seems to represent just one more example, not of any real tendency toward international freedom, but a tendency to create ever new supranational bureaucratic organizations for world centralization of power. And the OTC would also deprive Congress of still more of its proper powers under the Constitution. There seems to be no good reason why Congress should vote to establish the OTC. On the contrary, it is rather time that we should start withdrawing from the thoroughly unsound international organizations, typified by the IMF, that stand in the way of freedom, stability, and sound economic progress.

Compulsory Unionism
May 30, 1955

There has lately been increased rebellion against the trend toward compulsory unionism. Opponents rest their case on the principle that no man should be compelled to join a union in order to get or keep a job. But most of the rebels are modest in their aims. What they seek (like Gerard D. Reilly, whose pamphlet, States Rights and the Law of Labor Relations, was discussed here a couple of weeks ago) is little more than the retention in the Taft-Hartley Act of the provision which permits the states to forbid compulsory unionism.

But if any permanent success is to be achieved in this cause its aims must go much farther. Let us begin, for example, with the Taft-Hartley law itself. It must never be forgotten that this is merely an amendment of the Wagner Act. Like the Wagner Act, it forbids “discrimination in regard to hire or tenure of employment or any form or condition of employment to encourage or discourage membership in any labor organization.” Yet, in clear contradiction to this, it permits the imposition of the compulsory union shop. If the Taft-Hartley Act is to conform with its own declaration of purpose, it must forbid the employer to discriminate in favor of union workers as it forbids him to discriminate in favor of nonunion workers. It cannot permit the compulsory union shop, and it cannot permit so-called maintenance-of-membership contracts.

But any attempt to protect the right of the individual worker either to join or not to join a union would have to go much farther than this. For the Taft-Hartley Act gives a union that has gained the adherence of more than 50 percent of an “appropriate bargaining unit” in a plant or company the right to act as the exclusive bargaining agent for all the workers in that company. This right to bargain for other than its own members is a right not given by law to any other kind of private organization. As the eminent labor lawyer, T.R. Iserman, has pointed out: “The right to act as the exclusive bargaining agent of employees is far more important to unions than any right to force employees to join unions under closed-shop or union-shop contracts.”

But a still further amendment would have to be made in the Taft-Hartley Act before it could become a truly impartial and workable document. Congress would have to adopt the amendment suggested by Gerard Reilly (once a member of the National Labor Relations Board), under which Congress would clearly define “those areas which it intends to leave unregulated and those which it intends to leave to separate or concurrent regulation by the states.” Preferably Congress
should go even farther and leave to the states and localities all those matters, such as coercive picketing, sabotage, and violence, that the Federal government is not in a position to police. It is absurd for any governmental authority to try to lay down rules in spheres beyond which its own power of enforcement extends.

If we look at the question realistically, however, it is extremely unlikely, in view of the one-sided Washington attitude of the last twenty years, that Congress would now pass a balanced labor law which would consider first of all protection of the liberty of the individual worker to join or not to join a union, as he saw fit.

It may be asked, in fact, whether those who are now insisting that the law abolish any form of the compulsory union shop have fully studied the problems that this raises. It implies continued detailed intervention by government in the field of labor relations. Would it not be better to take the unions at their word and simply repeal the Taft-Hartley Act and return to the situation that existed in this country prior to 1935? Would it not be better for the Federal government to intervene only in undeniable interstate labor relations and leave the regulation of other labor relations either to the states or to the common law, which should protect the individual, whether worker or employer, from violence, but otherwise leave him free? These are large questions, which deserve deeper study than we have yet given them.

Irresponsible Spending
July 18, 1955

The other day Rep. Clarence Cannon, chairman of the House Appropriations Committee, made a promising analysis of some of the things wrong with our present Federal budget system and then came up with some very unpromising remedies.

At present, he said, Congress can wreck completely the best prepared budget. “Any senator can walk into the Senate Appropriations Committee and put anything in a bill he wants. Then when it gets to conference the senators say: ‘You can’t do anything about that—that’s Senator So-and-So’s item.' You’d be astounded at what some senators get away with. . . . You can go down the roll and find many members who never vote for a tax [increase] bill but for every appropriation bill. The people must be protected against that sort of statesmanship.”

What then are Congressman Cannon’s proposed remedies? To take away the power of Congress to wreck even the best prepared budget? Not at all. His proposed remedies are two. One is a bill to require the President to submit to Congress a balanced budget each year. This would appear to be quite inflexible and not allow for emergencies or crises. The other remedy is a bill that would abolish the present Budget Bureau under the Executive Department and assign its duties to a new agency operating under Congress.

This second bill is even more puzzling than the first. Chairman Cannon would apparently still require the President to submit a budget, but would deprive him of his chief agency of preparation and control. It would turn the preparation of budgets over to a Congress which, on Cannon’s own testimony, has been so busily engaged in mutual logrolling that it wrecks even the best prepared budget.

Much more promising proposals have been made by the Treasury Department and by the Hoover commission. Secretary Humphrey has proposed that Congress pass individual appropriation bills as at present, but not send them to the White House for signature until the overall total has been tabulated and cuts made to bring it down to the level of expected receipts. The Hoover commission has recommended that Congress stop appropriating enormous sums which may not be spent for several years, and appropriate money only for actual spending in a given fiscal year.

Unfortunately, while both of these proposals have merit, neither goes to the heart of the problem. The heart of the problem is that our Federal government has an irresponsible budget system. It is irresponsible because no single official or agency can now be held accountable or responsible for the final result. The President can recommend one set of expenditures; the House can raise them; the Senate can raise the House. This triangular competition in spending favors the localities and the pressure groups and leaves the taxpayer defenseless.

Nearly every other country has a more responsible system. In Great Britain for more than two centuries the wholesome rule has been established that Parliament may reduce but not increase any spending recommendation made by the executive government. This is the ideal. The very minimum requirement to bring us even near a responsible budget would be a constitutional amendment to give the President power to veto individual items in appropriation bills (a power now held by the governors in 37 states). Even better would be provisions such as those in the New York State constitution. These require the legislature to act on the governor’s whole budget before making any appropriations on its own initiative. Such extra appropriations must be in separate bills subject to veto.
If such a reform were adopted, it would still leave room even for the adoption of Congressman Cannon’s suggestions in a modified form. Congress could set up its own budget agency to maintain liaison with the Federal Budget Bureau throughout the year. And Congress could be given explicit power to return to the President any unbalanced budget and recommend that he cut spending to a specified overall sum. ♦

Abolish Exchange Control
July 25, 1955

Since the new Conservative victory at the polls, there is once more serious discussion of Britain’s abandonment of exchange control. If the government is to act, it should act now, when its victory is fresh and its prestige high, and when Labor cannot threaten to restore controls.

Recent discussion of British abandonment of exchange control has been much more realistic than the previous perfunctory discussion. It now envisages return of the pound first of all to a free or “floating” rate. Unless Britain contemplates returning immediately to a gold standard (which seems outside the realm of realistic discussion), a transitional free market for the paper pound is the only feasible method of ending exchange control. If it is ended in Britain, it will collapse in most of the rest of the world. An enormous step will have been taken back toward that interconvertibility of currencies and freedom of international trade that the world’s politicians have so long professed to want—and done almost everything to prevent.

For the last ten years many of us have been hoping for some clarity, courage, and common sense on this subject in Great Britain, only to be repeatedly disheartened by the confusion or acquiescence of most British discussion on the subject. But at last the tide seems to have turned. I recently received from England a booklet of 62 pages, The Free Convertibility of Sterling, by George Winder (Batchworth Press; London), which is the most lucid, thorough, and uncompromising protest against continuation of British exchange control that I have yet read.

Winder has published something more effective than a mere polemic. He has written a sort of elementary textbook. It begins by explaining exactly what foreign exchange is, how exchange rates are arrived at, and how foreign payments are made. It leads by that means into an explanation of how great the injustice and folly of exchange control really is. He emphasizes especially two aspects: (1) It involves price-fixing in currencies; (2) it involves arbitrary confiscation of the overseas earnings of a country’s own citizens.

It is only by rare accident, as Winder points out, that the arbitrary price put on controlled paper currencies can correspond with the relative real values of currencies as they would be reflected in free markets. Therefore, “where currencies are sold at controlled rates, one of the parties to every transaction will inevitably receive less than he is entitled to. Someone, in fact, is robbed.” The so-called “dollar shortage” was brought about simply by the underpricing of dollars. This under-pricing of dollars (or overpricing of sterling) also had the effect of encouraging British imports and discouraging British exports. “Sir Stafford [Cripps], over a long period, was paying our exporters 5 shillings for their dollars when in fact they were worth 7 shillings. All the time he was robbing our exporters he was pleading . . . that Great Britain must ‘Export or Die’.”

Perhaps worse than this economic damage is the immorality of exchange control—its complete disregard of the individual’s right to dispose freely of his own overseas earnings. “To be effective, currency laws must not only provide that people leaving a country be carefully searched, but that all overseas mail be censored. . . . All foreign currencies . . . owned by Englishmen must be surrendered to the government. There is here far more than control; there is quite literally confiscation. . . . Of course, compensation is paid but invariably it is insufficient. If this were not so there would be no need for punishment to enforce the surrender of currencies.”

A crowning irony, I may add, is that under our own foreign-aid program we have not only been subsidizing exchange control in Europe, but we have actually insisted that as a condition of receiving our aid the recipients must discriminate against American (i.e., dollar) imports! But it does not follow that because we have been injured by England’s exchange control, England has benefited. It has retarded the expansion of its essential export markets. ♦

The Seamy Side of TVA
August 1, 1955

One wonders whether the hue and cry that Democrats have raised over an alleged Dixon-Yates “scandal” is intended to divert public attention away from the failure of TVA and from the deceptions practiced to put over and extend that and many other socialized power projects.
In the 218-page report of the Hoover commission, and in the 1,783-page report of the task force under Admiral Moreell on which the final commission report was in large part based, we now have a mine of material exposing some of the misleading estimates and unkept promises by which Congress and the taxpayers were induced to undertake many public-power projects. There is not space enough here to cite more than a few random examples from the Hoover-commission report.

Among these are the persistent underestimates of government engineers concerning the real cost of these projects. "In the field of reclamation the original estimated cost of the 90 projects (outside the Missouri Basin) was $1,580 million, and in 1952, the estimated cost at completion was $3,317 million. The cost of the reclamation portion of the Missouri River Basin Project was estimated in 1944 at $850 million. In 1953, the same work was estimated at $3,717 million, an increase of about 343 percent." Only a small percentage of these increases was owing to soaring prices.

"A report to the House Committee on Public Works, rendered by its subcommittee to study civil works, in December 1952, states that the TVA reports its costs had exceeded its estimates by only 3.1 percent. But an examination of a 1936 report of the Authority showed that later estimates for Kentucky Dam exceeded the original by 93.6 percent; for Fort Loudoun Dam, by 74.7 percent; and for Fontana Dam, by 137.7 percent."

In a group of Bureau of Reclamation proposed projects the construction costs of irrigated land averaged $509 per acre for land that had an average market value of less than $150 per acre even with the full water supply.

Under the Constitution, Congress has authority to control navigable streams and floods, but no discoverable right to build hydroelectric power plants. This has led to the development of the shrewd doctrine that hydroelectric power may be developed and sold by the Federal government to the extent that it is "incidental" to flood control and navigation. It has also led, as the Hoover-commission report points out, to a bookkeeping allocation of all the costs possible to flood control and irrigation rather than power.

The Hoover task group laid down certain criteria for determining the real success or failure of Federal power projects: They ought to earn 3 percent interest annually to insure return of Federal borrowing costs. The investment should be properly amortized. The projects should pay local taxes equal to those of private utilities. Earnings of Federal projects should include an amount equal to the Federal tax exemptions, based on the tax payments of private utilities. With such an honest "yardstick," the TVA would show a deficit of $30 million in the fiscal year 1953 and an accumulated deficit up to that time of $100 million. The principal groups of Federal projects would show a cumulative deficit of $332 million.

The Hoover commission points out that the Federal taxpayer is subsidizing these projects. Less than 10 percent of the total population will be directly benefited even when the programs are completed. This means that 90 percent of citizens are forced to subsidize an arbitrarily favored 10 percent. The task group estimates that the Federal projects are selling power on the average at about 50 percent below its real cost.

Finally, while hydroelectric power plants were built under the pretense that they were "merely incidental" to navigation and flood control, the TVA "has now embarked upon an expansion of its power-generating capacity beyond hydroelectric plants by the building of steam plants."

The moral indignation of the zealots for socialized power at the Dixon-Yates contract seems misplaced.

---

**Unsound Wage Boosts**

August 8, 1955

Among the measures passed by Congress was one to raise the legal minimum wage from 75 cents to $1 an hour. The changes brought about by this measure will do more harm than good to marginal workers.

So far as basic principles are concerned, there is nothing I need add to my Newsweek article of Jan. 17, discussing President Eisenhower’s proposal at that time for an increase in the minimum wage from 75 cents to 90 cents an hour. If wages can be raised in any desired amount by law, without harmful consequences, why stop at Mr. Eisenhower’s 90 cents an hour? Or Congress’s $1 an hour? Or the CIO’s demand for $1.25 an hour? Why not $1.50, $2—or even more? The truth is that insofar as a law is effective in forcing wages above the level at which competitive-market forces would fix them, it creates unemployment. It does most harm precisely to the marginal workers it is most designed to help. For marginal firms which cannot afford the higher costs are forced to drop their marginal workers or go out of business entirely.

It is an error to suppose that the effect of a 33⅓-percent increase in the Federal minimum wage will be confined to the part of the labor force now getting less than the proposed new minimum. For other workers will demand the maintenance of their existing
differentials. The result must be upward pressure on all wage rates.

Congress, in voting for this measure, did not even take advantage of the opportunity to reduce the absurdities and contradictions in existing legislation. One of these is the joker in the existing wage-hour law, which provides that the employer must pay a 50 percent penalty increase for all hours above 40 a week no matter what his regular rate of pay. This provision penalizes most of the employers who are already paying most; it rewards most the workers who are already best off. This absurdity could have been easily cured if Congress, even when it insisted on boosting the regular minimum wage to $1 an hour, had simply fixed the minimum overtime rate at $1.50 an hour.

The other absurdity which Congress and the President could have taken this opportunity to get rid of is the Walsh-Healey Act. This law authorizes the Secretary of Labor to fix minimum wages in companies that are awarded Federal contracts. Successive Secretaries of Labor have used this act to force minimum-wage rates in particular firms or industries far above the general minimum-wage rate fixed under the so-called Fair Labor Standards Act. This is discriminatory legislation. It gives the country two minimum-wage laws, enforcing entirely different wage standards.

So much for the basic principles involved in the minimum-wage increase. But if ever a measure was unnecessary and ill-timed, this one is. The increase in minimum wages is being enacted at a time when wages in manufacturing industries average $1.87 an hour—the highest level in American or world history. And this figure does not yet reflect the formidable new increases that have just been achieved in wage rates in the automobile and steel industries and elsewhere. These increases have already led to an average increase of $7 a ton in the price of steel and are expected to lead to increases in automobile prices for 1956. Other things being equal, the effect of these wage increases, and of the consequent increases, should be to restrict the market for American products both at home and abroad, to bear heavily on marginal firms, and to cause unemployment.

The economic factors at work at any one time are so numerous and difficult to measure that the consequences of any one policy cannot be precisely predicted. Wage boosts of the present sort have in the recent past forced a further monetary inflation in order to make the wage boosts payable. That result may follow once more. But certainly the higher minimum-wage rate, on top of recent wage increases forced by strong unions, introduce an element of weakness, not of strength, in the present economic situation.

Keynesian Confusions
August 15, 1955

The British Government has announced a retrograde step in economic policy. This is worth study both on its own account and for the light it throws on American errors.

Richard A. Butler, Chancellor of the Exchequer, moved in the right direction when on last Feb. 24 he raised the interest rate that the Bank of England charges ordinary banks a full point, to 4½ percent. This was part of a courageous effort to curb inflation. But now he is taking measures that move away from economic freedom and yet do not promise to be very effective in halting inflation. He has raised the required down payment on installment purchases on such items as motor-cars and household appliances from 15 percent to 33½ percent. The purpose of this is to halt a so-called buying spree of the British public, and to correct Britain’s international balance of payments by forcing British manufacturers to find an export market rather than a home market for some of these goods.

As for correcting the balance of trade, the restriction on installment credit is irrelevant to real causes. Foreign trade, left to itself, will balance itself. It will balance itself for the simple reason that sellers insist on being paid for the goods they sell. What is unbalancing British trade now is exchange control. If the pound were set free it would seek the level that would balance imports and exports. A decline in the pound, for example, would raise the cost of imports, so discouraging and contracting them. It would increase the profit margin on British exports or reduce their foreign-money cost, so encouraging and expanding them. Ironically, Chancellor Butler now gives as his reason for postponing free exchange rates the very unbalance of trade that is caused by the existing ban on free exchange rates.

Britain’s new curb on installment credit (like our own Federal Reserve requirement for a 70 percent margin in the buying of stocks) is at once discriminatory, unnecessary, and futile. Installment credit, like stock-market credit, is derivative credit. If interest rates are raised generally, the whole volume of credit will be contracted or held from expanding. If, on the other hand, money is kept generally too cheap, credit must continue to expand. Governments cannot flood their countries
with credit and build effective dikes around special kinds of buying.

It is argued that the recently announced British steps are necessary because the February rise in the Bank of England discount rate to 4½ percent has proved ineffective. Bank loans, instead of dropping, rose by $448 million more in the first six months of this year compared with the first half of 1954. But this means merely that the British bank rate is still not high enough in relation to the demand for credit. (Our own recent Federal Reserve rate of 1¾ percent was even more inflationary in relation to our own money market.) If Chancellor Butler tried a Bank of England rate of 5 or 5½ percent he might find it effective enough.

Instead of taking this well-tested traditional step, Butler has preferred an unsound alternative. He has announced that the government will frown on capital expenditures for construction of new plants or equipment, and will postpone all such expansion plans in the nationalized industries (except for coal mines and atomic power plants). This action, like the even more drastic action of Sweden in curtailing investment in plants and equipment in private industry, rests on confused Keynesian theory. Direct government discouragement of new capital investment is the worst possible way to “combat inflation.”

Such discouragement must lead in the long run to higher rather than lower production costs, to less rather than more consumer goods, and to lower real wages than would otherwise prevail. The nation that follows such a policy will soon find itself handicapped in export competition with more progressive countries.

The dead hand of Keynesianism, and the fetish of “full employment,” still vitiate the policies of the leading nations of the West.

Our Two New-Deal Parties
August 22, 1955

Adjournment of Congress provides an opportunity for taking stock of present Federal economic policies. One central conclusion emerges. Mr. Eisenhower, with minor reservations, is now another New-Deal president. He has been pressing for the heart of what the New Deal stood for—big spending, big government, an ever-expanding paternalism. And the political situation is such that there is no real opposition to this pressure. We have now two New-Deal parties. Those millions of Americans who believe in economy, in balanced budgets, in some curb on centralization and expanded governmental power and paternalism, now have no national party to represent them.

Let us illustrate this by specific items. We have come a long way from the time when Mr. Eisenhower during his campaign suggested huge slashes in Federal spending, and even from the day of his first State of the Union message when he declared: “The first order of business is the elimination of the annual deficit.” He still pays lip-service to the need for a balanced budget, but this goal keeps receding into the future. As “the first order of business” it can no longer be reconciled with his actual policies.

The worst of them, from this standpoint, is his grandiose ten-year $31 billion Federal-state road-building program to be financed by special bond issues not to be counted as part of the national debt. This failed in the last Congress through the mere accidents of partisan jockeying for position. Mr. Eisenhower also advocated Federal aid to local school construction, and Federal reinsurance of private health plans. Both deservedly failed. The Federal government has no business in either field.

Mr. Eisenhower was successful, however, in his plan to continue foreign aid on a scale even higher than last year. He wants to scatter subsidies totaling $4.7 billion to dozens of foreign nations in a year in which we ourselves have an officially estimated deficit of $2.4 billion! For this same year, Mr. Eisenhower also insisted on appropriations for 35,000 public housing units (and got 45,000). From any standpoint such public housing is not merely unnecessary but dangerously ill-advised. It promotes subsidies and socialization at the expense of private initiative. It increases a wholly needless deficit. And it artificially stimulates still more housing at the very peak of prosperity and a housing boom.

The President insisted on other New Deal measures. At a time when hourly wages are the highest in American or world history he asked for a boost in the minimum wage from 75 to 90 cents an hour (and got $1). This measure will increase production costs and imperil the employment of the very marginal workers it is designed to aid. The Administration has also encouraged a whipping-up of the present boom by credit expansion, against which it is only now taking belated steps.

It is of course fair to point out that the President has taken some actions in the other direction. With the Dixon-Yates contract he tried to stop the growth of the Federal public-power colossus. But that whole contract was so ineptly handled and defended that the zealots of
socialized power think it provides them with a crucial 1956 issue. Again, the President made an effort to put some limit on the present appallingly costly, inequitable, and dangerous farm-price-support program. But here again his action has been so timid and inadequate that the situation is becoming constantly more critical.

It is also fair to point out that the majority of House Democrats supported some shamelessly demagogic measures and that Mr. Eisenhower courageously and successfully fought them (the $20 income-tax reduction for everybody, and the slapdash social-security revisions).

Yet on balance the central conclusion remains. We are drifting, under pressure from a Republican President and Democratic Congress leaders, toward ever-expanding Federal power and paternalism. The opponents of this drift are scattered and isolated, and there is now no national party even to state their case.

A Flood of Credit
August 29, 1955

We are enjoying at the moment the greatest prosperity in our history. But this boom has been in part created, and certainly raised to its present level, by a flood of credit. The measures so far taken to moderate it are timid and belated. Only time can reveal their effectiveness.

That the present boom is at record levels is shown by almost every major index—whether of employment, production, or money income. But the government policies responsible for this boom have been ill-considered and dangerous. When a government-created boom shows signs of getting out of hand, government officials begin to shake their fingers at the stock market, at private banks, and at private business practices, as if these were responsible. Of course they must assume part of the responsibility. But in most cases, and certainly in the present case, it is government policy that has mainly determined the result.

Suppose we begin with a segment of the economy where the direct hand of government is least visible—that of automobile credit, and of installment and consumer credit generally. In the latest figures, consumer credit has reached $32 billion, with installment credit at $25 billion, and with more than $12 billion in automobile credit alone. All these are the highest sums on record. But those close to the situation are even more troubled by the quality than by the quantity of this credit. The National Automobile Dealers Association is warning its members that “crazy credit terms” are a threat to the industry: “To sign a contract which results in a buyer owing more than his car is worth—at any time during the terms of the contract—is business suicide.”

All this may seem at first glance to be solely the fault of dealers, banks, and finance companies. But if the general supply of credit had not been kept artificially cheap and plentiful by government policy, these excesses of installment credit could not have developed. It was Federal Reserve policy that reduced the rediscount rate from 2 to 1½ percent in 1954; the rate was not restored to 2 percent until this month (Aug. 4). As a result of this low discount rate, and of other government policies, the country’s money supply (as measured by total bank deposits and currency outside of banks) increased $9 billion between May of last year and May of this year. This increased money and credit financed the boom.

But this is not the only way in which the government has brought about an inflationary credit boom. It now has $7 billion of the taxpayers’ money invested in the propping up of farm prices by its holdings of “surplus” crops. But most fantastic of all has been the policy in regard to housing.

Until a few weeks ago a veteran, under the government’s guaranteed mortgage plan, could “buy” a $10,000 home without putting up a nickel. He had 30 years in which to pay the mortgage off. The Veterans Administration and the Federal Housing Administration have now cut the payoff period down to 25 years. The VA will now require a down payment of 2 percent instead of none; the FHA, a down payment of 7 percent instead of 5. Even this mild change has led to cries of anguish from builders who had been profiting under the old rules. But what sort of government policy is it that encourages families to assume debts beyond their resources; that has piled up an $80 billion debt by its holdings of “surplus” crops. But most fantastic of all has been the policy in regard to housing.

If careful students of the business cycle have at last discovered any one thing it is that the best way to prevent a slump is to prevent the preceding unsound boom. Arthur F. Burns, chairman of the Council of Economic Advisers, has himself expressed such a view (see my Newsweek article of June 29, 1953). This wisdom has not been reflected in recent governmental credit policies.
‘Beyond’ Capitalism?
September 5, 1955

In *Newsweek* of Oct. 25, 1954, I reviewed a book on America written by the Swiss economist, Prof. William E. Rappard, published in Paris, and expressed the hope that it would be translated into English and published here. I am glad to announce that this has now been done. The translated work appears under the title *The Secret of American Prosperity* (Greenberg, $3.50). Its publication date is Sept. 8. The occasion provides an opportunity to review another book published in French, but with somewhat different implications. On June 26 last I was startled to read a Paris dispatch to *The New York Times* which began: “Capitalism in the United States is a thing of the past, according to an official document circulated in France by the United States Information Service.” I sent for the document, which runs to 80 pages.

A good deal of what the book has to say is shrewd and sensible. In fact, most of the best things it has to say were already said in Professor Rappard’s book. Rappard, for example, selects four main elements as explaining the economic superiority of the United States: (1) Mass production; (2) the application of science to production; (3) a passion for productivity; (4) the spirit of competition. The document published by the U.S. Information Service also explains American productivity under these four heads, sometimes in strikingly similar words, though if any credit is given to Professor Rappard my eye completely missed it.

Yet the USIS document remains especially disturbing because of its repudiation of “capitalism.” It reveals no understanding or recognition of the capitalistic basis of American productivity. The book bears the title *The American Economy* (*L’Economie Américaine*), and the subtitle *Beyond ‘Capitalism’ (Au-delà du ‘capitalisme’)*. The theme implied by this subtitle is carried out in the text: “America [my translation] has been a capitalistic state. . . . It has had its miserable proletariat and its injustices.” Again: “American life is no longer the life of a society essentially capitalistic. It is now approaching standards of justice and equality,” etc. What this book does, in brief, is to use the word “capitalism” pretty much in the same smear sense as the Marxist socialists who invented the word. It follows that, when general prosperity and productivity are to be explained, they cannot be explained on the assumption that America still has “capitalism.” It must have been superseded by something else. What this something else is, the USIS book never quite makes clear.

Nowhere, in fact, does this book give explicit credit for American progress in the capitalistic system. It explains how much the American economy owes to the beneficent interventionism of government: The TVA, farm-price support, FHA mortgage guarantees, minimum-wage laws, social security. Much is said of mass production, technical research, the spirit of competition, the raising of wages, the lowering of prices, the increase of purchasing power. But nothing is said about the basic capitalistic principles of which all these are consequences rather than causes. There is no emphasis on private property. Much is said about the willingness of American corporations to build new plants and to install ever new and more efficient machines. But it is not pointed out that for them to do this they must have acquired past profits to invest; they must be allowed profits, and they must have confidence that they will be free to make future profits.

What America has today is *capitalism*, at its highest development to date. If it is more productive than the capitalism of yesterday, it is primarily because the capitalism of yesterday made this possible.

This book of the USIS, in brief, is merely another illustration of the fact that while socialist and Communist governments have no hesitation in denouncing capitalism, the governments of capitalistic countries are afraid to defend capitalism. We fatuously deny that we have it, and spend millions of our taxpayers’ dollars in order to give the case away. ♠

Unstable Paradise
September 12, 1955

The unparalleled boom we are now enjoying is not confined to this country, but largely shared by Europe. Recent dispatches from there have reported that virtually every major industrial region is operating under conditions of “full employment.”

This is no mere coincidence. When major countries operated under an international gold standard, and when trade among them was comparatively free, it was only natural that prosperity (or depression) in one area should spread to others. And though the world today is much less of an economic unit than it used to be, though each country tends to pursue its own paper-money policy and to erect all sorts of barriers to imports, this mutual influence still holds to some extent.

But what has mainly caused the widespread full employment of today is the political popularity of “full-employment policies” within every nation. These are also supported by the intellectual prestige of Keynesian
doctrines. And in any case, who can argue against “full employment”?

Yet there is a fly in the ointment. Hurricane warnings trouble this paradise. What threatens to cause hurricanes is not the end-result sought. Full employment (when the phrase is appropriately defined) is both a desirable end in itself and a necessary means for the achievement of such wider ends as maximum production and maximum consumer welfare. The real trouble lies in the means being used to bring full employment about.

The most desirable way to bring about enduring “full employment” is to provide a stable currency, and to keep prices, wages, and interest rates free, competitive, and flexible, so that a workable dynamic relationship can be constantly maintained between one price and another, one wage and another, between prices and costs, prices and wages, payrolls and profits.

But this is not what the leading nations of the Western world are doing today. They have achieved their present full employment by monetary inflation—that is, by steadily increasing their supply of money and credit. The United States money supply (bank deposits plus currency outside of banks) increased from $204 billion in May a year ago to $213 billion in May of this year. In a roughly corresponding period, in leading European countries, we find a money increase in England from 5.32 to 5.43 billion pounds sterling; in Germany from 23.4 to 26.1 billion marks; in Italy from 3,523 to 3,956 billion lire; in Belgium from 180 to 190 billion francs, and in France from 4,664 to 5,312 billion francs.

A defense which will doubtless be offered in at least several cases is that this increased supply of money was not created by deficit financing but by an effort of the banks to “meet the legitimate demands of business.” This sort of defense overlooks the fact that both in America and in most European countries money rates have been kept artificially low through government policy. It is these low interest rates that have encouraged dubious borrowing and thereby increased the money and credit supply.

Inflation produces its alleged miracles by temporarily increasing volume of sales and profit margins. But the full employment that follows from this always produces union demands for increased wage rates. Once these increased wage rates are granted, they threaten foreign or domestic sales through increased prices, or threaten to wipe out profit margins. This is the fear that haunts European governments today. The Keynesian “cure” is to inflate the currency a little more, in order to restore profit margins and consumer purchasing power. This is the inflationary spiral, which may so easily get out of hand.

In brief, the blessings of full employment obtained through inflation are unstable and dangerous. The government that embarks upon such a policy is like a juggler forced to keep more and more china plates in the air and dreading a single miss. That is why interest rates are being raised everywhere, why there are fears of a new round of inflation, and why the world is now likely to see increasingly serious discussion of a return to more orthodox measures.

What Is Progress?

September 19, 1955

At the adjournment of the last session of Congress, the President at his press conference made some remarks that require more serious examination than they have yet received. It may seem a late date to hark back to something that Mr. Eisenhower said on Aug. 4, but his words on that occasion threw a great deal of light on his philosophy of government, and on the policies we may expect him to follow while he remains in office. He remarked at that time that he had a “little list” of “needed” legislation, of which at least four items were still “absolutely vital to our future. . . . They are school construction for our children, the health program, the highway program, and the water resources.”

Now of course schools and health and highways and water are vital to our future. But this is not exactly what Mr. Eisenhower meant. He meant that it was “absolutely vital” for the Federal government to subsidize local school construction; for the Federal government to reinsure private health insurance; for the Federal government to provide enormous grants for highway construction; etc. It is not only not vital for the Federal government to do these things; it is dangerous politically and economically. The notion that the Federal government must take over such functions goes directly counter to the principles of our Constitution and to our ideals of local self-government.

Other remarks of the President at this conference implied a broader philosophy no less disturbing. Mr. Eisenhower pointed to the “almost unprecedented prosperity” in America today, and implied that this boom must be kept whirling at its present peak, or beyond, with no slackening whatever. “If we are going to keep that kind of thing moving,” he said, “it means that there must forever be action, not only in the economic and industrial field on the part of the individuals in our system of free enterprise, but government as
On Aug. 25 George M. Humphrey, Secretary of the Treasury, announced that the deficit for the current fiscal year (ending next June 30), which was estimated in January at $2.4 billion, is now estimated at only $1.7 billion. He went farther. “Barring some unforeseen development we think that we should, and that we can, balance the budget this year.”

This made cheerful headlines. But a closer look was less reassuring. The reason for the reduction in the estimated deficit lay wholly in an increased estimate of Federal receipts since January, owing to the present boom. Treasury receipts are estimated at $2.1 billion more than in January. But expenditures also are now estimated at $1.4 billion more than in January.

It is disturbing to notice the items on which spending estimates are now increased. The largest increase is $1.1 billion for farm-price support. Another increase is $272 million for foreign economic aid. Here are two items on which drastic spending cuts, rather than increases, would be more justified. Even more disturbing are comparisons of proposed expenditures for non-defense items as a whole. In the current fiscal year the Treasury will pay out $25.1 billion for nondefense items, compared with $22 billion forecast seven months ago, and with only $21.3 billion actually spent in the year ended June 30, 1954. This year’s budget would already be indicating a substantial surplus instead of a deficit, in brief, had nondefense spending been held to the fiscal 1954 level.

The Democratic majority has not come forward with any specific suggestion as to where the President might cut nondefense spending. Adlai Stevenson, in fact, indicates that he doesn’t think enough of the taxpayers’ money is being thrown away in piling up farm surpluses.

But when it was given out on Sept. 6 that the Defense Department was aiming at an expenditure of only $33 billion for the current fiscal year instead of the $34 billion in its estimate two weeks earlier, one Democratic senator immediately shouted that this was “putting dollars ahead of defense,” and another was sure it would mean “a sacrifice of national security.” Obviously neither had any means of knowing whether his charge was true.

To say that a budget made up of hundreds of thousands of heterogeneous items is “safe” at $34 billion and “dangerous” at $33 billion is to talk obvious claptrap.

Harry S. Truman (the man who advocated a $9.9 billion deficit for the fiscal year 1954) rose to new heights of comic inconsistency. He declared that this is no time to reduce taxes because Mr. Eisenhower must balance the budget! A few days later he called the

**Balance It Now**

September 26, 1955

The budget has become a political football. The leaders of both parties, with a few honorable exceptions, are competing with each other in demagogy rather than responsibility.
proposed military expenditure cut a “politically inspired plan to balance the budget!”

Secretary Humphrey rightly declared: “If there ever is a time when our budget should be balanced, it is now.” But he added that once a balanced budget was achieved, “still further progress would justify lower tax rates.” Immediately, Democratic Senator George and Republican Senator Millikin said they would favor tax reductions next year even if government spending and income were not completely balanced.

Amid this bipartisan competition in demagogy one or two voices have been courageously raised on both the Republican and Democratic sides in favor of economic sense. Congressman Daniel A. Reed, chief Republican spokesman on taxes in the House, has branded talk of substantial tax relief next year as “premature.” Clear, firm, and emphatic, as usual, has been Sen. Harry F. Byrd: “It would be foolhardy to balance the budget and then unbalance it by a premature reduction in taxes. I strongly favor tax reduction made possible by retrenchment in spending.”

But if we judge by the level of political humbug to which both parties have now descended, these isolated voices of sense and courage do not seem likely to prevail.

A Fallacy Exposed Again
October 3, 1955

In his column in The New York Times of Sept. 8, Arthur Krock presented one “obviously important reason why the Secretary of the Treasury and other Presidential advisers believe that the budget can soon be balanced . . . without depressing the buoyant national economy.”

This reason is that private spending in this country, in Krock’s words, “has been steadily replacing . . . and topping, the billions cut from the budget by the Eisenhower Administration.” This conclusion is supported by a table (at the bottom of this column) of comparative official statistics for the second quarters of 1953, 1954, and 1955. The figures are expressed in billions of dollars at seasonally adjusted annual rates. They show that while government spending was running at an annual rate of $3.4 billion less in the 1955 quarter than in 1954, and $15.8 billion less than in the corresponding 1953 quarter, nongovernment activity was running in the second quarter of 1955 at a rate $30.6 billion higher than in the same period of 1954 and $31.3 billion higher than in 1953.

Krock calls this “one of the most remarkable aspects of economic development in the United States for years. For,” he correctly says, “the view has been, and still is, strongly held that shrinkages in the Federal budget must in time, and at a certain point, start the economy downward.”

Yet there is really nothing astonishing about this development except to those who have so tenaciously held this completely false view. I hope I may be forgiven if I cite the new comparisons with special satisfaction. In my Newsweek column of Jan. 12, 1953, I remarked: “What troubles me about the current crop of forecasts for 1953 [including one by the Department of Commerce] is that most of them rest on [the] fallacious . . . assumption that the future of business activity at this time depends primarily on the government’s defense-spending program. If that rises, we are told, business activity and prices will rise . . . but if it declines, there’s no telling how much business will deteriorate.”

This assumption, I pointed out, would lead to the absurd conclusion “that the more resources we are forced to devote to making guns and tanks and shells, instead of consumer goods, the richer we become. . . . The fallacy consists in looking only at the government’s defense payments and forgetting that the money for these comes ultimately from taxes. If defense payments suddenly dropped from the present $50 billion a year to only $10 billion, taxes could also be cut by $40 billion. Then the taxpayers . . . would have $40 billion more to spend than they had before, to make up for the $40 billion drop in government spending. . . . There is no reason to suppose that the overall volume of output or activity would decline.”

I went on to show that the whole theory that defense spending is necessary for prosperity “got a crushing refutation at the end of the second world war. Immediately after Japan surrendered in August 1945 there was a sweeping cancellation of war contracts. Government economists predicted that unemployment would reach 8 million by the following spring. Nothing of the sort happened.”

Yet this fallacy was still raging so strongly a year and a half later that in Newsweek of July 19, 1954, I pointed out again: “In the fiscal year 1944 the Federal government spent $95 billion; in the fiscal year 1947 it spent $39 billion. Here was a drop in the annual Federal spending rate in this three-year period of $56 billion. Yet, far from there being a recession in this three-year period, there was a substantial increase in employment, wages, and prices.”
Congress actually voted several years ago to reduce the corporate income tax rate from 52 percent to 47 percent. But it has been voting to postpone this cut from year to year; and the reduction is now being treated as out of the question. Yet a cut in the corporate income tax from 52 percent to 50 percent would mean a cut in revenues of only about $85 million.

If the top rate on the personal income tax were reduced from its present level of 91 percent to 80 percent next year, and then successively to 70, 60, and 50 percent, the cut would probably not reduce revenues at all. It would in fact, probably increase them. I have pointed out in preceding articles (March 29, 1954) that “of the $31 billion that the personal income tax yields, only about $1 billion comes from the rates above 50 percent.” All we have done by these confiscatory rates on the higher incomes has been to erode the incentives to produce higher incomes.

The reason why neither of these two tax reductions is now discussed is purely political. The Democrats started up the propagandistic howl that the Eisenhower Administration is a government “for big business” and “for the rich.” Administration officials seem to be in deadly fear of this charge. But they are likely to do best politically as well as economically if they act now with statesmanship, courage, and sense.

It was recently calculated that American industry has invested about $12,500 for every job it has created. This tremendous investment putting incomparably more and better machines and equipment in the hands of the American worker than in the hands of any other worker, is the main if not the sole reason why the American worker’s productivity is greater than that of any other worker in the world, and why his wages are correspondingly greater. If industry is drained of these investment funds American supremacy will be lost. If the incentives to earning, saving, and investing wealth are removed, the very source of productivity and high wages will be removed. By all odds the best way to “help the little fellow” is to encourage the profits, savings and investments that make his job and his income possible.

Delegation of Power
October 17, 1955

“In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation or inability, both of the President and Vice President,
declaring what officer shall then act as President, and such officer shall act accordingly until the disability be removed or a President shall be elected." Thus reads the Constitution. Death and resignation are matters beyond dispute; but "inability" is more often than not a question of opinion. Does it refer to physical inability? Or (as some suggest), merely to mental inability?

And who is to decide that the inability exists? The Constitution does not say explicitly who is to make that decision, but by implication it puts it in the hands of Congress. Congress, in any case, is explicitly authorized to pass laws governing the subject. And Congress may also, by explicit direction, provide for purely temporary replacement of the President "until the disability be removed."

Yet from the beginning of our history Congress has neglected its clear duty in this matter, in spite of the sharpest reminders. President Garfield was shot on July 2, 1881, and lived on for 80 days. During his illness he performed only one official act—the signing of an extradition paper. At the first opportunity one would have thought that Congress would have made legal provision to prevent a repetition of such paralysis in government. It did nothing. President Wilson collapsed on Sept. 25, 1919, and was not able to attend a Cabinet meeting until the following April. Once more government had been paralyzed. Once more Congress ignored a warning.

This is not the moment to attempt to make any Constitutional change concerning this problem; but it is clearly the time to make legal provision for the present emergency. A person who has suffered a coronary thrombosis needs, above all, two things—complete physical and mental rest (and this is usually to be counted in months rather than weeks), and complete relief from anxiety. The great danger of the present situation is that Mr. Eisenhower will be pushed into attempting too much too soon, and risking a setback. Many Republicans are trying to minimize his illness. Some even foolishly talked of his resuming the reins of government in a few weeks. And a few extreme Democrats call it presumptuous for Vice President Nixon or Sherman Adams to carry on routine functions. Yet it is of the utmost importance not only that Mr. Eisenhower should not be prevailed upon to do too much too soon, but that he should not be made to suffer anxiety because of his enforced inactivity.

The simplest and safest way to insure the President his needed rest, and at the same time to avoid the many dangers of a temporarily headless government, is to get Mr. Eisenhower's consent to call a special session of Congress and to submit to it, a simple bill allowing the President to delegate as much of his powers and duties as he saw fit to the Vice President, and also to withdraw this delegation at any time he thought proper. This would give Mr. Eisenhower the choice of acting in whatever way he thought wisest. It would give him the assurance that the Vice President could make whatever decisions or take whatever actions were necessary until the President's full recovery. And it would insure that these actions would be legal.

The fact that there is no government emergency at the moment of writing is not a reason for doing nothing. On the contrary, it provides the very opportunity necessary for Congress to provide the discretionary powers of delegation which could enable our government to make whatever quick decision or set of decisions might be necessary in the event of an unexpected emergency in foreign relations or in domestic economic policy without strain on the President or further risk to his health. This is the course indicated by forethought and common prudence.

The Farm ‘Parity’ Fraud
October 24, 1955

The myth of a farm “crisis” has been built up in recent months by the farm bloc in Congress. Farm income is of course below the Korean-war boom level. But nothing justifies the label of a “crisis.” And apart from this, the “remedies” proposed are utterly devoid of economic sense.

The whole notion of a price “parity” that ought to be perpetually maintained between farm and nonfarm prices is absurd. So is the whole idea that any group of producers is perpetually entitled to some fixed “fair share” of the national income. If there were any merit in such a notion, it ought to be universally applied. If farm prices are to bear the same relationship to nonfarm prices that they bore in the extremely favorable period from 1910 to 1914 (now more than 40 years past), then the price of everything ought to bear that 1910–14 relationship to the price of everything else, and the public Treasury ought to be used to maintain this relationship. Nobody has so far been brazen enough to propose anything so preposterous. Everyone knows that the supply and demand and conditions of cost of production for every commodity change every year. The market, as well as “fairness,” must reflect such changes.

The parity nonsense is not applied consistently even to farm prices. It is applied to half a dozen so-called “basic” commodities—wheat, cotton, corn, tobacco, rice, and peanuts—and about twenty “nonbasic”
commodities. Taken all together the value of price-supported items is less than half of total farm cash income. The farmers who raise the other commodities must depend on themselves. But the price supports distort farm-price interrelationships and often increase the pressure on farmers raising unsupported commodities. Cattle raisers, for example, are hurt by the artificially high prices they must pay for feed.

The methods of providing price supports are also inconsistent, one-sided, and about as mischievous as could be imagined. The government makes “loans” to farmers for some crops at the high price level that Congress prescribes. If the price rises even above that level the farmer can sell his crop and make the extra profit. If it falls below that level he can let the taxpayer take the loss.

One result of this system has been the piling up of huge artificially created farm surpluses in warehouses. The government now holds $7 billion worth of farm products in storage. More and more storage space, expensive and but for this foolish plan entirely needless, is being built to hold these mounting surpluses. Even a large number of second-world-war freight ships are now being used to hold millions of bushels of grain.

These surpluses hang over the market, and exercise a depressing effect on market prices. To maintain our artificial farm-price levels we impose import quotas on foreign farm commodities. Worse, we try to dump our government-created surpluses on foreign markets. We thereby create an immense amount of ill will abroad and make a mockery of all our pious advice that the world should lower international trade barriers. The American city worker pays these artificial farm prices both as a taxpayer and as a consumer who is charged more for his foodstuffs in the market.

It would be easy to suggest a less preposterous “farm policy” than the present one. The real gain from the Benson program is not that it provides “flexible” price supports but that it makes possible lower price supports. But the main problem is to get the government altogether out of this fantastic fiasco. It is the program itself that is today creating most of the farmer’s problems. Without it he would not have been encouraged to raise unsalable crops, but could have adjusted himself to actual demand as every other producer must do.

On the economic side it would not be too difficult for the government to get out from under the present program. It could announce a halt in further price support within a year. But what is primarily needed—and what seems to be altogether lacking—is the political courage in Washington within either party to talk sense to the American people on this issue.

Farm Fiasco: A Way Out
October 31, 1955

The so-called farm “crisis,” as I pointed out here last week, is not primarily economic but political. It exists chiefly in Washington. And politicians, instead of considering how to extricate the government from its price-support fiasco, talk of even bigger and more harmful subsidies.

It is true that certain farm groups, such as hog raisers, today face special difficulties. But realized gross farm income was running in the first half of this year at the annual rate of $33.7 billion, compared with an average annual income of $33.8 billion in the preceding nine, years (which include the Korean-war boom years). This hardly indicates a crisis.

Regardless of such comparisons, the whole farm subsidy program is wrong in principle. In the long run it must work more harm than good to the farmers themselves. The chief problem today is to extricate the government from the present fiasco. Let us look at some ways in which this might be done.

1—The whole notion of a price “parity” that ought to be perpetually maintained between farm and non-farm prices is ridiculous. But the parity formula is at least being made a little less preposterous than it has been. Instead of taking the 40-year-old period from 1910 to 1914 as the basis, we are now transferring to a rolling average of the relationships between prices paid and prices received by farmers for the ten years preceding each crop year.

2—A more important step (if we assume that it is politically impossible to get rid of the price-support program altogether) would be to lower the price-support level, not to a point where it would assure the farmer a so-called “fair” income, but to the point where it would protect him against out-of-pocket loss. The reason for this should be obvious. Wherever a surplus already exists it is fantastic for the government to offer a support price to encourage the farmer to grow a still greater surplus. Rather the effort must be to prevent the farmers from repeating the collective error that led to the problem. Government estimates indicate that farm production expenses are usually about two thirds of realized gross farm income. On this basis the government support level should not be 90 percent of “parity,” or even 75, but only about 67 percent.

3—Even assuming that some price-support program is to continue, there is no justification for offering the farmer or any other producer a one-way speculation against the taxpayer in which the taxpayer takes all the losses and the producer only the profits. Instead of
its present “nonrecourse loans,” the government should buy outright, and be free to dispose as it wishes of what it holds.

4—There is a possible way in which the government could get out from under its present enormous holdings of crop surpluses, and in the process perhaps solve several problems at once. This would be to offer to sell its holdings, at a price slightly below estimated cost of production, back to the farmers themselves. Each farmer might be allowed to buy an amount proportionate to that of his own production of that commodity in the preceding year. The government would doubtless take a big loss on this—but not as big as it ultimately would by continuing its present program. The farmers who bought the commodities would be free to sell them in the market at the best price they could get.

Under such an arrangement a farmer could have a good part of one year’s crop, say, without the usual work and risks of raising it. He would almost certainly be able to sell it at a profit. Few farmers, knowing in advance that this carry-over would be thrown on the market, would plant the same crop for the new year. (Any such government plan should of course be announced a month or so before the normal planting season.) In this way most of the surpluses now held by the government could be worked off in a short period.

The farm price-support program has been growing like a cancer. Only a drastic surgical operation seems likely to curb it now. 

A Flood of Debt
November 7, 1955

The current prosperity has been mounting to ever higher peaks. In the third quarter of this year the total amount of goods and services produced in the U.S. (the “gross national product,” affectionately known as GNP) rose to an annual rate of $392 billion, the highest on record.

Official estimates also intimate that the increase in the gross national product in the third quarter was founded on consumer buying, itself at the annual rate of more than $256 billion, highest in history. But how stable is this economic paradise? For how many quarterly periods can we continue to build up new records? In Newsweek of Aug. 29, in a column entitled “A Flood of Credit,” I pointed out the large extent to which the current boom rested on credit expansion. An article on the same theme appears by Jules Backman in the October issue of a little magazine called Challenge, published by New York University. Though many of the statistical comparisons that Professor Backman makes cover the same ground as those in my Aug. 29 column, his own article adds some additional and very striking comparisons.

The boom in housing, in automobiles, and other durable goods has been financed to a large extent by personal debt. By the end of June 1955, the volume of automobile credit outstanding, at $12.5 billions, was 23 percent higher than twelve months earlier. Total consumer credit, at $32.5 billion, increased 13 percent during the same period. The August total of $33.6 billion compared with only $5.7 billion at the end of 1945.

Again, under the imprudent mortgage guarantees of the Federal Housing Administration and the Veterans Administration, mortgage debt on one- to four-family houses climbed from $66.3 billion at the end of 1953 to an estimated $82 billion in June 1955. Together, consumer credit and mortgage debt have increased from about $24 billion at the end of 1945 to about $110 billion, while total private debt has risen from $140 billion to $360 billion.

Are we too deep in debt? Professor Backman makes some judicious answers. He points out, quite rightly, that any exact quantitative measurement of the safe limit to personal debt is impossible. But he also points out that the current ratio of consumer debt to total personal income after taxes is the highest on record. To put it another way, the rate of increase in consumer credit has been greater than the rate of increase in consumer income.

And he makes a sensible observation that emphasizes the dangers in this situation. The safeness of consumer credit is not measured solely by the ability of the borrowers to carry the interest burden, or even to repay the principal. It is measured also by the impact of expanding debt on the future level of general business activity. When consumers spend beyond their incomes, they obviously stimulate the economy to the extent of their borrowing. A family earning $100 a week, for example may spend much more as it refurnishes a home, buys a car, a television set, or a refrigerator. But at some future date, the family will have to spend less than its current income if it is to repay the loan. If the total volume of consumer credit merely stops growing, part of the stimulus to the economy is lost. When repayments exceed new debt, recessionary tendencies may develop. Yet periods of borrowing must be followed by periods of repayment.

Considerations like these perhaps explain why our Federal monetary authorities are fearful of a further rise in credit, but fearful also of bringing the rise to a halt. Some officials discourage the idea of a further advance in the Federal Reserve discount rate even above 2½
percent because “it might rock the boat.” But may it not eventually rock the boat still more to allow credit expansion to continue? The country’s money supply (measured by bank deposits and currency) increased $10 billion at the end of July compared with the same date a year ago, largely as a result of a $9.4 billion increase in commercial bank loans in the same period. How long can we keep up this rate of money and credit inflation? ♦

Stevenson’s Farm Claptrap
November 14, 1955

Developments of the last few weeks reveal once more that no matter how high or harmful a subsidy may be, it creates vested economic and political interests that demand not merely its continuance but its increase.

Even Secretary Benson, who has been urging moderation and sense, was forced by political clamor to announce that $85 million of the taxpayers’ money would be thrown into buying pork and lard in an effort to halt the decline in hog prices. True, hog prices are comparatively low. But it never occurs to those who are bawling for government subsidies to ask why hog prices are low, and what the consequences may be if the government boosts them. The truth is simply that hog prices have been falling because the demand for pork has been declining while the supply of pork has been increasing. Profitable hog prices will not be restored until the supply of hogs is brought into workable relationship with reduced demand. But any government support which falsifies prices will encourage hog raisers to continue in the same course that led to their existing troubles. It will prolong and eventually increase these troubles.

In the same way, it is the 90-per-cent-of-parity support for “basic commodities” that led to the huge crop surpluses which have exhausted storage capacity, mis-directed farm production, forced our farm products out of world markets, led to our import quotas and export dumping schemes, and thrown a heavy burden on the city buyer of foodstuffs and on the taxpayers.

The appalling consequences of this policy should at last be clear even to a schoolboy. Yet that great statesman and intellectual, Adlai Stevenson, has joined the clamor for an immediate return to rigid farm prices at 90 percent of parity. His argument for this is incredibly naïve. “Our objective for agriculture,” he declared, “is equality with the other parts of our economy.” What does he mean by “equality”? Does he mean that everybody, whether farmer, factory worker, or film star, should have the same income as everybody else? He cannot mean anything like this—which shows how loosely he uses words.

He tries to explain what he does mean: “Our yardstick for measuring this equality is parity—a formula for fairness based on relating what a farmer gets for what he sells to what he must pay for what he buys. And 90 percent of what is fair is certainly not unfair or too high.” Here is a priceless specimen of begging the question. If parity is “fair,” then it certainly cannot be unfair. In fact, if parity is “fair,” only 90 percent of it must be unfair. Why is Stevenson so niggardly? Why not 100 percent parity for 100 percent fairness?

Of course what “parity” really means is that a certain past relationship between prices that existed from 1910 to 1914, or in the ten past years, is to be perpetually preserved, at the expense of the taxpayer and consumer, no matter how drastic the changes have been in supply and demand or in the conditions and costs of production. If Stevenson knows anything about this matter at all, he must know that as a result of trying to maintain 90 percent parity the government is now holding $7 billion in unsalable farm surpluses. It would take nearly a year to use up the American cotton already in storage. It would take at least two years to consume the record volume of American wheat already in storage. When such surpluses already exist, it is preposterous to support prices that encourage the farmer to grow still greater and more unmanageable surpluses.

What Stevenson is really saying is that he desperately wants the Democratic nomination; and that he thinks the farmers’ vote can be bought by this further bribe at the expense of the taxpayers and of city workers who must pay it through higher food bills. If Stevenson does not realize the economic consequences of what he is proposing, he is surely not fit for the high office to which he aspires. If he does realize these consequences, then we can only conclude that, like Harry Hopkins, he cynically thinks the American people are “too damn dumb to understand.” ♦

Revolt against Spending
November 21, 1955

Immediately before last year’s Congressional elections, I pointed out in this column (Nov. 1) that the “middle-of-the-road” and semi-New Deal policies being pursued by the present Administration would probably be the main cause of a Republican Congressional defeat if it occurred. Following those elections (Nov. 22), I remarked that the real danger of the Republican defeat that had just occurred was that “Administration
Republicans . . . may interpret the result as a repudiation of President Eisenhower’s more conservative policies and a public demand for return to New Dealism—to big government, big spending, inflation, and subserviency to labor-union bosses.” Unfortunately, this interpretation did in the main prevail. In this year’s local elections we have had further Democratic gains. And once more it is widely argued that this is because the Eisenhower Administration did not go sufficiently left.

A more plausible interpretation is the very opposite—that the Democratic voters, as usual, voted for Democrats, but that a substantial percentage of conservative Republicans, disheartened by the abandonment of traditional conservative Republican policies on the part of the Administration, simply stayed home—as they did in the Truman-Dewey election of 1948 and as they did last year.

It might be difficult to prove this interpretation statistically if we did not happen to have direct evidence that whatever caused the election of more Democrats and fewer Republicans, it was not a drift of the electorate toward the left. This direct evidence shows, on the contrary, a return toward conservatism. It shows a revolt, above all, against the constant increase of government spending.

The most dramatic example of this was in Ohio, where, in the face of tremendous CIO propaganda, the voters overwhelmingly rejected a proposal to increase the state’s unemployment-compensation benefits from a maximum of $33 to $50 a week, to extend the length of time a person can receive benefits from 26 to 39 weeks, and to permit the payment of state unemployment benefits to people drawing out-of-work pay from private industry. The votes of many factory workers, including rank-and-file CIO members themselves, must have been against this proposal to bring about such a defeat.

Only slightly less dramatic were the results in New York State. Here the voters heavily rejected a proposed constitutional amendment to authorize a $750 million bond issue for highway construction. They defeated a proposed amendment authorizing local governments to borrow in excess of their debt limits for sewage systems. They rejected a proposition to authorize the lending of $50 million in state housing funds for “middle income” housing. The voters have hitherto been approved by overwhelming majorities.

Over the country as a whole, the balloting resulted in the defeat of 75 percent of the bond issues proposed to finance road building and other projects. This reversed the pattern of recent years in which the voters have ratified an average of 85 percent of the bond issues submitted to them.

Let us hope that the lesson will not be lost in Washington. If people in our richest states have finally decided that they cannot afford to keep on piling up debt for more roads and other improvements in their own localities, what, do you suppose, would happen if they were permitted to vote directly on the Administration’s grandiose national road-building program, or on its policy of scattering subsidies totaling $4.7 billion to dozens of foreign governments?

Next week I expect to write about the spread of the political delusion that the government can draw on a sort of Fourth Dimension to supply everybody’s needs or wants without taking the corresponding dollars or goods away from anybody else. This year’s elections show that the voters are less subject to this delusion than most of our politicians.

The Fourth Dimension
November 28, 1955

We are heading into our 23rd deficit in the last 26 years. In the richest and most productive year in our history, with the most onerous taxation we have known until this decade, our Federal revenue still does not equal our Federal spending. That spending now runs to about $64 billion a year-twenty times the rate at which we were spending, say, in 1928. Yet the Administration professes helplessly that it cannot cut this down. It is not merely defense but nondefense spending that is at record levels. From a hundred directions come demands for more funds—for grandiose highway programs, Federal aid to schools, flood control, more social security, more aid to the farmers, more foreign aid. And so on and on.

It now seems futile to criticize any specific spending program. For a general delusion has taken hold of the overwhelming majority of our Washington rulers. This delusion has been given what seems to me its most appropriate name by the European economist, Wilhelm Röpke. “When demanding assistance from the state,” he wrote, “people forget that it is a demand upon the other citizens merely passed on through the government, but believe they are making a demand upon a sort of Fourth Dimension which is supposed to be able to supply their hearts’ content without any individual person having to bear the burden.”
This name for the delusion is comparatively new. But the delusion itself, and correct descriptions of it, are very old. “The state,” wrote the French economist Frédéric Bastiat a century ago, “is the great fiction through which everyone attempts to live at the expense of everyone else.” And in 1842 Macaulay declared: “It is supposed by many that our rulers possess, somewhere or other, an inexhaustible storehouse of all the necessaries and conveniences of life, and, from mere hardheartedness, refuse to distribute the contents of this magazine among the poor.”

This delusion thrives today as never before. Every morning our newspapers report statements that the government has not yet begun to meet our highway needs, our education needs, our farm-support needs, our hospitalization and health needs, and a thousand other “needs.” The tacit assumption is always that an increase in government spending will meet more of our total needs than were met before. But this comes from overlooking the fact that the government has not a dollar to spend on anybody that it does not take from somebody else. When a pressure group says: “We demand that the government should pay for us,” it is really saying, “we demand that other people should pay for us.”

The net result of this process is that instead of meeting more of the people’s needs than otherwise, we actually meet fewer. This is true for several reasons. In 1829, the poet Robert Southey (who was a New Dealer a century before Franklin D. Roosevelt and a Keynesian a century before Keynes) wrote that “a liberal expenditure in national [public] works” was “one of the surest means of promoting national prosperity.” Macaulay pointed out in a blistering retort some reasons why public spending is usually less needful and more wasteful than private spending.

We may add other reasons. For every additional dollar that the government spends, the taxpayers have one dollar less to spend. The situation is worse than this. Taxation erodes the incentives to produce and earn. It penalizes success, and the production of marketable products, often in order to subsidize continued production of unmarketable products. It sets up an army of taxgatherers. In the end it meets fewer real needs than before. People spend the money they themselves earn on what they themselves really want. The government spends money, not on what the rest of us want, but on what the bureaucrats think is good for us.

The delusion of an economic Fourth Dimension flourishishes not merely through stupidity, but because there is now an enormous vested interest in keeping it alive.

What Is a Liberal?
December 5, 1955

We have all been long indebted to Judge Harold R. Medina, now of the U.S. Circuit Court of Appeals, for the patience, balance, and firmness with which he presided at the trial of eleven top Communists in 1949. A few weeks ago he put us further in his debt by exposing the inverted semantics into which most of us have recently fallen in our political discussion—particularly in the strange use of the word “liberal.” He regards himself as a liberal, Judge Medina declares, and he does not intend “to be frightened away because the Communists and their coadjutors have tried to appropriate the word ‘liberal’ just as they have the names of our great Presidents, Abraham Lincoln and Thomas Jefferson, by the use of Aesopian language, twisting names and personalities to suit their purpose.”

Today Socialists, fellow travelers, and Communists all call themselves liberals. As a result, as Judge Medina points out, the word has taken on “a sinister and evil connotation.” I should like to supplement his own remarks on this strange usage and its results.

Originally (as its Latin root liber implies) the liberal was a man who believed in freedom. The foundations of the liberal tradition were laid in England by such great figures as Milton, Locke, Hume, Burke, Adam Smith, and Mill. Politically, the liberal tradition stood for freedom for the individual, the Rule of Law, strict limitation of the powers of government, and decentralization and diffusion even of these limited powers. Economically, the liberal tradition stood for protection of private property, and for freedom of trade, of prices, of markets, and of enterprise.

But through historical accident and intellectual confusion, the word “liberal,” particularly in this country, altered and finally reversed its meaning. Today, in popular speech, a “liberal” has come to mean a person who wants constantly to expand the powers of government, and to centralize them in Washington at the expense of the states and localities. It has come to mean a person who disparages Congressional restraint on the executive power and who prefers bureaucratic discretion to the Rule of Law. Economically, it has come to mean a person who distrusts freedom of markets and freedom of enterprise; who distrusts private ownership and management and extols government ownership and management; who presses for more government “planning,” and who wants to tax and penalize success in order to subsidize failure.

Most of those in America who are called “liberals” today are, in brief, either Socialists, statists, or state
The Federal Reserve Board is to be congratulated on its 1934. TVA, for example—furiously resent application of the France, for example, the economists who are opposed December 12, 1955 (Reserve Banks) may indeed seem high. It is the fourth term to themselves. It has had a noble meaning. When anything acquires value, it becomes worth stealing. But what is much harder to understand is why many who are libertarian in their own basic philosophy not only fail to challenge the Socialists’ and statist’s title to the word “liberal,” but have themselves begun to use it as a stigma.

This particular perversion of the word’s meaning has not occurred in most of Western Europe. In France, for example, the economists who are opposed to Socialism and state “planning,” and advocate private enterprise and free markets, now call themselves the “neo-liberals.” Their Socialist opponents admit their title to the word, and openly disparage liberalism. In Continental Europe, and even in England, the Socialists know and admit they are Socialists. But those who support Socialist principles here—the zealots for their title to the word, “liberal,” but have themselves begun to use it as a stigma.

We need to return to first principles in our political and economic thinking. But we will never do so until after we have reexamined our political and economic vocabulary.

Cheap Money Means Inflation
December 12, 1955

The Federal Reserve Board is to be congratulated on its courage in approving an increase in the discount rate from 2¼ to 2½ percent. Only a firm rein on interest rates can prevent a new spiral of inflation.

This mild action was promptly denounced, not only by Democrats in Congress but even by some bankers and businessmen. “Money was tight enough already,” complained one banker; “they’re going to make it unavailable.” If one takes comparisons for the last twenty years alone, a 2½ percent discount rate (the rate at which member banks can borrow from the Federal Reserve Banks) may indeed seem high. It is the fourth increase this year, and the highest discount rate since 1934.

But our generation has become so accustomed to cheap money that we have lost our perspective. In 1929 the discount rate of the Federal Reserve Bank of New York was raised to 6 percent. It had averaged around 4 percent for the preceding decade. It had been as high as 7 percent in 1920. Nor is the present discount rate high compared with official discount rates in the rest of the world. Money has been getting tighter everywhere. A recent compilation by the London magazine The Banker showed that in early August the discount rate in Britain was 4½ percent; in Germany, 3½ percent; in Sweden, 3¾ percent; in Denmark, 5½ percent.

In fact, if the Federal Reserve System were operating on pre-Keynesian policy it would today be charging a much higher discount rate. The late Benjamin M. Anderson, who was for many years economist of the Chase National Bank, declared in discussing the belated increase of the rediscount rate in 1920: “The Federal Reserve System should have held to the orthodox rule of keeping the rediscount rate above the rate to prime borrowing customers at the great city banks.” Today this rate is 3½ percent. The purpose of this “orthodox” rule was, of course, to penalize and discourage borrowing from the Federal Reserve Banks rather than to encourage the commercial banks to over lend to their own customers and then to reback at the Federal Reserve at an actual profit to themselves.

I do not mean to suggest that the Federal Reserve System could return overnight to this traditional rule, so long neglected. But it is time for us to recognize more clearly the direct causal connection between artificially low interest rates and inflation. Many bankers and economists talk and write today as if the sole cause of present-day inflation were a budget deficit financed by unloading government securities onto the banking system. But the inflation will be brought about, even without a budgetary deficit, whenever interest rates are kept too low in relation to the supply of and demand for real savings. This leads to overborrowing, and an increase in the money supply which pushes upwards on prices.

Some reasons why the Federal Reserve Board has now increased the discount rate are clear. The board is concerned about the upward pressures on the price level of steel, other primary metals, and building materials. Most of our economy is already operating practically at full capacity—at “full employment” of available men and resources. Any further increase in loans would tend merely to push up prices rather than lead to any further expansion in output.

Consumer spending has been rising more rapidly than consumer income. Installment credit and mortgage debt are at record levels. In September total consumer credit outstanding was at $34.3 billion, compared with $28.9 billion a year previous, and with $8.4 billion
at the end of 1946. The stock market has been buoyant. Industrial companies have been announcing the most ambitious expansion programs on record. The country’s money supply (total bank deposits and currency outside of banks) stood at the end of September at $215 billion—an increase of $7 billion over the year before. Total bank loans stood at $78.4 billion—an increase of $11 billion over those of September 1954.

It was time for the government to take its foot off the accelerator. *

A Two-Point Farm Program
December 19, 1955

A few weeks ago Secretary of Agriculture Benson invited “everyone” in the country to send in his ideas about solutions to the farm problem. “I guarantee to you,” he said, “that those ideas will receive the most careful attention possible.”

Thus encouraged, I should like to propose a very simple farm program. I have already suggested, in *Newsweek* of Oct. 31, some ways in which the government might extricate itself from the present farm fiasco, but those proposals tried to take into account what political pressure groups might accept. If we consider merely what plan would work best economically, such a plan could be reduced to two points.

The first point may strike some readers as extremely novel, because it is almost nowhere being suggested. This is that Congress stop all price guarantees and all promises of support-buying of any kind on any crop that has not yet been planted.

Let us look at the remarkable advantages that such a plan would have. (1) It would mean immediately an enormous saving to the nation’s taxpayers. (2) It would soon mean a great saving to the nation’s food buyers and food consumers. (3) It would end any further accumulation of farm surpluses. Marginal farmers would stop raising crops on marginal acres. Farmers and the government would cease to hold crops off the market. We keep forgetting that the present farm surpluses are purely the creation of the price-support program itself. Farmers raise crop surpluses because they are encouraged to do so by an excessive price. The surpluses pile up because they are unsalable at the price set.

(4) With the removal of price guarantees and supports, there would no longer be any need for government acreage control or marketing quotas. Farmers do not plant crops on which they do not expect a profit. Marginal producers are no longer induced to grow crops on marginal acreage. (5) Removal of price guarantees and supports would restore a better balance of farm production. Unfavored farm commodities would no longer be caught in an artificial price-cost squeeze. (6) Our foreign economic relations would immediately improve. We would no longer need to impose farm import quotas or try to dump surpluses abroad.

But while termination of further price guarantees or supports would prevent the present situation from getting still worse, as it otherwise threatens to do, it would not solve the problem of the huge $7 billion worth of surpluses that the government already holds. This brings me to the second step of my proposed program. The government would sell its existing surpluses back to the farmers themselves. Each farmer might be allowed to buy an amount proportionate to that of his own production of a surplus commodity in preceding years. The government could assure the sale simply by offering the surpluses to the farmers at, say, two thirds of the world market price of each commodity at the moment of sale. Each farmer would be free to dispose of what he bought as he saw fit. He could store it at his own expense, or sell it through the speculative markets.

There would then be no need to subsidize the farmer to put his acreage in soil-conserving crops. Once again guided by free market prices, most farmers would realize the folly of raising more of a crop until the existing surplus was worked off. They would meanwhile have sufficient incentive to conserve their own soil.

It is true that the government would take a big loss in selling these surpluses back to the farmers. But most of this loss is inevitable anyway. It will be immensely greater, in fact, if the government continues with its present program. It is true that individual farmers would for a year or two be paid, in effect, for not raising crops in which surpluses existed. But the twin objectives of a “soil bank” and of getting rid of surpluses would be achieved.

The only alternative to halting present farm price supports is further losses to taxpayers, further piling up of surpluses, and ultimately much further harm to farmers themselves. *

Arithmetic of Federal Aid
December 26, 1955

The present ballyhoo for Federal aid to local schools is one more example of the delusion that Federal money comes out of a sort of Fourth Dimension, and doesn’t really cost anybody anything.

The chief argument for Federal aid is that the states and localities cannot afford to pay for their own
This was the kind of bill that actually emerged from the House Education and Labor Committee last summer. Under it, about half the Federal appropriations would go to the fourteen wealthiest states, and only a fourth to the fourteen poorest. As Freeman points out, the fourteen wealthiest states control 53 percent of the votes in the House of Representatives, and the fourteen poorest states only 23 percent.

The arithmetic of Federal aid, in brief, is entirely unsound. From where, then, does the constant political pressure come for Federal aid? From the very persons who ought to be the greatest defenders of states’ rights, but who turn out to be among its greatest enemies. From many governors, state legislators, and local educators. The reason is not obscure. If state officials get Federal aid, they can argue to their local voters that they have brought benefits to the state without raising taxes. The argument is, of course, fallacious. The voters of the states and localities simply pay for schools in increased Federal taxes instead of increased local taxes. To be sure, the exact increase of the Federal tax burden on himself is much harder for the individual taxpayer to trace. The Federal government can even create the illusion that Federal aid doesn’t cost anybody anything, because it can run a deficit and print more paper money.

The pressure for Federal aid to education, in sum, perfectly illustrates the delusion that funds appropriated by the Federal government are not really supplied by the voters of the states and localities, but come out of a sort of Fourth Dimension. The sad truth is that there is no magic in Federal aid; that everything has to be paid for; that if the Federal government helps to pay for local education it must end by controlling local education, and that states’ rights will become a hollow shell.

The moment we examine it, this argument vanishes into thin air. For the residents of the states and localities who “cannot afford” to pay for adequate education are the same people who would be called upon to pay increased Federal taxes to supply Federal aid. In *Newsweek* of Nov. 28, Raymond Moley discussed some of the fallacies of Federal aid to education, based on the excellent study by Roger A. Freeman, published by the American Enterprise Association in Washington, D.C. But here I should like to call attention especially to the economic and fiscal fallacies.

Freeman argues that, if anything, the states and localities are now in a better position to pay for education than the Federal government. State and local government debt is small compared to the huge Federal debt. Twenty-five years ago the Federal government collected one fourth of all taxes in the U.S.; today it takes three fourths. It is high time to reverse this trend.

When such facts are pointed out, some proponents of Federal aid are content to argue that the Federal government should aid the poorer states alone. Freeman points out what is wrong with this argument. The discrepancies in fiscal capacity among states have greatly narrowed in recent years. Between 1940 and 1953 the per capita income in the twelve highest-income states rose 37 percent in dollars of constant value, whereas in the twelve lowest-income states it rose 96 percent.

And Federal aid to the poorer states alone is politically so improbable as to constitute a daydream. Congressmen from New York may gain politically by getting Federal aid for New York; but they will get few votes in their own districts for taxing New Yorkers to help build schools in Mississippi. Experience has shown, in fact, that the only kind of bill for Federal aid to education that has a political chance in Congress is one which makes a flat per pupil grant to all states.
The present proposals for still larger farm subsidies at the expense of the taxpayers are one more example of how Federal spending programs, no matter how huge or how harmful, tend to grow even greater.
